Minnesota Academy of Medicine

Meeting of November 12, 1952

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, November 12, 1952. Dinner was served at 7 o'clock and the meeting was called to order at 8:10 p.m. by the President, Dr. O. H. Wangensteen.

There were fifty-six members and five guests present.

Minutes of the October meeting were read and approved.

The Secretary reported that the Executive Committee, at the request of the applicant, had approved the transfer of the name of Dr. Arthur Ide, from the Active to the Senior Membership list. Upon ballot, this was approved by the members present.

Upon ballot, the following men were elected as candidates for membership in the Academy:

Minneapolis	Dr. Ejvind Fenger
Saint Paul	Dr. Lawrence Hilger
	Dr. Burtis Mears
	Dr. Ben Sommers
Austin	Dr. David P. Anderson
Red Wing	Dr. Ray Hedin

The scientific program followed.

Dr. C. W. Lillehei, University of Minnesota, by invitation, gave the paper of the evening, entitled "The Effect of Left to Right Circulatory Shunts upon Susceptibility to Infection."

The meeting was adjourned.

Wallace P. Ritchie, M.D., *Secretary*

Meeting of December 10, 1952

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, December 10, 1952. The dinner was served at 7 o'clock and the meeting was called to order at 8:10 p.m. by the President, Dr. O. H. Wangensteen.

There were fifty-five members and two guests present.

Minutes of the November meeting were read and approved.

Dr. Wangensteen said he felt some sort of commendation to Dr. Wallace Ritchie as Secretary, was in order, and he also wanted to thank Dr. Thomas Lowry for the fine work he had done as Chairman of the Program Committee.

The following members were elected as Officers for the year 1953.

President	Dr. E. A. Regnier, Minneapolis
Vice President	Dr. Charles N. Hensel, St. Paul
Sec'y-Treasurer	Dr. Robert E. Priest, Minneapolis

The scientific program followed.

Dr. Wendell Hall, University of Minnesota, by invitation, gave a talk on "Human Brucellosis in Minnesota." *(See Page 460)*

DISCUSSION

Dr. Wesley W. Spink, Minneapolis: I suppose that in the past many papers of historical interest and importance have been presented before this Academy, and the one that Dr. Hall has presented tonight should be included in this category. I doubt whether many individuals in this country can bring together thirty-five well-studied, bacteriologic-proved cases of human brucellosis. It takes a long time to accumulate such an experience. Over a period of fifteen years, my associates and I, including Dr. Hall, have studied 110 culturally proved cases. This does not include an equal number of cases with undoubted brucellosis having epidemiologic, clinical and serologic evidence of active disease. All these active cases have been screened from several hundred cases of suspected brucellosis.

There are several aspects of this disease that are of historical interest, as far as the state of Minnesota is concerned, and one in particular that relates to the University of Minnesota. Minnesota has long been a leader in the efforts to eradicate brucellosis from farm animals. Participants in this activity have included individuals in the Division of Veterinary Science in the University, such as the late Dr. C. P. Fitch, Dr. W. L. Boyd, Dr. H. C. Kernkamp and Dr. M. Roepke; members of the Laboratories of the State Board of Health, such as Dr. O. McDaniel, Dr. L. Heathman Barr, Dr. D. Fleming and Dr. H. Bauer; Dr. Randolph West of the Minnesota Livestock Sanitary Board, and Dr. Fred Driver of the Bureau of Animal Industry in the U. S. Department of Agriculture.

Although Bang had established the etiology of contagious abortion in cattle in 1897, and Bruce had isolated the causative agent of Malta fever from humans in 1887, the first human case due to *Br. abortus* was not established until 1924. But a former Professor at the University of Minnesota came very near establishing the fact that human beings could contract brucellosis from cattle a decade before this was proved. A young bacteriologist trained in serologic techniques in Copenhagen became interested in the complement-fixation test for brucellosis, and in 1912 published a paper from the University of Wisconsin showing that of 76 head of cattle, 30 had serologic evidence of brucellosis. Furthermore, he isolated *Br. abortus* from bovine fetal material, the second man in the United States to do so up to that time. That man was Dr. Winfred Larson, late Professor and Chairman of the Department of Bacteriology at the University of Minnesota. Dr. Larson moved on to Minnesota from Wisconsin and in 1913, he published another significant paper with Dr. J. P. Sedgwick, Chairman of the Department of Pediatrics. He demonstrated complement-fixing antibodies and agglutinins for brucella in 17 per cent of the sera from over 400 infants and children. In the discussion of their paper they postulated about the significance of these brucella antibodies, but they did not take the final step and attempt the isolation of brucella organisms from human beings. They concluded, though, that further investigations were necessary.

The impetus for the control and eradication of animal brucellosis in Minnesota has stemmed from two fundamental facts. First, the disease is an economic liability to the farmer and to the livestock breeder because it causes abortions and because a diseased cow is a poor milk producer. Second, these animals are the reservoir for the human disease.

Prior to World War II, efforts in Minnesota to eradicate bovine brucellosis were attended with considerable success. If the work had progressed uninterrupted, by today brucellosis would be much less of a problem. But due to the war, activities centering around a control program abated, and there was an associated increase in the incidence of animal and human brucellosis. But since the conclusion of World War II the eradication program in Minnesota is underway again, and other states are also engaging in aggressive programs. These increased efforts in other states are due to two recent developments. One relates to the announcement of the Chicago Board of Health that after January 1, 1955, all milk and milk products sold in that city for human consumption shall come from herds of cattle free from Bang's disease. This edict struck particularly hard at Wisconsin, where the dairy industry is the backbone of the state's economy. The State Legislature became interested, and appropriated a large sum of money to investigate the disease in cattle. Recent figures indicate that about 30 per cent of the herds of cattle in Wisconsin have animals with Bang's disease. The other development that is speeding up eradication programs is the decision of the U. S. Public Health Service to revise the milk code so that all milk and milk products sold for human use shall originate from herds that are following either Plan A or Plan B eradication programs. Plan A calls for the serologic testing of all cattle in a herd, and then the slaughtering of all positive reactors. Plan B means the testing of cattle, but deferring slaughtering of the reactors, and vaccinating the calves with brucella antigen. Both plans are in effect in areas in Minnesota, and I am sure that the State Legislature will take an increased interest in the efforts of the farmers and livestock producers to eliminate this brucellosis. At the present time, only three states have been accredited as free of brucellosis—Maine, New Hampshire and North Carolina.

Minnesota has been a most progressive state in the efforts to eliminate brucellosis. The pattern of the program has been adopted by several other states. I believe that since World War II the incidence of the bovine brucellosis has dropped because the attack rate in human beings is declining. This decline is not entirely due to the compulsory state law requiring the pasteurization of all milk sold for human use.

Dr. Theodore Sweetser, Minneapolis: I think Dr. Spink or Dr. Hall might mention some of the aspects of the situation in Rochester or in that area. I think brucellosis has been part of the problem there in relation to the distribution of milk to other states.

Dr. Spink: In answer to Dr. Sweetser's question, I am simply saying—I do not know. I do not believe that the incidence of bovine brucellosis in Minnesota is as great as in Wisconsin. Iowa poses a considerable problem, because the disease there is most prevalent in swine, and most of the human cases are derived from this source. But Iowa is taking active steps to eliminate the disease in hogs.

Dr. Thomas Lowry, Minneapolis: Ten or twelve years ago brucellosis was a very fashionable diagnosis, so to speak. Many patients came in with lymphadenopathy which they themselves had noted and which had caused a diagnosis of brucellosis to be attached to them on quite uncertain grounds, without adequate culture studies. At that time a great deal was being done, at least in some parts of the country, with vaccine therapy. Immediately, therefore, the patient who was considered to have brucellosis was apt to be given vaccine and developed a low agglutination titer against brucella organisms.

The only point in referring to it at all is that in my experience that type of individual has practically dropped out of sight. The patient who develops such a false titer is rarely seen at present in this vicinity as compared with a few years ago. I think it is largely through the efforts of Dr. Spink and Dr. Hall, who have insisted on adequate bacteriologic data before any sort of treatment is given, that this change has come about.

Dr. E. T. Evans, Minneapolis: As mentioned, brucellosis may produce spondylitis. The first group is, of course, the acute spondylitic reaction. I think Dr. Wangensteen will recall a patient we saw fifteen or sixteen years ago at the University Hospital in which the acute process was present for several months and finally quieted down with a diagnosis made only on differential exclusion. A second group is the development of a chronic subacute spondylitis without significant changes in the early cases and with symptoms that again must be diagnosed by exclusion. The third group is the chronic spondylitis in which the diagnosis is made largely on history and the associated finding of the so-called "parrot-beak" changes in the region of the intervertebral space. These patients may be noted on routine x-rays, and the only history one can find is that in years past the patient had a period of considerable localized backache.

As to differential diagnosis, two serious problems present: First, acute osteomyelitis. This is not an osteomyelitis but rather an intervertebral space involvement with secondary osteitis producing the eventual "parrot-beak" finding. They are essentially intervertebral disc in nature with secondary localized osteitis or periostitis. The other groups that are difficult to differentiate are, of course, the tuberculous cases. Inasmuch as most of these patients are farmers, we frequently find a positive Mantoux test. Tuberculosis, however, is a more chronic disease, seldom associated with as much pain as is present in the acute spondylitis cases seen with brucellosis. Careful x-ray studies, the presence of a perivertebral abscess, or the localized finding of destructive osteitis within the body of the vertebra or adjacent to the intervertebral space in planograms, should clinch the diagnosis.

Now that we are hearing so much about acute disc prolapse, degenerative disc with acute symptoms and functional low back complaints, secondary to disc degeneration, I think it is well to remember that if you have an acute disc syndrome, brucellosis as a cause should not be overlooked. It is my understanding that at least two patients have been operated upon for acute disc lesions, which proved to be brucellosis.

Dr. Spink: The most common complication of brucellosis is spondylitis. In Minnesota, not more than 5 to 10 per cent of all the cases develop spondylitis. But in some Mediterranean areas that I have visited recently, more than half of the hospitalized patients have had this complication. It is quite dramatic what rest in bed and antibiotic therapy will do for these patients. Any patient, particularly a farmer, who has received a diagnosis of a slipped or herniated intervertebral disc, should be screened serologically for brucellosis.

Dr. Hall, closing: Dr. Hansen has asked about the eye symptoms in brucellosis. Three-fourths of the patients had headaches and these characteristically were frontal headaches referred to the occiput and down the back of the neck. There were no patients in this series who had any objective evidence of infection in the ears or eyes, and I do not recall any who had a history of eye disease. I can't recall seeing any patients in whom the disease was proved by cultures who had iritis or iridocyclitis; some with positive skin tests and low titers of agglutinins who had received brucella vaccine, had flare-ups of recurrent iritis. I certainly feel that iritis is uncommon in the disease and that probably brucellosis is a rare cause of the iridocyclitis.

Dr. Wangensteen asked about infection of the udder or mastitis. I am not a veterinarian but, as I understand it, Gargot or clinical mastitis in cows is usually streptococcal in origin and not caused by brucella. Mastitis is very uncommon in the human females with brucellosis.

I would like to say something else about the differentiation from tuberculosis. As far as spondylitis is concerned, brucella spondylitis treated with rest and chemotherapy is followed by improvement, which is more rapid than seen in Pott's disease. Furthermore, pulmonary lesions are rare in brucellosis and common in tuberculosis.

The meeting was adjourned.

Wallace P. Ritchie, M.D., *Secretary*

Meeting of January 14, 1953

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, January 14, 1953. Dinner was served at 7:00 p.m., and the meeting was called to order at 8:10 p.m. by Dr. Moses Barron who had been asked to preside, this being the annual meeting at which the address of the Retiring President is given.

There were forty-eight members and four guests present.

Dr. Barron announced the names of the past presidents who were present—Drs. H. L. Ulrich, J. E. Hynes, E. M. Jones, R. T. La Vake, C. B. Drake, James A. Johnson, H. B. Zimmermann, A. G. Schulze, E. M. Hammes, T. A. Peppard, William Hanson, W. H. Hengstler, and O. H. Wangensteen.

No business was transacted at this meeting.

Owen H. Wangensteen, University of Minnesota, gave his address as Retiring President, entitled "A Look Backward." (See page 471).

There was no discussion.

The meeting was adjourned.

Robert E. Priest, M.D.

WHO IS THE "POWERFUL AMA LOBBY"?

You are, Doctor. This fact was brought out in a recent talk in Pittsburgh by Dr. Frank Wilson, director of the American Medical Association office in Washington. The function of this office is frequently misunderstood, even by members of the medical profession. As a matter of fact, the AMA has only two registered lobbyists in Washington—Dr. Wilson and one of his associates. They are registered only for protection of the AMA, and not because of the amount of lobbying they do.

The Washington office of the AMA is best considered as an information center, both for members of the profession and for members of Congress and government agencies. It was first established in 1943, after necessary legislation was passed by the House of Delegates of the AMA. At present, it has a staff of fifteen, including three physicians, two editors, a lawyer, a business manager and his assistant, and an executive assistant. It certainly doesn't sound like the huge "pressure group" that some columnists write about, does it?

It publishes three different types of newsletters. The first and basic publication is *The Bulletin.* This lists by number and name all legislation introduced into Congress that has medical significance. In addition, a brief abstract of the bill is given, but there is no editorializing. In other words, the official attitude of the AMA toward that specific piece of legislation is not given. The Bulletin is factual information and nothing else.

The second publication is *Capitol Clinics,* which is an informal newsletter on happenings in Federal agencies that would be of interest to the medical profession. The third publication is *Special Bulletins,* which is published more irregularly, and gives factual reports on specific agencies or policies. After the *Special Bulletins* is prepared and before it is published, the Washington office has it checked by the head of the agency or policy committee to make sure that the facts are correct.

Now, about this lobby system. Dr. Wilson and his associates never tell a senator or congressman how to vote. Their function is merely to inform the legislators on health problems. For example, a bill may be introduced on the subject of multiple sclerosis. Probably Senator Bloop from Siwash Falls, Idaho, has never even heard of the disease, let alone know what his attitude should be toward this piece of legislation. So he would call the Washington office and ask for information on "this multiple whatchamacallit," and be given a definition in lay terms together with some facts on the incidence, methods of treatment, and any other pertinent information. With this, he can form some intelligent attitude and decide whether he will be for it or against it. Argument for and against medical legislation is presented to congressmen, but under no circumstances is pressure applied.

The "pressure" is applied by the average physician at home, which means you, Doctor. When you write, wire, or call your congressman, you are making your wants known to him as far as medical legislation is concerned. A good representative in Washington desires these letters or telegrams because they let him know how the people at home feel about a particular bill. Congressmen respect the opinion of physicians in spite of the fact that as a group they are number poor in voting strength. Our representatives respect the influence of physicians in the community, and they will listen to you if your arguments are sound and your attitude is reasonable. If you want information about a piece of legislation before you write your senator or representative, the Washington office of the AMA will be happy to send it to you also as one of their services.

How much does it cost to run the Washington office? Hold onto your hats, because the "huge slush fund of the AMA lobby" amounts to 3 per cent of the budget of the American Medical Association, or about $200,000 annually. If you figure 15 salaries, office expenses, the cost of printing and paper, and miscellaneous items of overhead, there certainly isn't enough left to influence congressmen on one piece of legislation, let alone the dozens of bills presented annually.

So the next time one of your friends sounds off on the AMA lobby, here are a few facts you can hand him hot off the griddle. You, Doctor, are the American Medical Association and all its component parts.—*Bulletin of Allegheny County Medical Society.*

◆ Reports and Announcements ◆

FAMILY DOCTORS' DAY

The second Family Doctors' Day will be held on Wednesday, June 3, at the University of Minnesota Hospitals. Once again, an informal program, featuring topics of general interest, has been planned. All physicians are cordially invited to attend this program which will be presented by the Department of Surgery. The day's activities will include the following:

11:00 a.m.	Clinical-Pathological Conference; Todd Amphitheater, University Hospitals
12:00 noon	Luncheon with Department of Surgery Staff; Powell Hall Recreation Lounge
2:00 p.m.	Conference on Common Problems in General Surgery; Heart Hospital Theater, University Hospitals

PHYSICIANS NEEDED FOR THE BUREAU OF INDIAN AFFAIRS

Doctors are needed for service in The Bureau of Indian Affairs on reservations west of the Mississippi and in Alaska. A limited number of positions in the Fish and Wildlife Service are located in The Pribilof Islands off the Alaskan mainland. Applicants for the position of Medical Officer must be graduates of medical schools of recognized standing and will receive compensation ranging from $5,940 to $10,800 depending on qualifications and experience. Forms may be obtained from the U. S. Civil Service regional office at the Post Office and Custom House Building in Saint Paul.

HEART DISEASE RESEARCH GRANTS

Grants and fellowships in the field of heart disease research totalling more than $810,000 have been announced by the Life Insurance Medical Research Fund, an organization of 145 U. S. and Canadian life insurance companies. The new awards raise to more than 5.5 million dollars the money which has been contributed to research by the Fund since it was organized late in 1945.

Today's awards include $664,386 in grants-in-aid to university hospitals and research centers and $139,925 which will be used in supporting forty scientific fellowships for young men and women. The grants-in-aid will make possible fifty-two individual investigations to be carried on in twenty-three states, three Canadian provinces, in Puerto Rico and in two other countries.

Established to support research which will help prolong life, the Life Insurance Medical Research Fund is the pioneer agency supporting research into diseases of the heart and arteries. These diseases are the number one health problem now existing in the country and account for more than half of all deaths. Support of research into heart disease as the sole activity of the Fund was decided upon at a conference of medical scientists held in New York City last June.

Since the Fund began operation it has supported 205 research programs and 241 research fellowships and its work has been carried on in ninety-eight different institutions. Numerous important additions to knowledge about heart disease have been made and many important leads will be investigated during the coming year directed to better methods of treating heart disease and obtaining more knowledge about how it may be controlled or prevented.

Two grants were made to further research in Minnesota. An award of $16,000 was made to the University of Minnesota Medical School for research by Dr. Ivan Baronofsky on problems of acquired heart disease from the standpoint of surgical treatment. The other grant was a postdoctoral research fellowship award which was made to Dr. Morley Cohen, of Minneapolis, for research under the guidance of Dr. C. Walton Lillehei of the University of Minnesota.

WALTER REED SOCIETY

At the Walter Reed Society meeting held April 8, in Chicago, the following officers were elected: Dr. Max S. Sadove, Head, Department of Anesthesia, University of Illinois, president; Dr. Charles F. Code, Professor of Physiology, Mayo Foundation, University of Minnesota; Dr. Clinton H. Thienes, Director, Huntington Memorial Hospital, Pasadena, California, and Dr. Y. T. Oester, Head of Pharmacology, Stritch Medical School, Loyola University, vice presidents, and Dr. Frances A. Hellebrandt, Director, Department of Physical Medicine and Rehabilitation, University of Illinois, secretary-treasurer.

The Walter Reed Society is comprised of individuals who have served as voluntary subjects for experimental research.

Woman's Auxiliary

BLUE EARTH COUNTY HOLDS RECRUITMENT TEA

Mrs. Alton E. Lindblom, President

The Woman's Auxiliary to the Blue Earth County Medical Society were hostesses to sophomore, junior and senior high school girls at a tea designed to interest them in nursing careers. The tea was held at the home of Mrs. Bradley Troost in Mankato, the first week in April.

Attendance was good, and two student nurses and one graduate nurse discussed nursing career advantages with the high school girls. Also, the Auxiliary sponsored a movie on nursing at the meeting.

The Blue Earth County Auxiliary has also been very active throughout the year, carrying on many important auxiliary programs in the community.

In Memoriam

ADOLPH H. AHRENS

Dr. Adolph H. Ahrens, formerly a resident of Saint Paul but recently on the staff of the Sandstone state hospital, died apparently from a stroke on April 15, 1953. He was seventy-one years of age, having been born on August 15, 1881, at Otranto, Iowa.

Dr. Ahrens attended the University of Minnesota from 1906-1909 and graduated from Hahneman Medical College in Chicago in 1910. He interned at Flower Hospital in New York City and took postgraduate training in cystoscopy at the New York Postgraduate School.

Dr. Ahrens began practicing in Saint Paul in 1912, and in May, 1952, moved to Sandstone where he was on the staff of the state hospital there.

Dr. Ahrens was a member of the Ramsey County Medical Society, the Minnesota State Medical Association, and the American Medical Association. He was a past president of the Saint Paul Automobile Club, a life member of the Saint Paul Athletic Club and a past president of the Optimist Club of Saint Paul.

Mrs. Ahrens had acquired a reputation in medical circles as a composer and singer, having sung in productions of the Saint Paul Civic Opera when she lived in Saint Paul. Dr. Ahrens is survived by his widow, Jane, a daughter, Mrs. Frederick H. Clapp, two granddaughters, a brother, Dr. Albert E. Ahrens, and a sister, Mrs. Clara Hedemark, all of Saint Paul.

ELTON FORREST CLOTHIER

Dr. E. F. Clothier, a practicing physician of Elk River for the past seventeen years, died on March 26, 1953, of a heart attack.

Dr. Clothier was born in Minneapolis, July 16, 1902. He graduated from the University of Minnesota Medical School in 1929 and interned at St. Mary's Hospital in Minneapolis and at Glen Lake Sanatorium. He practiced from September, 1929, to November, 1935, at Westfield, Wisconsin, before taking over the practice of Dr. G. E. Page at Elk River in 1935.

Dr. Clothier was a member of the East Central Medical Society, the Minnesota State Medical Association and the American Medical Association. He was also a member of the Northwest Pediatric Society.

Dr. Clothier lived at nearby Little Falls. He is survived by his wife, Rose; two sons, Alan of Elk River and Forrest of Wisconsin, and a daughter, Carole Ann, of Elk River.

PETER HUBERT CREMER

Dr. Peter H. Cremer, Hastings, Minnesota, died March 22, 1953, at the age of seventy-five.

Dr. Cremer was born March 21, 1878, at Cashton, Wisconsin. Tragedy struck his home during his childhood when diphtheria took three of his brothers and sisters within a few days and three more died during the following three weeks. A graduate of Rush Medical College, Chicago, in 1904, he practiced a short time at Red Wing and Cannon Falls before locating at Hastings in 1916.

Dr. Cremer was mayor of Hastings from 1942 to 1944 and was a Dakota County Commissioner from 1932 to 1944. He also served as city health officer.

In 1949 he was named the eminent first citizen of Hastings by the Lyle Russell Post of the Veterans of Foreign Wars. Attending the ceremony were Governor Luther Youngdahl and high ranking officials of the Minnesota Veterans of Foreign Wars.

He was a member of Goodhue County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Dr. Cremer was married to Delia Noel of Mazeppa in 1914. They had no children. He is survived by one brother, Herman Cremer, of Cashton, Wisconsin.

FRANCIS J. CROMBIE

Dr. Francis J. Crombie, of North Saint Paul, died March 9, 1953, at the age of forty-eight.

Dr. Crombie was born at Columbus, Ohio, September 8, 1904. He graduated from the University of Minnesota Medical School in 1931 and interned at Miller Hospital, Saint Paul. He had practiced at North Saint Paul since 1931 and had opened new offices in 1950 on Highway 100 near the town. During the past year, Dr. M. J. Bernier had been associated with him.

Dr. Crombie was widely known as a breeder of Holstein cattle and was a director of the Twin City Milk Producers Association.

He was a member of the Ramsey County Medical Society, the Minnesota State Medical Association and the American Medical Association and was a member of the staff of St. John's Hospital in Saint Paul.

Dr. Crombie was married to Veronica Zankel while a student at the University. His wife and six children survive him.

FREDERICK ALONZO ENGSTROM

Dr. Frederick A. Engstrom of Wanamingo, Minnesota, died on April 8, 1953.

Dr. Engstrom was born in Red Wing on June 15, 1883, and was reared in Cannon Falls where he attended high school. After attending Carleton College for two years, he transferred to the University of Minnesota where he received his medical degree in 1908.

During World War I, he served in the Army Medical Corps and was discharged in 1919 as a major.

Dr. Engstrom, for a time, was a member of the Rice County Medical Society, the Minnesota State Medical Association and the American Medical Association. He had practiced for over thirty years in Wanamingo and

(Continued on Page 548)

Childhood constipation deserves treatment which gently restores normal peristaltic movements; drastic elimination cannot permanently correct the condition and may be harmful to the child.

ROLE OF METAMUCIL® IN ESTABLISHING PROPER BOWEL HABITS IN CHILDREN

Metamucil's bland, demulcent bulk is a physiologic way to manage bowel dysfunction in youngsters.

Metamucil does more than merely clear the constipated bowel. When taken with adequate amounts of water, Metamucil's hydrophilic colloid has a proved corrective effect on the child's misfunctioning intestines. Use of Metamucil early in life assures a natural method of elimination and helps guard against formation of the "laxative habit" in later years.

Mixed with fruit juice, milk or the child's favorite beverage, Metamucil provides a gentle, corrective stimulation to peristalsis. There is never a "rush"—never a weakening diarrhea with Metamucil.

Metamucil is the highly refined mucilloid of Plantago ovata (50%), a seed of the psyllium group, combined with dextrose (50%) as a dispersing agent. It is accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

SEARLE Research in the Service of Medicine

FREDERICK ALONZO ENGSTROM

(Continued from Page 546)

was a member of the local Masonic Lodge and the Wanamingo school board for a number of years. In 1936, he was chairman of the Goodhue County Democratic Committee.

Dr. Engstrom is survived by his wife, two sons, Conley A. of Eden Prairie and Dr. Frederick W. of Detroit, Michigan, and a daughter, Mrs. Janet Hendricksen of Minneapolis.

MIGUEL ANGEL FLORES

Dr. M. A. Flores, a Costa Rican native who was a consul at Rosemount, Minnesota, and practiced medicine there, died suddenly of heart disease on April 14, 1953. He was sixty-two years of age.

Dr. Flores was born at Heredia, Costa Rica, April 19, 1890. He obtained his M.D. degree from the University of Pennsylvania in 1918 and practiced for four years at Lonsdale before moving to Rosemount.

Dr. Flores is survived by his widow and three children, Michael, Ofelia, and Ester. Two brothers and a sister live in Costa Rica and one sister in Mexico.

JENNETTE M. McLAREN

We wish to pay tribute, worthy and well deserved, to Dr. Jennette M. McLaren. She was born in McHenry County, Illinois, December 26, 1857, the daughter of Mr. James A. McLaren and Susanna Quilhot McLaren and died Easter Sunday evening, April 5, 1953, at Fairview Hospital in Minneapolis, Minnesota—a span of over ninety-five years.

A group of the McLaren family, about 1750, came from Pertshire, Scotland, where the family had been for 300 years. They settled in and about Johnstown, New York. Some moved to various parts of the United States but Dr. McLaren's direct ancestors remained a considerable time in the above location. Her father came west and took up government land in northern Illinois. Dr. McLaren's mother was of French origin and one ancestor, a physician, came to America from Bordeaux, France.

Dr. McLaren attended the local rural school and high school in Illinois and then taught for six years. She matriculated in the Medical School at the University of Michigan, where, according to her statement, the course had been rather recently extended from two to three years. She was graduated June 30, 1887.

There were few available intern positions for women at that time but she secured a fourteen months' internship in the New England Hospital for Women and Children in Boston. Because of the excellent service which she received and liked, she stayed over the regular term to fill a vacancy in the dispensary service. She always praised the hospital and its work.

She was licensed in Minnesota by examination (License Number 60) on April 8, 1889, and first began practice in Minneapolis, in an office on Western Avenue. She brought with her to Minneapolis Mary M. Hall, an excellent nurse from the Boston Hospital School of Nursing. After nine months, she came to Saint Paul where she was engaged as house physician in a private hospital of nine beds, opened at 653 and 655 Portland Avenue in November, 1889, by Dr. Helen W. Bissell. Doctors Charles A. Wheaton, Archibald MacLaren, John F. Fulton and Perry H. Millard were among those who brought patients to the hospital. Doctor Bissell had been the resident physician in the Boston Hospital.

From 1890, for ten or twelve years, Doctor McLaren was associated with Dr. Archibald MacLaren in the gynecological clinic at the West Ninth Street Dispensary and assisted him in many hospital cases till the introduction of interns obligated him to give them the opportunity for work.

At one time she had charge of the maternity cases at the Salvation Army Home, before the Home became associated with the Department of Obstetrics of the University of Minnesota. She also taught obstetrics at the City and County (Ancker) Hospital and maintained an office in the Endicott Building.

When the Lowry Building was being planned, Dr. A. W. Dunning, a specialist in nervous and mental disease (for whom the Dunning Playground was named) asked Doctor McLaren to share his office and from the plan of the building they chose Suite 803. Before the expiration of their first lease at 803 Lowry Building, in September, 1915, Doctor Dunning and Doctor McLaren asked Dr. Katherine A. Nye to become associated with them. In December, 1915, Dr. Dunning, after a few hours' illness, died of a coronary disease. Doctor McLaren and Doctor Nye continued to occupy this suite and in September, 1921, Dr. Lillian L. Nye joined them. Doctor McLaren continued to practice at 803 Lowry Medical Arts Building until her retirement in 1939 at the age of eighty-one.

In 1911, she visited England spending some time in London clinics. Later, she went to Johns Hopkins for observation of Dr. Wm. Osler's excellent work.

Doctor McLaren was affiliated with most of the Saint Paul hospitals, but more particularly in the later years of her practice with St. Luke's and Miller. She had an extensive practice and a host of friends.

About 1929 she went on a nine months' trip around the world.

Throughout her medical career, Doctor McLaren was active and interested in many civic and philanthropic organizations, the Community Chest, Salvation Army Home for Girls, Jean Martin Brown Home, Protestant Home, the Young Women's Christian Association, Baby Welfare Association (now the Family Nursing Service), Minnesota State Board of Examiners of Nurses, and the Alpha Epsilon Iota sorority. She was very active in her church, especially in the Christian Endeavor and missionary departments. She was a member of the Dayton Avenue Presbyterian Church of Saint Paul until 1938, when she became a member of the Grace Presbyterian Church of Minneapolis. She moved from Saint Paul to Minneapolis on December 30, 1937, making her home with Mr. and Mrs. James E. Williams.

She was an emeritus member of the University of Michigan Alumni Association, a member of the Ramsey

County Medical Society, and the Minnesota State and American Medical Associations.

Doctor McLaren used to say, "While a man's life does not consist of the abundance of things which he possesses, yet I cannot help liking some of the things which I possess." She was most happy on three occasions—the first, when she received her Emeritus Honor Alumni pin from the University of Michigan in 1949; the second, when she received her Fifty-Year pin from the Minnesota State Medical Association; and the third, when she was given her Life Membership Certificate from the Minnesota State Medical Association.

She was active until a week before her death. She had many hobbies. She was a very genuine person and gave of herself unselfishly for others, performing many deeds of kindness of which few knew. If human and unavoidable mistakes were made, she always went a long way to make amends.

On December 1, 1952, Doctor McLaren mailed the following copy in her own handwriting to Dr. Katherine A. Nye:

> "I know the night is near at hand,
> The mists lie low on hill and bay,
> The autumn leaves are drifting by
> But I have had the day.
> Yes, I have had, dear Lord, the day:
> When at thy call I have the night
> Brief be the twilight as I pass
> From light to dark, from dark to light."
>
> S. Weir Mitchell, M.D.

Dr. McLaren is survived by three nieces: Mrs. C. E. Taylor of Orange, New Jersey; Mrs. C. B. Long and Mrs. Ada Sprecher, both of San Jacinto, California. Two nephews, John McLaren Burbank of Saint Paul and James Frank Burbank of Woodstock, Illinois, also survive her.

Because of Doctor McLaren's Scotch and French descent, I would like to paraphrase a quotation from the song "Beside the Bonnie Briar Bush" which surely applies to her, even though her remains are in the family lot in Woodstock, Illinois.

> "The Doctor—bless her sainted soul—
> Has made her final call."

We honor Dr. Jennette M. McLaren as a grand *pioneer physician.*

Katherine A. Nye, M.D.

CHARLES K. MAYTUM

Dr. Charles K. Maytum, a senior consultant in the Division of Medicine at Mayo Clinic, died on April 10, 1953, at the age of fifty-seven years.

Dr. Maytum was born at Alexandria, South Dakota, December 20, 1895. He attended South Dakota University before obtaining his M.D. degree from the University of Iowa in 1919. He interned at Cincinnati General Hospital and practiced in South Dakota in 1921 and 1922 before taking a residency at the Mayo Foundation from 1922 to 1925. He joined the Mayo Clinic in 1925. In 1934, Dr. Maytum was made an assistant professor at the University of Minnesota graduate medical school and the Mayo Foundation. In 1945, he became an associate professor.

For three years, during World War II, Dr. Maytum served as a lieutenant colonel and later as a colonel in the Medical Corps of the Army.

He was a member of the Olmsted-Houston-Fillmore-Dodge County Medical Society, the Minnesota State Medical Association, and the American Medical Association.

Dr. Maytum is survived by his wife, Elinora; a daughter, Mrs. John W. Berkman, of Rochester; two sons, Wellington James of Virginia Beach, Virginia, and Charles David of Albuquerque, New Mexico. Three brothers and four sisters also survive.

RELIABILITY!

For years we have maintained the highest standards of quality, expert workmanship and exacting conformity to professional specifications . . . a service appreciated by physicians and their patients.

◆ Of General Interest ◆

First Lieutenant Fae M. Adams, M.C., of San Jose, California, was sworn in on March 11, 1953, the first woman to receive a commission in the Regular Army of the United States. One of the Army's twenty women reserve medical officers now on active duty, Lieutenant Adams has been stationed at Camp Crowder, Missouri, since July 6, 1952. She is the first woman medical officer integrated into the Regular Army under legislation passed by the 82nd Congress.

* * *

Dr. Kristofer Hagen, of Cokato, attended a medical conference in Chicago, early in March. **Dr. William T. Greenfield,** also of Cokato, attended a meeting of the American Academy of General Practitioners, March 22, in St. Louis, Missouri.

* * *

Dr. Malcolm W. Hargraves, of Rochester, was named by the governor to a four-year term on the State Water Pollution Control Commission, in March. He succeeds Val P. Stauder of Saint Paul.

* * *

Dr. Paul C. Leck, Austin, attended a meeting of the House of Delegates of the American Medical Association in Washington, D. C., March 13-14. The session was called to consider President Eisenhower's proposal to establish a new cabinet post—that of health and education—under the Federal Security Administration. President Eisenhower addressed the group Saturday, March 14.

* * *

Dr. Robert Weyhrauch, formerly a member of the staff of the Alexandria Clinic, joined a medical clinic in Waterloo, Iowa, in March. Dr. Weyhrauch recently was separated from the Army Medical Corps.

* * *

Dr. Leon M. Boyd, of Wadena, attended the meetings of the Graduate Medical Assembly, held in New Orleans, Louisiana, in March.

* * *

Dr. K. L. Nelson, health officer at Warroad, in conjunction with **Dr. C. B. Nelson,** of the Minnesota State Health Department, issued a public statement in March concerning precautions to be taken in preventing and caring for persons with infectious hepatitis. The community of Warroad was having a mild epidemic.

* * *

Dr. Henry Van Meier, of Stillwater, spoke Sunday, March 15, from the pulpit of the Ascension Lutheran Church, Saint Paul, on "Guilt, Tranquility, and God." Dr. Van Meier's talk included both the psychiatric and religious development of his topic.

* * *

Dr. Clayton Klakeg, of Rochester, was married, March 3, to Miss Shirley Jane Richards, of San Bernardino. California. The wedding took place in the First Congregational Church of San Bernardino.

* * *

Dr. John M. Waugh, Mayo Clinic surgeon, was honored March 14, at the Founders' Day convocation of Tarkio College at Tarkio, Missouri, for "outstanding achievements and services to others." A 1927 graduate of Tarkio College, Dr. Waugh was one of ten alumni and five citizens who received citations of merit.

* * *

Dr. Robert Hebbel, professor of pathology at the University of Minnesota, spoke at the meeting of the Twin City Society of Medical Technologists, held at Macalester College, Saint Paul, March 19.

* * *

Dr. J. E. Murphy, who has practiced in Staples since June 1949, left for Whitefish, Montana, March 6. where he will be associated with the John B. Simons Clinic.

* * *

Dr. Sam Boyer, Jr., of Duluth, spoke on "Diseases of the Heart and Their Treatment," to the members of the Private Duty Section, Second District Nurses Association, at the March 17 meeting held at St. Luke's Hospital in Duluth.

* * *

Dr. F. C. Westerman, of Montgomery, was elected president of the staff of directors of the new Community Memorial Hospital of New Prague, at the February meeting.

* * *

Dr. Donald C. Balfour, director emeritus of the Mayo Foundation, has been elected foreign correspondent in the division of surgery, obstetrics and surgical specialties of the National Academy of Medicine.

* * *

Dr. and Mrs. C. J. Lund, of Fergus Falls, returned March 14, from a trip that took them to New Orleans, Biloxi and Mobile. While in New Orleans, Dr. Lund attended the New Orleans postgraduate assembly which about 3,000 physicians attended.

* * *

Speakers at the Minnesota Welfare Conference held March 23-25 in the Nicollet Hotel, Minneapolis, included: **Dr. C. Knight Aldrich,** associate professor of psychiatry at the University of Minnesota; **Dr. Frank H. Krusen,** of the Mayo Clinic and **Dr. Robert Mooney,** specialist in internal medicine, Saint Paul.

* * *

Dr. Viktor Wilson, Rochester, Sixth district health officer spoke at an open meeting on public health at the Methodist Church in Austin, April 1. **Dr. Paul**

Leck, Austin physician, and several other local persons also addressed the group.

* * *

Dr. I. L. Oliver, of Graceville, attended the Inter-American Session of the American College of Surgeons, held at Sao Paulo, Brazil, during January and February. More than 200 surgeons from the United States attended various clinics and medical seminars throughout South America.

* * *

Dr. C. G. Uhley, of Crookston, president of the Minnesota division of the American Cancer Society, was the principal speaker at an open meeting accenting county cancer fund appeal, which was held in the Auditorium at Thief River Falls, March 19. Dr. Uhley explained recent developments in the battle against cancer and showed motion pictures dealing with the disease. **Dr. Theodore Bratrud,** of Thief River Falls, also spoke.

* * *

Dr. Delmar R. Gillespie, of Saint Paul, attended a regional meeting of the American College of Physicians, held at Kansas City, Missouri, March 20. Dr. Gillespie also visited Fort Leonard Wood, Missouri, where he was stationed during World War II.

* * *

Dr. A. L. Walonick, who has been in practice with the Twin Valley Medical Center for the past two years, left in March to practice in St. Louis Park. **Dr. C. J. Stadem** now operates the Twin Valley Center alone.

* * *

Dr. P. B. Schoeneberger, of Perham, talked on recent developments in the treatment of cancer to the members of the Frazee Women's Study Club, March 26. Movies on cancer were also shown.

* * *

A new cobalt unit to aid in cancer treatment, purchased with a $50,000 gift from an anonymous Minneapolis donor, was put into operation at the University of Minnesota in April. The unit is part of the equipment of the University's radiation therapy division.

* * *

Dr. J. E. Edwards, of the Mayo Clinic, spoke on his experience in Korea last fall as a consultant to the U. S. surgeon general, at the spring convention of the International Relations Club held in Rochester, March 20. The International Relations Club is sponsored by colleges in the Rochester area.

* * *

Three Duluth surgeons—**Dr. Gordon J. Strewler, Dr. Josiah Fuller,** and **Dr. George F. Nisius,** discussed "Timely Cancer Topics," at a cancer forum, held March 21, in St. Luke's Hospital in Duluth.

* * *

Dr. F. F. Callahan, Saint Paul, chief of medical services, state division of social welfare, took part in a panel discussion. "What are the Problems Affecting the Employment of the Tuberculous in Industry?" at the spring meeting of the Minnesota Rehabilitation Association, held at Ft. Snelling, March 24.

* * *

Dr. Paul J. Bilka of Minneapolis, gave a talk before the Grand Forks District Dental Society at Grand Forks, March 18. His subject was "Recent Advances in the Diagnosis and Treatment of Rheumatic Diseases."

* * *

Dr. I. Fisher, of Minneapolis, spoke before a regional seminar meeting at Marshall, Minnesota, March 31. Dr. Fisher's topic was skin cancer.

* * *

Dr. and Mrs. Bernard Flynn, of Hibbing, celebrated their tenth wedding anniversary, March 8, by entertaining the members of the Adams Clinic staff, of which Dr. Flynn is a member.

* * *

Dr. H. G. Ahrens, of Worthington, associated with the Worthington Clinic for the past year, left March 26 for Lincoln, Nebraska, where he now practices.

* * *

Dr. James J. Waring, professor of medicine at the University of Colorado Medical School, gave the eighteenth annual John W. Bell Tuberculosis lecture to members of the Hennepin County Medical Society, April 6, in Minneapolis. The lectureship is

named for the late Dr. John W. Bell, who practiced medicine in Minneapolis for fifty-one years.

* * *

Dr. James Wagoner, of Harmony, recently moved into his new clinic building which was completed March 22.

* * *

Dr. W. G. Benjamin, Dr. R. J. Kotval, and **Dr. R. W. Keyes,** of Pipestone, attended the Lyon-Lincoln County medical seminar, March 31, held at Marshall.

* * *

Two representatives of the State Board of Health, **Dr. R. N. Barr,** Deputy Executive Secretary for the State Board, and **Dr. Helen M. Knudsen,** of the Hospital Facilities Division, spoke at Hastings, March 25, to a group of citizens trying to decide what must be done to get Memorial Hospital finished and into operation.

* * *

An acute shortage of nurses forced partial closure of the White Earth Indian Hospital on the reservation. **Dr. R. W. Williams,** Minneapolis area medical officer for the U. S. Public Health Service, announced in March that admissions to the hospital would stop April 1, and thereafter patients are to be transported to the Indian Hospital at Cass Lake.

* * *

Dr. Clark H. Millikan, of the Mayo Clinic, participated in a postgraduate course in neurology which was sponsored by the University of Kansas School of Medicine in Kansas City, Kansas, March 18.

* * *

Dr. John Giebenhain, recently separated from service with the army medical corps, resumed his practice at 2220 Lowry Avenue N., Robbinsdale, in March.

* * *

Dr. E. V. Bridge, medical director and superintendent of the Mineral Springs Sanatorium at Cannon Falls, spoke to the members of the Northfield Lions Club, March 16, advocating the practice of taking chest x-rays of all patients admitted to the local hospital.

* * *

Dr. Edgar V. Allen and **Dr. Robert R. Kierland,** of Rochester, attended the special session of the House of Delegates of the American Medical Association, held in Washington, D. C., March 14.

* * *

Dr. Hendrik De Kruif, of Fergus Falls, spoke to people of Fergus Falls in March urging better support of the blood program there, which is facing an acute crisis due to lack of donors for blood replacement.

* * *

Dr. M. H. Larson, who has been operating a small hospital at Nicollet, began practice in Lake Benton in the new clinic which was completed late in April.

KNOX GELATINE
AS A
PHARMACEUTICAL PRODUCT

Not all gelatine
is made with pharmaceutical care!

Not all gelatine is made like KNOX!

For example, **Knox** is made with the same rigid type of controls which are back of the only accepted blood plasma extender for use in shock management. A number of gelatines have an acid pH whereas the pH of **Knox Gelatine** is neutral.

For over 50 years **Knox** has always had the patient in mind, and every one of the seventeen steps in the **Knox** operation is controlled as carefully as the finest pharmaceutical, with the result that **Knox** standards are higher than U.S.P. and 85 to 87 per cent of **Knox Gelatine** is pure protein composed 100 per cent of various amino acids.

Knox Gelatine is practically standard in the diets of Diabetes, Colitis, Peptic Ulcer and Low Salt, Reducing and Liquid and Soft Diets.

Behind the Scenes KNOX GELATINE

If you are interested in seeing just how Knox Gelatine is made, write for our new photographic brochure, *"Behind the Scenes with Knox Gelatine"* (reading time—10 minutes). At the same time specify brochures on any diets mentioned above in which you may be interested. Knox Gelatine, Johnstown, N. Y. Dept. MM

Available at grocery stores in 4-envelope family size and 32-envelope economy size packages.

KNOX GELATINE U. S. P.
ALL PROTEIN NO SUGAR

Dr. James H. De Geest, Minneapolis General Hospital intern, was injured when the ambulance in which he was making an emergency sick call, collided with an automobile. Dr. De Geest suffered a nose injury. The ambulance driver and the driver of the automobile were not hurt.

* * *

Dr. J. Arnold Malmstrom, of Virginia, suffered a heart attack March 19, at his home. He is reported doing well at the Virginia Municipal Hospital but he will be hospitalized for a considerable period of time.

* * *

Dr. Charles W. Mayo, of Rochester, spoke on "Ulcerative Colitis" at a meeting of the Dutchess County Medical Society in Poughkeepsie, New York, March 11.

* * *

A Russell J. Moe Scholarship fund was established by the headmaster at Shattuck School, Faribault, in March, in memory of the late **Dr. Russell J. Moe,** Duluth physician and surgeon who died March 8. Dr. Moe's elder son, Russell, Jr., was graduated from Shattuck in 1952, and another son, Richard, is a member of the junior class at the present time.

* * *

Dr. Warren E. Wilson, of Northfield, was elected city physician for one year by the Northfield City Council at the meeting held March 17.

* * *

Dr. Kathleen B. Jordan, of the Granite Falls Riverside Sanatorium medical staff, and field physician for the state Christmas Seal organization, gave tuberculin test check-ups to about 1,135 Owatonna school children, the week of March 23.

* * *

Dr. A. H. Pemberton, of Rochester, was guest speaker at a meeting of the Fellows' Association of Texas, the membership of which is made up of former fellows of the Mayo Foundation, at Temple, Texas, March 7.

* * *

Dr. K. A. Peterson, disaster medical officer at Marshall, assisted with a four-day disaster institute held at Marshall High School, March 18-21, for Red Cross branch officers and city officials from surrounding towns.

Dr. L. C. Barr, of Albert Lea, assisted with the local spring immunization clinics held in the community rural schools.

* * *

Dr. J. M. Gacusana and **Dr. K. W. Covey,** of Mahnomen began a week-end schedule of taking calls, in March. Only one of the doctors will be available each weekend from Saturday noon until Monday morning. As a public service, the local paper will carry a notice each week listing the doctor who is on call.

* * *

Dr. H. L. Huffington, of Montevideo, opened an office for practice in the Anderson Building at Waterville, April 15.

* * *

Drs. Arlie R. Barnes, William H. Dearing, Hugh R. Butt, and **Edgar V. Allen,** of the Mayo Clinic, were directors of Course No. 4, "Selected Subjects in Internal Medicine," conducted at the Mayo Clinic and Mayo Foundation for members of the American College of Physicians, the week of March 23. Course No. 1 was given in Cleveland; Course No. 2, in Los Angeles; and Course No. 4, in New York.

Guest speakers at the course given in Rochester included **Dr. Edmund B. Flink,** professor of medicine at the University of Minnesota; Dr. Carl V. Moore, professor of medicine in Washington University, St. Louis; Dr. John E. Howard, professor of medicine at Johns Hopkins University, Baltimore; Dr. Irvine H. Page, director of research in the Cleveland Clinic, Cleveland, Ohio; Dr. H. Marvin Pollard, professor of medicine in the University of Michigan, Ann Arbor; Dr. Leon Schiff, professor of medicine at the University of Cincinnati; and Dr. Eugene A. Stead, Jr., professor of medicine at Duke University, Durham, North Carolina.

* * *

Drs. R. P. Buckley, R. J. Dittrich, George Doyle, R. A. Place and **John Powers,** all of Duluth, assisted in the immunization clinics recently held throughout the Duluth parochial schools.

* * *

Dr. Mario Fischer, of Duluth, was elected chairman of the sub-committee named to work with the architect on the plans for St. Mary's Hospital in-

firmary, at the meeting of the St. Louis County board, held March 16. **Dr. P. G. Boman**, and **Dr. A. O. Swenson** were also named to the committee.

* * *

Dr. M. H. Larson, of St. Peter, attended a jubilee dinner in Milwaukee, March 26, held in honor of the twenty-fifth anniversary of his graduation class at Marquette University Medical School.

* * *

Dr. C. A. Williams, of Pipestone, attended the American Academy of General Practice meeting held in St. Louis, Missouri, the last week in March, on his way home from a six-weeks' vacation spent at Houston, Texas, and Florida.

* * *

Dr. C. E. Wilson, acting superintendent of the Blue Earth Community Hospital, reported on policies and statistics for the preceding year to the members of the Hospital Auxiliary at their annual meeting, held March 20.

* * *

Clarkfield, one of the largest schools in Yellow Medicine County to have a 100 per cent record of students participating in the tuberculin test survey, was presented its TB Control Certificate by **Dr. Kathleen Jordan**, field physician for the state Christmas Seal organization, in March.

* * *

Dr. H. L. Stemsrud, **Dr. E. R. Sather**, and **Dr. L. F. Wasson**, of Alexandria, attended a dinner meeting of the Park Region Medical Society, held at Fergus Falls, March 21.

* * *

A free test for diabetes was offered the people of Nobles County during the period from April 6 through April 18. **Dr. D. J. Halpern**, of Brewster, chairman of the Nobles County Health Council, and **Dr. D. E. Nealy**, of Adrian, assisted the committee working on the project. The survey was sponsored by the Nobles County Health Council, the Public Health Nursing Service, the County Medical Society, and District 5, of the Minnesota Department of Health.

* * *

Dr. Frederick W. Behmler, formerly a member of the State Board of Health and now chief of staff at the Stevens County Community Hospital, was the principal speaker at a meeting of local citizens of Alexandria held March 26, to discuss construction of a Douglas County Community Hospital.

* * *

Dr. Owen H. Wangensteen, chief of the department of surgery, University of Minnesota Medical School, wrote a series of news stories on cancer for the Associated Press in March and April.

* * *

Dr. J. C. Vezina, of Mapleton, visited Dixon, Illinois, in March to attend a funeral of an old friend and visited many of his friends of years gone by when he was a coach at the Dixon High School.

HOMEWOOD HOSPITAL is one of the Northwest's outstanding hospitals for the treatment of Nervous Disorders—equipped with all the essentials for rendering high-grade service to patient and physician.

Operated in Connection with Glenwood Hills Hospitals

HOMEWOOD HOSPITAL
Corner Penn and Plymouth Avenues North
Minneapolis Minnesota

The Dixon paper carried an interview with Dr. Vezina on changes that have come about in some of the games, since 1920 when he was coaching.

* * *

Dr. Carl Kohlbry, medical director for the Duluth public schools, spoke on "Common Emergencies in Childhood," at the First Aid Instructors Club meeting, April 8, held at the Red Cross headquarters in Duluth.

* * *

Shortages of qualified personnel are slowing down chronic hospital planning in Minnesota, **Dr. Helen Knudsen** of the State Health Department said in a news interview, March 29.

* * *

At present, there are four hospitals in the state designed to treat patients with chronic diseases and, combined, these institutions have only 409 beds. Three of the units—St. Luke's Infirmary at Duluth, the Variety Club Heart Hospital on the University of Minnesota campus, and St. John's Hospital in Saint Paul—have been built since 1947 with federal aid. The fourth is the Virginia Infirmary at Virginia, constructed with funds furnished by St. Louis County. The building program, which has doubled the state's capacity in the last six years, is now temporarily stalled due to lack of trained personnel to staff further units.

* * *

Dr. Charles C. Cooper, of Saint Paul, held open house in St. Louis for all the Minnesota M.D.'s who were attending the American Academy of General Practitioners meeting held in St. Louis the last week in March. Physicians from Saint Paul who were present at the open house include **Dr. James Reid, Dr. John Ryan, Dr. A. E. Ritt, Dr. Floyd Thompson, Dr. H. J. Setzer, Dr. E. J. Fogelberg,** and **Dr. Arthur E .Walker.**

* * *

Dr David Hoehn, of Holdingford, returned March 27, after attending Medical Meetings in Los Angeles, California, and a meeting of the American Academy of General Practice in St. Louis, Missouri, for the past three weeks.

* * *

Dr. O. J. Swenson and **Dr. S. T. Normann,** of Waseca, attended the meeting of the American Academy of General Practice held at St. Louis, Missouri, the last week in March.

* * *

Dr. George S. Allen, formerly of New York, joined the staff of the Mineral Springs Sanatorium recently. He is assistant to **Dr. Ezra Bridge.** Dr. Allen was graduated from the University of Rochester Medical School in 1950, and interned at Memorial Hospital, Rochester, New York. Before coming to Mineral Springs, Dr. Allen was on the staff of the Veterans Hospital for tuberculosis patients at Batavia, New York.

* * *

Dr. W. M. Akins, of Red Wing, served as co-chairman for the annual Heart Fund campaign in the city, during the month of March.

* * *

Dr. L. B. Kuhlmann, of Melrose, initiated construction on a new medical office on Riverside Avenue near the Melrose Hospital, the first week in April.

* * *

Dr. Harold S. Diehl, Dean of the University of Minnesota Medical Sciences, was a guest member on the monthly doctor's round table which was televised on WCCO-TV at 8:45 a.m., Easter Sunday. The subject for discussion was chest x-raying of all hospital patients and employes as a protection against tuberculosis and an aid in discovery of tumors, cancer, heart disease, and other chest area conditions.

Regular panel members are **Dr. J. Arthur Myers,** Professor of Medicine and Public Health, University of Minnesota; **Dr. John Briggs,** Saint Paul, Chief of Medicine at Ancker Hospital; and **Dr. Ezra V. Bridge,** superintendent of Mineral Springs Sanatorium, Cannon Falls.

* * *

Dr. and Mrs. R. A. Beise of Brainerd will be Minnesota's guests of honor at the First Western Hemisphere Conference of the World Medical Association, to be held in Richmond, April 22-25, 1953, in observance of the lengthening of life and the constant improvement of human health.

Governor C. Elmer Anderson made the selection at the request of Governor John S. Battle of Virginia, who had asked each of his forty-seven fellow-Gov-

. . . now conveniently located for faster service

ernors to appoint a physician who will reach the age of seventy-five during 1953 to visit Virginia and tell of medical advances that have taken place during his lifetime. The invitation includes the physician's wife.

Dr. Beise, a surgeon, was born in 1877, just before pioneering Robert Koch published a history-making treatise on causes of infection, opening the way to rapid progress in various fields of medicine. Dr. Beise was graduated in 1901 from Rush Medical College, Chicago.

At the Richmond conference, guests will be greeted by Dr. Louis H. Bauer, president of the American Medical Association, and by leaders of Latin American medical societies. In addition to scientific sessions, there will be opportunities for visiting historic sites in Virginia, including the eighteenth century Williamsburg restoration. Expenses of the conference, and of guests and delegates, are covered through a grant by A. H. Robins Co., Inc., ethical pharmaceutical house of Richmond, on the occasion of its seventy-fifth anniversary.

* * *

Five new physicians, who were appointed as members of the permanent staff of the Mayo Clinic in April, are: **Drs. Lloyd G. Bartholomew, William J. Martin, Raymond V. Randall, Randolph A. Rovelstad** and **Donald A. Scholz.**

Dr. Bartholomew was graduated from the University of Vermont College of Medicine in 1944, interned at Mary Hitchcock Memorial Hospital, Hanover, New Hampshire, and was assistant in medicine following his internship. He served with the army medical corps for two years and was a fellow in medicine at Mary Hitchcock Hospital for a year. He entered the Mayo Foundation in April, 1949, and received the degree of M.S. in medicine from the University of Minnesota in July, 1952.

Dr. Martin received his medical degree from Georgetown University Medical School, Georgetown, Maryland, and interned and was a fellow at Georgetown University Hospital. He served with the army medical corps for two years. Dr. Martin entered the Mayo Foundation in 1949, and received the degree of M.S. in medicine in June, 1952.

Dr. Randall was graduated from Harvard College Medical School in 1945, interned at Massachusetts General Hospital, Boston, and served with the army medical corps for two years. He entered the Mayo Foundation in 1948, and received the degree of M.S. in medicine from the University of Minnesota in June, 1951. From 1951 to 1952 he was a teaching fellow in pediatrics and medicine at Harvard Medical School, and returned to the Mayo Foundation as an assistant to the staff in October, 1952.

Dr. Rovelstad was graduated from Northwestern University Medical School in 1944, interned at Passavant Memorial Hospital, Chicago, and entered the Mayo Foundation in January, 1945. He served with the army medical corps for two years and has been assistant to the Mayo Foundation staff since October, 1951. Dr. Rovelstad is a candidate for the Ph.D. degree in medicine.

Dr. Scholz received his medical degree from Western Reserve Medical School in 1945, interned at City Hospital, Cleveland, and served with the army medical corps for two years. He was a medical resident at City Hospital, Cleveland, for one year and entered the Mayo Foundation in July, 1949. He received the degree of M.S. in medicine from the University of Minnesota in July, 1952.

* * *

Dr. Howard L. Horns, Assistant Dean of the University of Minnesota Medical School, left for Fort Sam Houston, Texas, March 16, to serve with the U. S. Army.

Dr. Horns is certified by the Board of Internal Medicine and is an Associate Professor of Medicine. In 1949, he succeeded **Dr. Myron Weaver** as Assistant Dean. (Dr. Weaver left to become Dean of the new medical school of the University of British Columbia in Vancouver, Canada.) In this capacity, Dr. Horns has served as chairman of the Admissions Committee, chairman of the Student Work Committee and chairman of the Internship Committee. Now forty-one, Dr. Horns was rejected for military service in World War II.

As Associate Professor of Medicine, Dr. Horns has been chief of the Hematology Clinic of the University Hospital's Out-Patient Department, and in charge of the sophomore medical course in Physical Diagnosis. He has served for three months each year as attending physician to one of the medical services of the University Hospitals and has been the consultant in radioisotopes to the Ft. Snelling Veterans Hospital.

Dr. William F. Maloney has been appointed acting Assistant Dean of the Medical School. He was graduated from the University of Minnesota in 1941 with a major in Business Administration and received his medical degree in 1946. After his separation from the Army medical corps, Dr. Maloney served as a part-time staff member at Glen Lake Sanatorium and did special graduate work at the Trudeau Sanatorium, Saranac Lake, New York. From 1950 to 1952, he was a fellow in medicine at the University Hospitals and from July 1, until he was appointed Acting Dean, he held a National Heart Institute Traineeship in the Department of Medicine.

Dr. Maloney will devote part time to teaching and clinical service in internal medicine and part time to his duties as Acting Assistant Dean of the Medical School.

* * *

Assisting at laying the corner stone, March 30, for the new Mayo Clinic diagnostic building were **Dr. S. F. Haines**, chairman of the board of governors of the Mayo Clinic; **Dr. C. W. Mayo**, chairman of the Mayo Association; and **Dr. M. W.**

* * *

Dr. Robert Holmen, of Saint Paul, presided at the laymen's session of the Ninety-fifth Annual Convention of the Augustana Lutheran Minnesota Conference, held at the Gloria Dei Lutheran Church, Saint Paul, during the week of April 13. Bishop Bo Giertz of Sweden was a guest at the conference.

* * *

Dr. Luther H. Zick, a general surgeon, joined the staff of the Grand Rapids Clinic in April. A 1943 graduate of the University of Michigan Medical School, Dr. Zick served with the army in World War II, and completed a residency at the Mayo Clinic before going into private practice at Tampa, Florida.

Construction has been started on a new clinic building in Grand Rapids.

* * *

Dr. Mary C. Ghostley, retired director of Lake Julia Sanatorium at Puposky (Lake Julia was closed in January because of the decline of tuberculosis incidence), was appointed director of District Health Unit No. 1 of the Minnesota Department of Health with headquarters at Bemidji. Dr. Ghostley was made a life member of the Minnesota Public Health Conference in 1950 and was presented with a plaque by the Minnesota Tuberculosis and Health Association for distinguished service.

* * *

Dr. Kenneth Stein, of Lakeville, joined the staff of the State Hospital in St. Peter, in April.

* * *

Dr. E. J. Wohlrabe, Dr. E. L. Penk, and **Dr. W. G. Nuessle,** of Springfield, assisted with the immunization program in the public and parochial schools in Brown County, from April 13 through April 17.

* * *

Dr. A. S. Midthune, of Lake Park, president of the Clay-Becker County Medical Society, endorsed the 1953 American Cancer Society crusade which opened in Detroit Lakes, April 1.

* * *

Dr. S. W. Watson, of Royalton, attended the convention of the American Academy of General Practice held in St. Louis, Missouri, the last week in March.

* * *

A farewell party for **Dr. C. R. Ferrell** was given April 9, by the citizens of Remer. Dr. Ferrell, who lived in Grand Rapids, had been making two trips a week to Remer to take care of his patients there.

* * *

Dr. L. N. Dale, of Red Lake Falls, attended the annual convention of the American Academy of General Practice, held in St. Louis, Missouri, the last week in March.

* * *

Dr. W. W. Will, of Bertha, attended the American Medical Association House of Delegates meeting, held in Washington, D. C., March 13-14.

* * *

Among the forty-two doctors who began fellowships at the Mayo Foundation spring quarter, are **Dr. John L. Juergens,** Belle Plaine, and **Dr. Lewis W. Larson,** Saint Paul, majoring in internal medicine, and **Dr. Frederick L. Behling,** Moorhead, majoring in orthopedic surgery.

* * *

Dr. D. E. Nealy, of Adrian, who was on the Nobles County Committee for the survey of diabetes project (April 6 through 18), was interviewed over station KWOA, Worthington, April 5, concerning the cause and treatment of diabetes.

* * *

Dr. Stewart C. Thomson, assistant director of the University of Minnesota School of Public Health, spoke on public health problems at the sixteenth annual continuation study course for pharmacists, held at the Center for Continuation Study, April 20-22.

* * *

Dr. Albert L. Walonick, formerly of Twin Valley, opened an office in St. Louis Park, April 9. Dr. Walonick, a graduate of the University of Minnesota, interned at Minneapolis General Hospital and was a navy surgeon for four years.

* * *

Dr. and Mrs. O. K. Behr, of Crookston, returned in April from a combined business and pleasure trip to California. In Los Angeles, Dr. Behr attended a meeting of the American College of Surgeons.

* * *

Dr. Glenn P. Schmitz, president of the Morrison County Medical Society, endorsed the 1953 American Cancer Society crusade, which opens in Little Falls, April 20.

* * *

Dr. Frank W. Newell, former University of Minnesota student and intern at Ancker Hospital, Saint Paul, has been named associate professor of ophthalmology at the University of Chicago.

* * *

The inaugural ceremony of Dr. Edward J. McCormick of Toledo, Ohio, as president of the American Medical Association, will be broadcast over the American Broadcasting Company network on Wednesday evening, June 3, by transcription inasmuch as the network will be devoted to the coronation ceremonies of Queen Elizabeth of England. Also transcribed on Wednesday night will be the popular "Dr. Christian" radio program featuring the well known actor Jean Hersholt. This will be carried by the Columbia Broadcasting System. Physicians who cannot attend the AMA meeting in New York are urged to watch the radio listings in the newspapers for the local broadcasting times.

* * *

Correction.—In the April issue Dr. Albert V. Stoesser was incorrectly reported to be one of the candidates orally examined by the new Subspecialty Board of Pediatric Allergy, whereas he served as an examiner.

The item should have read:

Dr. Albert V. Stoesser, Department of Pediatrics, University of Minnesota, was one of the examiners on the new Subspecialty Board of Pediatric Allergy which examined its first group of candiates orally at the Children's Hospital, Harvard Medical School, Boston, February 25, preceding the annual meeting of the American Academy of Allergy.

HOSPITAL NEWS

Dr. Roy Hoffman, of Minneapolis, was named chief of the **Fairview Hospital**, Minneapolis, medical staff, with Dr. Donald Simonson, vice chief; Dr. Titus Bellville, secretary, and Dr. Conrad Karleen, treasurer.

The medical staff executive committee includes the officers and Dr. John Moe, Dr. Myron Lysne, Dr. William Davis, Dr. Rudolph Koucky, and Dr. Donald Frane.

* * *

St. Joseph's Hospital, Saint Paul, opened a research laboratory to study diseases of the veins and arteries, in April. Prevention as well as treatment will be among the objectives of the laboratory, the only facility of its kind in the Twin Cities for specific study of these diseases. This additional laboratory system will begin research into characteristics of the diseases, using rabbits for testing, and establish a diagnostic clinic to study the human element this summer.

The director of the animal experiments is Dr. Davitt A. Felder, instructor in surgery at the University of Minnesota, and supervisor of teaching in surgery at St. Joseph's Hospital.

The laboratory has been named the David Young Memorial Laboratory. At present it is financed by two grants: $5,000 annually is contributed by the David Young Foundation of Saint Paul, and $26,000 has been authorized by the Louis and Maud Hill Foundation through the University of Minnesota.

BLUE CROSS-BLUE SHIELD NEWS

An astounding finding resulted from a recent analysis of Blue Shield claims disallowed during the year 1952. The analysis revealed that 60 per cent of claims classified in 1952 as "rejects," either had no Blue Shield contract in effect or else involved medical service not provided by the contract. In more exact detail, 20 per cent of these so-called rejections were based upon the fact that the subscriber had no Blue Shield contract, and another 10 per cent included the reasons that the contract had been cancelled, the service was rendered before the effective date of the contract, or the patient was a nineteen-year-old dependent not covered by a family contract. Of the remaining, 25 per cent involved non-hospitalized medical care, and 5 per cent unrelated x-ray services neither of which is covered under the contract. Still another interesting feature of this study was the fact that only 9.4 per cent of claims rejected were the result of pre-existing conditions whereas this figure had been as high as 13.6 during 1951.

The significance of these figures lies in the fact that 60 per cent of so-called rejected claims are not "rejects," and with some explanation can be avoided right in the doctor's office. In fact, the use of two general procedures by the staffs of the doctors' offices will enable them to determine in the great majority of cases whether or not the claim will fall into one of the above mentioned rejection categories.

The first of these procedures is the examination of the subscriber's identification card. From this, it can readily be determined whether or not the patient or subscriber has a Blue Cross or a Blue Shield contract, or both. On the side of the card containing the subscriber's name appears a space marked "coverage." In this square usually will appear several letters and possibly also a number. If the subscriber has a Blue Cross contract the *first* letter will be either a capital "S" or "F" depending on whether the subscriber has a single or family Blue Cross contract. If the subscriber has a Blue Shield contract, the *last* letter in the series will be either a capital "S" or "F" for single or family Blue Shield coverage depending on which type of contract the subscriber holds. If the subscriber has *no* Blue Shield contract no additional "S" or "F" will appear in the square after the number. If the subscriber has only a Blue Shield contract, the letter "F" or "S" will appear thus "—S" or "—F." A similar explanation is also contained on the identification card itself.

If the subscriber has no Blue Shield contract, this should be explained to him, and in those cases where he maintains that he has Blue Shield coverage regardless of the identification card, the suggestion can be made that he clear this with the Blue Shield office before a claim is submitted.

The second general procedure involves asking the subscriber a few simple questions. As stated before, 10 per cent of the rejections involve services rendered to nineteen-year-old dependents, services prior to the contract's effective date and services rendered after the contract is cancelled. Thus, the patient should be asked his or her age if a dependent, and if he or she is over nineteen years of age, a claim should not be submitted under the parents' contract. The other two items can be covered by asking the subscriber when his contract went into effect, and whether or not he remains in good standing insofar as his premiums are concerned.

Such measures in the doctor's office will have an extremely salutary effect in reducing the amount of paper work required of the doctor and his staff. In addition to this advantage, they should help in the collection of accounts directly from the patient rather than delaying collection through first routing it to Blue Shield. And a by-product of these advantages to the physician is the avoidance of poor public relations, and misunderstandings for Blue Shield in cases where no Blue Shield contract is in effect.

Executives of the Blue Cross and Blue Shield Plans of the United States and Canada held their annual conference in Hollywood, Florida, from April 12 to 16. The conference took up matters of national policy and means by which co-ordination of activities of the various plans can be extended.

During the conference, Richard M. Jones, Chicago, Director of the Blue Cross Commission of the American Hospital Association, announced that more than 44,000,000 people are now enrolled in Blue Cross Plans. This is an all-time high for the non-profit hospitalization plans which have been approved by the American Hospital Association.

"This is nearly 28 per cent of the entire population," Jones said. "In many areas the percentage is much higher. In Minnesota alone, approximately one million subscribers and dependents are enrolled (one out of every three persons.)

More than 25,000,000 people are now enrolled in Blue Shield plans . . . 16 per cent of the entire population. In Minnesota, over a half-million persons are protected.

Guest speakers at the national conference of Blue Cross and Blue Shield plans included Admiral W. J. P. Blandy, U.S.N., Ret., president of the Health Information foundation, New York, who spoke on "Assisting the Cause of Voluntary Health Insurance," and Artemas C. Leslie, Pennyslvania Insurance Commissioner, whose talk was entitled, "An Insurance Commissioner Looks at Blue Cross and Blue Shield."

Other guest speakers included David J. McDonald, Pittsburgh, president, United Steelworkers of America, CIO, and A. R. Mathieson, Pittsburgh, United States Steel and Carnegie Pension Fund, who discussed, respectively, the stake of labor and management in health care. More than 1,500,000 workers and dependents in the steel industry are enrolled in Blue Cross . . . among the largest enrollments within any one industrial group.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

BOOKS RECEIVED FOR REVIEW

THE WECHSLER-BELLEVUE SCALES—A Guide for Counselors. C. H. Patterson, Veterans Administration Center, Fort Snelling, Saint Paul, Minnesota. 139 pages. Price $3.75, flexible binding. Springfield, Illinois: Charles C Thomas, 1953.

DIAGNOSTIC TESTS IN NEUROLOGY. A Selection for Office Use. Robert Wartenberg, M.D. Forewords by Sir Gordon Holmes, M.D., F.R.S., and Stanley Truman, M.D. 228 pages. Illus. Price $4.50, cloth. Chicago: Year Book Publishers, 1953.

BCG VACCINATION. Report prepared under the direction of Lydia B. Edwards, M.D., Chief of Field Studies, and Carroll E. Palmer, M.D., Ph.D., Director, WHO Tuberculosis Research Office, Copenhagen. 307 pages. Illus. Price $3.00, paper cover. New York: Columbia University Press, 1953.

THE OCULOROTARY MUSCLES. By the late Richard G. Scobee, B.A., M.D., F.A.C.S. Second Edition. 512 Pages. Illus. Price $11.00. St. Louis: Mosby, 1952.

This edition has 502 pages and 159 illustrations, compared to 352 pages and 112 illustrations of the first edition.

Many of the sections, notably those dealing with physiology, have been rewritten with more detail added. The functional and surgical anatomy sections have been enlarged as well as those on hyperphoria and exophoria.

The section on therapy is rewritten to cover more specific problems, and a long awaited chapter discussing reasons for failure in tropia surgery has proven to be one of the main attractions of this new edition.

William J. Hultgen, M.D.

CLINICAL ELECTROCARDIOGRAPHY. By Francis F. Rosenbaum, M.D. Edited by Henry A. Christian, M.D. 206 pages. Illus. Price $4.50. New York: Oxford University Press, 1950.

Clinical Electrocardiography by Francis F. Rosenbaum, M.D., published by the Oxford University Press in 1950, and appearing as reprinted from Oxford Loose-Leaf Medicine with the same page numbers as in that work, is a succinct and clear exposition of modern cardiographic procedure.

Unipolar precordial leads and unipolar limb leads are discussed, the latter in Wilson's terminology, not that of Goldberger. The discussion of the mean electrical axis is very good, and the diagrams shown in Figure 51 are particularly apt.

The discussion of myocardial infarction is adequate, particularly the section headed "Myocardial Infarction Complicated by Bundle Branch Block or Arborization Block."

The discussion of the anomalous atrioventricular ex-

WHERE ALCOHOLICS ACHIEVE INSPIRATION FOR RECOVERY

Where gracious living, a homelike atmosphere and understanding companionship contribute to successful rehabilitation.

200 acres on the shores of beautiful Lake Chisago

The methods of treatment used at the Hazelden Foundation are based on a true understanding of the problem of alcoholism. Among the founders of the nonprofit Hazelden Foundation are men who have recovered from alcoholism through the proved program of Alcoholics Anonymous and who know the problems of the alcoholic. All inquiries will be kept confidential.

HAZELDEN FOUNDATION

Lake Chisago, Center City, Minn. Telephone 83

citation (Wolff-Parkinson-White Syndrome) is particularly good in its description of the cardiographic deflections. Unfortunately, the upper and lower limits, in seconds, occurring in this condition are not given.

Finally, there is a very satisfying discussion of heart block, extrasystolic arrhythmias, and paroxysmal tachycardia.

The entire book is well-executed and should be in every cardiologist's library. The points discussed above were handled in a way that particularly appealed to the reviewer.

Edgar T. Herrmann, M.D.

DOCTOR IN THE HOUSE. By Richard Gordon. 186 pages. Price $2.75. New York: Harcourt, Brace and Company, ©1953.

Partly with affection, but mostly with good-natured banter, a London doctor casts in the form of a fictional narrative the life and struggle of an English medical student. In a steady flow of wit, he describes the medical student's introduction to classes and King George's pub, and he follows his school life through to the final examinations and the subsequent attainment of a medical degree.

In order to grasp and portray so cleverly the lively sketches of his fellow students and associates, Richard Gordon has drawn heavily on his imagination, yet his anecdotal style makes the impossible almost believable.

Although this book is written for general publication, and lacks highly technical language, the humorous tone, medical word-play, and ludicrous similes (the Chief Surgeon is described as a "therapeutic thunderbolt" who could "slit a Christmas turkey to ribbons in a couple of minutes"), makes this amusing reading for anyone in the medical field, as well as the laity.

Betty R. Ward, M.T.

CEREBRAL PALSY

Cerebral palsy, a crippling disorder handicapping more than 550,000 U. S. children and adults, received wider medical attention during 1952 than ever before, Dr. Charles F. McKhann, medical director of the United Cerebral Palsy Association, New York, reports in the section on cerebral palsy prepared for the new edition of the American Peoples Encyclopedia Yearbook which will be published soon. Although no general preventive or cure for the condition has been found, important progress in the treatment and rehabilitation of cerebral palsied persons has been made, Dr. McKhann asserts.

uncomplicated progress...

Tolerance of feedings	good
Incidence of digestive disturbances	low
Growth response	Satisfactory
Discontinuation of night feeding	early
Health and development	excellent

The uncomplicated nutritional progress[1] of infants fed Lactum® speaks for its sound rationale. Lactum is Mead's liquid formula made from whole milk and Dextri-Maltose.® It provides generous milk protein for sturdy growth and sound tissue structure, with sufficient calories to spare protein and meet the infant's energy needs.

Lactum is convenient and easy to prepare—simply mix equal parts of Lactum and water for a formula supplying 20 calories per fluid ounce.

Whenever antihistaminic therapy is needed to prevent or relieve allergic symptoms, prescription of BENADRYL Hydrochloride (diphenhydramine hydrochloride, Parke-Davis) has become a customary procedure in the daily practice of many physicians. Because relief is rapidly obtained and gratifyingly prolonged, many thousands of patients have been spared the usual discomforts of hay fever, vasomotor rhinitis, acute and chronic urticaria, angio-neurotic edema, pruritic dermatoses, contact dermatitis, serum sickness, food allergy, and sensitization to penicillin and other drugs.

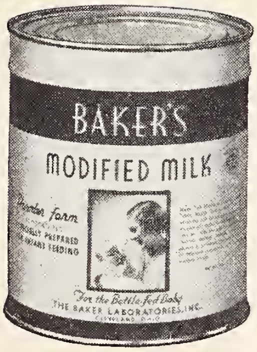
50 YEARS AGO

". . . in all cases where the milk supply is not private and its conditions fully known, all milk for use in the nursery should be boiled immediately upon its arrival in the house. . . . Milk completely sterilized by several exposures to heat . . . and hermetically sealed, will keep sweet for many weeks, and this device is most valuable for long journeys or ocean voyages." (1)

Baker's Modified Milk *Powder* is suggested for baby's safety when traveling. Mother can put the prescribed amount of powder for each feeding in a capped, sterile nursing bottle and carry boiled water in a Thermos bottle. Each feeding can then be prepared just before use.

The powder is also especially adaptable for use wherever refrigeration facilities are not available. Here, too, individual feedings may be mixed as needed.



POWDER and LIQUID
Baker's Modified Milk is made from Grade A Milk (U. S. Public Health Service Milk Code), which has been modified by replacement of the milk fat with animal and vegetable oils and by the addition of carbohydrates, vitamins and iron.

SUPERMIX liquid chemicals are 6 ways better than powders

Read why 83% of GE's customers have switched to liquids

SUPERMIX X-RAY DEVELOPER

EVERY PROCESSOR WANTS THESE	HOW SUPERMIX LIQUID CHEMICALS GIVE YOU THESE ADVANTAGES
1 BETTER FILMS	SUPERMIX Developer brings out every bit of contrast, density and detail that are in the film. And, with proper refreshing, it will do it in the same time month after month.
2 MORE FILMS	Using SUPERMIX liquid chemicals, you can process nearly twice the number of films possible with powders in a given time. That means you can handle a much greater film load without interruption.
3 FASTER PROCESSING	Fresh SUPERMIX Developer works in 3 minutes. Fresh SUPERMIX Fixer clears in 45 seconds — films are ready for wet-film viewing in 4 minutes — completely developed and fixed in 5.
4 LESS WORK	No pails, pans, paddles, thermometers or screwdrivers! Just pour SUPERMIX into the tank, add water at working temperature — and you're all set. No overnight wait.
5 EXTREME STABILITY	SUPERMIX Developer, Refresher and Speed Fixer have withstood tests in temperatures as low as 75° below zero . . . as high as 155° F for 30 consecutive days—without damage.
6 LOWER COSTS	The long life and increased output of SUPERMIX liquid chemicals save you money. Using Refresher, you can process 1200 14 x 17's in SUPERMIX for a cost of *only 3.7¢ each!*

Ask your GE x-ray representative for a copy of our informative booklet, "A Look at X-Ray Film Processing," or write:

NOTES: TREATMENT OF ANAL PRURITUS

New! SOOTHING, READY-TO-USE PADS REPLACE HARSH TOILET TISSUE

What are they?

Tucks are pure, soft outing flannel pads moistened and mildly medicated with a special solution containing witch hazel and glycerin.

Gentle, thorough

Being moist, Tucks clean the pruritic area completely, removing all vestiges of contaminating fecal material. Being soft, they cannot irritate sensitive anal tissue and cause further aggravation.

Majority improve

Numerous clinical reports indicate that a majority of cases of anal pruritus will show appreciable improvements when Tucks are prescribed to replace toilet tissue. Tucks have been recommended further as a prophylactic measure against all forms of anorectal disease which may be caused or aggravated by improper anal hygiene. We suggest you try Tucks for your next case of anal pruritus.

How supplied

Tucks are provided in jars of 100. A supply for trial will be sent you upon written request. Address Dept. M-3, Fuller Pharmaceutical Co., 715 So. 10th St., Minneapolis 4, Minn.

Re: Digitalization

Unless the situation is very urgent, it is usual to give 0.6 mg. of 'Crystodigin' by mouth, to be followed by 0.4 mg. every 6, 12, or 24 hours until a full effect is obtained —usually within 2 or 3 days. The total dose will seldom exceed 1.8 mg. Then the dosage can be reduced to the maintenance level.

For maintenance, patients' requirements vary. As little as 0.05 mg. is sufficient in some cases. The usual case requires 0.1 mg. More rarely, 0.2 mg. or slightly more will be required.

Eli Lilly and Company • Indianapolis 6, Indiana, U.S.A.

'Crystodigin' is available in 0.05-mg., 0.1-mg., 0.15-mg., and 0.2-mg. tablets. Ampoules containing 0.2 mg. per cc. are available in 1-cc. and in 10-cc. (rubber-stoppered) ampoules.

THE FUTURE OF THE MEDICAL SCHOOL OF THE UNIVERSITY OF MINNESOTA

E. T. BELL, M.D.
Emeritus Professor of Pathology
University of Minnesota Medical School
Minneapolis, Minnesota

I HAVE chosen to speak of the future of our medical school rather than of its past. We can learn from the past but we cannot change it. The future is what we make it. The Medical School has a short past but an infinite future. It will go on as long as our society endures. When the youngest of us has passed on it will still be young. We cannot conceive of any form of society except barbarism in which it will not be necessary to train physicians. Even Soviet Russia with her harsh despotic government has medical schools, although they have probably deteriorated. The socialization of medicine, undesirable as it is, would not weaken medical education.

We cannot plan very far beyond the span of our own lives, but we can build a solid foundation for those who come after us. We should plan now to meet the problems that we can foresee.

I think of the Medical Foundation as a self-perpetuating body composed of men and women with a deep interest in medical education and an unselfish devotion to the medical school. I think of it also as a permanent advisory council always ready and willing to support the school. I do not think we should interfere with the administration except in a dire emergency. Certainly we should not interfere with the splendid present administration, but there was a time about forty years ago when the school was saved from disaster and started forward by the intervention of three loyal alumni, of which our beloved Dr. Ed Tuohy was one. But for these three men our progress would have been delayed a score of years. If such a situation should arise again this organization should come to the rescue.

What are the problems that the medical school faces in the foreseeable future?

Shortage of Physicians

The people in the rural areas of the state are complaining bitterly because they have no doctors, and their voices are growing louder in the legislature each biennium. There are as many doctors per thousand of population as we have ever had, but a great many are in the armed services and there is every indication that this situation will continue for a long time. A more important cause of the shortage is an increased public demand for medical service which has been stimulated by health programs. It is hard to find a physician at the present time who does not have all the work he can handle. If the population of the United States continues to increase as anticipated and the output of medical graduates remains the same, there will eventually be an even greater shortage. We know that the shortage of physicians is not due to a deliberate action of the medical profession in curtailing the supply of young doctors, but the public thinks it is our fault. They believe we are like a trade union which restricts the number of apprentices they will train. We must do something about this situation. If we continue to ignore it the public may give us something that we do not like such as socialized medicine. I believe that we must try to increase the number of doctors without sacrificing the quality of their training. How can we accomplish this?

It seems easier and less expensive to increase

An address to the Minnesota Medical Foundation, May 18, 1953.

the enrollment in existing schools than to establish new ones. One very important point that our legislature does not understand is that nearly half of our graduates go to other states, and other states supply a large percentage of Minnesota doctors. If we should double the enrollment at Minnesota it might not help our local shortage. Our graduates might go to other states as half of them now do. Any helpful action must be on a national scale. If all the State-supported schools or a majority of them increased their enrollment it would improve the situation. We cannot expect the private medical schools to act since they are not under legislative pressure.

If Minnesota should increase her enrollment as much as 50 per cent the quality of instruction would deteriorate unless our staff and teaching facilities were correspondingly increased. The state would be obliged to spend more money. Expansion of the basic science departments could be accomplished without a great outlay of money, but a suitable increase in the hospital services would involve an enormous expense if it could be accomplished at all under our present system.

But we could have enormous clinical facilities without any additional expense if we could persuade the people of our state to build federal, state and municipal hospitals on or near the Medical Campus.

The Veterans Administration is now convinced that their hospitals under the supervision of medical schools give vastly better service to veterans than those placed in small communities. They want to have their hospitals run by the medical schools, but Congressmen and other politicians often thwart them and get the hospitals located where they are inaccessible to medical students. Let us get the veterans' organizations to support us in demanding that these hospitals be built near medical schools. The State could then train more doctors with little additional expense.

The State should build at least one mental hospital near the campus. We do not have an adequate medical staff in any of the state hospitals, but such a hospital near the campus would be well staffed and would supply desirable clinical material.

Minneapolis should build its new City Hospital on or near the campus. A city hospital provides a rich variety of clinical material. Patients are better cared for in a teaching hospital since the staff know that they are being criticized by eager young minds. The University of Cincinnati uses the Municipal hospital as its sole source of clinical material. About forty years ago the Rockefeller Foundation offered to build Minneapolis a hospital on the University Campus. The regents offered the land free, but our shortsighted City Council declined the gift.

One of the tasks which this organization might undertake is to persuade the people of our state that they can have more doctors without much additional expense if they will build their federal, state and municipal hospitals accessible to the Medical Campus.

General Practice and Specialization

In the past there has been much criticism directed at the medical school because a disproportionate number of graduates become specialists. However, this situation is improving. Because young men have had to spend two years or more in military service they do not have the time to devote three years to preparation for a specialty and more of them are going into general practice. We should make special provisions for these men such as a two-year internship with emphasis on Internal Medicine. There is an unfortunate tendency for men in general practice to take up major surgery without adequate training. Unnecessary and incompetent surgery is injuring the reputations of all of us and creating a distrust of doctors. Perhaps we teachers do not spend enough time indoctrinating our students with their obligation and responsibility to the public which has borne the major share of the cost of their education.

Our medical school now ranks high as a center for good teaching and creative thought. Let us try to maintain this excellence. I have every confidence that those who come after us will carry on.

Because of wider and broader education people have learned the value of modern medicine in relieving and preventing sickness. New health attitudes are resulting from intelligent health education.—Hugh R. Leavell, M.D., *New England J. Med.,* (Dec. 4) 1952.

PATIENTS' IMPRESSIONS OF A COMMUNITY MENTAL HEALTH CENTER

CHARLES KRAM, Ph.D., and N. J. BERKWITZ, M.D.
Minnesota Department of Public Welfare
Albert Lea, Minnesota

THE *Albert Lea Community Mental Health Center* is a state-supported unit under the supervision of the Department of Public Welfare of the state of Minnesota. It began operations in January of 1951.

The clinic has a twofold purpose. Follow-up treatment is provided for patients provisionally discharged from state hospitals who reside near the clinic. In addition psychiatric care is offered to indigent state residents upon referral by their family physicians. The clinic also acts as an educational center for the community regarding mental health matters.

The staff consists of a psychiatrist, a psychiatric social worker, a clinical psychologist, and a clerk-stenographer. The clinic is located in one of the office buildings in the center of town.

Treatment consists of psychotherapy, eclectic in nature. Faradic stimulation[1] combined with intravenous sodium amytal is given as an adjuvant to psychotherapy in a fairly large percentage of patients treated.

In the Spring of 1952, it was felt that a sufficient number of patients had been seen to warrant making a survey. This survey was to have a threefold purpose: (1) to obtain the patients' opinions of clinic services; (2) to inform the clinic of means through which these services could be improved; and (3), to gain information as to the efficacy of the treatment.

It was decided to employ a questionnaire form to be mailed to each patient and ex-patient. Simplicity and brevity were stressed in constructing the questionnaire and the accompanying explanatory letter. A code number was typed on each questionnaire, and fairly inconspicuously located so as to permit for anonymity if desired by the respondent. The code number allowed for identification of the patient.

The questionnaire consisted of six items. The first five items comprised attitudes regarding cessation of therapy, benefits received, returning to the clinic if necessary, and the no-fee basis under which the clinic operates. Each item could be answered by checking one of the several possible replies listed under each of the five items. The sixth item invited criticisms and suggestions.

A total of 172 replies were received. Fourteen letters were returned because the present address was unknown to the post office.

TABLE I.
NUMBER OF QUESTIONNAIRES SENT AND RECEIVED

	Ex-Hospital Patients	Privately Referred Patients	Total
Number Sent	65	277	342
Number Received	55	186	241
Per Cent Received	84.61%	67.14%	70.46%

One month later a follow-up letter with a questionnaire form was again sent to 156 individuals of the original 342. These were the individuals who had not replied formerly. The follow-up letter elicited more than a 20 per cent increase in the number of replies. A greater percentage of ex-hospital patients replied than did the non-hospital patients.

A total of 69 replied to the follow-up letter. This yielded a grand total of 241 replies out of the original 342 forms mailed. Table I presents this information with corresponding percentages.

In almost every instance, the patient himself filled out the questionnaire. There were a few instances wherein the patient was a youngster or illiterate and where, therefore, a parent or a spouse replied for the patient.

Not all the respondents answered each item on the form. There were 30 forms returned completely blank but accompanied by a letter. There were also 42 forms which were found to be partially blank. Consequently, in compiling the total results for each item, it was necessary to determine a separate index, from which individual percentages were then computed.

Results

It shall prove significant in the interpretation of the therapeutic results, in Table II to keep in mind that almost 70 per cent of the replies were from individuals who were no longer receiving therapy.

TABLE II. PATIENT STATUS

	Ex-Hospital Patients		Privately Referred Patients		Grand Totals	
	N	Index	N	Index	N	Index
	54	100.00%	186	100.00%	240	100.00%
Present Patients	6	11.11%	68	36.55%	74	30.83%
Former Patients	48	88.89%	118	63.45%	166	69.17%

TABLE III. REASONS FOR TERMINATING THERAPY

	Ex-Hospital Patients		Privately Referred Patients		Grand Totals	
	N	Index	N	Index	N	Index
	36	66.66%	97	52.15%	133	55.41%
Maximum Benefits Achieved	20	55.55%	70	72.16%	90	67.67%
Against Clinic Advice	0	00.00%	9	9.27%	9	6.76%
Extraneous	16	44.45%	18	18.54%	34	25.56%

The indeces indicate the percentage of replies to that specific item, from the total number of questionnaires returned. The percentages underneath are then computed from each index, taking that index-percentage to be 100.00 per cent.

It may be noted that 16.61 per cent more of the privately referred patients ceased therapy because of having received maximum benefits. None of the ex-hospital patients stopped therapy against the advice of the clinic.

As may be seen from Table IV, 8.98 per cent more privately referred patients felt they had improved as a direct result of therapy whereas 9.75 per cent more patients stated a lack of improvement. This may be partially explained in that privately referred patients are seen more frequently and receive more intensive psychotherapy. The ex-hospital patients usually receive direct counseling.

It is interesting to note, in Table V, that 3.45 per cent more ex-hospital patients stated a preference for returning to the clinic. Although, as a group, fewer had considered themselves improved in comparison to privately referred patients.

The fact that 10.23 per cent more ex-hospital patients preferred paying a fee may be accounted for in that having been previously hospitalized they had already received more state aid and possibly felt more indebted. At any rate, the total 16.12 per cent, who were in favor of fees, constitutes a large enough percentage to merit further deliberation on the matter of charging a nominal clinic fee.

TABLE IV.
PATIENTS' OPINIONS OF THERAPY RESULTS

	Ex-Hospital Patients		Privately Referred Patients		Grand Totals	
	N	Index	N	Index	N	Index
	40	74.07%	156	83.87%	196	81.66%
Condition Improved	30	75.00%	131	83.98%	161	82.14%
Therapy Terminated Prematurely	2	5.00%	9	5.76%	11	5.61%
Condition Unchanged	8	20.00%	16	10.25%	24	12.24%

TABLE V.
PATIENTS' FUTURE PLANS REGARDING CLINIC TREATMENT SHOULD PSYCHIATRIC CARE BE NEEDED

	Ex-Hospital Patients		Privately Referred Patients		Grand Totals	
	N	Index	N	Index	N	Index
	32	59.25%	79	42.47%	111	46.25%
Will Return	25	78.13%	59	74.68%	84	75.67%
Will Not Return	7	21.87%	20	25.32%	27	24.33%

The ex-hospital patients found more to criticize negatively than to approve, when compared to the privately referred patients. However, when many of these criticisms are examined, they are found to be projections of near-psychotic mentations. For example, one such patient felt we lacked divine inspiration, another felt guilty because by attending the clinic he was acting contrary to God's wishes.

A number of suggestions were helpful and the clinic intends acting upon them. For example, one patient stated she felt uneasy at meeting other patients in the clinic who were from her home town. Several patients preferred not having "Mental Health Center" mentioned on the phone when being called, as they were on party lines.

Furthermore, about ten patients who had stopped therapy against clinic advice, found themselves eager to return after ventilating themselves in this part of the questionnaire.

Over half of the respondents were sufficiently interested to voluntarily write letters, in addition to completing the questionnaire. More than 40 per cent found no objection to signing their names to their replies.

A small percentage refused to admit patient status even though in each instance the clinic files held contrary evidence. A total of six former patients (2.50 per cent) stated they wanted to

TABLE VI.
PATIENTS' ATTITUDES TOWARDS LACK OF FEES

Hospitalized Since Therapy	4	7.40%	5	2.68%	9	3.75%

sever all relations with the clinic. No one of the six offered any reasons, however.

Another measure of therapeutic success may be seen by the fact that only 3.75 per cent, a total of nine patients, had required hospitalization following their visits to the clinic. Five of these nine patients were seen at the clinic for examination only. Following this, hospitalization was recommended.

Conclusions

A questionnaire survey was made of 342 patients who had attended the Albert Lea Community Mental Health Center for examination and treatment. The period of treatment extended from January 10, 1951, through May 1, 1952. A total of 241, or 70.46 per cent, replied.

The following significant trends are indicated:

(a) 69.17 per cent of the respondents were no longer in therapy.

(b) 67.67 per cent had achieved the maximum benefits the clinic could offer.

(c) 82.14 per cent felt improved as a direct result of therapy.

(d) 75.67 per cent plan to return to this clinic if they should need further treatment.

(e) 83.88 per cent preferred the absence of fees.

(f) 63.26 per cent spontaneously expressed appreciation and approval of the clinic.

(g) 51.25 per cent voluntarily wrote a letter in addition to answering the questionnaire.

(h) 3.75 per cent have been hospitalized.

The purpose of the questionnaire has been fulfilled. The results suggest that the form of psychotherapy offered meets with success in a majority of cases (82.14 per cent). In addition only 3.75 per cent of the total required hospitalization. Most of the patients seen, 63.26 per cent, were appreciative of the clinic's efforts, and approved of the clinic routine. Many of the suggestions offered by 36.72 per cent of the respondents shall be incorporated into the present clinic framework so as to provide improved satisfactory service.

BARRIERS AGAINST DISEASE

Our community-wide barriers against disease, applying to large groups rather than only to individuals and not possible except through organized action, are: physical—filtration of water, pasteurization of milk, improved housing, and air pollution control; physiological—widespread immunization programs, better nutrition, and fluoridation of water supplies; epidemiological—isolation, quarantine, vector eradication, and early case control; and educational — accident prevention, heart disease, and cancer information leading to prevention or early recognition, and promotion of health habits leading to a high level of total physical, emotional, and mental efficiency.—Berwyn F. Mattison, M.D., *Am. J. Pub. Health,* (Dec.) 1952.

PRIMARY NEOPLASMS OF THE LUNG

Review of Minneapolis Public Health Center Cases

DE FOREST R. HASTINGS, M.D., F.A.C.P.
Minneapolis, Minnesota

THE various primary neoplasms of the lung are more frequently diagnosed than formerly and their increased incidence is recognized. Heretofore clinicians believed that chest tumors were rare, their antemortem diagnosis almost impossible and the treatment so unsatisfactory as to make a careful search for them a variable waste of time and effort. These tumors may now be removed with relative safety as a result of the newer methods of surgery. Thoracic surgery is available in almost all parts of the country and there is justifiable reason at this time for all physicians to give great heed to the early diagnosis of these lesions. Community-wide chest x-ray surveys have revealed a certain number of these neoplasms hitherto unsuspected. When removed in the incipient stage, there is a great possibility of accomplishing a cure. It has been shown that many of the chronic or persistent infections of the lung are due to bronchial occlusions by tumors—only curable by surgery. Following is a discussion of the increasing frequency of carcinoma, a description of the means of its detection, and a presentation of a few of the cases seen in the Public Health Center Chest Clinic in Minneapolis.

Incidence

The incidence of primary neoplasms, particularly bronchogenic carcinoma, is increasing more rapidly than any other form of malignancy. Forty years ago carcinoma of the lung was rarely seen. Today carcinoma is one of the most frequent malignant lesions in man. In the ten years from 1938 to 1948, the number of fatalities from bronchogenic carcinoma in the United States increased 144 per cent—from 6,732 in 1938 to 16,450 in 1948. In this same period of time, the total cancer deaths from all types of cancer increased 31 per cent—149,214 in 1938 to 195,594 in 1948. From 1920 to 1948 the death rate from bronchogenic carcinoma per 100,000 population in the United States increased ten times—from 1.1 to 11.3 per cent. In 1950, the death rate from bronchogenic carcinoma in Minneapolis was 8.6 per cent. According to Doll and Hill, deaths from cancer of the lung in England increased fifteenfold from 1922 to 1947.

There has been considerable controversy concerning the cause of the increase in bronchogenic carcinoma, but no known cause has been definitely proven. According to Wynder, and Graham, excessive and prolonged cigarette smoking is an important factor in the genesis of bronchogenic carcinoma. They have found that in their 605 male patients with bronchogenic carcinoma, only 2.6 per cent did not smoke or smoked minimally, whereas over 96 per cent had smoked heavily for over twenty years. "In the controlled male population 14.6 per cent did not smoke and 73.7 per cent smoked moderately." Levin, Goldstein and Gerhardt also found that there were more smokers among cancer patients than in non-cancer patients and that the patients with bronchogenic cancer usually smoked cigarettes. It is my opinion that there is a positive correlation between carcinoma and smoking.

Diagnosis

Sputum examination for cancer is gaining popularity in many medical centers and hospitals as experience with the method is acquired. Expectorated specimens may be smeared while fresh and examined by the technique of Papanicolaou, or bronchial washings may be obtained, centrifuged and imbedded for staining with hematoxin and eosin. In our experience sputum examination has been very unsatisfactory and has given us very little of value in the diagnosis of neoplasms.

The standard x-ray examination of the chest, while one of our most valuable aids in the detection of primary lung tumors, often fails to reveal the shadow of the tumor itself. Lateral views and often oblique projections will sometimes show abnormal shadows behind the heart or diaphragm. Even the evidence provided by radiographs may only indirectly point to the presence of a tumor, such as atelectasis of a lobe or lobule, interstitial pneumonitis and abscess, virus pneumonia, apparent tuberculosis or pleural fluid. Certainly, absence of a tumor shadow is insufficient evidence upon which to rule out the existence of a tumor when symptoms or signs indicate the possibility of its presence. All too often an early carcinoma or other bronchial neoplasm is not recognized until the x-ray is repeated. When definite tumor shadows are seen on the x-ray film, it is impossible to identify with certainty the type of neoplasm present.

Carcinoma of the bronchus is the most frequently encountered primary tumor of the lung. Most of the other primary neoplasms will be revealed in the course of an attempt to prove or disprove the presence of carcinoma. The diagnosis of bronchogenic carcinoma is often rendered difficult because of an associated pulmonary infection. The clinical and x-ray pattern may be indistinguishable from tuberculosis, even as to cavity formation. Interstitial pneumonitis and abscesses often complicate the picture, and a diffuse, infiltrative type of carcinoma closely resembles fungus infections in its clinical and roentgenological manifestations. To further complicate the diagnosis, non-pathogenic monilia is found in the sputum as acid-fast forms of bovis actinomycetes. Bronchial carcinoma may appear to be a discrete, sharp and circumscribed intrapulmonary tumor which grows at an imperceptible rate and has the appearance of a benign tumor. Yet more of these circumscribed shadows are due to carcinoma than are due to adenomas, hematomas and all the rest of the less malignant tumors combined.

Fluoroscopy of the chest is valuable in showing evidence of obstructive tumors. It is also a means of detecting paralysis of one side of the diaphragm when it exhibits paradoxical motion as the patient inhales sharply—a sign which would indicate involvement of the phrenic nerve. Pleural fluid is readily detected. Bronchography is of value in demonstrating the presence of neoplasms in the bronchi, especially when they lie in a smaller bronchus beyond the visible range of bronchoscopy. Persistent filling defect on repeated examination must be viewed as strong evidence in favor of a primary lung tumor. Bronchoscopic examination of the patient suspected of having a primary neoplasm of the lung is absolutely indicated. A high proportion of lung tumors can be detected directly or indirectly by this means.

The total blood counts and differential white cell counts are apparently unaffected directly by primary neoplasm of the lung, and changes are often due to a pulmonary infection. Anemia when present is usually of the secondary or hypochromic variety. The sedimentation rate is usually elevated in the presence of malignant tumors and its increase serves only to arouse suspicion of their presence. Insufficient data are available as yet to establish the place of serological tests for malignancy and the diagnosis of pulmonary neoplasms, especially since tuberculosis frequently produces a false positive result.

Extrapleural thoracotomy should be widely used in patients who present strong presumptive evidence of primary neoplasm of the lung but whose preliminary examination has failed to yield a positive diagnosis. It is used with the same degree of safety as is exploratory laparotomy. To wait to see what develops in a patient who offers suggestive evidence of a pulmonary neoplasm, is to let the opportunity for cure be forever lost. Even benign-appearing tumors should be explored promptly because many of them are actually malignant. Others have malignant potentialities; they may eventually produce bronchial occlusion with suppurative complications. Even those completely benign may assume a size sufficient to crowd contiguous and vital structures with ultimate death of the patient.

Treatment

Until Graham, in 1933, performed the first successful pneumonectomy for a bronchogenic carcinoma, such a diagnosis was equivalent to a death sentence for the patient. The literature now contains an increasing number of patients reported to be alive five or more years after pneumonectomy for carcinoma of the bronchus. The mortality rate incidental to a total pneumonectomy has been reduced to a level comparable to that of an abdominal operation. According to Kinsella, the mortality rate from lobectomy is about 2 per cent, and from pneumonectomy somewhat higher because the general condition of the patient may be rather poor. Technical advantage in physiology, anesthesiology, blood banking, chemotherapy, antibiotic therapy and thoracic surgery has made invasion of the chest a safe and practical procedure.

The objectives of treatment of the patient with bronchogenic carcinoma are twofold. Primary consideration is, of course, complete eradication of the neoplasm. When examination indicates that carcinoma is confined to one lung or the regional lymph nodes, total pneumonectomy is the treatment of choice. The second consideration of treatment is that of palliation and amelioration of the various symptoms when a curative surgical procedure is impossible. As to the inoperable patient, it is important for the comfort and happiness of the patient to maintain as high a level of general health as possible. The use of nitrogen mustard has recently produced marked benefits in the reduction of pain and improvement of bronchial drainage.

2. Metastatic Sarcoma	1			1
Total Sarcomas	3		1	2
Total Malignant Tumors	44	5	8	31

Table I shows the clinic attendance and x-rays over a five-year period and the classification of patients attending the medical clinic.

Of the 25,987 patients attending the medical clinic in the five-year period, 10,803 (41.6 per cent) were diagnosed tuberculosis, 2,724 (10.5 per cent) were diagnosed negative, 199 (.8 per cent) were diagnosed probable tumors with further clinical studies indicated, and on 12,261 (47.1 per cent) the diagnosis was deferred.

There has been an increasing number of potential tumors found each year in the five-year period. In 1947-48, .8 per cent of the total medical clinic attendance were probable tumors; in 1948-49, .1 per cent; in 1949-50, .6 per cent; in 1950-51, (.5) per cent, and in 1951-52, 1.8 per cent.

The higher incidence in 1947-48 is probably explainable by the fact that there was a more select screening process because of the Mass City X-Ray Survey conducted that year. In 1951-52, the clinic assumed the responsibility of intense follow-up on all individuals with possible tumors, which fact would undoubtedly have some bearing on the markedly increased rate in that year.

In Table II, of the total malignant tumors found, forty-one (93.2 per cent) were carcinomas, and three (6.8 per cent) were sarcomas.

Twenty-seven (65.9 per cent) of the carcinomas had their primary site in the lungs or bronchi. Four (14.8 per cent) of this group have had successful operations, seven (25.9 per cent) had some form of surgery and were found to be inoperable, and sixteen (59.3 per cent) had no surgery and were in all probability, as far as we have been able to establish, inoperable.

Five (11.4 per cent) of the total group of malignant tumors had successful operations; eight (18.2 per cent) were found to be inoperable, and thirty-one (70.4 per cent) had no surgery.

There were no inoperable cases among the benign tumors (Table III). Thirteen (59.1 per cent) of the total number were successfully operated upon, and nine (40.9 per cent) had no surgery. Several of the lateral group have been scheduled for surgery, but it has not been com-

pleted as yet. The greater percentage of benign tumors found and those on which a positive diagnosis was established by the pathologists' report following surgery were: granulomas (13.6 per cent) and neurofibromas (22.7 per cent).

Table IV indicates the types and distribution of lung cysts found. Eight (80 per cent) of these have had surgery. On two (20 per cent) surgery is not indicated at the present time.

Conclusions

The incidence of primary neoplasms of the lung, particularly bronchogenic carcinoma, is increasing more rapidly than any other form of malignancy. Forty years ago, carcinoma of the lung was rarely seen. Today carcinoma is one of the most frequent malignant diseases in man.

The experience with pulmonary tumors at the Minneapolis Public Health Center is presented. During the period from July 1, 1947, to July 1, 1952, 83,708 individuals were seen in the x-ray clinic: of these individuals 25,987 were seen in the Medical Clinic. One hundred ninety-nine possible lung tumors were studied. Representative case histories of these groups are given. Of the twenty-seven patients in the malignant group (primary in the lung), eleven had been operated upon. On four of these eleven patients, surgery was successful and they have survived for a period of five to twenty-seven months, seven of the patients operated on (three were biopsies) were found to be inoperable. One of these patients is still living and has been for approximately eight months. Of the twenty-two in the benign group, thirteen patients were operated upon and have survived for a period of seven to sixty months.

THE CLINICAL DIAGNOSIS OF SOME BULLOUS DERMATOSES

CARL W. LAYMON, M.D.
Minneapolis, Minnesota

FEW dermatologic problems are as complex as those concerning the bullous dermatoses. Differences of opinion concerning these diseases are numerous, and the confusion is considerable. There are a large number of synonyms in the nomenclature, and the numerous proper names assigned to these disorders help in no way to understand their pathogenesis. Even now there is debate as to the identity of dermatitis herpetiformis and pemphigus.

Dermatitis Herpetiformis and Pemphigus

Morphology is undoubtedly an important aid in the differentiation of dermatitis herpetiformis and pemphigus. Before Duhring[3] described dermatitis herpetiformis there was general agreement that various types of lesions occurred in pemphigus. Now, if various types of lesions occur, a diagnosis of dermatitis herpetiformis is usually made. The axiom that vesicles or bullae which occur on an intact skin signify pemphigus, and that such lesions on reddened skin signify dermatitis herpetiformis, is an old one. Vesicles or bullae can form on erythematous skin, but the redness may quickly disappear. Conversely, lesions can appear on intact skin and soon be surrounded by a red halo, so it is not possible to be certain about the condition of the skin when the blister developed. Such an unreliable sign can never be used to differentiate dermatitis herpetiformis from pemphigus. Polymorphism has been stressed in dermatitis herpetiformis. It occurs, however, in many cases of pemphigus.

Grouping of lesions is prominent in dermatitis herpetiformis, but is frequently found in pemphigus. In pemphigus vegetans there may be definite grouping. A multiform eruption which doesn't have features of outspoken pemphigus vegetans or foliaceus, plus vesicular, herpetic lesions and early pigmentation is an important group of findings pointing to a diagnosis of dermatitis herpetiformis.

Mucosal involvement is well recognized in pemphigus. Mucosal lesions in dermatitis herpetiformis are extremely rare and offer no important differential point as far as their clinical appearance is concerned. Pure morphologic analysis often does not permit a differentiation between these dermatoses.

Nikolski's sign, which was first described at the Fifth Congress of Russian Physicians in 1894, is not constant but is seen often in pemphigus. It has been observed most frequently in the progressive stages but is not a particularly ominous sign. In most cases of dermatitis herpetiformis Nikolski's sign is absent. Most observers, however, believe that it may be positive in dermatitis herpetiformis, which again emphasizes the insufficiency of our differential diagnostic aids.

Pruritus and other paresthesias are far more prominent symptoms in dermatitis herpetiformis than pemphigus. These must be regarded as a part of the sum-total of various signs and symptoms and cannot be depended upon alone for differential diagnosis.

Eosinophilia in the blood and bullae is frequent in dermatitis herpetiformis but may be found in pemphigus. Many authors feel that this is no differential point at all. Eosinophils have been found as high as 74 per cent in the blood of patients with pemphigus.

For a long time it was believed that sensitivity to halogens was an almost pathognomonic sign of dermatitis herpetiformis and was lacking in pemphigus. Patients, however, in whom dermatitis herpetiformis was originally diagnosed and who presented a positive reaction to potassium iodide, have been known to die with obvious pemphigus several years later.

Undoubtedly, sulfapyridine is the most effective drug in the treatment of dermatitis herpetiformis. In 1947 Costello[1] sent a questionnaire to 100 dermatologists throughout the country, and those who had experience with the drug in this disease stated that 80 per cent of the patients improved to the extent that they were free of symptoms. Twelve per cent of the physicians reported patients who were cured with this form of treatment. In most cases the favorable response is prompt and dramatic. In contrast, sulfapyridine produces only slight or transient improvement in pemphigus.

From the Division of Dermatology, University of Minnesota, H. E. Michelson, M.D., Director; and the Department of Dermatology, Minneapolis General Hospital, Carl W. Laymon, M.D., Director.

While not an infallible method, the therapeutic test with sulfapyridine is the best single means which we have to differentiate dermatitis herpetiformis from pemphigus.

The course is an important factor in the differential diagnosis of the two diseases. Periodicity and heteromorphism speak for dermatitis herpetiformis, while uniformity and homogeneity of bullous outbreaks, plus monotony, favor a diagnosis of pemphigus. It is not acceptable to consider chronic pemphigus as purely bullous since there may be considerable variation as to types of lesions. Pemphigus may start as a vesicular eruption with the later development of bullae. Urticarial wheals and erythematous blotches are frequently seen in dermatitis herpetiformis, but the idea that such lesions are never present in pemphigus is not tenable. Erythema multiforme-like lesions may occur in both disorders.

The long duration with relatively slight disturbance of the general health favors a diagnosis of dermatitis herpetiformis. Not all cases of pemphigus, however, have serious disturbances of the general health until years after the onset. In dermatitis herpetiformis, too, there may be constitutional symptoms, but a favorable course with a non-lethal ending is the rule.

In the light of our imperfect knowledge, it may be summarized that dermatitis herpetiformis is a chronic, inflammatory, exudative dermatosis, an important clinical peculiarity of which lies in the maintenance of good general health, variable burning and pruritus, periodic outbreaks, and a nonfatal outcome. From the clinical standpoint dermatitis herpetiformis is characterized by wheals, papules, vesicles, and rarely pustules. Bullae occur only exceptionally through the confluence of smaller lesions. Scales, erosions, crusts, and spotty pigmentation are important secondary lesions. Another noteworthy sign is the grouping over the shoulders, axillas, sacral regions, flexor surfaces of the upper portions of the arms, and the inner portions of the thighs and legs. Sometimes lesions occur on the dorsal surfaces of the feet, infrequently on the scalp, and rarely, if ever, on the mucous membranes. The groups are of variable size, and depending upon the duration of the disease, show both primary and secondary lesions. Nikolski's sign is rarely, if ever, present. Thus the designation dermatitis herpetiformis should be used only for a well-defined chronic, pruriginous, inflammatory-exudative dermatosis with a favorable prognosis and *only* for such a circumscribed symptom-complex.

Herpes Gestationis

This was described as early as 1875 by Milton[7] in England, and later by Duhring[4] in America. It may occur at any time during pregnancy but usually after the fifth month or during the early postpartum period.

Grouped vesicles and bullae on an erythematous base are the common lesions, first appearing on the abdomen and accompanied by burning and itching. The groins, breasts, and extensor surfaces of the extremities may become involved. Later the eruption may become generalized. The mucous membranes are said to be free in most cases. The disease is prone to recur in succeeding pregnancies. Although some authors have reported recurrences only when the infant was a boy, most observers believe this is not true. Miscarriages, stillbirths, and monstrosities have been reported to occur in patients who had herpes gestationis.

Herpes gestationis is likely to occur earlier and be more severe in subsequent pregnancies. Like ordinary dermatitis herpetiformis, eosinophilia, ranging from 28 to 50 per cent, has been reported in this disorder. The prognosis is usually good. Duhring and other authors stated that herpes gestationis resembles ordinary dermatitis herpetiformis in every respect except the cause (pregnancy). Deaths, however, have been reported in this disease.

Dermatitis Herpetiformis in Children

It should be strongly emphasized that this disorder is extremely rare in children. The lesions tend to be more purely vesicular or bullous with a generalized distribution, and the grouping, which is so characteristic for adults, is usually lacking. The intense paresthesias which characterize the disease in the adult are as a rule less intense, and pigmentation is not a noteworthy feature.

Impetigo Herpetiformis

This is a rare and confusing disorder. The eruption consists of vesicopustules from 1 to 3 mm. in diameter which are discrete in the beginning but soon coalesce to form oozing, crusted foul-smelling lesions surrounded by a dull zone of erythema. Lesions spread peripherally by formation of new pustules leaving reddened, shiny, apparently healed areas.

Lesions of the mucous membranes, especially of the mouth, are present. These consist of grayish white plaques bordered by detached necrotic mucous membrane. They are painful and interfere with mastication and deglutition. In this stage their appearance simulates pemphigus vulgaris.

The disorder most frequently begins in the genitocrural regions where large denuded, crusted, soggy, erythematous patches are encountered. The lower part of trunk and lower extremities may be affected. Rarely the eruption is generalized.

The symptoms are severe, consisting of fever, rapid pulse, vomiting, diarrhea, bone and joint pains, and great prostration. Anorexia, severe pruritus, and insomnia lead to rapid loss of strength and weight.

Bacteriologic examination of the blood and lesions fails to show a causative organism. The cause is unknown. The occasional manifestation of convulsions suggests pathology of the endocrines, especially the parathyroid glands.

The disease usually occurs late during pregnancy or during the puerperal period. Spontaneous abortion has been followed by recovery. Cases in non-pregnant women and even males have been reported. The relationship to dermatitis herpetiformis and pemphigus is not clear. Fletcher Hall,[5] in 1944, reported a case in a male, in which a remission was obtained after treatment with sulfapyridine. His patient did not die. Henry Michelson[6] recently had a case of impetigo herpetiformis in which there was an extremely favorable response to sulfapyridine, suggesting that the disease may be closely aligned with dermatitis herpetiformis. The prognosis is grave, since the maternal mortality is between 70 and 80 per cent.

Pemphigoid Erythema Multiforme

Ordinary erythema multiforme of the so-called Hebra type will not be considered in this discussion. Cases of erythema multiforme are occasionally seen which closely resemble pemphigus. This is the type which Costello has called erythema multiforme pemphigoides. The term has also been used to describe severe bullous eruptions which sometimes follow smallpox vaccination or the ingestion of certain drugs. It is probably preferable, however, to reserve the term for cases for which there is no known cause. Costello and Vandow[2] studied a group of 150 cases of erythema multiforme which occurred over a twelve-year period. About 7 per cent of the entire group fell into the severe bullous type.

In most cases the disease begins on the skin. Occasionally, lesions in the mouth develop a few days before the skin becomes affected. Fever usually is present from the onset.

The eruption is made up of vesicles and bullae surrounded by an erythematous halo. They usually rupture early and become crusted. Grouped iris lesions are frequently present. In most instances the disease was symmetric and extensive. The face, dorsal surfaces of the hands and forearms, neck, trunk, and lower extremities are most frequently involved. Severe itching and burning are common. Ruptured bullae, irregular areas of erythema, and erosions of the soft palate, tongue, cheeks, and pharynx are commonly observed in the mouth. There is crusting and fissuring of the lips, mild conjunctivitis, and lesions of the vulva. Recurrences are rather common, as in ordinary erythema multiforme.

The symptoms are less intense than in other types of erythema multiforme. Loss of weight, strength, and appetite are unusual. In most cases fever from 102 to 104 degrees F. persists from two to six weeks. As a rule, it is more prolonged than in the ordinary type of erythema multiforme. In the blood the leukocyte count is slightly increased and there is occasional eosinophilia. Secondary anemia is frequent.

According to various writers the differentiation of pemphigoid erythema multiforme from certain cases of pemphigus is difficult and in some cases almost impossible. An extremely rapidly appearing pemphigoid eruption with generalized distribution suggests erythema multiforme pemphigoides rather than pemphigus vulgaris, which as a rule becomes generalized only after a period of several weeks or months.

The Stevens-Johnson Type of Erythema Multiforme

There have been numerous papers dealing with a rare clinical syndrome characterized by abrupt onset with symptoms suggesting an acute respiratory infection with marked prostration and elevation of temperature and accompanied by the simultaneous development of edematous areas of erythema of the skin and vesicobullous lesions of the mucous membranes. Within a few days the lesions rupture, producing extensive bright red areas of denudation especially around the mouth, eyes, nose, anus, and genitals. Severe conjunctivitis is usually present. The eyelids may be stuck together by crusted, greenish exudate and erosions. Ulceration and scarring on the cornea may result in partial or complete loss of vision. The disease usually runs a fulminating course for about two weeks when the temperature finally falls. In several series the mortality rate has run about twenty per cent. Some of the patients develop a generalized vesicobullous eruption. Slight leukocytosis (10,000 to 15,000) is usually present. Anemia is unusual. Patients who have the Stevens-Johnson type of erythema multiforme occasionally develop pneumonia. Secondary infection of the bullae may occur. Hyperpigmentation frequently remains after the lesions heal. The average age in Costello's series was twenty-six years although the disease may occur in children. It seems to be more common in the winter and spring and is more frequently seen in males.

Summary

1. The bullous diseases frequently present an extremely difficult diagnostic problem.

2. The greatest confusion exists in attempting to differentiate certain cases of dermatitis herpetiformis from pemphigus.

3. The various diagnostic aids, including morphology, hematologic findings, sensitivity to halogens, response to treatment and course are not infallible.

4. The favorable response of dermatitis herpetiformis to sulfapyridine and the lack of response of pemphigus is probably the best single means of differentiation between the two diseases.

BIRTH RATE INCREASES

According to the Public Health Service the national birth total continued to rise during the first three months of 1953, after setting a new annual record of 3,889,000 registered and unregistered births in 1952.

Births during the first quarter of 1953 were running about 29,000 ahead of the same period last year, an increase of 3 per cent. March was the tenth consecutive month in which the estimated total births topped corresponding monthly figures for the previous year.

The level of births for the first three months is at an annual rate of twenty-five live births per 1,000 population. This is slightly higher than the birth rate for the first quarter of 1952.

Since the end of World War II, more children have been born every year than in any wartime or prewar year. From 2,858,000 of registered and unregistered live births estimated for 1945, the total soared to 3,817,000 in 1947. After dropping to a slightly lower level for the next three years, birth totals reached a new high in 1951 and broke the record again in 1952.

Based on registered births alone, 58,000 more couples had a first child in 1951 than in 1950, according to preliminary estimates. This 5 per cent increase in first-born children was largely a sequel to the marriage upswing that began in June, 1950, at the start of the Korean War. Births of second-born children increased by 2 per cent over 1950.

Births of third children increased by 9 per cent, and of fourth children by 13 per cent. These increases continue a steady rise that has been going on since the end of World War II.

Marriages dropped in the last half of 1951, so it is likely that fewer couples had their first child in 1952 than the previous year. But since total births went up, it probably meant a further rise in the births of second-born or later children during 1952.

DERMO-FUNGOUS ALLERGY

HAROLD G. RAVITS, M.D.
Saint Paul, Minnesota

THIS DISCUSSION is limited to the allergic manifestations of the superficial fungous infections. The study of the immunologic mechanisms in fungous disease closely parallels the allergic processes in tuberculosis. Bloch and Jadassohn and their followers studied extensively the biologic and allergic phenomena in fungous infections and contributed much of the original work in this field, much as Koch and his school in tuberculosis. Experimental studies have been done principally in infections in guinea pigs produced by the species Trichophyton gypsum. It has been shown that the hypersensitivity develops only during the course of an infection and the peak of hypersensitivity is reached some two to three weeks after the lesions are healed and gradually decreases over a period of months after the infection. Primary infections in the guinea pig run their course in three or four weeks with the peak of intensity about the twelfth day. In reinoculations the response is accelerated being most intense within six days and completely healed in ten or twelve days.[3] Similar experiments in man resemble those in the guinea pig as far as the difference between first inoculations and reinoculations are concerned except in man the course of events is less constant and regular. Once an individual has recovered from a fungous disease the entire skin surface including the clinically unaffected areas acquire a state of specifically altered reactivity as evidenced by the more rapid and less severe reaction to reinfection. The evolution, configuration, and involution of the mycotic foci are dependent upon the immunologic state of the skin. When the allergy is strongly developed, the fungi may be destroyed directly; when it is of lower degree, it serves only to inhibit the multiplication of the fungi so that they can again multiply as soon as the immunity retrogresses.

As a rule, allergic hypersensitiveness of the skin is encountered in the deep inflammatory mycoses, though it may develop in superficial mycoses provided they are of long standing. Also the degree of allergy depends in part on the species of fungus, animal species of fungi being more likely to sensitize than the human variety.

A high degree of allergy is manifested by patients with dermatophytids. The term "id" is understood to designate the reaction of a highly allergic skin to a hematogenously distributed organism or its products.

The altered reactivity of the skin can be demonstrated by means of the trichophytin skin test. Trichophytin is prepared from cultures of trichophytons or immunologically related fungi such as epidermophytons and microsporons. An established positive trichophytin reaction appears almost exclusively in susceptible humans or animals who have been infected or otherwise adequately exposed to the specific agents or their products. Trichophytin sensitivity can persist long after the disease process is healed.

The degree of skin sensitivity to trichophytin can be deliberately altered by repeated intracutaneous injections of the specific extract. Reactions to the trichophytin skin test are of very limited diagnostic value. The reaction to trichophytin indicates only that an adequate specific exposure has taken place at some time in the past and does not necessarily mean that an individual is suffering from active trichophytic disease. It is sometimes of value in special problems of differential diagnosis. The usual twenty-four to forty-eight hour papular tuberculin-type reaction is elicited by the intracutaneous injection of .1 cc. of 1:30 to 1:50 dilution of a standard trichophytin. The test is read at twenty-four, forty-eight, and seventy-two hours. Inflammatory erythema and infiltration appear at twenty-four to forty-eight hours and usually persist for two to four or more days and may persist up to several weeks. Persistent reactions may become eczematous, lichenified and scaly. The reaction (1 to 3 cm.) should be considered positive only if the reaction at the trichophytin site is significantly greater than the reaction at the con-

---

Read before the American College of Allergists, Graduate Instructional Course, Chicago, Illinois, April 25, 1953.

trol site. A negative reaction indicates that the individual has never had a sensitizing infection with trichophyton or immunologically related fungi or that the individual has been exposed but is in a state of anergy; also it may be that the individual has been exposed to fungi but is still in the incubation period of the infection.

The significance of the urticarial skin test responses to trichophytin is unknown. It is much less common than the tuberculin-type response. The urticarial reaction is read and evaluated fifteen to twenty minutes after the intracutaneous injection of 0.01 to 0.02 cc. of trichophytin. A control test should also be done. Some of the patients showing immediate urticarial responses to trichophytin have circulating passive transfer antibodies of the Prausnitz-Kustner type. The early response may be of occasional diagnostic value owing to the fact that most of the early responses have been found in: (1) chronic Trichophyton purpureum infections; (2) recurrent erysipelas-like involvement of the legs presumably due to fungi[4]; (3) asthma, rhinitis, urticarias presumably due to products of dermatophytes.

Many of the mycotic infections present features which are instructive from the point of view of allergy. Dermatologists have been able to study the effects of allergy on the primary lesions of fungous infections much more intensively than internists can study the relationship between allergy and primary tuberculosis. This is true because in fungous diseases the skin and its appendages are the organs of first infection in most cases and the development and course of the primary lesion and changes in skin allergy are all constantly accessible to observation and investigation.

It has been found that the production of trichophytin sensitivity in a fungus-infected individual as well as the character and course of the disease depend to a great extent upon the species of the infecting fungus. There is a tendency for certain fungi to be more common in animals (zoophilic) and for others to be more common in man (anthropophilic). When zoophilic fungi affect man they generally produce higher degrees of trichophytin sensitivity, greater degrees of inflammation, and a higher incidence of dermatophytids than do the anthropophilic fungi. Also the tissues of the human host have greater degrees of resistance as shown by a lesser degree of infectiousness and greater tendency to spontaneous healing and better response to various forms of therapy. Thus can be demonstrated the common close association between the production of allergic sensitivity and the increase in capacity to overcome infection.

It has been experimentally demonstrated that the local variations in the grade of hypersensitiveness may explain the commonly observed corymbiform or iris-shaped lesions.[1] The refractory free zones that appear in or about healed foci may be regarded as an expression of local immunity which is responsible for spontaneous healing of skin diseases.

The diagnosis of the classic forms of dermatophytids is usually simple and direct. In many cases as in ringworm of the scalp or beard there is a clear sequence of exposure, primary infection, development of allergy, appearance of primary lesions and eruption of the "id." Experimental studies by Williams and Peck have shown that certain eczematous eruptions on the hands are dermatophytids secondary to fungus foci in the skin on the feet, toes and possibly toenails.[2,5] The usual sites on the hands are the sides of the fingers and the palms. The lesions are usually vesicular, simulating dysidrosis. The reason for this localization is unknown but factors considered have been terminal circulation of the hands, contact with fungi producing local sensitization, traumatic factors and sensitization to light. In the classic dermatophytid following a deep infection of the hair follicles, the trunk is usually involved with follicular localization of lichenoid papules and occasionally eruptions simulating a toxic erythema. Constitutional symptoms such as fever, chills, lymphadenitis secondary to kerion are not commonly part of the complex which includes an eruption secondary to tinea pedis. The diagnosis of dermatophytid has been used very glibly in this country without careful observation and study of hand eruptions. Peck has laid down definite criteria. One dictum that a positive blood culture is essential is rather drastic. The following conditions for diagnosis of a dermatophytid are minimal but necessary.

1. There must be a demonstrable focus that contains pathogenic fungi.

2. The intracutaneous trichophytin test gives a positive reaction.

3. Fungi are usually not found in the lesions of the dermatophytid.

4. The secondary rash may be due to irritation of the primary focus by treatment or to a spontaneous inflammatory change. The injection of trichophytin for diagnosis may cause the development of a generalized dermatophytid eruption. The dermatophytid usually disappears spontaneously when the focus has been eradicated. Exceptions to this occur when there are secondary eczematous changes and the rash continues because of sensitivity to other substances or because of the action of primary irritants.

The condition known as keratolysis exfoliativa is often considered as a form of dermatophytid. Here the lesions consist of superficial scaly macules which may coalesce and are localized to the palms or soles. The lesions are at first unruptured empty vesicles.

Fungous infections also play a contributory role in the production of the hypersensitivity to other agents such as drugs and chemicals. Fungous infections can pave the way for a subsequent contact dermatitis because the continuity of the skin is interrupted by the infection thereby permitting the entry of secondary sensitizing substances.

In many cases, the clinical pictures of vesicular, eczematous and scaling dermatophytids of the hands cannot be distinguished from similar eruptions of the hands due to other causes. Even though some of the aforementioned criteria for an "id" eruption prevail, we may have these same findings when hand eruptions are not fungous "ids," but are contact-type eczematoid dermatitis or some other form of eczematous dermatitis. It has been shown that a clearcut contact dermatitis of the feet may be followed by a secondary eczematoid eruption of the hands and the reverse also holds true i.e., a hand eruption followed by secondary changes on the feet. The diagnosis of eczematous dermatophytid of the hands is no doubt being overworked, but there is also no doubt that many eczematous eruptions of the hands will not clear up until fungus foci elsewhere have been adequately treated.

When a fungous focus is found to be the cause of a secondary eruption, the secondary eczematous lesions usually require local antieczematous treatment as used in the treatment of eczema.

To understand the rationale and objectives of treatment, it must be remembered that these fungi do not elaborate any toxin or primarily harmful substance. But it has been shown that fungi produce lesions on the skin because they and their products sensitize the skin both locally and generally. So as far as can be determined, fungi elaborate not toxins but allergens. These fungous allergens often produce an eczematous form of skin hypersensitivity. These organisms multiply in and on dead tissue; hence, they are found in abundance in the dead horny layers of the skin and in the dead macerated or dried debris and scales in and around the hairs and nails.

Infections with monilias produce a skin sensitization to oidiomycin and not to trichophytin. It is probable that trichophytons and perhaps other pathogenic fungi have antigens in common with those contained in penicillin. This may account for vesicular and other reactions resembling fungous eruptions which are commonly seen on hands, groin, et cetera, following penicillin administrations.

Hyposensitization with trichophytin is generally of little value in the treatment of superficial fungous infections and "ids." Trichophytin desensitization is always tedious and like all other immunologic therapy involves the dangers of occasional increased sensitivity, focal flare-ups, exacerbation and extension. This procedure is not advisable as a routine therapeutic measure in ordinary or mild cases. However, in severe recalcitrant cases with full recognition of the relatively slim chance of success the measure warrants careful trial. It is sometimes followed by improvement or even cure when all other attempts have failed. Intracutaneous injections of trichophytin or oidiomycin beginning very carefully with doses below those which produce strong local reactions constitute the usual method.

Both the primary fungous eruptions and the secondary fungous eruptions known as dermatophytids are considered to be allergic manifestations essentially based on specific sensitization of the skin to fungous products. The fungous eruptions are, in general, eczematous. In most instances, they are similar in their pathogenic mechanism to the allergic eczematous dermatoses produced by contact with exogenous eczematogenous allergens. Treatment should be directed at the specific fungous focus and at the eczematous eruption.

INFECTIONS OF THE URINARY TRACT

Helpful Hints on Management

EDWARD N. COOK, M.D.
Rochester, Minnesota

THE TREATMENT of infections of the urinary tract has been of great interest and practical importance for many years. The armamentarium of drugs for management of these infections is vastly different from that of years ago. Nevertheless, in our experience in Rochester, the problem is still a most difficult one at times.

Before going into a detailed discussion of the various chemotherapeutic and antibiotic compounds which are at the disposal of the physician today, it becomes necessary again to review a number of basic concepts concerning the management of these infections. Without this fundamental knowledge the most sincere efforts may amount to naught. Too frequently, better judgment is abandoned in the face of exorbitant claims made by enthusiastic physicians and, more particularly, by some manufacturers. I would in no way detract from the ethical efforts of scientifically minded manufacturers; man in general owes them great thanks for what they have contributed in research concerning synthesis of the new compounds. Nevertheless, it is imperative that certain important facts which have been known throughout the entire field of medicine for years be kept in mind. Certain underlying concepts are necessary precursors of any treatment.

Many years ago I remarked that the story of infections of the urinary tract was a simple story and should be told in a simple way. Today there are a few more complicating factors to reckon with but the fundamental thought is the same, particularly if attention is given to certain basic principles of the art of diagnosis. First to consider is the value of the history obtained from the patient. Frequent urination, burning on urination and urgency are the cardinal symptoms of all infections of the urinary tract, be they primary or secondary. To treat these symptoms with drugs to relieve acute difficulty is justifiable but beyond this such treatment is willful neglect. This triad of symptoms may represent urethritis in the female, prostatitis and posterior urethritis in the male, stricture, or even interstitial cystitis. At this point it will not be superfluous to urge again careful evaluation of the history. When this analysis is studied in conjunction with the findings noted on examination of a properly obtained specimen of urine, the physician then, and then only, is ready to outline the management. If the foregoing are correctly done, ordinary judgment usually will dictate the needed additional diagnostic procedures and the required treatment.

If a female complains of burning and frequent urination but results of examination of urine are completely negative, the physician immediately should think of chronic urethritis; if she complains of urgency, the physician should consider trigonitis or cysts of the vesical neck; if the complaint is of the combination of frequency, nocturia and pain when the bladder is full, but the patient says these are relieved by voiding, the physician should call to mind interstitial cystitis. Too often, in the presence of such symptoms, treatment is by means of numerous new chemotherapeutic and antibiotic compounds, the only benefit of which accrues to the manufacturers of the drugs. Careful evaluation of subjective and objective findings in such cases certainly would lead to proper management.

A discussion of this sort naturally will raise the problem in the mind of the general practitioner, and at times in the mind of the urologist, as to how far one should go in treatment without complete urologic study. Certainly it would not be wise to submit everyone to complete urologic examination because of certain symptoms which suggest infection. However, if certain facts in the history or physical examination indicate the possibility of a coexisting pathologic process, these facts must be recognized and must govern the procedure. Infections of the urinary tract are secondary as often as they are primary and the physician must ever be cognizant of this. Not only is this important from the angle of diagnosis but, more particularly, from the angle of treatment.

Naturally, the type and site of the infection must be ascertained. That proper examination must be made of a properly obtained specimen of urine goes without saying. The specimen must be obtained by catheter from a female or it must be a second-glass specimen if the patient is a male.

From the Section of Urology, Mayo Clinic.

It should be examined grossly, then microscopically under the high dry objective, and finally the sediment should be stained with Gram's stain to ascertain the presence or absence of microorganisms. Culture of the urine is helpful but by no means necessary to good management in the majority of instances.

With the above information at hand, the presence of infection established, and the causative organism known, it would be ideal if there were available a "drug for a bug." However, such a utopian elixir does not obtain and the quicker this is realized the better off everyone concerned will be. There are many reasons why there is no specific against a particular microorganism. First, there is much difference in the sensitivity of the various strains of any organism to any particular medication. Second, but of less importance, is the individual's ability to take the drug and excrete it in the urine. Third, there must exist varying resistance of the different organisms to one or another of the many chemotherapeutic compounds after a period of administration of the drug. This is particularly true of the staphylococci. Consequently, qualification is necessary when statements are made concerning the proper drug to use in management of infections with certain organisms.

In general, the organisms found can be divided into two great groups: the Gram-negative bacilli and the Gram-positive cocci. The former are represented by Escherichia coli, Aerobacter aerogenes, bacteria of the genus Proteus, and the Pseudomonas organisms. Representatives of the latter are the staphylococci, the Streptococcus faecalis, and the hemolytic streptococci. As mentioned previously, there is no "drug for a bug." Consequently, each preparation will be named with a view to listing the organisms usually eradicated by its administration.

Preparations for Administration

Sulfonamide.—My experience with this drug indicates that in any of its many forms it is the most nearly universal urinary antiseptic. It is cheap; it can be given in small doses with few, if any, toxic reactions. Certainly it is effective against the majority of the usually encountered Gram-negative bacilli but not against the Pseudomonas organisms. It is equally effective against staphylococci and streptococci but has little or no effect on the growth of Streptococcus faecalis. It is given orally and, in my experience, a dose of 2.0 gm. daily for a week is sufficient. This drug also is of value when intermittent medication may be desired. A course of medication given for five to seven days of each month for three or four months may be of great value in eliminating a recurring infection.

Penicillin.—This preparation is most useful, when given either alone or in combination with the sulfonamides or streptomycin. Its efficacy seems to be decreased when used with aureomycin or terramycin. The dose is 300,000 to 600,000 units given daily, intramuscularly. It has been of value in treating the usual bacillary infections but not those caused by the Pseudomonas and also has been worthwhile against most coccal infections, at times even against the Streptococcus faecalis.

The experience with penicillin furnishes an example of why dogmatic statements of efficacy of any substance are unwise. In the first few years following the development of penicillin, most organisms of the genus Staphylococcus were completely eradicated by administration of this drug. At present, in our clinic, almost 50 per cent of the staphylococci found are not sensitive to penicillin, either experimentally or clinically. Toxic manifestations are minimal but rather severe skin reactions do occur at times. I do not believe that penicillin is a drug to be given promiscuously.

Aureomycin and Terramycin.—These two antibiotics will be considered together because their action is much the same. The drugs are given orally in divided doses, 250 mg. every six hours. They are particularly of value in treating infections with Streptococcus faecalis and Aerobacter aerogenes. Infections attributable to the Proteus or Pseudomonas organisms are rarely affected. Symptoms of toxemia after administration of these substances are similar but they are more severe and of more common occurrence following use of aureomycin than terramycin. Nausea and vomiting, and more frequently diarrhea, may be troublesome.

At times, following sterilization of the bowel with these drugs as a preoperative measure, severe, fulminating staphylococcal pseudomembranous colitis has developed. While this complication is not of common occurrence, its possibility must be borne in mind.

Chloromycetin.—This drug was briefly my personal choice among all the antibiotics, and from certain standpoints it still is, except that it must be appreciated that a severe toxic reaction has developed in a small percentage of cases. The aplastic anemia to which I refer has developed in some cases after a relatively small dose has been given for only a short time. Other toxic manifestations are nil. The quantity to be administered is 1.0 gm. daily, given in divided doses for five to seven days. However, I believe it should not be used unless studies of sensitivity reveal that the offending organism is sensitive to it alone and the patient is seriously ill.

Polymyxin.—My experience with this antibiotic is extremely limited. Nephrotoxic and neurotoxic symptoms are of such degree that I believe its use is justified only in serious situations where studies of sensitivity show that it alone is of value.

Neomycin.—This is another antibiotic which is toxic at times. It causes certain disturbances of the middle ear similar to those encountered following use of streptomycin. Its use is indicated only if studies of sensitivity show it to be the only drug to which the infecting organism is sensitive.

Erythromycin.—This is well tolerated in most cases. Certain limitations to its use must be appreciated. It is of value only in treating infections with Gram-positive organisms. It has shown no effect on urinary Gram-negative bacilli.

Streptomycin.—A few years ago I was strongly of the opinion that this preparation was of little importance in the field here concerned, with the exception of cases of infection with organisms of the genus Proteus. When the drug was administered to patients suffering from such an infection, and the treatment was supplemented by administration of sulfonamides, the results were good. The poor results against the usual bacillary invaders, coupled with the not infrequent manifestations of toxicity relative to the middle ear, made me hesitant to prescribe the drug. With the advent of dihydrostreptomycin such toxic side effects became minimal; an additional favorable feature is that time of administration is short. Resistance of the infecting organisms to the preparation seems to build up rapidly. This fact should be appreciated in planning dosage; consequently I advise 2.0 gm. daily for two days, followed by 1.0 gm. daily for an additional three or four days.

Mandelic Acid.—Availability of the foregoing preparations should not cause abandonment of an old standby. When renal function is normal, mandelic acid can be given with few toxic reactions, and no danger. This drug holds an important place in the treatment of many bacillary infections and also in treatment of infection with the Streptococcus faecalis.

Arsenic for Intravenous Injection.—Through the ages, progress has left many worthwhile things by the wayside. In years past, many coccal infections responded well to intravenous administration of arsenic. I have given oxophenarsine hydrochloride (mapharsen), 0.03 to 0.04 gm, intravenously, four or five days apart for three injections. The results often are startling.

Chemotherapeutic and Antibiotic Preparations in Combination.—Before leaving the subject of the immediately preceding paragraphs, I should like to mention the increased benefit which at times obtains when these preparations are used in combination. There seems to be a synergistic relationship between the sulfonamides on the one hand and either penicillin or streptomycin on the other hand; also penicillin and streptomycin seem to act synergistically. However, it has been definitely shown that penicillin in combination with aureomycin or terramycin definitely decreases the activity of both drugs of the combination.

Local Treatment

Too frequently, because of the ease of prescribing one of the foregoing compounds, the value of properly administered local treatment has been forgotten. Lavage of the bladder with potassium permanganate, boric acid, or acetic acid, followed by instillation of ½ ounce (15 cc.) of 5 per cent solution of mild silver protein (argyrol) may give quick relief of acute symptoms. At times, continuous lavage with solutions of silver nitrate of increasing strength is of great value in treatment of incrusted cystitis. Here, too, cystoscopy under anesthesia and removal of the incrustations with the heel of the scope or blunt forceps, will hasten recovery. For the extremely irritable bladder, instillations of silver iodide may be of help.

Clinical Entities

Chronic Urethritis.—This troublesome condition is of most common occurrence among females. The urethritis may be granular and there may or may not be cicatricial change. Instillation of a 5 per cent solution of mild silver protein (argyrol) once daily for five or six days, with adequate dilatation to size 32 or 34 French if indicated, is most helpful. Warm sitz baths are useful adjuncts in treatment. Rarely is fulguration indicated and overtreatment must be guarded against.

Chronic Prostatitis.—How much should be done for this condition? First of all, I am certain it rarely causes trouble to elderly men. If a patient is less than thirty-five or forty years of age, I advise regular massage twice weekly for eight to ten weeks, after it has been ascertained that there are no contributing foci in teeth or tonsils. If a patient is more than forty years of age, I usually advise against local treatment unless there are associated symptoms such as burning on urination, dysuria, frequency, or distress in the suprapubic region or groin. Perineal pain and testicular distress are not attributable to chronic prostatitis.

Interstitial Cystitis.—This miserable condition often requires the most careful handling. Overdistention of the bladder under anesthesia and instillation of solution of silver nitrate have proved helpful. Fulguration of the inflamed portions occasionally has been beneficial. Cortisone and alpha-tocopherol have been given orally with varying results.

Amicrobic Pyuria.—This rare but interesting clinical entity usually is attended with most severe symptoms. There is a high degree of pyuria but the urine is free of any known organisms. In the course of differential diagnosis, tuberculosis of the urinary tract always must be excluded. Foci in other parts of the body may contribute to the condition. Local treatment, chemotherapeutic drugs and antibiotic preparations are of little value. Intravenous administration of arsenic is almost a specific.

The Most Important Consideration

In closing, I would like to make a solemn plea for complete absence of dogma in treating infections of the urinary tract. What is sauce for the goose is not always sauce for the gander. Each case must be studied individually and, above all, the possible relationship to the infection of a coexisting lesion in the urinary tract must ever be borne in mind. Too often, the first sign of a vesical neoplasm may be an acute infection of the urinary tract, which subsides with medication. If the patient is of middle age or older, cystoscopy is a dependable way to exclude this possibility. Again let me say that treatment of infections of the urinary tract, while it may seem simpler than it was ten years ago, is actually much more involved if it is done in other than hit-or-miss style. Certainly, the more cases of such infection which I see, the more I feel that I must learn more about them.

MINNESOTA MATERNAL MORTALITY STUDY

By the Maternal Mortality Committee of the Committee on Maternal Health of the Minnesota State Medical Association

A CONTINUOUS Statewide Maternal Mortality Study is being carried out as a cooperative study between the Minnesota State Medical Association and the Minnesota Department of Health. It is being conducted by a group of physicians known as the Minnesota Maternal Mortality Committee. This Committee was appointed by the Committee on Maternal Health of the Minnesota State Medical Association, and its members, representing various geographic areas of the state, are serving without remuneration. The funds for the study are being provided by the State Department of Health and a member of that organization, the Chief of the Section of Maternal and Child Health, is also a member of the Maternal Mortality Committee. Two well-trained obstetricians perform the field work of the study and they meet with the committee at various intervals. This study is patterned almost entirely after the previous study which was carried out in the State of Minnesota in 1941-1942.[3]

This report is a general summary of the first year of the current study, from April 1, 1950, through March 31, 1951. It is felt that to better understand subsequent tables and comments, the setup of this study should be discussed briefly. Prior to the onset of the study, all hospitals, city and district health departments, were requested to report maternal deaths promptly to the State Department of Health. Also physicians throughout the state were notified of the study through the Newsletter of the Executive Secretary of the State Medical Association and in addition, by means of notation in Minnesota Medicine. Reports of maternal deaths were made directly to the Section of Maternal and Child Health or indirectly through the Section of Vital Statistics of the State Department of Health. An appointment was then made promptly with the involved physician and the obstetrician-investigator set out to obtain all data regarding the death. The field-work consisted of reviewing the hospital medical records, prenatal records and interrogating all persons who were involved—i.e., physician, consultants, anesthetist, pathologist, interns, residents, nurses, et cetera. Thus an exhaustive amount of data was obtained; in fact, an eighteen page questionnaire was completed for each death. When deemed necessary, x-rays, pathological material, et cetera, were brought to the Committee for review. The obstetrician-investigator then summarized the case study. In his preparation of the case summary additional consultation was obtained from non-obstetrical specialists as the need arose. The case summary was next reveiewed by one of the Committee members. Finally, at periodic intervals, the case summaries were presented to the Committee as a whole where final decisions were made as to cause of death, criticism of the management of the case as to whether care was contributory or not contributory to the death of the patient, completion and adequacy of autopsy, completeness and accuracy of death and birth certificates, and final assessment was made as to preventability of, and responsibility for, the death. The case summaries were always presented anonymously where free discussion was possible and unbiased opinions were thus rendered.

The following minimum requirements for adequate obstetrical care were adopted by the Minnesota Maternal Mortality Committee:

Minimum Requirements for Adequate Obstetrical Care

First prenatal visit

1. Adequate history and general physical examination with accurate follow-up of any abnormality revealed by these.
2. Pelvic mensuration to include intertuberous diameter, diagonal conjugate and palpation of sacrum and spines.
3. Laboratory workup—blood serology for syphilis, hemoglobin, urinalysis and Rh determination.

Routine prenatal visits

1. Blood pressure determination.
2. Urinalysis, especially for albumin.
3. Weight determination.
4. Abdominal palpation during last two months of gestation.
5. Reasonably adequate study of abnormalities presenting themselves during these visits.

General Summary of study made from April 1, 1950, to March 31, 1951.

Labor and delivery

1. Adequate use of generally recognized obstetric procedures.
2. Observance of adequate asepsis.

Postpartum care

1. Reasonable promptness in the recognition of abnormalities.
2. Reasonable promptness in the institution of adequate treatment.

Postmortem examination

1. Completeness in itself or as an adjunct to clinical observation.

Death certificate

1. Accuracy in assignment of cause of death.
2. Completeness of data requested.

Birth or Stillbirth certificate

1. Completeness in reporting desired data.
2. Accuracy of data.

Death certificate of child

1. Accuracy in assignment of cause of death.
2. Completeness of requested data.

The maternal mortality rate is intended to be a measure of risk of death from childbirth. It is the number of deaths of women ascribed to pregnancy, childbirth and the puerperium (as set out in Class XI of the Manual of the International List of Causes of Death) per 1,000 live births, over a given time, usually taken as one year.

Chapter XI, number 640-689 (pages 178-188) includes:

pyelitis and pyelonephritis of pregnancy and puerperium;
toxemias and sepsis of pregnancy and puerperium;
placenta previa and abruptio, and other hemorrhage;
ectopic pregnancy, abortion;
anemia of pregnancy;
hydatidiform mole;
puerperal phlebitis;
pulmonary embolism;
puerperal psychosis, and
other related causes.

As in the previous study of 1941-1942,[3] all deaths, associated with pregnancy and the postpartum state are included in this report. The literature makes it clear that there is not uniformity of opinion as to what constitutes a maternal death. The Committee felt that in all fairness it was necessary to present all the deaths associated with pregnancy and the postpartum state so that there could be no question of selection. With the presentation of all data, anyone so desiring can calculate corrected figures for so-called "obstetrical deaths." The time limit of the postpartum state is another controversial issue which has not been settled. Some reports include deaths six weeks, others three months and still others six months postpartum. Unfortunately disease processes do not limit themselves to certain time limits. For uniformity, the Committee adopted the three-month postpartum period previously used by the Bureau of Census with the exception of chorionepithelioma deaths. Here is a definite disease of pregnancy, i.e., of the chorionic epithelium and the Committee set no time limit with respect to the inclusion of these deaths in this study. The value of maternal mortality studies such as this has been well established and is common knowledge. No further comment will be made in this regard except to emphasize that the objective of this study is to lower the maternal mortality rate in the State of Minnesota. Certainly none of us is infallible and lessons learned from the study should have an effect with regard to the management of subsequent obstetric patients.

TABLE I.
SOURCE OF REPORTING OF MATERNAL DEATHS

		No.	Per Cent

Original physician	3		
Field investigator of study	3		
Medical social workers	2		
Consultant	1		
Nurse	1		
Medical student	1		
Non-involved physician	1		
Matching birth and death certificates	9		
Totals		68	100.0

The source of reporting of material deaths is shown in Table I. In 69 per cent of the deaths, notification came through the usual channels of the Division of Vital Statistics and the City Health Departments through the Section of Vital Statistics. What is more important is the fact that twenty-one deaths, (31 per cent) would have been missed had the usual methods of reporting been relied upon since pregnancy or postpartum state was not mentioned on the death certificates of these. In other words, using the criteria set for this study, the maternal mortality rate as determined from the death certificate for the full

TABLE II. INTERVAL BETWEEN DEATH OF PATIENT AND INVESTIGATION

Interval	No. Deaths	Per Cent

45 and over	3	122	24.6
Not stated		30	
Totals	68	76,074	0.894

year of this study would be underestimated by 31 per cent. In three instances the original physical notified the Committee of the death yet failed to mention pregnancy or postpartum state on the death certificate. In the current death certificate form being used by the Section of Vital Statistics, if pregnancy or childbirth complications contributed to the patient's death, these should be listed under "Disease or Condition Directly Leading to Death." If not, the pregnancy state or postpartum state (three months) should be noted under "Other Significant Conditions." As a further check and in addition to the twelve deaths already discovered by various individuals as listed in Table I, the Section of Vital Statistics performed the difficult task of cross-matching death and birth certificates. This was accomplished in the following manner. The death certificates of all women between the ages of fifteen to forty-five dying during the current year of study were taken to the files of birth and stillbirth certificates and these were searched to determine whether a reportable birth had been registerd under the name of the deceased within three months of the date of death. As noted in Table I the search revealed nine additional deaths. Even with the cross-matching technique, four deaths would have been missed since of the twenty-one discovered by additional effort, four died undelivered and thus there were no reportable births for these. The implication of discovering twenty-one deaths which would have been missed is that the yearly Minnesota maternal mortality rate is being underestimated by approximately 0.18 points. The 1950 rate of 0.58 per 1,000 live births[4] should in reality be 0.76. It should be kept in mind that the above calculation represents all deaths associated with pregnancy and the puerperium as adopted by the Committee, in contradistinction to corrected rates of the State Department of Health—i.e., including only so-called "obstetrical deaths." Further analysis of the twenty-one deaths reveals that three were actually the result of obstetrical complications and another was due to rheumatic heart disease where pregnancy effect is certainly clear. The remainder were three suicides, one homicide, two automobile accidents, three brain tumors, two with brain pathology (?tumor, ?hemorrhage), one leukemia, one ruptured intra-cranial aneurysm, one spontaneous hemothorax, one acute yellow atrophy following infectious hepatitis and in two instances the cause of death was not determinable.

The time interval between death of the patient and the investigation is given in Table II. Three-fourths of the deaths were investigated within three months of the time of death. The longer interval of six months and beyond concerned the deaths which were discovered by additional effort as already noted in Table I. The cross-matching procedure was not done until the end of the current year of study which was the reason for delay. Because of poor medical records, about which more will be said later, the sooner the death is investigated and while all details are fresh in the minds of those concerned, the more accurate the data will be. For this reason, for subsequent yearly studies, the State Department of Health requires all hospitals and physicians to notify the State Department of Health within three days of the time of death of a patient dying in association with pregnancy or the postpartum state.

Analysis of maternal mortality (per 1000 live births) according to the age of the mother at the last birthday is recorded in Table III. This shows a progressive increase in the mortality rate with each older age bracket. These figures follow the trends shown by Yerushalmy, Palmer and Kramer[3] and Dickinson and Walker.[4] The mortality

TABLE IV. MATERNAL MORTALITY (PER 1000 LIVE BIRTHS) ACCORDING TO ORDER OF BIRTH

Order of Birth	No. Mat. Deaths	No. Live Births	Mat. Mort. Rate

rate of patients forty to forty-four is ten times that of patients fifteen to nineteen. There were three deaths in the forty-five and over age bracket even though there were only 122 live births for this age group, giving a staggering mortality rate of 24.6 per cent. The youngest patient was eighteen and the oldest forty-seven. All were white except one Indian and one Mexican. Of the sixty-eight mothers, three were illegitimately pregnant. There were a total of sixty-eight deaths among 76,074 live births for an uncorrected mortality rate of 0.89. The sixty-eight maternal deaths produced 162 motherless children. The socio-economic aspect of this is clear.

Table IV shows maternal mortality (per 1000 live births) according to order of birth. Sixteen (23.5 per cent) of these mothers were primigravidas and the remainder (76.5 per cent) were multiparas. The maternal mortality rate with the first pregnancy is higher (0.7 per cent) than with the second and third pregnancies (0.6 per cent, respectively), but rises appreciably with increasing parity. Again these trends compare with those of Yerushalmy, Palmer and Kramer.[5] Since the youngest mothers are generally of lower parity and older mothers of higher parity, an attempt was made to correlate age and order of birth by keeping one of these factors constant but no significant data was obtained since this series is so small.

Various phases of prenatal care are considered in the next four tables. Obtaining a blood test for syphilis early in the prenatal workup of a patient has long been considered a standard procedure essential for adequate prenatal care. The time of obtaining this test in the current pregnancy is analyzed in Table V. Thirty-one (45.6 per cent) of these mothers had no serology taken even though they were registered. By registered is meant that the patient engaged the services of a physician for prenatal care. In seven instances (10.3 per cent) the test were taken after the first visit and in three instances (4.4 per cent), the test was not obtained until hospitalization. It is difficult to comprehend this failure of physicians to obtain a blood test for syphilis since laboratory facilities of the State Department of Health are made available without charge. Since almost one-half (46 per cent) of these mothers did not have the test taken even though they were registered, one wonders what percentage of mothers surviving pregnancy and the postpartum state are receiving the test. One encouraging bit of improvement is to be noted, however, in comparing this data with that of the previous study in 1941-1942.[3] Whereas 62 per cent had no serology in 1941-1942 study, this decreased to 46 per cent for the present study.

The importance of Rh determination in the obstetrical patient has also been well established. In Table VI the maternal deaths are analyzed according to Rh determination. It is seen that twenty-three mothers (33.8 per cent) had no Rh determination even though they were registered patients and eleven (16.2 per cent) did not have the test until after delivery even though they were also registered. In other words, 50 per cent of the registered patients had no Rh determination done at all or until after delivery which again illustrates the faulty type of care these mothers received.

Pelvic mensuration is recorded in Table VII. Slightly over two-thirds of these mothers had no pelvic mensuration or incompletely measured pelvis (less than the minimum requirements adopted by the Committee). Of the sixty-two patients (91 per cent) who were registered, 40, or 65 per cent, had no pelvic mensuration or less than required. One death was directly attributable to the fact that the pelvis was incompletely measured. This patient was an essential primigravida who had a transverse presentation at thirty-six weeks gestation which reverted to a floating vertex at term. These warning signs still did not stimulate the physician to at least complete the pelvic mensuration or obtain x-ray pelvimetry. After seventeen hours of good labor, simple anteroposterior and lateral films of the pelvis were obtained because the vertex was not engaged. These films were reviewed by the Committee and revealed a rachitic pelvis with probable inlet and midpelvic contraction. Certainly accurate x-ray pelvimetry was in order. Following a prolonged, obstructed labor, high forceps extraction was attempted but failed. The infant expired soon after the forceps attempt. Patient was then fed juices and water and was taken back to the delivery room where midforceps extraction was attempted under ethylene gas general anesthesia. She vomited and became cyanotic. Suction was applied, oxygen administered and her color returned to normal. Patient was then re-anesthetized, again vomited, aspirated, and remained cyanotic. Difficult midforceps extraction of a stillborn infant was then carried out under local anesthesia. She expired as a result of aspiration (anesthetic death) but the undetected pelvic contraction was the underlying cause of the difficulty. Another patient's death was indirectly attributable to lack of pelvic mensuration. She was a secundigravida whose first pregnancy was terminated by classical cesarean section because of "outlet contraction." No clinical measurements were available but the physician stated that the transverse interspinal diameter was small since this would not admit his fist. Simple anteroposterior film of the pelvis had been taken and was available to the Committee for review. This revealed a typical gynecoid inlet, normal sidewalls, small blunt spines and normal pubic angle. The same physician managed her current pregnancy and decided upon repeat cesarean section for delivery, the indication being "outlet contraction and previous cesarean section." She expired during the procedure as a result of respiratory paralysis due to incompetently applied spinal anesthesia in which 20 mg. of pontocaine was used. In one instance the physician deliberately falsified pelvic measurements on the hospital chart. When interrogated about this, his reason was that "these were required to be on the chart by the American College of Surgeons."

Considering the criticism of prenatal care as a whole (Table VIII), it is seen that the care was judged faulty by the Committee in 69 per cent of the cases. The faulty care contributed directly to the patient's death in 21 per cent.

The question arose as to whether lack of hospitalization was a factor in the production of these mortalities. In Table IX, place of death is tabulated with place of delivery. All but five patients (92.6 per cent) were hospitalized for delivery, or for illness if they died undelivered, and thus lack of hospitalization can be exonerated. In

*See Table XIV.
**68 patients—1 set of twins.

1950, 98.3 per cent of all births in the state occured in hospitals.[4]

Attendant at delivery is given in Table X. Seventeen, or 25 per cent, of the patients died undelivered and all but one had physician care. The one patient unattended at delivery (spontaneous abortion at home), subsequently had physician care. Nurses were in attendance for delivery in three instances because of the rapidity of the process but the physicians arrived for delivery of the placenta. All of these had physician prenatal care. Physicians, as noted in the table, were in attendance for the remainder except in one instance where a midwife was present. She was responsible for the patient's death since she insisted on attending the delivery at home and the patient died of postpartum hemorrhage due to retained placenta. In summary then, all but two patients (97 per cent) had physician care. In 1950, physician attendance for births in the state was 99.8.[2]

Duration of pregnancy at delivery or at death if the patient died undelivered is listed in Table XI. Gestation of less than twenty-eight weeks or in the absence of a reliable history, delivery of a fetus weighing less than 1,500 grams or measuring less than 35 cm. in crown-heel length, was classified as abortion. In the absence of a reliable history, pregnancy was considered as term if the fetus weighed at least 2,500 grams and/or measured at least 45 cm. in crown-heel length. Excessive size was diagnosed if the fetus weighed 4,000 grams or more. As shown in the table, almost two-thirds (63 per cent) of the deaths occurred at term or past term. Three postmortem cesarean sections were done, none of which was indicated. Two were done ten and eighteen minutes, respectively after death. Credit for the third one goes to an undertaker with the indication being monetary. The patient was an eclamptic and died undelivered at term. The undertaker told the husband the distorted fact that a state law required him to evacuate the fetus. Accordingly, the fetus was evacuated and two funerals were held.

Data pertaining to presentation of the fetus and duration of pregnancy is shown in Table XII. Seventy-seven per cent of the patients had vertex presentation, 3 per cent uncomplicated breech and in 20 per cent the presentation was unknown (in the abortion-premature group where presentation was no factor). Malpresentation was certainly no serious factor in the production of these deaths.

Data regarding type of delivery and duration of pregnancy are shown in Table XIII. Excluding the seventeen who died undelivered, 46 per cent of these patients delivered spontaneously and 54 per cent were delivered by operative means. Further analysis of the twenty-eight operative deliveries is recorded in Table XIV. Only 16 (57 per cent) of these procedures were indicated and one-third of the procedures contributed directly to the patients' deaths. Thus radicalism played a prominent part in the demise of these patients. In a summary of this sort, presentation of details of these operative deliveries is not possible. In all likelihood this aspect will receive further attention in subsequent publications. One comment is in order, however. The procedure of accouchement force, which is never indicated, led to one patient's death. The cesarean sections comprised almost one-third of all the operative deliveries and of the nine, six were indicated. Further analysis of the cesarean sections according to type, indication and cause of death is shown in Table XV and is self-explanatory. Two-thirds of the cesarean sections were classical in type and it seems strange that the established superiority of the low cervical type has not yet been accepted. Comparing the cesarean section problem with the previous study of 1941-1942,[3], it is seen that all nine sections of the present series were elective whereas of the twelve in the previous series, five were non-elective (from eight to 120 hours after the onset of labor).

Analysis of the total operative procedures (obstetric and non-obstetric) done or attempted upon thirty-eight patients is recorded in Table XVI. In this general summary it is not possible to present details of these procedures. Of the sixty-one procedures, only twenty-eight, or 46 per cent, were indicated and 17 (28 per cent) contributed to the death of the patients. This again illustrates that radicalism was a prominent factor in the production of these deaths.

Table XVII analyzes the maternal deaths according to the anesthetic and anesthetist for delivery. Of the sixty-eight deaths in this series, forty-two had some form of anesthesia as shown in the table. The danger of inhalation anesthesia in the obstetric patient because of onset of labor after meals, delayed emptying time of the stomach, et cetera, is common knowledge. In spite of this fact, of the forty-two anesthetics, twenty-five, or 60 per cent, were inhalation anesthetics. Two deaths were directly attributable to this type of anesthesia. The patients were fed during labor, received inhalation anesthesia, vomited and aspirated. Realizing that the availability of competent anesthetists for the smaller hospitals in the state is an acute problem, it would seem that local anesthesia is the ideal solution. Here is a procedure which is safest for both mother and child and the technique is simple and easy to master. Of the forty-two anesthetics administered, only 10, or 24 per cent, had local infiltration alone. It seems strange that this simple procedure has not gained more favor. Of the remaining anesthetics given, six were spinal and one was caudal. Two patients lost their lives as a result of incompetent spinal anesthesia. One patient received 120 mg. of novocaine for cesarean section (twice the safe maximum dose), was tilted in slight Trendelenburg, no intravenous fluids were started, no blood pressure cuff was applied, only 2.5 mg. of neosynephrine was given intramuscularly and she was being checked occasionally by the circulating nurse regarding color and pulse. Two physicians were performing the surgery and a third was standing around to take the baby. His services would have been much more useful had he been at the head of the table

observing the patient. She expired twenty minutes following the injection of novocaine as a result of respiratory paralysis and shock. The other patient received 20 mg. of pontocaine with dextrose for cesarean section (four times the safe maximum dose for the pregnant patient) and the head of the table was not elevated until the anesthesia had reached the nipple line. She likewise expired as a result of respiratory paralysis and shock. Of the forty-two anesthetics administered only three (7 per cent) were given by physician-anesthetists, six (14 per cent) by nurses without previous anesthesia training, fourteen (33 per cent) by nurse-anesthetists and nineteen (45 per cent) by the obstetrician.

The death interval of the mother after birth of the fetus correlated with the cause of death within the first twenty-four hours is recorded in Table XVIII. Considering only those patients who delivered, twenty or 39.2 per cent expired within the first twenty-four hours following delivery. It is seen that one-half of these (ten) expired as result of shock and the remainder due to toxemia, anesthesia and miscellaneous causes.

Considering entire care during labor and/or for delivery (Table XIX), the Committee assessed care as adequate in only 30.9 per cent. Care was faulty in some aspect in 56 per cent and contributory to the death of the patients in 44 per cent.

An evaluation of postpartum care is summarized in Table XX. Of the patients receiving postpartum care, only 37.5 per cent had care which was considered adequate and the remainder (62.5 per cent) had faulty care. Of the patients with faulty care, in 56 per cent of the instances, this care contributed to the death of these patients.

Adequacy of consultation is analyzed in Table XXI. As in the previous study of 1941-1942,[3] consultation was considered adequate when the patient was examined by the consultant and there was fulfillment of the minimum standards as adopted by the Committee. Telephone and "curbstone" consultations were considered inadequate. Twenty-nine or 42.6 per cent of the patients had no consultation whereas the Committee judged that in seventeen (25 per cent) of these, consultation was

definitely indicated. The lack of consultation when indicated in 25 per cent and inadequate consultation in another 25 per cent shows that one-half of the total number of patients were not given the benefit of an established procedure during their fatal illness. There is no question but that many of these women could have been salvaged had adequate consultation been obtained.

The primary causes of death are listed in Table XXII. In some instances several factors may have contributed to the patient's death but only the primary cause is listed. The causes of death as shown in the table were determined by the committee after careful evaluation of each case and are independent of the causes listed on the death certificates.

In a general summary of this sort it is impossible to enumerate the details of these categories. Subsequent publications will be forthcoming but certain comments are in order at this time. Toxemia of pregnancy was the leading cause of death and briefly the most glaring errors with regard to management of this condition were inadequate prenatal care, failure to act in the presence of symptoms, especially epigastric pain, inadequate patient study, inadequate sedation, use of intravenous saline, use of pituitrin, administration of open drop ether for convulsions in the presence of pulmonary edema, excessive intravenous therapy and delay or absence of consultation. It is interesting to note that

in this group there were two deaths from severe liver necrosis wih massive hemorrhage. Eastman[2] states that this is a rare complication and he quotes Sanes and Kaminski who reported a case of their own and abstracted five additional cases from the literature. All of these occurred in eclamptics whereas the two in this series occurred in an arteriosclerotic and in an unclassified toxemia.

Obstetric hemorrhage was the second leading cause of death. In five out of these nine

TABLE XXIII. PRIMARY CAUSE OF DEATH

deaths the Committee assessed direct responsibility for the death to the physician involved. It is surprising that hemorrhage took such a heavy toll in spite of present-day improved obstetric technique and the availability of blood for transfusion. In all but one of the nine instances, Red Cross blood banks were available yet the patients received an inadequate amount of blood, none at all or it was administered too late. The false idea seems to be prevalent that one pint of blood is adequate blood replacement therapy. No consideration was given to the administration of type O, rh negative blood in an emergency or forcing blood in under pressure. One patient with history and findings which were typical of rupture of the uterus was allowed to remain in shock for seven and one-half hours until her death. Two hours prior to death, 1,000 cc. of 5 per cent glucose in normal saline was started subcutaneously and thirty minutes before death, 500 cc. of plasma was started. Injudicious use of pituitrin and pitocin were responsible for the death of two of these hemorrhage deaths. The first was a grand multipara who was proceeding normally in labor until the physician administered pitocin, 4 m. (h) near the completion of the first stage. The result was laceration of the cervix, hemorrhage and death. The second patient received a single dose of 1 cc. of pituitrin (h) for induction of labor (administered by a nurses' aid) whereas the physician had ordered 4 m. every one-half hour for five doses.

It is surprising that infection was the third leading cause of death in spite of the availbility of sulfonamides and the numerous antibiotics. The four anesthesia deaths have been discussed in detail elsewhere. Combining the 1941-1942 study[3] and the present one, it is seen that there were a total of seven anesthetic deaths and nine eclamptic deaths. Thus anesthesia as a cause of death in the state is very nearly as important as eclampsia. The significance of this is obvious. It is gratifying to report that there was no single death attributable to ectopic gestation during the current year of study.

Table XXIII represents a more concise summary of the cause of death. One-third of all the deaths were due to non-obstetrical complications. Comparing this with the previous study of 1941-1942,[3] a definite trend of improvement is noted in the obstetric care. In the previous study only 17 per cent of the deaths were due to non-obstetrical complications. If the so-called non-obstetrical deaths are excluded, the present study shows a corrected maternal mortality rate of 0.6 per 1,000 live births (forty-six deaths among 76,074 live births).

Preventability of death with establishment of responsibility for death is presented in Table XXIV. Twenty-two or 32.4 per cent of the deaths were assessed as preventable by the Committee and physicians were entirely responsible in nineteen and partially in two. When the Committee assessed deaths as possibly or probably preventable, these were considered as not preventable in the final tabulation. In a report concerning maternal mortality in the United States in 1949, Dickinson and Welker[4] state that "the rate of 1 per 1.000 live births is apparently an irreducible minimum" and that "the maternal mortality problem in the United States is no longer a serious national problem but is, rather, one for local action in those areas in which maternal mortality rates are still relatively high." The Committee wishes to take issue with these statements. In the state of Minnesota where the uncorrected maternal mortality rate for the pres-

ent year of study is 0.89 per 1,000 live births (below the corrected national figure of 1 per 1000), there is still ample room for improvement since one-third of these deaths were definitely preventable. Marked improvement of care in the state has occurred as noted by again comparing the present study with the one done in 1941-1942.[3] In 1941-1942, 73 per cent of the deaths were considered preventable whereas this decreased to 32 per cent in the present study.

Adequacy of postmortem examinations is recorded in Table XXV. Thirty-five per cent of the patients had autopsies which were considered adequate in arriving at an accurate diagnosis. This is an improvement as regards previous study of 1941-1942[3] when only 8 per cent were considered adequate. There is much room for improvement as evidenced by the fact that in 42.6 per cent of these deaths, no attempt was made to obtain an autopsy. This indicates an unhealthy lethargy on the part of the physicians since the value of an autopsy is certainly clear. Since many of the physicians gave the reason that no pathologist was available, the Committee has arranged for the service of a University of Minnesota pathologist for subsequent deaths. He can be obtained by contacting the State Department of Health.

Analysis of maternal death certificates according to accuracy and completeness is shown in Table XXVI. Only 22 per cent of these were complete and correct. In six instances (8.8 per cent), there was actual falsification of the certificate. One physician was involved in two instances. His first patient died suddenly during labor with cause of death unknown (clinical history and findings suggested possible amniotic fluid embolism but no autopsy was obtained), yet the physician listed cause of death as unqualified coronary occlusion due to rheumatic heart disease. His reason was "so he wouldn't be bothered by the State Health Department." His other death was an unmistakable anesthetic death (spinal anesthesia), yet he listed this as "surgical shock." The third death was also a spinal anesthetic death but the physician listed the cause of death as "pregnancy." The fourth death was also an anesthetic death (inhalation anesthesia with vomiting and aspiration) and the physician listed this but did not mention the pregnancy state. The fifth patient died as a result of generalized peritonitis from a perforated appendix yet the perforated appendix was not mentioned even though this was found at autopsy. With regard to the sixth death, the death certificate was falsified for fear of legal implications. Considering the one item on the death certificate of cause of death, 33.8 per cent of these were comletely incorrect when compared with the actual cause of death as determined by the Committee. This immediately raises the question of the accuracy of the data supplied by the Bureau of Vital Statistics of the State Department of Health when material presented to them on the death certificates is so incorrect.

In the same vein, analysis of birth and stillbirth certificates according to accuracy and completeness is given in Table XXVII. Only 31 per cent of these were complete and correct.

Outcome of child and duration of pregnancy is tabulated in Table XXVIII. It is seen that only 46.4 per cent of the deliveries associated with these maternal deaths terminated with living children who survived, 26.1 per cent terminated with stillbirths or neonatal deaths, 7.2 per cent terminated as abortions and 20.3 per cent died undelivered. A total of seventeen patients died undelivered but three of these were subjected to postmortem cesarean sections without success. Of the remaining fourteen, nine or 13.2 per cent had viable pregnancies. The above figures coincide with those of the previous study in 1941-1942,[3] and again show the strong association be-

tween death of the mother and loss of the offspring.

Summary

As previously mentioned elsewhere in this summary, five patients died without having been hospitalized at any time during their illness. Considering only bare essentials of a medical hospital record as acceptable, twenty-five of the sixty-three (40 per cent) were grossly inadequate. In eight instances only nurses' notes were available. In one instance there was no medical record available even though patient expired soon after admission to the hospital. In many instances, physician prenatal records were also grossly incomplete and in several instances, no prenatal records were available.

1. A continuous yearly maternal mortality study is being carried out in the State of Minnesota by the Maternal Mortality Committee of the State Medical Association. A general summary of the study, from April 1, 1950, through March 31, 1951, has been presented.

2. Due to the failure of physicians to mention pregnancy or the postpartum state on the death certificate, the yearly Minnesota maternal mortality rate is being underestimated by 31 per cent or approximately 0.18 points.

3. Analysis of the maternal mortality according to the age of the mother showed a progressive increase in rate with each older age bracket. The mortality rate of patients forty to forty-four is ten times that of patients fifteen to nineteen years of age.

4. There were sixty-eight maternal deaths among 76,074 live births for an uncorrected maternal mortality rate of 0.894.

5. Analysis of the maternal mortality according to order of birth showed a progressive rise in rate with increasing parity after the third delivery.

6. Even though the obtaining of a blood serological test for syphilis has long been considered a standard procedure essential for adequate prenatal care, 46 per cent of these mothers had no serology taken even though they were registered. By registered is meant that the patient engaged the services of a physician for prenatal care.

7. Even though the importance of an Rh determination in the obstetric patient has also been well established, 50 per cent of the registered patients had no Rh determination done at all or it was done after delivery.

8. Of the sixty-two patients who were registered, forty or sixty-five per cent had no pelvic mensuration whatsoever or less than the minimum requirements as adopted by the Committee. Two deaths can be attributed to the fact that their pelves were incompletely measured.

9. Considering the minimum requirements for adequate obstetrical care as adopted by the Maternal Mortality Committee, prenatal care was faulty in 69 per cent, care during labor and/or for delivery was faulty in 56 per cent and postpartum care was faulty in 63 per cent. The faulty care contributed directly to the patient's death in 21 per cent as regards prenatal care, 44 per cent as regards labor and delivery and 56 per cent as regards postpartum care.

10. Sixty-three patients (93 per cent) were

hospitalized for delivery or for illness if they died undelivered.

11. Sixty-six patients (97 per cent) had physician care.

12. Malpresentation was no factor in the production of these deaths.

13. Radicalism was a prominent factor in the production of these deaths as evidenced by the fact that 54 per cent of the deliveries were by operative means. Of the total number of operative deliveries (twenty-eight), the Committee judged only sixteen (57 per cent) to be indicated and one-third of the procedures contributed directly to death of the patients.

14. The cesarean sections comprised almost one-third of all the operative deliveries. All of the nine cesarean sections performed were elective and the Committee judged six of these as being indicated.

15. Considering the total number of operative procedures performed (sixty-one), both obstetrical and non-obstetrical, 46 per cent were indicated and 28 per cent contributed to the death of the patients.

16. Of the sixty-eight maternal deaths, forty-two had some form of anesthesia for delivery. Of the forty-two anesthetics, 60 per cent were of the inhalation type. Four deaths were directly attributable to anesthesia. Two deaths were due to vomiting and aspiration and two were due to incompetently applied spinal anesthesia. Only 7 per cent of the anesthetics were administered by physician-anesthetists.

17. Twenty-nine or 43 per cent of the patients had no consultation whereas the Committee judged that in seventeen (25 per cent), consultation was definitely indicated. Another 25 per cent had consultation which was inadequate.

18. The primary cause of death is tabulated. Toxemia was the leading cause, obstetric hemorrhage second and infection third.

19. One-third of deaths were due to non-obstetrical complications. On excluding the "non-obstetrical deaths," a corrected maternal mortality rate of 0.6 per 1,000 live births is obtained.

20. Twenty-two or 32 per cent of the deaths were assessed by the Committee as preventable. The physician was entirely responsible in nineteen and partially in two.

21. Thirty-five per cent of the patients had autopsies which were considered adequate.

22. Only 22 per cent of the death certificates were complete and correct. In six instances there was actual falsification of the death certificate. Considering the one item on the death certificate of cause of death alone, 34 per cent of these were completely incorrect when compared with the actual cause of death as determined by the Committee.

23. Only 46 per cent of the deliveries associated with these maternal deaths terminated with living children.

24. Considering only the bare essentials of a medical hospital record as acceptable, 40 per cent were grossly inadequate and often enough there was no record at all. This almost always means that essential laboratory and clinical data were not obtained. Diagnostic failure was often dependent on this. Hospitals must see to it that this situation is changed since the safety of patients is directly involved.

25. All hospitals are now required to notify the State Department of Health within three days of the time of a maternal death.

LESIONS OF THE CHEST

The existence of isolated well-circumscribed intrathoracic nodules on routine x-ray examination of the chest may indicate the presence of significant disease. In particular, the possibility that the lesions represent an early phase in the development of bronchogenic carcinoma is to be considered. The asymptomatic character of the nodule, the absence of physical signs and the apparent state of good health of the patient must not lead the physician to the false conclusion that the abnormality cannot be signficant and that it therefore does not require treatment.—Sidney E. Wolpaw, M.D., *Annals of Internal Medicine*, Sept., 1952.

TESTS FOR CANCER

Clinicians, surgeons and pathologists alike anticipate the time when a reliable and inexpensive test will be readily available for the detection of cancer. Such a time has not arrived yet, despite the fact that literally hundreds of techniques for this purpose have been published. Nevertheless, so many of these proposed tests have achieved such wide publicity, or even notoriety, that the pathologist frequently is questioned as to why he does not perform such tests. Therefore, this report will attempt a brief summary of the present status of such tests.

Recent improvements in therapy make imperative the development of a technique to allow early diagnosis of malignant disease. Why has no investigator come up with a reliable immunologic test for cancer similar to the tests that have been available for years in diseases such as syphilis, typhoid fever and brucellosis? The basic problems in cancer are quite different from those in an infectious condition. The etiologic factor concerned in cancer is unknown; indeed, a number of different causative agents may be present, which circumstance may render attainment of a single, successful test rather remote in light of current knowledge. Homburger[1] discussed the evaluation of diagnostic tests for cancer; his report summarized a number of past and present techniques, most of which have been discarded. He listed 238 references, yet it is certain that many more tests than this have been fostered at some time or other. In general, he divided the basic categories of tests into morphologic techniques, tests based on urinary constituents, chemical changes in the blood, chemical changes in the body secretions, immunologic changes and enzymologic procedures.

What are some of the requirements of a good test for cancer? The test must detect malignant disease in an early stage. The technique must be simple and readily reproducible. The procedure must be of great specificity so that positive results will be found only in malignant disease. It is obvious that any test giving an appreciable incidence of false positive results will entail great expense for subsequent diagnostic work and will impose extreme mental anguish on healthy persons victimized by such faulty results. False negative reactions should not occur; the dangers of such negative reactions in the presence of a malignant tumor are obvious. Positive and negative reactions should be sharply demarcated, with a minimal zone of doubtful reactions.

Acquisition of such a test might appear to be related to utopianism but actually many immunologic and chemical procedures performed daily in medical laboratories approach this degree of accuracy, specificity and reliability. Certainly, no test for detection of cancer available at present can remotely qualify for these requirements.

Tests proposed for the diagnosis of cancer range in complexity from observation of the patterns in a drying drop of blood to extremely complicated chemical and enzymatic assays. The basic fault in many of these tests is that the characteristic claimed to be diagnostic for malignancy is one that is extremely unstable or variable, making reproducible interpretations of changes in such a characteristic well-nigh impossible. Many of us remember the test proposed several years ago by a young pathologist in the Upper Midwest; the technique depended on a relatively simple change in the urine. This pathologist and his test became famous when results of his test performed on his own urine suddenly changed from negative to positive; he was then found to have a malignant brain tumor, which caused his death shortly after its discovery. What has happened to this test? It has suffered the same retreat into obscurity that has occurred to so many similar tests based on superficial study of a handful of cases and so often colored by the bias of the original promulgator.

Another test was based on decolorization of methylene blue by plasma. It was stated by Black that plasma obtained from patients who had cancer displayed decreased powers of reduction and that such plasmas could be differentiated accurately by their action on dyes. The original report of this test showed considerable lack of information concerning the malignant disease itself and even greater lack of data about other possible complicating factors. Great controversy arose concerning this test for several years until a number of reports had accumulated to demonstrate its complete invalidity as a procedure for the detection of cancer.

A large number of tests dealing with chemical changes in the blood have been proposed. Many of these tests give an amazingly high incidence of positive reactions in patients who have cancer; however, an even more amazingly high incidence of positive reactions occurs in control patients. One test gave correctly positive results in 52 to 91 per cent of cases, but correctly negative results in as few as 20 per cent of cases. Positive reactions to another procedure were 85 per cent correct but the test gave as much as 76 per cent false negative results. Still another test gave 72 to 96 per cent positive reactions in a series of patients who had cancer but at the same time gave from 5 to 54 per cent positive results in patients who did not have malignant disease.

The iodoacetate index has been studied by a number of workers after being tried by Huggins and his group in an effort to "screen" patients who had cancer. Huggins and his co-workers were conservative about the specificity of this procedure. Homburger stated that the original technique was not reproducible and possessed an uncertain end point. A recent modification was more reproducible but also more insensitive; a survey showed that it produced 21 per cent false negative and 23 per cent false positive reactions. It was evident that these rates would be even greater in early stages of malignant disease. Homburger concluded that in its present form the procedure was useless and confusing as a diagnostic test for cancer. Nevertheless, advertisements appeared from commercial laboratories offering a kit for the practical performance of the Huggins' test for cancer in the physician's office. Such a situation obviously is deplorable.

It is apparent, therefore, and regrettably so, that no reliable test for the detection of cancer is available at present. This means that the early diagnosis of cancer still depends on education of the general population and constant awareness by the physician of the possibility of malignant disease. Use of biopsy and of smears for malignant cells is the only dependable means at hand for identification of cancer.

This is the sixth in a series of editorial reports sponsored by the Minnesota Society of Clinical Pathologists and designed to foster closer relationships among practicing physicians and pathologists. The previous reports have emphasized what the pathologist can do to aid his colleagues. This report discusses a hiatus in laboratory procedures and points out what the laboratory physician cannot do. It is anticipated that a reliable test for the detection of cancer will be developed at some future time; when it is, the procedure will be embraced eagerly by all physicians.

REVISION OF N. N. R. STATEMENT ON TESTES

In the customary annual reconsideration of the text of New and Nonofficial Remedies it was pointed out to the Council that exaggerated and unwarranted claims are made for the use of these agents in the so-called male climacteric. In order to promote rational use and to establish reasonable limits to such claims the Council adopted the following paragraph to be inserted in the general statement on testes (N. N. R. 1952, p. 367):

"A spontaneous cessation of hormone release by the testis with aging has been recognized as a rare entity termed male climacteric or menopause. Symptoms are similar to those of the female menopause. In the vast majority of instances, the vague manifestations of a psychoneurosis are incorrectly confused with those of organic testicular disorder. Criteria for laboratory confirmation of the diagnosis of male climacteric are equally confused. At present, such diagnosis probably is not justified without the demonstration of castration levels of urinary gonadotropin, as in the female. Testosterone provides effective replacement therapy only in the true disorder."

The Council has hitherto accepted only preparations of testosterone propionate and methyl testosterone. As corollary to the preceding decision the Council voted also to consider preparations of free testosterone.

Case Report

DISSECTING ANEURYSM OF THE AORTA WITH NEUROLOGICAL COMPLICATIONS

EDWIN G. BENJAMIN, M.D., ALBERT J. GREENBERG, M.D.,
and ANDREW J. LEEMHUIS, M.D.
Minneapolis, Minnesota

Dissecting aneurysm of the aorta is a relatively uncommon condition. It may, however, present a wide variety of symptoms and clinical findings. It may be confused with many intrathoracic conditions especially coronary thrombosis. The abdominal findings may suggest any of several acute surgical conditions, diagnosis of which could result in unwarranted operations. A correct diagnosis is essential if an accurate prognosis is to be given. Almost all of the conditions with which it may be confused are less rapidly fatal.

Case Report

A white man, aged fifty, was admitted to Northwestern Hospital, Minneapolis, at 10:00 a.m. on June 10, 1952. His complaints on admission were as follows: (1) acute left anterior chest pain, radiating from the sternum through to the back, at the cardiac level; (2) paralysis of the lower extremities; (3) numbness in the lower abdomen and legs. These symptoms were associated with profuse perspiration and a cold and clammy skin.

History of Present Illness.—The patient stated that he went to his work in a restaurant in Minneapolis at the usual time on the day of his admission. He felt well until approximately 9:30 a.m. Then, while going upstairs, he was suddenly seized with an excruciating pain in the left chest and the left part of his back. The pain was so severe as to cause prostration. He took a dose of baking soda in water without any relief. He arrived at the Northwestern Hospital by ambulance shortly following the onset of the pain. He stated that he had had some pain in the right flank during the past year that came in spells, although it was never as severe as the present attack; it was enough, however, to cause him to consult another physician. He said that the doctor took x-rays of the kidney region, but that no definite diagnosis was made. He had an exacerbation of this pain in the side the night before the present attack and, on instructions from his doctor, took a hot sitz bath which gave him considerable relief.

Past History.—The past history was essentially of no importance. He had had no serious illnesses and no operations. Close questioning revealed that about thirty years previously he had had a course of treatment with arsenicals, most likely for a luetic infection. He had had no treatment for this condition recently.

Physical Examination.—The patient was a well-developed, well-nourished, white man, about fifty years of age. He was approximately 6 feet tall and weighed about 200 pounds. At the time of the examination, he was obviously in great distress. The skin was cold and clammy, and he was perspiring profusely. He was moderately cyanotic. His blood pressure on admission was reported as 180/60; temperature, 97 degrees; pulse, 98; respirations, 26.

The positive findings on physical examination were as follows. There was a systolic murmur to the left of the sternum, grade II, soft, and somewhat coarse. The heart did not appear enlarged, and the liver was not palpable. There was some tenderness on deep pressure in the abdomen but no masses could be felt. There was a difference of the blood pressure in the arms: the left 86/70; the right, 200/100. The pulse in the left wrist was barely palpable, the right easily palpable. The femoral pulse of the right could not be detected; the left was barely palpable. There was no pulse in the popliteal artery on either side. The legs were cyanotic, and the muscles were very hard. Both lower extremities were cold and clammy and numb. Both extremities in the lower portion seemed to be slightly swollen. Neither lower extremity could be moved voluntarily.

Neurologic Examination.—The twelve pairs of cranial nerves, including a funduscopic examination, did not reveal any evidence of abnormality. Both of his arms were strong and did not show any muscular weakness, despite the difference between the blood pressure in right and left arms. The reflexes were present and equal, and sensation in all modalities was normal. The abdominal reflexes were absent bilaterally.

The right leg was flaccid and did not show any femoral pulse. It was mottled in appearance and both the patellar and Achilles reflexes were absent. All of the toe signs were negative. The left leg was very rigid but there was a very feeble femoral pulse. The rigidity was so great that the reflexes could not be elicited. The toe signs in the left leg were negative.

There was complete anesthesia to cotton, pin-prick, pain, vibratory sense and position sense in both lower extremities and this level of anesthesia extended up to the umbilicus. From the umbilicus to approximately the rib margin, there was a partial anesthesia. The patient had an atonic bladder and was unable to void.

Laboratory Data.—On admission, the urine was normal, except for a faint trace of albumin, an occasional white cell and a few hyaline casts. The blood showed: hemoglobin, 14.2 grams; leukocytes, 11,600; neutrophiles, 86 per cent; lymphocytes, 14 per cent; sedimentation rate, 25 millimeters in one hour. The serum amylase was 57 milligrams per cent.

Subsequent laboratory examinations on June 11 showed no significant changes. The blood urea nitrogen was 22.

Urinalysis, June 11, showed hemoglobin and red blood cells in the urine, 400 cells per high-powered field. Guiac tests run on this urine were 4 plus. The blood Wasserman was negative.

An electrocardiogram was taken on admission and reported as follows:

"Slight STV-1, 2, 3, 4 elevation. High, peaked TV-3, 4. Negative TV-1. This is within normal limits. The changes in the V-1 occasionally seen as only findings in infarction. If clinically indicated, suggest serial tracings."

Another electrocardiogram was taken on the following day and was reported as follows:

"Changes since 6/10/52 are increased rate and height

Presented at the Annual Meeting of the Southern Minnesota Medical Association, Austin, September 8, 1952.

or depth of all T-waves. The tracing is normal except for tachycardia."

X-Ray Reports.—Radiograph of the abdomen, taken June 10, failed to show abnormality in the kidney or bladder regions, but evidence of excessive gas in the stomach and intestines was present.

Radiograph of the chest, taken June 10, showed some ectasia of the aorta and a heart shadow suggesting a left ventricular type.

Course in Hospital.—The condition of the patient went rapidly downhill. His pain was controlled with 15 milligram doses of morphine and 100 milligram doses of demerol. His pulse became weak and feeble; respirations rapid and shallow. He expired approximately 9:30 p.m. on June 11, 1952, about thirty-six hours after admission.

Autopsy Findings.—Gross examination of the aorta revealed a large mass within the wall of the vessel, 3 centimeters in diameter, in the area of the left subclavian branch, and another in the lower third of the aorta. Incisions of these masses showed them to be filled with clotted blood. The root of the aorta was thin-walled and showed, 1.5 centimeters above the aortic valve, a transverse rent in the intima which measured 4 centimeters in length. This communicated with a dissecting aneurysm which extended the entire length of the aorta and ended abruptly with the bifurcation of the common iliac artery. It was possible to push a blunt probe through this rent in the root of the aorta into the region of the left subclavian mass. There was a communication in the form of a longitudinal dissection running from 1.5 centimeters distal to the aortic valve down through the two aforementioned masses to the iliac arteries and forming a cuff around them. Microscopic studies revealed medial necrosis of the aorta. The remainder of the autopsy was noncontributory.

Differential Diagnosis

The differential diagnosis included hematomyelia, thrombosis of the anterior vertebral artery, infectious myelitis, and dissecting aneurysm. The patient had no history of an acute infection, being in relatively good health, and the onset of his difficulty was quite sudden. The blood pressure difference between the right and left arms made us feel that the most likely diagnosis was one of secondary damage due to vascular changes in the spinal cord from a dissecting aneurysm rather than any primary pathology in the vascular supply to the spinal cord itself.

The combination of neurological and vascular abnormalities narrowed the diagnostic possibilities. Myocardial infarction seemed unlikely in view of the normal electrocardiogram and the acute onset of the neurological abnormalities. A pre-existing luetic aneurysm was considered as a basis for the vascular abnormalities, but the chest x-ray did not reveal any evidence of any aneurysm of the thoracic aorta.

For these reasons, the diagnosis of dissecting aneurysm of the aorta was made. The pain arising in the chest, subsequently in the back, and the development of the paralysis of the lower extremities seemed to make this diagnosis more tenable than any other. The age and the patient's antecedent hypertension also were compatible with this diagnosis.

The upper half of the spinal cord is supplied by the anterior and posterior spinal arteries which arise from the vertebral artery and anastomose up and down the cord. It also has a good blood supply from above the level of the fifth cervical vertebra down from the lateral spinal arteries which arise from the subclavian artery. The middle section of the cord has a rather poor blood supply, and the middle section as well as the lower half receives its blood supply from the intercostal, the lumbar arteries, and the internal iliacs, all of which arise from the thoracic and abdominal aorta.

If the loss in strength, disturbed sensation and the lost reflexes in the lower extremities were due to an ischemic damage or necrosis of the peripheral nerves in the legs secondary to occlusion of the femoral arteries, there would of course not be any changes in the abdomen, and the bladder should be functioning properly. Because of the loss of abdominal reflexes, the loss of sensation extending completely to the umbilicus and partially to the rib margins, and the loss of bladder function, it was felt that the damage was probably due to the dissection of an aneurysm separating the layers of the aorta and disturbing the blood supply throughout the spinal cord from approximately the eighth thoracic vertebra down.

Discussion

Shennan's review, in 1934, stimulated the modern interest in dissecting aneurysm of the aorta. He studied the world's literature at that time. Of 300 cases reported, only six had been diagnosed ante mortem. In 1937, White described the experience at the Massachusetts General Hospital and commented upon the rarity of the diagnosis and further stated that an increased awareness of this condition would undoubtedly lead to additional cases being diagnosed ante mortem. In 1947, White again reviewed the case experience at the Massachusetts General Hospital and found that the diagnosis had been made much more frequently during this ten-year period than it had been at the time of his earlier report. He ascribed this to an increased suspicion of this condition prior to the death of the patient. Weisman and Adams in 1944 reviewed the neurological complications attending a dissecting aneurysm as observed at the Massachusetts General Hospital. It is interesting to note that prior to 1944 in only two cases had the pathology of the spinal cord been studied. They described the various neurological manifestations of this condition. Scott, in 1948, found that of 424 cases of dissecting aneurysm which had appeared in the world literature and were suitable for analysis, 21 per cent had neurological abnormalities.

As early as 1937, White commented upon the fact that a surgical approach could be feasible under certain conditions. More recently, because of the advances in vascular surgery, it has been thought that in some cases in which the outcome might be otherwise fatal a surgical approach might be successful. If this should prove feasible the importance of diagnosis would be accentuated.

Medical therapy has little to offer a patient of this kind; however, an occasional patient does survive the acute attack. It is estimated that the duration of life following the acute episode is about five days and the mortality is in the neighborhood of about 90 per cent.

History of Medicine In Minnesota

MEDICAL HISTORY OF THE COUNTY OF YELLOW MEDICINE

MILDRED B. LEE
Granite Falls, Minnesota

The County of Yellow Medicine lies in the central southwestern part of the State of Minnesota. It is a long, narrow county, shaped somewhat like a hammer, with the head embedded in Redwood County and the handle extending westward to the South Dakota line. Upon its northern boundary lie the Counties of Lac qui Parle and Chippewa; on the south are Redwood, Lyon, and Lincoln Counties, and its eastern boundary is the Minnesota River.

From east to west the county measures at its greatest length fifty-four miles, and at its greatest width twenty-one miles. Within its confines lies an area of land and water, rolling prairie and wooded valleys, totalling 763.12 square miles.

The waters which drain from this area in creeks and rivers flow in a northerly or northeasterly direction to discharge into the Minnesota River. In the western townships the Lac qui Parle River, as sparsely wooded as the lake for which it is named, winds almost directly northward. Florida and Canby creeks empty into it. The Yellow Medicine River rises in the southwestern highlands to flow in a generally northeasterly direction almost the entire length of the county, gathering in its course Spring Creek and other streams which run bank-full in spring, and dwindle through the hot, dry summer months. Beginning as a prairie river, treeless and smiling, the Yellow Medicine follows a valley which gradually widens and deepens and becomes quite heavily timbered for the last fifteen miles of its journey toward the Sky-Blue-Water.

In the northeastern corner of the county a small stream appropriately called Stony Run loops in and out at the foot of the bluffs which edge the Minnesota Valley. Below this creek a small stream heads in the Minnesota River, and serves as a spillway for seasonal floodwaters as it flows southward in a wide curve to rejoin the river below Granite Falls. Still further south, Hazel Creek flows through a deeply eroded and beautifully wooded channel to empty into the Minnesota.

There are no large lakes in the county, but ponds and sloughs are plentiful on the table lands above the Minnesota Valley. Trees grow only in the protected places where water collects, or along the river, for the rainfall of the area is insufficient, and the prevailing westerly winds are too arid, for the development of natural timber. Groves have been planted for windbreaks but the trees do not grow to great size.

The Minnesota Valley at this point presents to the incoming traveler a panorama of extraordinary beauty. Coming suddenly to the edge of the table land he sees the steep descent as the land drops away to form a valley which is from 130 to 175 feet deep, and from one and a half to two miles wide. In it, blue in the distance, meanders the river. Falling over an old divide at Granite Falls, it foams up whitely around the great blocks of granite cast in its bed by some ancient volcanic disturbance; then spreading out into quiet water it narrows again to pass between grey granite promontories which bear the marks of glacial action. At Minnesota Falls it drops over another old divide in a fall of fifteen feet, making a total descent of ninety feet in less than two miles.

Upon the valley floor areas of granite outcroppings alternate with bottom lands of rich black soil. The glacial waters of the ancient River Warren, which once filled this valley from bluff to bluff, cut deeply into the glacial till and exposed the bedrock which here and there thrusts up through a thin crust of earth. Trees fringe the river banks, creep up the hillsides, and even rock ledges give root-hold to fern and honeysuckle, wild plum, thorn apple and wild grape.

At its deepest point the valley is 835 feet above sea level. The table land which spreads westward from it reaches an elevation of 1737 feet above sea level as the rolling prairie gives way to the more hilly terrain of the region called Antelope Hills, near the South Dakota line.

The name Yellow Medicine has reference to the moonseed (menispermum canadense), a plant valued by the Indians for its medicinal qualities. From the long, slender, bitter root of this plant came the yellow medicine which, according to legend, was sought by an Indian maiden to cure the sickness of a great chief. The moonseed grows in other parts of the state, but its presence in the thickets bordering the Yellow Medicine seems to have been the distinguishing characteristic of the river. The first white men knew the place by its Indian name, Pehijutazi, and its English equivalent appears upon the earliest maps of the country.

Indian villages flourished in the wooded valley of the Yellow Medicine, for it was a favorite camping place; quantities of arrow heads and pottery shards found in the vicinity indicate that there were villages here, and even today the Indian village three miles south of Granite Falls bears the name Pehijutazi among its own residents.

The names given to the twenty-one townships of the county reflect the history or topography of the country, and the national origins of the settlers who named them. The three fractional townships bordering the Minnesota River are Stony Run, Minnesota Falls, and Sioux Agency, which are descriptive and historical names. The four townships running diagonally parallel to them are Lisbon, Hazel Run, Wood Lake and Echo. Friendship, Sandnes and Posen, which complete the hammer head, were and are predominantly Norwegian. Next are Tyro and Normania, Omro, Swede Prairie (named for the first four Swedish families settling there); then Oshkosh, Burton, Hammer, Wergeland, Norman, Florida and Fortier. The last-named three townships have always had a somewhat larger percentage of non-Scandinavian inhabitants. Fortier was named for Joseph Fortier, one of the first settlers and also the first sheriff of the County.

The recorded history of Yellow Medicine County properly begins in 1851, for in that year the forces were set in motion which were to make the region historically notable. It might also be said that those forces were given impetus still earlier, when the end of the war of 1812 set people moving westward in search of new homes; or with the financial crisis of 1837 which caused more prospective settlers to look toward the free lands of the west in the hope of recouping lost fortunes. And there can be no question but that the rivalry between the new cities of the middle west, Chicago and St. Louis, for the advantage of being the railroad center from which lines would creep westward, also had some influence; for the Chicago proponents had to face the hard fact that lines running west from that city must pass through Indian territory unless the tribes could be shifted to some other region.

All these forces merged and became vocal in the clamour for more lands for white settlement. In 1849 the only portion of the state open to settlement was the area purchased from the Indians through the negotiations of Zebulon Pike. The region which was to become Yellow Medicine County was inhabited by the fierce and warlike Sisseton and Wahpeton tribes of the Sioux with the Wahpekutes and Mdewakantons to the east and south. All the lands south of the Minnesota River were claimed by the Sioux, and to the north were the Chippewas, their ancient enemies. Sporadic warfare went on between the tribes, for how was a young warrior to win a feather for his headdress except by killing an enemy? It was therefore not a region favorable to exploration, although access to it could be gained by way of the Minnesota River.

Some historians believe that Baron de la Hontan ascended the Minnesota River in the winter of 1688-89. If this is correct, then de la Hontan would have passed along the eastern border of the county, and been forced by the nature of the terrain to pass through some part of it. But the weight of opinion is that de la Hontan's "Long River" was not the Minnesota; and although fur trappers and traders, French-Indian voyageurs and couriers des bois must have gone up and down the river and across the prairie, no white man left a record of such a journey, until the nineteenth century was well on its way.

The first white men known to have made use of the inland waterway, and therefore to have at least touched upon Yellow Medicine County, were members of the Selkirk Colony and officers of the Hudson's Bay fur trading company, who in 1819 made a journey up the Red River of the North, the Bois des Sioux River, to Lake Traverse, across the divide to Big Stone Lake, and thence down the Minnesota River to its mouth. Their purpose was to buy seed for the Colony at Pembina, where the crop of the previous year had been destroyed by grasshoppers; and Prairie du Chien was the nearest source of supply. It is of record that the party touched at Fort Snelling both going down and passing up the river. In April, 1819, they reached Prairie du Chien, purchased wheat, oats, peas, and some chickens, and loaded it all on a boat (some say a flat boat, others "three Mackinaw boats manned by six hands each"); and began the long journey back to Pembina. In ascending the Minnesota they would have had the advantage of spring flood-waters, but could not avoid portaging around the falls at Minnesota Falls and Granite Falls, and so would have been the first white men known to have been even briefly in Yellow Medicine County.

The first exploration of the upper Minnesota Valley was made by Major Stephen S. Long, who in 1825 was ordered by the government to explore "the St. Peters to its source." In the summer of that year Major Long headed an expedition composed of twenty soldiers from the fort, a geologist, an artist, and other observers, and proceeded up the Minnesota, half the party going by water and half by land. Again the need to portage around the falls would have brought white men into Yellow Medicine County. Still later, Major Sumter's military expedition to impress the Indians doubtless passed through some part of the county.

The first white men actually to settle in the territory passed through it in 1835 on their way to the Lac qui Parle region, but eventually they were to return and become the first residents of the county. In the spring of that year Dr. Thomas S. Williamson arrived at Fort Snelling with a missionary party, in search of a place to establish a mission in Indian territory. The question of where to go was answered by Joseph Renville.

This rather remarkable descendant of an early French adventurer had long been useful to government. He had served the English as a captain in the forces at their northern posts; and when the United States belatedly asserted claim to the great northwest territory Renville transferred his allegiance to the government. He served as guide, and interpreter to Major Long's expedition, for on his mother's side he was of the Sioux and he had married an Indian woman of that tribe. He was one of the voyageurs and couriers de bois who played a colorful part in the early history of the country. By 1835 he was the owner of a trading post at Lac qui Parle, and father of a numerous brood of Indian children for whom he wished to provide religious instruction. With this purpose in mind he offered the missionaries his help and protection in building a mission near his post.

So on June 22 the missionary party set out from Fort Snelling in the fur company's Mackinaw boat for the first part of their journey. At Traverse des Sioux they transferred to Renville's Red River ox carts and traveled overland the rest of the way. At Lac qui Parle they lived for a year within Renville's stockade, then moved into the mission built on the north bank of the Minnesota River. From this point they carried on missionary work throughout the territory.

One of the first acts of the first territorial legislature of the newly created Minnesota Territory was to demand the purchase of more lands from the Indians. As a result messengers were sent to the tribes of the Upper Sioux requesting them to attend a conference at Traverse Des Sioux in the summer of 1850. Although the Upper Sioux were believed to be more amenable to persuasion, they were reluctant to part with their remaining lands, and only a few responded. But the idea persisted, and in the summer of 1851 the tribes were finally gathered together at the meeting place for a treaty conference, in the course of which they reluctantly agreed to part with all their lands in Minnesota except a strip ten miles wide on each side of the Minnesota River from the mouth of the Yellow Medicine to Lake Traverse, which was to be and remain "forever" their reservation. Later, following their example, the tribes of the Lower Sioux sold their lands also, retaining a similar strip of land from New Ulm to the mouth of the Yellow Medicine.

The southern boundary line of the lands reserved to the tribes of the Upper Sioux passed diagonally through the present townships of Echo, Wood Lake, Hazel Run and Lisbon, which was the part of Yellow Medicine County most accessible for settlement.

The price to be paid for the lands was a little more than a million and a half dollars, or about twelve and a half cents an acre; and for convenience in making the payments which were to cover a period of fifty years, and furnishing certain services designed to improve, educate, and civilize the Indians, two agencies were to be set up within the reservation. One was to be at Redwood, and the other at Pehijutazi.

Two men who were familiar with the territory attended this conference: the Rev. Stephen R. Riggs and Dr. Thomas S. Williamson. At this time Rev. Riggs was in charge of the Lac qui Parle mission and Dr. Williamson was at Kaposia, Little Crow's Village, to which he had been invited in 1846. Kaposia was located just below the present site of Saint Paul, and since the Indians living there would have to move westward onto the new reservation Dr. Williamson immediately began to plan for a new mission at the Upper Sioux Agency at Pehijutazi.

In the summer of 1852 Dr. Williamson went to Pehijutazi and there began the construction of a home for his family. It is eminently fitting that a county named for a medicinal plant should have had a medical man for its first resident.

Dr. Williamson had been born into a family with a tradition of service in the church, but he had first chosen medicine as his field of endeavor. He had begun his medical practice in Ripley, Ohio, married one of the belles of that city, Miss Mary Poage, and built up a good practice. But as the years passed the conviction grew upon him that his mission in life should be to serve God and mankind through the church, and he began the training which led to his ordination as a minister of the Presbyterian church and a missionary of the American Board of Missions.

In this way Dr. Thomas S. Williamson became the first resident of Yellow Medicine County and the first doctor to practice there; for according to the Rev. Mr. Riggs, Dr. Williamson's ministry and his medical skill went always "hand in hand" throughout his long life. While the Indians did not readily give up their traditional tribal practices and medicines, they were willing to let the doctor try his skill along with their own medicine men. Dr. Williamson was a skilled physician and a man of deep natural piety; his sympathy for the Indians was sincere and he never failed them.

The winter of 1852-53 was a severe one. The Williamson family suffered, almost starved, in their new home at Pehijutazi. But in the summer crews began work on the buildings for the Agency, choosing a site upon the bluffs overlooking the Minnesota River, about a mile from the mouth of the Yellow Medicine River. The logs used for construction of the first Agency buildings were felled in the timber along the Yellow Medicine, and later a portable sawmill was erected on this river.

The first Agency officials arrived at Pehijutazi in the summer of 1854, and with them came the Agency doctor, Dr. Jared Waldo Daniels, whose brother Asa Wilder Daniels served in the same capacity at the Lower Sioux Agency. Late in the summer the Rev. Stephen Return Riggs also came to establish a new mission. Joseph Renville's death was followed by the burning of the mission; so the Rev. Riggs put his household goods on a boat at Lac qui Parle and came down river to establish his own mission at Hazelwood, on Hazel Creek.

Up to this time medical practice in Yellow Medicine County had been entirely in accordance with the Indian tradition. It consisted of the use in various ways of medicinal herbs gathered and dispensed by the women and the medicine men, potions brewed of plant, animal, and insect life, chants, charms, and superstitions. Yet after the manner of all primitive peoples, they had discovered some remedies for common ills. It is suggested that many white settlers, far from medical aid, made use of such Indian remedies, and lives were saved by them.

Dr. Williamson's route of travel to the territory in 1835 had been overland to Galena, Illinois, then by steamboat up the Mississippi to Fort Snelling. By 1854 the railroad line had reached Madison, Wisconsin, and in 1857 the Milwaukee and Mississippi Railroad was able to advertise a train service from Chicago and Milwaukee to Prairie du Chien, where it connected with "a new and superior line of steam packets, under the control of the Milwaukee & Mississippi Railroad, on the Upper Mississippi River to Saint Paul, Minnesota, and all intervening points, with stages to all points of Northern Iowa. Lands in Iowa and Wisconsin were being settled, and settlers from those states were moving northward into southern Minnesota. But the part of Yellow Medicine County which was open to settlement was still too far west, and too near the Indian country, to be desirable for settlement.

In these years the Upper Sioux Agency grew in extent and power, and became the capital of all the Indian country. The tribes gathered there to receive annuity payments, to draw upon the store of food supplies, and secure other benefits due them under the terms of the treaty. The Indians were encouraged to place their children in the government school, or in the Missionary school, and avail themselves of the doctor's services, for the white man's diseases were already making inroads upon the tribes. It was the policy of government to civilize the Indians and persuade them of the advantages of the white man's way of life. As an inducement they were given building materials if they wished to build houses, and were offered instruction in farming methods. Some twenty "farmer Indians" settled down near the agency, acquired cattle, and farmed with fair success.

The houses which the Indians built were described by Mr. Knute Glaim, an early settler who spent the winter of 1866 in an Indian house, as follows:

> "Those houses, built of brick made from clay on what is now the Ingval Imes farm, were enclosed by one row of solid brick. As soon as the weather got cold the frost would form on the inside of the brick walls, and by mid-winter that coating of frost would be more than an inch thick. It was just like living in a refrigerator. It was no wonder the Indians moved out of them." (From an interview reported in the *Granite Falls Tribune,* February 18, 1949.)

The brick of which such houses, and other buildings at the agency, were made, was manufactured at the brick yards on the Yellow Medicine to augment the dwindling supply of timber for construction purposes. The first log buildings of the Agency were all replaced by buildings of frame or brick construction. The brick yards continued in operation until about 1886.

The farmer Indian soon found that farming was not profitable, for after working all summer while his brother "blanket Indians" lived more joyously by hunting and fishing, he would have a store of food put by, but as soon as the blanket Indians ran out of food they descended upon him and literally ate him out of house and home. The community system of living was traditional, and it continues in this locality to this day, the greatest single barrier to individual Indian progress.

By 1860 the Upper Sioux Agency buildings spread for half a mile along the bluffs above the Minnesota River. Dr. Williamson's mission included many buildings, and the Riggs mission on Hazel Creek was one of the largest and best equipped of all the Indian missions. Rev. Riggs essayed to teach the Indians something about government as well as religion; the Republic of Hazelwood had its own officers.

In that eventful year the new Republican party succeeded in electing Abraham Lincoln President, and a change of administration brought a change of officers at the Upper Sioux Agency. Agent Brown was replaced by Agent T. J. Galbraith, an official who came to be cordially disliked by the Indians. In the spring of 1861 Sumter was fired upon, and Dr. Daniels resigned his post in the hope of being assigned to a regiment going south. After a few months he was appointed Assistant Surgeon to the Sixth Minnesota, but he did not go south. He was to see all of his military service in the north and northwest against the Indian tribes.

The Agency of this period has been described for us by a writer quoted in Rose's History of Yellow Medicine County:

> "On the bluffs, about 40 rods east from the Agent's house, was the government warehouse, built of brick and two stories high. In the rear, T. J. Galbraith's rooms. A little north Dr. Wakefield's residence, northwest the boss carpenter's residence, a large two-story brick building. East from our boarding house was Mr. Givens' the second agent's house, and also the house of Noah Sinks, the clerk. A mile or so away the Yellow Medicine flowed into the Minnesota River. There was timber on both streams and some on the bluffs north of the Agency. The government buildings stood on the high bluffs, one side extending and spreading out on the prairie westward. (Parker I. Pierce, in "Antelope Bill.")

Soon after Lincoln's inauguration an emissary of government assured the Indians that they would receive an additional "very rich" gift in the fall of 1861. In expectation of this the tribes came down in the fall, only to learn that the promised gift had not arrived. They waited there, while the hunting season passed, drawing upon the food stores of the Agency. When the shipment finally came snow was deep on the ground, the hunting season was past, and no food had been laid by for the winter. The "very rich" gift turned out to be only $10,000 worth of goods, or about $2.50 per Indian. Since the Indians had no food laid by they remained at the Agency, subsisting on the supplies doled out to them.

When the next payment came due in July four thousand Indians assembled at the Agency to receive their annuities. By that time the Agency supplies were almost exhausted. The rainfall had been scant, and prospects of raising corn in the little squaw patches were poor. Again the shipment was delayed, and there was much grumbling and open show of dissatisfaction over what the Indians regarded as repeated failure to fulfill the terms of the treaty. The tribes had learned by this time that they could not live solely by hunting and fishing on the lands they had left; they had become increasingly dependent upon the white man's pork and flour, which must be paid for in coin, or produce, or furs. As the weeks passed there was actual hunger among the tribes. Their credit was cut off at the stores, and many differences arose. Once more the Soldiers' Lodge, a secret order organized only for the hunt or for war, came into existence.

There were grievances of long standing, but the sum of it all was that the Indian at last realized the hopelessness of his situation.

On August 18, 1862 this discontent exploded into action. A few Indians in search of liquor touched off the uprising of 1862 when they turned upon the settlers in the little village of Acton and massacred its entire population. They then fled to the villages of the Lower Sioux and a council of war was held. Although some Indians were reluctant, all agreed that now "their hands were bloody," and they had no choice but to try to drive the white man out of their valley.

News of this decision traveled swiftly to the mission and the Agency borne by friendly Indians (some of them Renville's descendents). Under cover of darkness the people of the Riggs mission escaped to an island in the river where they spent the night. Dr. Williamson delayed, sending his young people ahead. Dr. Wakefield was away from the Agency with the Agent, and his wife took matters into her own hands. Setting out with her children on foot for Redwood, she was overtaken and picked up by a young man driving a horse and buggy. Unwittingly they were going toward the danger, and before they could reach Redwood the young man was killed and Mrs. Wakefield and children taken captive.

At the Agency Dr. Wakefield, unaware of this development, took refuge with the twenty-two men and forty children and women who remained there in the government warehouse which was "built of brick and two stories high." They had little in the way of guns and ammunition, but fortunately the Indians busied themselves first with looting and burning the stores. In the early morning hours John Other Day and other friendly Indians secured a team and wagon, and helped the refugees to escape across the river. The wounded and small children rode in the wagon while the rest of the party walked behind. In this manner they made their careful way to Fort Ridgely, which they found under seige. St. Peter was also under seige, but shortly after they had passed it was liberated by troops from the fort, so Dr. Wakefield turned back there to assist in caring for the wounded. The others made their way to Fort Snelling.

During the uprising battles were fought up and down the valley, with varying degrees of success, but the decisive battle of the Sioux war was fought at Wood Lake in Yellow Medicine County. The uprising lasted for six weeks and cost, according to Dr. Williamson's estimate, the lives of 312 settlers. Eleven lives were lost at the Agency. At the conclusion of hostilities the white captives were released and Mrs. Wakefield and children were reunited with the doctor.

After the uprising the rights of the Indians under the treaty were declared forfeit as to the lands of their reservation, and all who were suspected of taking part in it were rounded up and imprisoned.

In the makeshift prisons at Mankato and Fort Snelling the Indians were crowded together under the worst possible conditions. Food was scanty and of poor quality; confinement in close quarters led to sickness, and to make matters worse the women and children of the prisoners followed the menfolk and had to be provided for. Dr. Williamson and his son, the Rev. John Williamson, worked tirelessly with the Indians and for them, writing many letters to the President setting forth evidence of extenuating circumstances in particular cases, while week after week the court martial sifted evidence. In the end the court martial pronounced sentence of death upon four hundred Indians.

With characteristic thoroughness President Lincoln himself examined the evidence and reduced the number sentenced to death to thirty-nine. The condemned Indians were executed at Mankato; the others were transported to their new reservation in the west in the summer of 1863. Loaded upon steamboats, they were taken down the Mississippi and up the Missouri to Crow Creek. The Rev. John S. Williamson has written this account of the journey:

> "The mortality was fearful. The shock, the anxiety, the confinement, the pitiable diet, were naturally followed by sickness. Many died at Fort Snelling. The steamboat trip of over one month under some circumstances might have been a benefit to their health, but when thirteen hundred Indians were crowded like slaves on the boiler and hurricane decks of a single boat, and fed on musty hard tack and briny pork which they had not half a chance to cook, diseases were bred which made fearful havoc during the hot months, and the 1,300 souls that landed at Crow Creek June 1, 1863, decreased to 1,000. So the hills were soon covered with graves."

All of Yellow Medicine County was now open to settlement, but for three years no white settler came to live in the region. Indian and white alike shunned the scene of bloodshed, and the ruined buildings lay undisturbed.

At the end of the Civil War there was the shift in population which is the aftermath of all wars, and new settlers flowed in upon the middle western states. "Uncle Sam is rich enough to give us all a farm" was the popular song, and literally true. The Homestead Act of 1859 made taking up of claims to land little more than a formality. Its purpose was simply to hasten the settlement of the territory. As the population increased the nine counties established by the first legislature had been divided and subdivided, and in 1865 Redwood County was created, and embraced within its borders all the territory from its present eastern line to the South Dakota border.

When the first settlers came to what is now Yellow Medicine County it was a part of Redwood County. They came in the summer of 1865, civil war veterans and settlers who had located in the southeastern counties for a few years on their westward trek. John Winter had come from Canada to locate briefly at LeSueur; Benjamin F. Saunders was a veteran; George E. Olds had brought his family from Massachusetts, settling in Olmsted County. He had worked in railroad construction as a surveyor, and for most of his life combined this calling with farming. Joseph Fortier had been in the region as a clerk for Myricks Store at the Agency, and there were also George S. Johnson and D. P. Lister, veterans of the Civil War, and Hiram Hodgkin, brother-in-law of George E. Olds, who came in 1865.

President's Letter

A DIFFICULT DECISION

It may come as a shock to members of the Minnesota State Medical Association to learn that a special assessment was voted by the House of Delegates to furnish a fund to undertake care of our indigent members. This action was taken in Saint Paul at the 100th Anniversary meeting of the Association, and delegates from the county medical societies took the matter under serious consideration before acting.

It is probable that the House of Delegates experienced the same sense of shock when they learned that not enough funds were secured by voluntary subscription to make an adequate start in caring for our indigent. You will recall that this voluntary project was begun as a result of House of Delegates action at the 1951 annual meeting.

Naturally, there is some doubt in the minds of those attending the House of Delegates session, whether the action was wise, but it probably will do no harm if doctors understand the purpose and if the fund can stand as a single assessment, after which voluntary subscriptions can be resumed.

It should be emphasized that this action was taken by the House of Delegates, representatives to which are elected by each county medical society in the Association. The prevailing feeling seemed to be that the delegates regretted the necessity of taking such drastic action, but that the worthiness of the fund and previous unsatisfactory results required quick and decisive action.

Admittedly, this project can be a thorny subject. The Council, directed by the House to work out details, has appointed a committee to make a quick study and evaluation of the problem, and to discover the best means of utilizing the monies raised.

The final plan which the committee evolves may not be perfect and may require revision as experience dictates, but I am sure there will be little or no dissension from the guiding principle—that medicine can and will take care of its own needy members.

Conrad J Campbell

President, Minnesota State Medical Association

Editorial

Carl B. Drake, M.D., *Editor;* George Earl, M.D., Henry L. Ulrich, M.D., *Associate Editors*

THE STATE MEETING

THE CENTENNIAL meeting of the Minnesota State Medical Association in Saint Paul in May fulfilled expectations for an outstanding meeting in celebration of the 100th anniversary.

Registration figures showed 1907 physicians; 410 nurses, dietitians, technicians, social workers and medical secretaries; 159 scientific exhibitors; 536 commercial exhibitors; 544 Woman's Auxiliary members and 836 guests (total 4,392).

Dr. Justus Ohage of Saint Paul was chosen president-elect and will serve as president in 1954. He is the son of the late Dr. Justus Ohage of Saint Paul who also served as president of the State Association in 1895. It is interesting to note that the only other combination of father and son to serve as presidents of the State Association were Dr. W. W. Mayo, president in 1873 and his sons, Dr. W. J. Mayo, president in 1894 and Dr. Charles H. Mayo, in 1906.

Other officers chosen were Dr. Paul C. Leck of Austin, first vice president and Dr. Vernon D. E. Smith of Saint Paul, second vice president. Dr. B. B. Souster of Saint Paul and Dr. W. A. Condit of Minneapolis were re-elected secretary and treasurer, respectively. Dr. C. G. Sheppard of Hutchinson was re-elected speaker of the House of Delegates and Dr. Haddon Carryer of Rochester was re-elected vice speaker.

District councilors elected were: Dr. J. M. Stickney, Rochester, First District; Dr. R. C. Hunt, Fairmont, Second District (re-elected); Dr. A. O. Swenson, Duluth, Third District (re-elected).

Drs. F. J. Elias, Duluth, O. J. Campbell, Minneapolis, and George A. Earl, Saint Paul, were all re-elected delegates to the American Medical Association.

The State Association meeting in 1954 will be held in Duluth and in 1955 in Minneapolis.

At the annual banquet which was attended by about 500 members and guests, some nineteen members were admitted to the Fifty Club, limited to those who have practiced fifty years. They were Drs. William F. Braasch, Rochester; Charles F. Brigham, and Richard O. Julian, St. Cloud; John J. Catlin, Buffalo; Theodore L. Chapman and Olin W. Rowe, Duluth; Don F. Fitzgerald, Wayzata; John H. Higgins, Harry G. Irvine, Henry W. Noth, Anton G. Wethall, Minneapolis; Joseph A. Poirier, Forest Lake; Auvigne M. Randall, Ashby; Stella L. Wilkinson and Frederick C. Schuldt, Saint Paul, and Benedik Melby, Blooming Prairie.

Also announced at the banquet was the awarding of a distinguished service medal to Dr. Julian F. DuBois of Sauk Center, secretary of the Minnesota State Board of Medical Examiners since 1935, past president of the Federation of State Medical Boards in 1942 and president of the American College of Physicians and Surgeons in 1947, and elected a member of the National Board of Medical Examiners in 1950. Unfortunately, Dr. DuBois was unable to be present to receive the award. Dr. Carl B. Drake, Saint Paul, was also awarded the Association's distinguished service medal for his labors as editor of MINNESOTA MEDICINE for the past thirty-four years.

The award for the best scientific exhibit tendered each year by the Southern Minnesota Medical Association went this year to Drs. J. J. Wild and John Reid of the Department of Electrical Engineering of the University of Minnesota for their exhibit entitled "Echographic Cancer Diagnosis." Honorable mention went to Dr. Kinsey M. Simonton of the Mayo Clinic for his exhibit entitled "Surgical Management of Chronic Mastoiditis."

The Art and Hobby Show displayed nearly 200 entries and attracted much interest. The Popularity Award went to a portrait of "A Lady" by Dr. Alex Ratelle, it having received the greatest number of votes by visitors.

Among the water colors, first prize went to "Log Cabin" by Dr. Daniel De Gallier; second prize to "St. Catherine College Chapel" by Dr. Andrew Christiansen; and third prize to "Vermont Hills" by Dr. Samuel F. Haines.

In the oils, first prize went to "Winter Wonderland" by Dr. J. Benepe; second prize to "White River, Bad Lands" by Dr. James H. Crowley; and third prize to "Flood Waters" by Luisa Kerschbaumer.

In photography, first prize went to "Sunwapta Valley" by Dr. John P. Wendland; second prize to "Smiling Girl" by Leonard Arling; and third prize to "The Shop" by F. H. Walter.

The centenary meeting has passed into history. A summary of the meeting would not be complete without mention being made of at least a few of the noted out-of-state visitors who added so much to the program. Dr. Richard R. Trail, of London, head of the Papworth and Enham-Alamein rehabilitation centers for the tuberculous in England, was the St. Joseph's Hospital Centennial Lecturer and addressed six medical organizations in the Twin Cities during his brief stay. He proved himself an authority in his specialty of chest diseases. Since the meeting, Dr. Trail has been awarded the honorary title of Commander of the British Empire. Sir Alexander Fleming, director of St. Mary's Wright Fleming Institute of London, who also took part in the St. Joseph's Hospital centenary celebration, spoke with authority on the subject of penicillin. Dr. Alton Ochsner, chairman of the department of surgery at Tulane University, is as outstanding a clinical teacher as any surgeon in the country and contributed two fine addresses to the program. These addresses, as well as those presented by the other outstanding visitors and Association members, will appear in MINNESOTA MEDICINE beginning with the August issue.

INFLUENZA AND PNEUMONIA

LITTLE progress has been made so far in the treatment and prevention of influenza. Even the differential diagnosis of influenza from influenza complicated by a pneumonia, from lobar pneumonia, or from an acute respiratory infection, is often difficult. The classification by life insurance companies of influenza and pneumonia under one heading as a cause of death seems therefore reasonable.

Influenza and pneumonia still constitute an important cause of death, being the third in importance, cardiovascular disease being first, and cancer second. Though the death rate from influenza and pneumonia has dropped nearly three-fourths since 1936, and a half during the past eight years, there were 51,000 deaths from this cause in 1951. With the advent of the sulfas fifteen years ago the death rate from influenza and pneumonia began to decline. This decline continued with the discovery of the antibiotics. How much these two drugs benefit in influenza is debatable. We doubt whether they are of any service in the treatment of influenza itself but believe their administration is justifiable for the purpose of preventing a complicating pneumonia.

Influenza occurs each year more often in the winter and early spring, three-fifths of the deaths from this disease occurring in the first five months, from December through April each year. The mortality is much higher in males forty-five years of age and over than in females of a similar age, and is particularly severe in infancy and old age. Those with chronic diseases are more likely to succumb to influenza and pneumonia than otherwise healthy individuals. This fact is confirmed by studies made by the Public Health Service which show an increase in deaths from all causes other than influenza and pneumonia in the weeks which show an excess mortality for these two causes.

It would be too much to expect a 100 per cent cure of pneumonia by any drug. Marvelous as the results are in pneumonia from the administration of the antibiotics many instances are encountered in which they prove futile. The development of resistance to certain antibiotics on the part of certain bacteria is given as the explanation of such failures and the reason for refraining from prescribing an antibiotic for each and every infection, or danger of infection, which is the present-day vogue.

One interesting development in the study of influenza epidemics is the establishment of a world-wide network of influenza laboratories and a world influenza center in London for a compilation of information as to the influenza virus strains responsible for epidemics in various parts of the world. This is one of the worth-while activities of the World Health Organization. Another reference laboratory in New York, known as the Strain Study Center for the Americas, is doing the same recording for the Americas. Epidemics due to the same influenza virus strain occurring in Africa or Australia in May have been followed to London in January. The establishment of these regional laboratories should prove of value in designating the proper vaccine for use in a certain locality. One of the reasons for frequent failure in the vaccination program for influenza has been need for the use of vaccines for specific strains of the influenza virus.

The influenza epidemic which was widespread not only in America but in central Europe, Hawaii and the Philippines, in January and February of this year was due to virus A prime and was fortunately comparatively mild. The epidemic of 1918 with its terrific mortality has not been forgotten. Nor has it been completely explained. It is not known how effective the sulfas and antibiotics would be in combatting a return of such an epidemic. The severity of an epidemic depends on the virulence of the specific influenza virus strain responsible and the degree and prevalence of immunity which may be present in the community as a result of previous recent epidemics due to the same virus strain. One discouraging factor is that immunity resulting from either infection or vaccination is not long lasting.

It would seem that as a result of the establishment of influenza laboratories it will be possible to designate the particular influenza virus responsible for any specific epidemic and the particular vaccine which should be used. The development of a longer lasting vaccine seems highly desirable.

THE DEAN'S PAGE

Beginning with the June number of Minnesota Medicine will appear a short article on some phase of the University of Minnesota Medical School which will be supplied by Dean Diehl's office. This monthly article will provide a contact between the Dean's office and the medical profession of the State. It is the wish of the profession to co-operate in every way with our medical school and it is just as true that the medical school wishes to foster close relationship with the medical profession. The article which will appear each month in Minnesota Medicine should further mutual understanding between the medical school and the medical profession of the state.

WORLD MEDICAL ASSOCIATION

THOSE who do not know of what the World Medical Association is composed and what its purposes are can get a clear idea from a reading of the President's Page in the April 25, 1953, number of the JAMA. We venture the opinion that not one in ten of our members knows the difference between the World Health Organization and the World Medical Association.

The World Health Organization, a branch of the United Nations, represents the governments of the world and is supported entirely by government funds. The World Medical Association, on the other hand, is a medical association composed of the national medical associations of forty-three different nations. No medical associations of countries behind the iron curtain are included. It is supported entirely by dues paid by the member associations and voluntary contributions and is independent of government and politics. Whereas, the AMA is made up of component state medical associations, the World Medical Association is made up of component national medical associations.

It is fortunate that we have members of our national medical association with breadth of vision and the energy to devote their time and talents not only to the problems of medicine in county, state and nation but in the world at large. Medical men like Dr. Louis H. Bauer, president this year of the AMA, and Dr. Elmer Henderson, past president, have each served as officers of the World Medical Association concomitantly with their tenure in their AMA offices, the former as secretary general and the latter as president. The scientific interests of the medical professions of all countries are similar although problems differ. The World Medical Association can speak for 700,000 physicians throughout most of the world and should possess authority.

The aims of the World Medical Association, according to Dr. Bauer, are: "To effect a better liaison among the doctors of the world; to serve as a forum for discussion of mutual problems; to disseminate information; to raise the standards of health, medical education and medical care throughout the world; to represent the practicing profession before other international bodies, when matters of health and medicine are discussed; and to give the average doctor a voice in international affairs; and to improve international relations."

One matter in which the World Medical Association served a most useful purpose was in the publicity it gave to the machinations of the International Labor Organization, editorial mention of which was made in our September, 1952, number.† As a result, Senator Bricker of Ohio has submitted a bill to Congress which will forestall the adoption of foreign idealogies by the mere majority vote of the United States Senate.

---

†Editorial: Back door entrance. Minnesota Med., 35:823 (Sept.) 1952.

Medical societies and individuals cannot join the World Medical Association directly. However, in the United States a World Medical Association United States Committee, Inc., has been established and can be joined by individuals, medical societies and business organizations. In this issue (page 653) appears a full-page advertisement, which we are happy to donate to the World Medical Association in order to further its altruistic purposes.

ARMED FORCES DISCOUNT REPORTS ON HEPATITIS RATE

Following press reports of high incidence of homologous serum jaundice (hepatitis) among U. S. troops getting plasma, the Armed Forces Medical Policy Council and Army Surgeon General's office decided the record should be set straight. These points were made: (a) Studies show that 23 per cent of the severely wounded receiving 5 to 10 units of plasma contract hepatitis from 60 to 180 days after the infusions, but mortality rate is only one in 1,000 cases, (b) while serum albumin has been found free of hepatitis virus, there isn't enough supply to replace plasma, (c) A National Research Council committee is working on sterilization of plasma but until it arrives at a solution, plasma will continue to be used by the services. Officials said they were anxious that the public not stop donating blood because of the misinformation on plasma.—*A.M.A. Washington Letter No. 7.*

ERADICATION OF TUBERCULOSIS

We have talked about the eradication of tuberculosis as if within a reasonable period that phenomenal condition might become an actuality. It might be well for us to drop this word and think more in terms of possible control. Even though a specific cure or a specific vaccine might be found, it would require generations to discover the last infected person. We look with much pride on the fact that today less than one-half of one per cent of dairy herds in this country are infected. The control program was started in 1916. Its basic features were tuberculin testing, slaughtering of infected animals and, finally, prohibiting the addition of new animals to the herd unless they were tuberculin negative. Thus, for many years this ideal, controlled program has resulted in eliminating the majority of infected cattle before clinical disease has developed and has thereby sharply reduced the chance for spread of infection. Nevertheless, despite these heroic efforts, the significant fact remains that there still exists small reservoirs of infection in our herds. The veterinarian is ever vigilant in his program, for the slightest neglect has again and again proved that, where the tubercle bacillus exists, it can flare into a consuming flame.—H. R. Edwards, M.D., *The Am. Review of TB,* March, 1952.

Minnesota Department of Health

REPORTING OF ALL DEATHS DUE TO OR ASSOCIATED WITH PREGNANCY

Since July 20, 1951, the State Board of Health has required the reporting of all deaths of women due directly to pregnancy or the puerperium as well as all female deaths where pregnancy was present but was not the cause of death and the postpartum period for three months following delivery. This does not include stillbirths or infant deaths.

The regulation is quoted below for the information and guidance of physicians and hospitals.

Reg. 125. Any death associated with pregnancy (including abortion and extra-uterine pregnancy) or the puerperium (for a period of three months' postpartum), whether or not it is the actual cause of death, will be reported to the Minnesota Department of Health, Division of Maternal and Child Health by mail within three days after such date, by the attending physician and by the hospital where the death occurs.

The following information will be included in the report:

Name and address of woman

Date of death Age at death

Cause of death

Name of attending physician and address

Name of hospital and address

The above report is in addition to the usual report by death certificate to the Division of Vital Statistics as now required by law.

RELATIONSHIP BETWEEN DISEASE AND SOCIAL FACTORS

More field studies are needed to establish quantitative relationships between disease and social factors such as age, race, sex, occupation, and economic status. These factors and their impact on community disease patterns are our counterparts of the clinicians' measurement of pulse, blood pressure, basal metabolic rate, etc., in the individual. They, and their relationship to disease and health deserve more attention than we have afforded them.—Berwyn F. Mattison, M.D., *American J. of Pub. Health,* Dec., 1952.

The Dean's Page

In response to a long standing and oft repeated invitation of the Editorial Board of Minnesota Medicine, the administration and faculty of the Medical School will utilize a page of this journal each month to inform the physicians of the state about the policies, activities, plans, and problems of the school. To be able to do this is a privilege for which the Medical School is deeply appreciative.

It is common knowledge that the standards of medical practice and the over-all reputation of the medical profession in an area are determined to a great extent by the quality and the reputation of the medical school serving that area. Consequently, the maintenance of high quality medical education has always been of deep concern to individual physicians as well as to the American Medical Association and its constituent state and county societies.

As I pointed out in my discussion of "Medical Schools and Medical Education over the Past Century" (Minnesota Medicine, April, 1953), medical schools of today are vastly more complex and are expected to meet demands and responsibilities more far-reaching than ever before. Even during the years of my own connection with the University of Minnesota Medical School, beginning as a medical student in 1914 and as a member of the staff in 1920, the quality, the tempo, and the standing of this institution have been completely changed.

The primary purpose of our Medical School is today, as it has always been, the training of general physicians to provide the best of medical care for the people of this area. Changes in the subject matter and methods of instruction have occurred and will continue to be made whenever improvement seems possible.

In graduate medical education for the training of specialists and in continuation medical education for physicians in practice great developments have occurred. Even more dramatic have been the advances in medical research.

It is with all of these developments that we are anxious to acquaint the physicians of the state. The Medical School wants and needs your interest, your understanding, and your support. We hope that this series of articles will contribute toward that end.

Harold S. Diehl

University of Minnesota

Medical Economics

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

ASSOCIATION DUES ARE COMPARATIVELY SMALL

Active members of county, state and national organized medicine may not realize the low figure their dues amount to when compared to those of the cultists.

Minnesota, for instance, has state dues of officially $40 per year, with national dues amounting to only $25 per year and county dues varying somewhat around those two figures. This should be critically compared with the dues charged of chiropractors in some parts of the country. The Indiana Federation of Chiropractors collects $240 a year from each member. This figure is quoted in the April issue of *Medical Economics* which also has this to say about the utilization of that money:

> "Most of the money goes to support the manifold promotional activities of the trade; some is spent to help extricate individual members from legal entanglements.
>
> "There's no escaping the fact that the chiropractic associations do a highly effective job in terms of service to members. If their energy, shrewdness, money and devotion were used in a better cause, the M.D. would have to give them his unstinting admiration."

Medical Economics puts its conclusion in the form of a warning to medical practitioners:

> "As it is, in these days of booming practices, some medical men shrug off the chiropractor as a minor nuisance; they dismiss his doctrine as a joke. In doing so, they lose sight of the implication in many a patient's tombstone epitaph: that there's nothing funny about dying."

SOCIAL SECURITY SURVEY TERMED HARD TASK

One of the greatest tasks undertaken by the Eisenhower administration is a thorough overhaul of our colossal system of social security "from the cradle to the grave." This statement was made by Arthur Sears Henning in a series of articles quoted in a recent issue of *Insurance Economics Surveys.*

Mr. Henning traces the rapid growth of the social security system:

> "In less than two decades the system has grown until it represents 26 billion dollars in reserve funds (17 billion in old age insurance, 9 in unemployment insurance), with approximately 17 million beneficiaries who in 1952 received payments aggregating nearly 9 billion dollars. Of these beneficaries more than 4 million were retired aged employes and their dependents who received more than 1½ billion dollars in benefits."

Increases Cause Action

According to the article, many changes and increases in economic considerations are the basis for administration action to overhaul the system. It is feared that an estimated 20 million old age beneficiaries receiving 13 billion dollars in benefits annually fifty years from now, and a trust fund of 106 billion dollars and payroll taxes doubled, this will have a damaging effect on the nation's economic structure.

A congressional inquiry into the system's operation under the previous administration has already been initiated. Representative Curtis of Nebraska heads this subcommittee of the house ways and means committee. One of the fields of inquiry will be "whether social security has been developed under the New Deal into a guarantee of a scale of living that for many people destroys the incentive for thrift, encourages shiftlessness and cultivates the attitude that 'the world owes me a living.' "

Twenty-Five Programs Now Operating

The report states that there are now approximately twenty-five public social insurance programs maintained by the federal, state and local governments throughout America. In 1952, there were more than 17 million beneficiaries of these programs who received pensions and other benefits aggregating $8,799,066,000. The author states:

> "Public social security on the national scale was born of the depression. Theretofore care of the destitute was universally considered the function of local government. Provision of economic safeguards against old age, sickness and death was not regarded a proper responsibility of government, least of all the national government. Security was an end to be attained by the individual through hard work and thrift within the framework of private enterprise."

"With the advent of the depression and increasing unemployment in the thirties, however," the report goes on, "tremendous pressure for the nationalization of relief developed. Roosevelt, who accurately sensed the political value of relief dispensation, swept aside the Hoover plan of state and local relief with federal financial aid and took over the job for Washington."

ILO Had Hand in Development

It is interesting to note that the International Labor Organization, the group which has lately fostered the advance of socialized medicine through international treaties, was actively supporting social insurance during its infancy.

Mr. Henning states: "By this time the international labor organization, an adjunct of the League of Nations dominated by foreign socialists, was spreading the gospel of social insurance along the lines of the contributory system which Bismarck borrowed from the German socialists as a means of defeating the liberal movement. The ILO thinkers proclaimed it the responsibility of the government to provide social security for the individual and to adopt such coercive measures as might be necessary to discharge this obligation."

FIGURES SHOW INCREASE IN LIVES SAVED

Rapid advances in medical science, steady rise in the general standard of living and improved safety measures were credited for an increase in lives saved since 1945.

A recent statistical bulletin from the Metropolitan Life Insurance Company states: "There were about 200,000 fewer deaths in our country in 1950 than would have occurred if the death rate of 1945 had continued unchanged. This is an outstanding achievement in life conservation for so brief a period. . . ."

The report goes on to state that if the mortality of 1945 by age, sex, and color had prevailed in 1950, the year would have seen almost 1,657,000 deaths, in place of the 1,452,454 actually recorded.

Decreases in mortality rates were broken down into specific diseases and other causes, and the bulletin notes:

> "This large gain in a single year reflects the decline in mortality from many diseases and various types of injury. However, most of the saving in lives is accounted for by a relatively few causes of death. . . ."

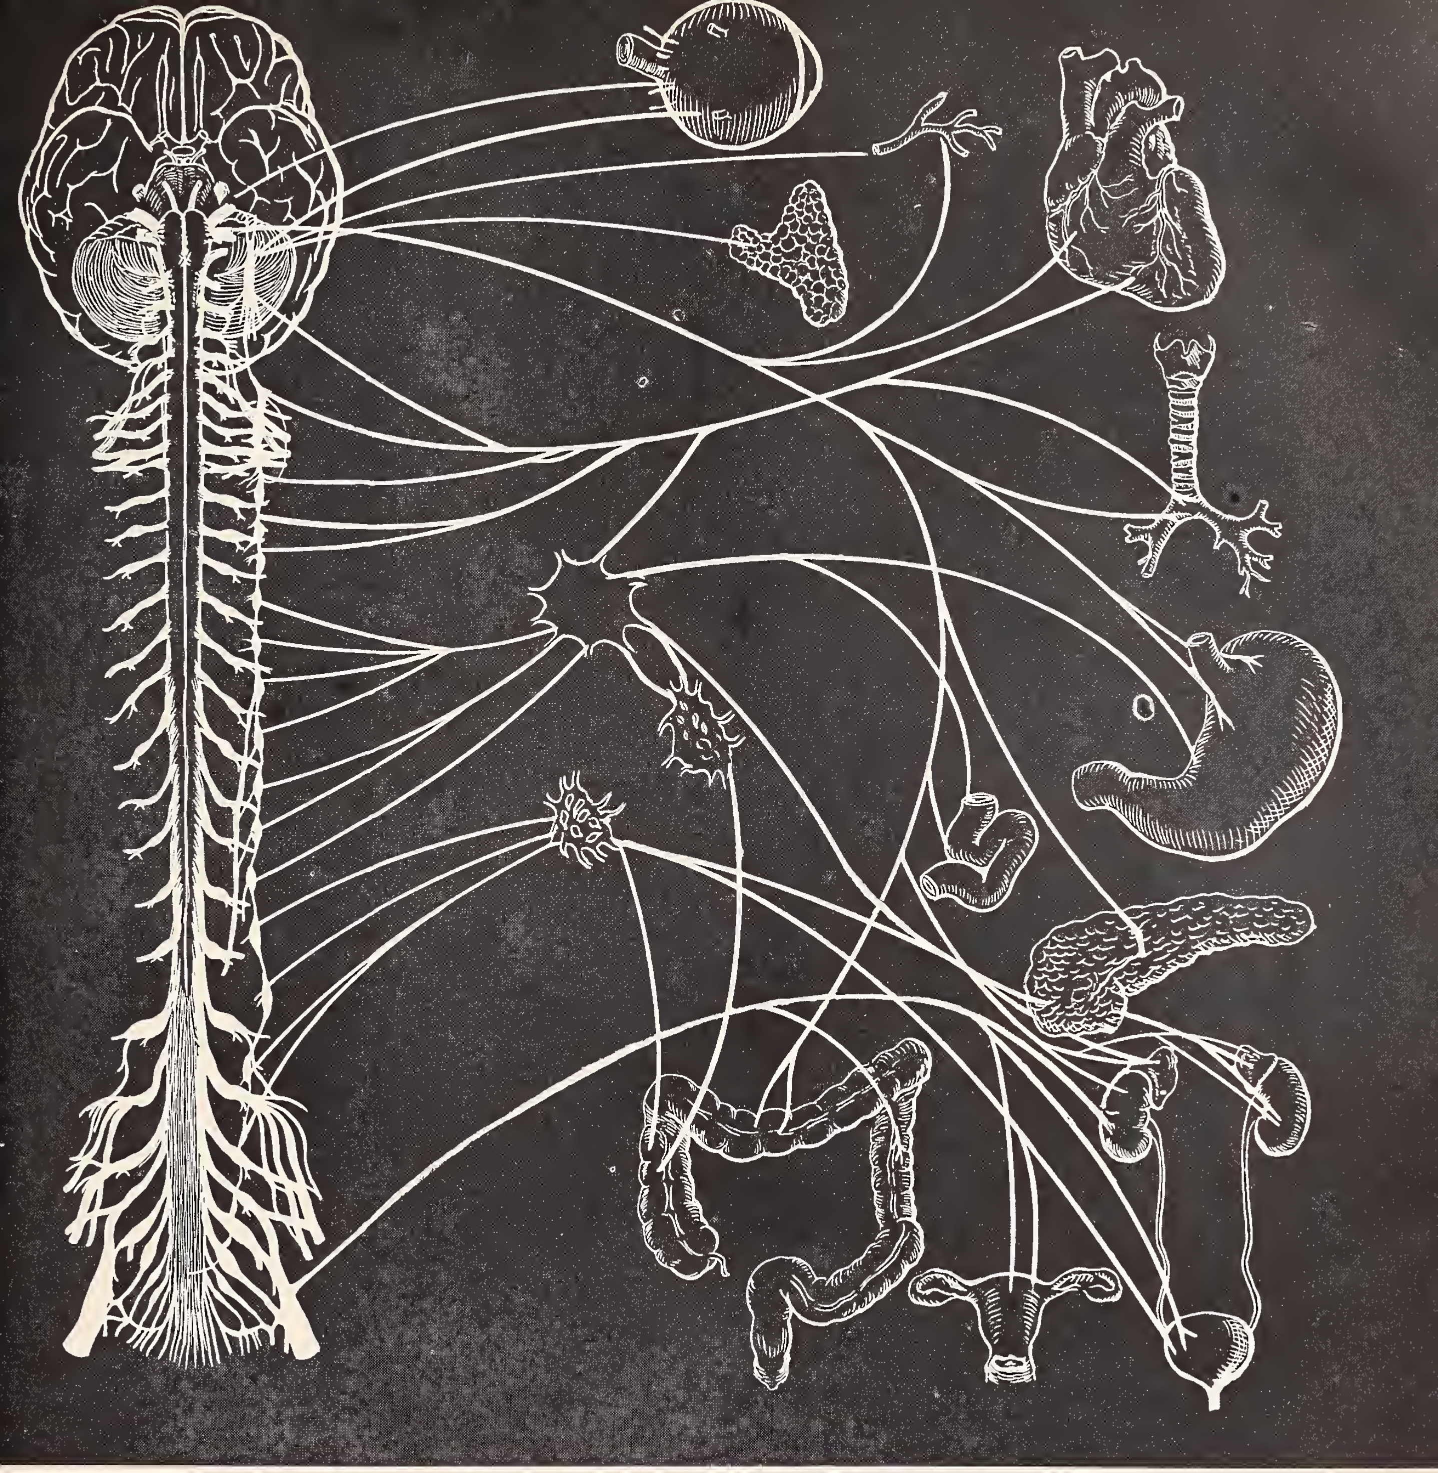
Cardiovascular Heads List

According to the bulletin, the diseases in the cardiovascular-renal field headed the list for number of lives saved. Surprisingly, the report stated, "instead of the 720,603 deaths from these conditions in our country in 1950, there would have been 771,614 such deaths if mortality had continued at the 1945 level. Thus, the actual deaths were about 51,000 less than the expected. This saving from the cardiovascular-renal diseases amounts to one quarter of the total saving in lives, and results for the most part from the reduction in mortality among women."

Significant changes in progress in communicable diseases was emphasized by the report:

> "Rapid progress in the control of the communicable diseases since 1945 has contributed substantially to savings in current mortality. Without this improvement there would have been at least 25,000 additional deaths from pneumonia and influenza among us in 1950 and almost the same number more from tuberculosis. The magnitude of these savings is even more striking when related to the actual number of deaths recorded for 1950. Thus, under the situation five years earlier there would have been over 50 per cent more deaths from pneumonia and almost 75 per cent more deaths from tuberculosis."

Again, this increase in the number of lives saved, puts added emphasis on the problem of geriatrics. More and more older people in the population are a constant challenge to medicine. In this respect, the House of Delegates of the Minnesota State Medical Association, in annual session in St. Paul on May 18, took steps to aid its own members who have reached the age where they are no longer able to earn a productive living. Doctors, too, have found themselves a part of this increase in the older population. The House of Delegates voted to create a Physicians' Assistance Fund, with every member an active supporter. The fund's details will be worked out by the Council of the Association, to be put into effect at the earliest possible date.



Excess neural stimulation over the parasympathetic subdivision plays an important role in such clinical conditions as peptic ulcer, certain forms of gastritis, pylorospasm, pancreatitis, spastic colon, bladder spasm and hyperhidrosis.

The Standard of Therapy in Peptic Ulcer

Banthīne® Bromide (brand of methantheline bromide) is a true anticholinergic which inhibits parasympathetic stimuli, acting selectively on the gastrointestinal and genitourinary systems. It exerts little or no influence on the normal cardiovascular system. Banthīne is supplied in oral and parenteral dosage forms.

COURSE IN MEDICAL USES OF ISOTOPES

The Special Training Division of the Oak Ridge Institute of Nuclear Studies has scheduled an advanced course covering the clinical applications of radioisotopes to be held from September 14-25, 1953. This advanced course, part of the continuing series offered by the Institute, is the second to be concerned with the medical uses of isotopes. The first was given in March, 1951.

Participation will be limited essentially to those physicians who have had clinical experience with radioisotopes.

Subjects to be discussed in the course include tumor localization, circulatory volumes and outputs, fluid and electrolyte spaces, therapy of blood diseases, theory of radiation dosimetry, radioactivity measurement, gold-198 and other colloids, interstitial and surface applications, teletherapy, iodine-131 in diagnosis and therapy, and external counting.

The course will consist of lectures, clinics, and exhibits of equipment. Speakers have been selected from among the leaders in the specific fields of interest.

Additional information and application blanks may be obtained from the Special Training Division of the Institute, P.O. Box 117, Oak Ridge, Tennessee.

SURGERY RESEARCH SCHOLARSHIPS AVAILABLE

The American College of Surgeons has established a research scholarship in surgery to be available for one who is in the last months of a residency training program. It will supply for the chosen candidate $20,000 over a period of three years. Candidates must receive the approval of the chairman of the department of surgery, the dean of the same medical school, and the authority of the executive office of the university making the proposal. The medical school supporting the nomination will be required to provide a satisfactory place to work as well as funds with which to supply necessary research. Inquiries may be addressed to The Research Scholarship Committee, American College of Surgeons, 40 East Erie Street, Chicago 11, Illinois.

INSTITUTE ON ESOPHAGEAL SPEECH

An Institute on teaching and improving esophageal speech will be held in Cleveland, Ohio, August 10 through 16 at the Cleveland Hearing and Speech Center. This Institute, the second one on Voice Pathology, is being sponsored by the American Cancer Society, National Cancer Institute of Institutes of Health, the Office of Vocational Rehabilitation, the Cleveland Otolaryngological Society, the Cleveland Academy of Medicine and the Western Reserve University School of Medicine.

Nationally known surgeons, speech pathologists and lay teachers of esophageal speech will conduct lectures, demonstrations and supervise practice in teaching esophageal speech; fluoroscopic views will be used to facilitate studies of the physiology of esophageal speech.

Non-speaking laryngectomized persons are invited to attend without charge. They may be sent by surgeons, cancer societies, societies for crippled persons and rehabilitation services.

Surgeons, speech pathologists and lay persons are invited to attend the sessions. Limited registration is necessary. Application must be mailed by July 15 to Warren H. Gardner, Ph.D., Program Chairman, 11206 Euclid Avenue, Cleveland 6, Ohio.

PAN-PACIFIC SURGICAL ASSOCIATION

Doctors are urged to make arrangements as soon as possible to attend the Sixth Pan-Pacific Surgical Congress to be held in Honolulu, Hawaii, October 7-18, 1954.

An outstanding program, including sessions in all divisions of surgery and related fields, promises to be of interest to all doctors.

The Association office has been appointed as travel agent for those attending the Congress and it is important that all hotel and travel reservations be made through the Honolulu headquarters of the Pan-Pacific Surgical Association.

For further information, please write to F. J. Pinkerton, M.D., Director General, Pan-Pacific Surgical Assotion, Suite 7, Young Hotel Building, Honolulu, Hawaii.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The Minnesota Society of Neurology and Psychiatry met May 2, at St. Mary's Hospital in Rochester. The scientific program included a "Symposium on Depth Electrography," presented by: Dr. H. W. Dodge, Jr., Technic; Dr. C. B. Holman, X-Ray Aspects; Dr. Gerd Fischer, Histological Aspects; Dr. E. A. Rodin, Normal Rhythms, Including Sleep; Dr. R. G. Bickford, Olfactory Response to Electrical Stimulation and Schizophrenia; Dr. A. A. Bailey, Focal Epilepsy; Dr. W. McK. Craig, Neurosurgical Assessment; and Dr. Howard P. Rome, Psychiatric Assessment.

Dr. Howard Gaudin of Auckland, New Zealand, spoke on "Socialized Medicine in New Zealand," at the afternoon session.

UNIVERSITY OF MINNESOTA MEDICAL SCHOOL CHANGES REQUIREMENTS

University of Minnesota medical students will no longer be required to complete a year's internship for the doctor of medicine degree. The new ruling was approved May 8 by the Board of Regents.

The move is in keeping with a general trend to abolish the requirement. Following the start of World War II, medical schools throughout the country dropped the practice. Only four still retain the "extra year."

Almost forty years ago, the University of Minnesota was the first school to establish the requirement of an internship. This action was taken to give internship recognition as an essential part of a physician's training and to discourage graduates of the medical school from entering practice without it.

Although the requirement is no longer necessary at

UNIVERSITY OF MINNESOTA MEDICAL SCHOOL CHANGES REQUIREMENTS

(Continued from Page 644)

Minnesota, Dr. Harold S. Diehl, head of the medical school, stated, "It is unthinkable that a graduate of our medical school today would enter practice without having an internship. The internship is now universally recognized as an essential part of medical education. In fact, most states require an internship for licensure and all special fields of medical practice require an internship as preliminary to specialty training."

WANGENSTEEN EDUCATION FOUNDATION ESTABLISHED

An Owen H. Wangensteen Surgical Education Foundation—honoring Dr. Owen H. Wangensteen, chief of the department of surgery—has been established at the University of Minnesota. The foundation was approved by the University's Board of Regents at their May meeting.

Initial funds to set up the Foundation were donated by Dr. F. John Lewis, associate professor of surgery; Dr. Richard L. Varco, professor of surgery, and Dr. Charles E. Rea, clinical associate professor of surgery. Purpose of the foundation is to promote advanced surgical education.

Dr. Wangensteen will act as an adviser in administration of the funds.

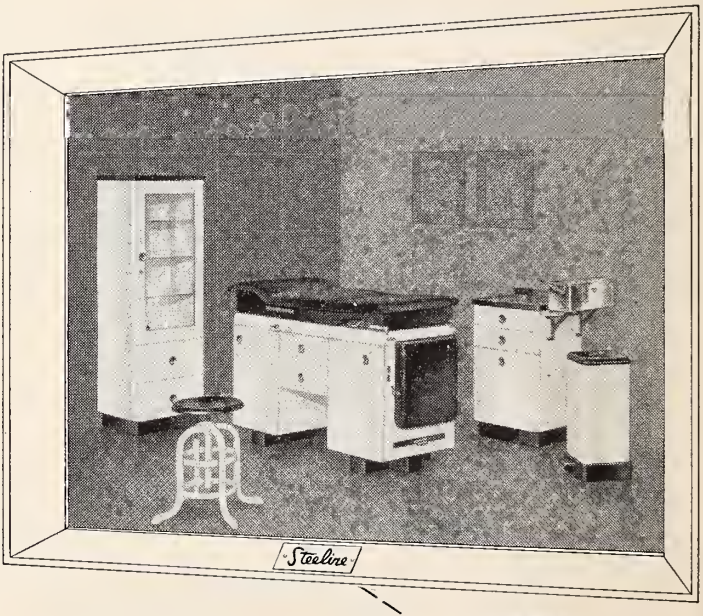
SENIOR CLASS LUNCHEON

The Minnesota Medical Alumni Association held a luncheon for the Senior class of the Medical School on Wednesday, May 27, at 12:30 p.m. in the Junior Ballroom of Coffman Memorial Union. An alumnus or a member of the Medical School faculty acted as host to each Senior student. The program following the luncheon included a brief outline of the objectives of the Medical Alumni Association and a short talk by Dr. E. T. Bell, Emeritus Professor of Pathology.

NURSE SCHOLARSHIPS AVAILABLE

The 1953 Minnesota legislature has set aside $75,000 for each year of the new biennium as a scholarship fund for the field of nursing. The scholarships are available to individuals with ability to complete the program of nursing education but who could not do so without financial aid.

Two types of scholarships are available: a maximum grant of $600 may be awarded for a student attending a *professional nurse's school*, and a maximum grant of $300 is available for the field of *practical nursing.* Requirements are that the individual must first be accepted by an accredited school of nursing (professional or practical) in Minnesota; that the student must agree to accept an educational experience in a rural hospital or a state hospital for the mentally ill as part of her education, and the student must agree to practice nursing for at least one year in Minnesota following graduation. Information may be had by writing the State Department of Education, State Office Building, Saint Paul 1, Minnesota.



design achievement in treatment room furniture

New Steeline has gone through fifteen years of gradual development to reach the fine degree of design perfection it now has. The suggestions of scores of physicians and the engineering skill of our own production plant have been combined to produce this outstanding treatment room equipment. New features such as foam rubber cushioned contour top, magnetic door latches, concealed paper sheeting holder, superb color finishes, etc., are all fully described and illustrated in our new full-color brochure—send for yours today.

Dear Doctor:

℞

Tolserol Tabs. 0.5 gram

Disp. #100

Sig: One tablet 3 to 5 times a day. Take after meals or with 1/3 glass of milk.

Usually Inadequate

This prescription is typical of many written for Tolserol Tablets*, as seen in a recent prescription survey.

Although some patients will respond to such low dosage, much better results can be obtained by following the recommended dosage: 1 to 3 grams, 3 to 5 times per day.

In accordance with this recommendation, the first dosage schedule for a patient could be:

℞

Tolserol Tabs. 0.5 gram

Disp. #100

Sig: Two tablets 3 to 5 times a day. Take after meals or with 1/3 glass of milk.

Better

Complete information on the use of Tolserol in muscle spasm of rheumatic disorders, neurologic disorders, and acute alcoholism is available from your Squibb Professional Service Representative.

Sincerely yours,

L. H. Ashe

Woman's Auxiliary

ANNUAL MEETING WELL ATTENDED

Mrs. Charles Waas
Mrs. W. H. Von Der Weyer

Attendance at the 31st annual meeting of the Woman's Auxiliary to the Minnesota State Medical Association was exceptional this year. About 300 doctors' wives attended the convention in Saint Paul, May 18, 19 and 20.

All events during the meeting brought Auxiliary members from all parts of the state. Attendance at the Executive Board meeting and lunchon on Monday was about fifty; at the annual meeting and luncheon on Tuesday it was nearly 200; and at the breakfast on Wednesday it was about 40.

Officers elected for the coming year at the annual meeting on Tuesday are: President, Mrs. Henry W. Quist, Sr., Minneapolis; President-Elect, Mrs. P. S. Rudie, Duluth; First Vice President, Mrs. C. L. Oppegaard, Crookston; Second Vice President, Mrs. Andrew Christiansen, Saint Paul; Third Vice President, Mrs. L. P. Howell, Rochester; Fourth Vice President, Mrs. O. J. Campbell, Minneapolis; Recording Secretary, Mrs. David Halpern, Brewster; Corresponding Secretary, Mrs. L. J. Leonard, Minneapolis; Treasurer, Mrs. C. W. Froats, Saint Paul; Auditor, Mrs. John K. Butler, Cloquet; Parliamentarian, Mrs. Leo Fink, Minneapolis.

Special tribute was paid to Mrs. S. S. Hesselgrave, who has terminated her long successful career as parliamentarian of the Auxiliary. It was with great regret that the Auxiliary accepted Mrs. Hesselgrave's resignation. Her long years of service have provided a lasting contribution to the Auxiliary's work.

Grateful thanks are extended to all committee chairmen for their excellent arrangements for annual meeting events. Without their valuable expenditure of time and effort, the meeting would not have been the success that it was. Visitors from all parts of the state expressed appreciation for the lovely appointments at all social functions, also for the fine reception they were given by those responsible for making them welcome.

The committee and the hostess auxiliary would also like to extend thanks and appreciation for the entire membership to the newspapers in Minnesota which did such a commendable job of covering the meeting events.

It is sincerely hoped that all Auxiliary members who attended this year's convention gained valuable information to take back to their local auxiliaries. Their presence is deeply appreciated, for without their active participation in all Auxiliary functions, Auxiliary work would be much less effective. The Auxiliary looks forward each year to having more and more doctors' wives attend all meetings, thereby making their membership more valuable to themselves, as well as to the Auxiliary as an organization.

AUXILIARY EXPRESSES THANKS

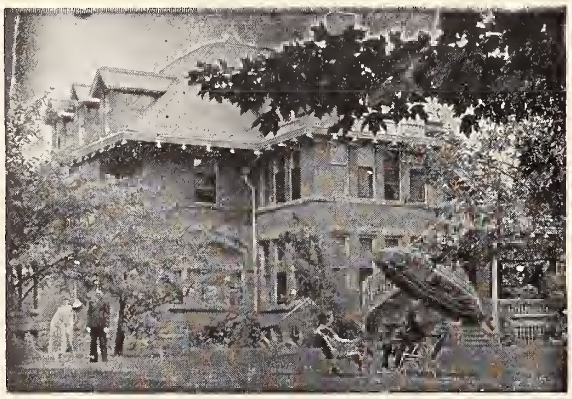
Mrs. M. I. Hauge, Clarkfield
Today's Health Chairman

Again this year, as in several years past, the Minnesota State Medical Association, in the name of the Woman's Auxiliary to the Minnesota State Medical Association, has given each of the 191 Minnesota legislators a year's subscription to *Today's Health.*

The Woman's Auxiliary would like to take this opportunity to thank a wise medical association for placing *Today's Health* with a law-making group who will become aware of the friendship and concern that the American Medical Association has for the health and welfare of the people in Minnesota.

CONQUEST OF TUBERCULOSIS

The conquest of tuberculosis in our country will be expedited by concentrating on those measures which have been most productive in the past decades. These are early case finding, prompt and adequate treatment, including the newer surgical procedures, and effective medical follow-up and rehabilitation of arrested cases. Vigorous efforts along these lines are absolutely essential not only for the welfare of those with the disease but also for the protection of those who might otherwise become infected. The detection and isolation of infectious cases are the most effective curbs to the spread of the disease.—Louis I. Dublin, "A 40-Year Campaign Against Tuberculosis," *Metropolitan Life Insurance Company,* 1952.

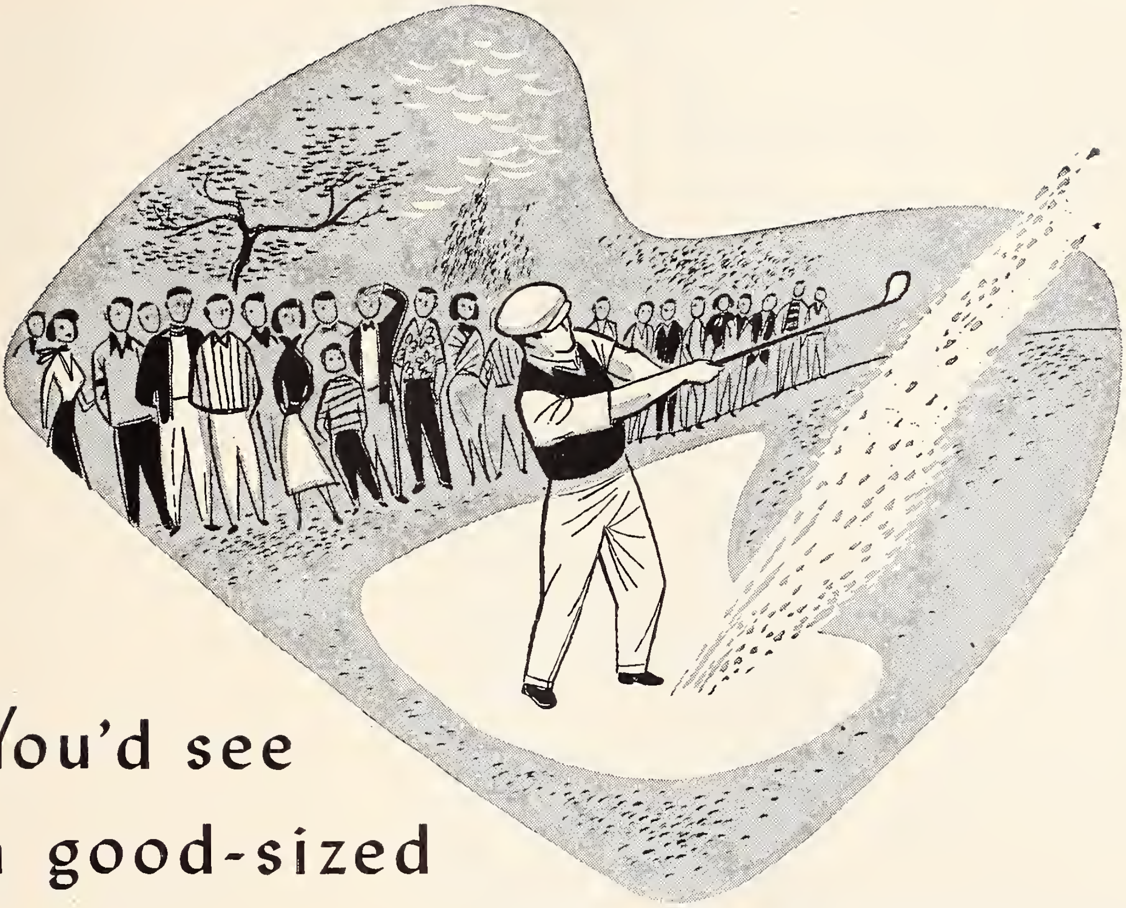


The Birches Sanitarium, Inc.

2391 Woodland Avenue
Duluth 3, Minnesota

A hospital for the care and treatment of Nervous and Mental disorders. Quiet, cheerful environment. Specially trained personnel. Recreational and occupational therapy.

Dr. L. R. Gowan, M.D., M.S., Medical Director



You'd see a good-sized gallery

. . . with all the patients who represent the 44 uses for short-acting

Nembutal®

WHAT YARDSTICK DO YOU USE TO DETERMINE the drug you write on your prescription? If the drug is a barbiturate—such as short-acting NEMBUTAL (Pentobarbital, Abbott)—you can measure it, compare it and sum it up in these four short sentences:

1. *Short-acting* NEMBUTAL *can produce any desired degree of cerebral depression—from mild sedation to deep hypnosis.*
2. *The dosage you need is small—only about half that of many other barbiturates.*
3. *There's less drug to be inactivated, shorter duration of effect, wide margin of safety and usually no morning-after hangover.*
4. *In equal oral doses, no other barbiturate combines quicker, briefer, more profound effect.*

Perhaps that's why—after 23 years, 598 published reports and more than 44 clinical uses—you'll find more and more prescriptions call for NEMBUTAL.

Abbott

In Memoriam

OLIVER R. BRYANT

Dr. Oliver R. Bryant, Minneapolis, died on his way from Inglewood, California, to his summer home at Cross Lake, on May 18, 1953. He was seventy-three years old.

Dr. Bryant was born December 1, 1879, in Rochester, Minnesota. He obtained his M.D. degree from the University of Minnesota in 1905.

He was in private practice in Minneapolis for twenty-five years and was chief medical officer of the Minnesota Soldiers Home for ten years. He was also on the staff of the Anoka State Hospital for five years.

Dr. Bryant was a Mason. He served with the 5th Minnesota Regiment in the Spanish American War and was a member of the Arthur MacArthur Post of Spanish War Veterans. He was an active sportsman and participated in fund-raising ventures to provide grain for the wildlife during the winter. He was a member of the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Dr. Bryant is survived by his wife, Hazel, and a son, John R., of Dallas, Texas.

J. E. CORRIGAN

Dr. J. E. Corrigan, a former pioneer physician and surgeon at Spooner, Minnesota, died March 30, 1953, at the home of his son Jack, at Excelsior, Minnesota. He was about eighty-six years old.

Dr. Corrigan was a graduate of the New York University Medical School in 1892.

After living in Spooner a number of years, Dr. Corrigan built a hospital (now the Pioneer Home) and carried on an active practice until he moved to Minneapolis about fifteen years ago and retired from practice.

Dr. Corrigan was a member of the Upper Mississippi Valley Medical Society, the Minnesota State Medical Association and the American Medical Association. He became a life member of the Minnesota State Medical Association in 1938.

WILLIAM FREDERICK CARL HEISE

Dr. W. F. C. Heise, founder of the Heise Clinic in Winona, died on May 29, 1953, at his home after an illness of several weeks.

Dr. Heise was born in Fountain City, Wisconsin, October 1, 1874. His long career witnessed and took part in the development of modern medicine and surgery. Graduating from Rush Medical College, Chicago, in 1896, he spent two years as an intern at the Presbyterian Hospital in Chicago. After practicing a short period in a small iron mining town in Michigan, he moved to Winona in 1898.

Dr. Heise had his five sons associated with him in his clinic. His oldest son, Herbert, is a graduate of Jefferson Medical College and specializes in surgery; William, a graduate of Northwestern, is a pediatrician; Philip, a graduate from the University of Arkansas, specializes in obstetrics and gynecology; Paul, a graduate from Marquette, is both surgeon and pathologist; Carl, a graduate of Jefferson, takes care of ear, nose and throat diseases. A portrait of the family hangs in the library of the American College of Surgeons in Chicago in view of the unique group of a family of six practicing together. Of further interest is the fact that Dr. Heise's brother, Dr. Carl A. Heise of Missouri Valley, Iowa, has two sons and two daughters who are physicians and one daughter who is a nurse.

Dr. Heise was a member of the Winona County Medical Society, the Minnesota State Medical Association, and the American Medical Association. He was a fellow of the American College of Surgeons.

He is survived by his widow, five sons, three daughters: Mrs. John Curtis of Winona and the Misses Ruth and Adele Heise, both teachers in Minneapolis.

GALEN K. SELLERS

Dr. Galen K. Sellers, Dassel, Minnesota, who had practiced medicine there since 1937, suddenly died of a coronary thrombosis on April 18, 1953. He was fifty-six years of age at the time of his death. Dr. Sellers was born in Bangor, Maine, on May 15, 1896, a son of the late Dr. and Mrs. Harry H. Sellers. In 1914 the Sellers family moved to Minneapolis, Minnesota.

He received his early education in Bangor, Maine, and in 1916 was graduated from the Shattuck Military Academy in Faribault, Minnesota. He served with the Armed Forces during World War I after which he began his pre-medical studies at the University of Minnesota and at the University of North Dakota. He received his medical degree from the University of Illinois in 1928 and served a year of internship at the Swedish Hospital in Minneapolis, completing his internship in 1929. From 1929 to 1931 he practiced medicine at Deer River, Minnesota, and from 1931 to 1937 at Motley, Minnesota. Since 1937 he had practiced medicine at Dassel, Minnesota, and at the time of his death was Chief of Staff at the Meeker County Memorial Hospital in Litchfield, Minnesota.

Dr. Sellers was a member of the Kandiyohi, Swift, Meeker County Medical Society, the Minnesota State Medical Association, and the American Medical Association. He was a member of the American Legion and was always interested and active in local affairs.

Survivors include his wife, Ada L. Sellers, and two sons, Galen and Robert, of Dassel, and a sister, Mrs. Burrell Laraway of Minneapolis, Minnesota.

Dr. Sellers was an able and conscientious doctor and was always a credit to the medical profession. He had a likeable and pleasant personality and will be sadly missed by all who knew him.

Cordelia

AWARD WINNING BRASSIERES!

Cordelia surgical brassieres have won the Blue Ribbon for five consecutive years. Now, Cordelia has won BOTH the GOLD MEDAL and BLUE RIBBON AWARDS at the 1952 California State Fair Fashion Exhibit.

Accepted For Advertising In Publications Of The American Medical Association

When she asks...

HERE ARE THE FACTS!

Most corrective, surgical and maternity brassiere problems have been scientifically solved by the staff of Physiospecialists at Cordelia of Hollywood.

THE GOLD MEDAL WINNER!

Each Cordelia brassiere is planned and made for easy, individual fittings by experts in local stores.

THE BLUE RIBBON WINNER!

Every Cordelia brassiere is a luxury in fashion fabrics — beautifully, youthfully designed. These are the facts judges took into consideration — then awarded *Cordelia the winner!*

ROBERT F. WERNER

Dr. Robert F. Werner, formerly of International Falls, died in Los Angeles, California, April 29, 1953. He practiced in Nevada City, California, from 1927 to 1932, in International Falls from 1933 to 1941, and in Minneapolis in 1942 before moving to California.

Dr. Werner was born at Center City, Minnesota, and graduated from the University of Minnesota Medical School in 1921.

Surviving are his wife, Elizabeth, and a son Robert, both of St. Paul.

WILLIAM FRANKLIN WILSON

Dr. William F. Wilson, a practitioner at Lake City, Minnesota, since 1893, died suddenly of a heart attack on May 29, 1953. He was eighty-eight years old.

Dr. Wilson was born in Jamaica, West Indies, October 5, 1864. He attended the medical department of Northwestern University, where he graduated in 1897. He took further study at Chicago Post Graduate School in 1899 and at New York Post Graduate in 1901. He acted as resident physician at the Minnesota School and Hospital for the Feeble Minded at Faribault from 1901 to 1904.

Dr. Wilson was secretary of the Wabasha County Medical Society continuously from 1896 until his death, except for one year when he served as president of the Society. He was automatically a member of the Minnesota State Medical Association and the American Medical Association.

Dr. Wilson served as a member of the United States Board of Pension Examiners. He was president of the Public Library Board from 1906 for many years.

Dr. Wilson is survived by a son, Arthur.

Tuberculosis is characteristically slow and insidious in its onset. A disease which has early and dramatic symptoms and makes its victims seek medical advice at once does not present the same difficulties of control as does a disease like tuberculosis. Robert J. Anderson, M.D., *Medical Papers of the Annual Meeting of the Canadian Tuberculosis Association,* May, 1951.

Of General Interest

Dr. J. Arthur Myers, professor of medicine and public health at the University of Minnesota, was the principal speaker at the Lyon County accreditation program, held April 20, in Marshall. To earn tuberculosis accreditation, Lyon County has met the two requirements—a low tuberculosis death rate, average of less than ten per 100,000 population annually for five years, and a low infection rate which is "sampled" by tuberculin testing all high school seniors in the county.

Dr. S. A. Slater, of Worthington, gave a report on Lyon County's recent tuberculin testing survey and presented the control accreditation certificate. **Dr. Kathleen A. Jordan,** of Granite Falls Riverside Sanatorium, presented certificates to the schools. **Dr. W. H. Valentine,** of Tracy, president of the Lyon County Tuberculosis and Health Association, was master of ceremonies.

* * *

Dr. John W. Gridley, of Arlington, was in charge of the program of the Arlington Parent Teachers' Association meeting, held April 20, in the high school auditorium. The program accented the health of the school child.

* * *

Dr. Clarence Paul Winchell, of the Heart Hospital, University of Minnesota Hospitals, presented case histories on heart disease in a speech to members of the Wright County Medical Society at their second clinical conference on cancer and heart disease, held in Howard Lake, April 14.

* * *

Drs. R. F. Pierson, D. Nywall, and **J. L. Bader,** of Slayton, attended the meeting of the Southwestern Minnesota Medical Society, held April 13 at Worthington.

* * *

The first in a series of eight lectures of a regional postgraduate seminar course, arranged for by the University of Minnesota, and sponsored by the Brown County Medical Society, was held April 7 at the Union Hospital in New Ulm. **Dr. Donald R. Lannin,** of Saint Paul, addressed the group on "Fractures in Children." **Dr. Lyle A. French,** of Minneapolis, gave the second lecture, April 14, "Head Injuries and Nerve Injuries." **Dr. O. B. Fesenmaier,** of New Ulm, is the local chairman of the course.

* * *

Dr. C. F. Cervenka, of New Prague, attended the annual meeting of the American Association of Railway Surgeons, held in Chicago the week of April 6.

* * *

Dr. Leong Hom, of Battle Lake, spoke at a public meeting on cancer sponsored by the Underwood Study Club, in the high school auditorium, April 16. The movie, "Breast Self-Examination," was also shown.

Dr. Edgar R. Sather, Alexandria, and **Dr. Edwin E. Emerson,** of Osakis, assisted in the Douglas County immunization program, sponsored by the county nurse, schools, and physicians, in April.

* * *

Dr. Joseph Buckley, of the Department of Anesthesiology, University of Minnesota, talked on anesthesia from a general standpoint, to the members of the Red River Valley Medical Society at their annual spring meeting held at Thief River Falls, April 21.

* * *

Dr. W. F. Mercil, of Crookston, attended the spring meeting of the State Obstetrics and Gynecology Society, held in Duluth, April 25.

* * *

Honored at the annual dinner of the American College of Physicians in Atlantic City, April 16, was **Dr. Howard A. Rusk,** New York, N. Y., winner of the Mutual of Omaha Dr. C. C. Criss Award. The award, a gold medal and a $10,000 honorarium, is presented annually as a memorial to the late Dr. C. C. Criss, founder of Mutual of Omaha. Dr. Rusk was chosen for the Criss Award from a field of 150 nominees by a board of judges, headed by **Dr. Charles W. Mayo,** of Rochester.

Dr. Edward C. Kendall and **Dr. Phillip S. Hench,** of Rochester, were winners of the 1951 Criss Award for their work with Cortisone.

The Criss Award is presented annually to the individual or individuals who have made outstanding accomplishments in the field of health or safety.

* * *

The first in a series of Family Doctors' Days was held April 29, at the University of Minnesota. The Family Doctors' Day series is sponsored in an effort to bring about a closer relationship between the medical faculty and physicians in active practice in the state, **Dr. Robert B. Howard,** director of medical education at the University, said. The program for the first session included **Dr. Wesley W. Spink,** professor of medicine, speaking on "Antibiotics in Medical Practice," and **Dr. C. J. Watson,** head of the department of medicine, on "Case Presentation." The program closed with a clinical-pathological conference staged by Dr. Watson and his staff.

* * *

Dr. Jack Delmore, of Roseau, president of the Red River Valley Medical Society, conducted the annual spring meeting of the society, April 21, at Thief River Falls.

* * *

Dr. G. K. Stillwell, of the University of Minnesota physiotherapy department, was guest speaker at the annual meeting of the Duluth Health Council, held April 21, in St. Luke's Hospital auditorium.

After All, You've Earned It

And now that you've earned it, what are you going to do with it?
(It's your money we are referring to)

First, of course, Operating Expenses must be paid . . .
Then Income Taxes . . .
Then Living Expenses . . .
Whatever remains is your Net Income, available for:
Insurance . . . Retirement . . . Savings . . . Investments . . . etc.

Your net income, wisely invested, works for you, also earns an income. What happens to this income?

Operating Expenses have already been paid . . .
So have Living Expenses . . .
Income Taxes, however, are something else . . .

If Your "Wisely-Invested" Funds Are Invested in Municipal Bonds the Income Is Exempt from All Present Federal Income Taxes.

Remember, an 8% taxable income, after taxes are paid, may be no more "net" income for you than a 3% tax-exempt income.

We can offer Municipal Bonds with yields of 4% or more.

Wangensteen, professor and chairman of surgery in the University of Minnesota Medical School, spoke on "Scholarship" at the annual dinner of Nu Sigma Nu Medical Foundation (Epsilon Chapter), held in the Minnesota Club, April 18. **Dr. E. S. Platou**, of Minneapolis, director of a scholarship fund drive of the foundation, also spoke. **Dr. Vernon D. E. Smith**, of Saint Paul, was toastmaster.

Cornerstone of a $100,000 Nu Sigma Nu Chapter House and Medical Foundation of the fraternity was laid at Oak and River Drive, Minneapolis, April 18. Participating in the ceremonies were Dr. Smith, who heads the building fund committee; **Dr. William Hartfiel**, Saint Paul Alumni Association and member of the National Executive Council, and **Dr. C. Naumann McCloud, Jr.**, of Saint Paul, secretary.

* * *

Dr. F. J. Kucera, and **Dr. James A. Blake**, of Hopkins, attended the University of Minnesota Continuation Center Course in gastroenterology on April 27, 28, and 29.

* * *

Dr. A. D. Larson, who practiced in the Herman vicinity for many years, was recently honored on the occasion of his ninetieth birthday at his home in California.

* * *

Dr. Carl Caspers, of Minneapolis, was guest speaker at the Clay-Baker County Medical Society meeting, which was held May 2, at the Detroit Country Club, Detroit Lakes.

* * *

Dr. M. E. Odland, of Detroit Lakes, talked on polio at the meeting of the American Legion Auxiliary, held April 27.

* * *

Dr. Olaf Lukk, and **Dr. Robert L. Wilder,** of Minneapolis, were awarded prize ribbons in the annual Northwestern Hospital art show, held the week of April 27.

* * *

Dr. John W. LaBree, clinical assistant professor at the University of Minnesota, spoke on "Essential Hypertension" at the fourth session, April 21, of the Southwestern Minnesota professional persons' medical meetings being held weekly in Marshall.

* * *

Dr. R. L. Anderson, who has been living in Rockford, Illinois, for the past year and a half, returned to Willmar in April, and is now associated with **Dr. L. J. Opsahl.**

* * *

Dr. Robert S. Hunt, who has been associated with his father, **Dr. R. C. Hunt,** in practice in Fairmont since 1940, left in May to practice in Portland, Oregon.

* * *

The American Medical Association has just published a pamphlet "A Doctor for Your Community" which is intended primarily for communities seeking a physician. It describes briefly the problem involved in obtaining a doctor, the things a community can do to attract and keep a doctor and examples of what has been done in various communities throughout the country.

* * *

Dr. Peter Murray, a Negro physician of New York, who has been serving as a member of the AMA House of Delegates, is the new president-elect of the Medical Society of the County of New York. He will take office in 1954. It is a post that no other member of his race has held in a medical society in the United States. Dr. Murray is director of the Department of Gynecology at both Harlem and Mount Sinai Hospitals in New York City.

Dr. Gerald T. Evans, director of the course in medical technology at the University of Minnesota, served as toastmaster at the annual dinner sponsored by Orbs, the campus honorary society in the field of medical technology, which was held in the ballroom of Coffman Memorial Union, May 14. **Dr. Wesley M. Spink,** professor of medicine, University of Minnesota, and **Dr. E. M. Brown,** medical technology faculty, were guest speakers.

* * *

The Epsilon Chapter of Alpha Epsilon Iota, natonal medical sorority, was host to 153 women, licensed to practice medicine and living in Minnesota, at a buffet supper in the Hotel Saint Paul, May 17, to celebrate the 100th anniversary of the Minnesota State Medical Association. **Dr. Lillian Mayer Fink,** of Minneapolis, was general chairman. Other committee heads were **Dr. Eva Jane Ostergren Larson** and **Dr. Cherry Cedarleaf,** of Saint Paul; **Dr. Emma Nickelsen Fronk, Dr. Helen Knudsen, Dr. Eleanor Iverson Gunlaugson, Dr. Olga Hansen Litzenberg,** and **Dr. Catherine Corson West,** all of Minneapolis.

* * *

Dr. S. Steven Barron, of Minneapolis, recently became engaged to Miss Lynn Keldan, of Chicago. Dr. Barron was graduated from the University of Minnesota Medical School and is now a member of the clinical faculty.

* * *

Dr. Paul Heise, of Winona, spoke to the members of St. John's Parent Teachers' Association on "Children's Diseases," at the meeting held May 8.

Dr. Heise is a staff member of the Heise Clinic of Winona which was featured in an article by Irving Wallace in the May edition of *Better Homes and Gardens.*

* * *

Dr. Carl Bretzke, a graduate of the University of Minnesota Medical School, will join the Klefstad Clinic at Greenbush, July 15.

* * *

Dr. Gordon R. Kamman, of Saint Paul, spoke to the members of the Women's Auxiliary of the Minnesota State Medical Association, at a luncheon held in Saint Paul, May 19, during the 100th Anniversary Convention of the Medical Association.

* * *

Dr. George Earl, of Saint Paul, was one of seven alumni of the University of Minnesota to receive an outstanding achievement award on May 22, 1953, at the hands of President Morrill. Dr. Earl is chief of staff of the Midway Hospital, Saint Paul. He is also the head of the Earl Clinic, Saint Paul, and one of the delegates to the American Medical Association House of Delegates. He has been for a

Dr. William B. Hildebrand, Menasha, Wisconsin, was chosen president-elect of the American Academy of General Practice at the annual meeting of the Academy, held in St. Louis in March. He has been secretary-treasurer of the Wisconsin Academy of General Practice since its inception and has just retired as president of the board of directors of the Academy.

* * *

At a meeting of the Blue Shield, held May 18, 1953, the following were re-elected to the Board of Directors: **Drs. O. I. Sohlberg,** Saint Paul, president; **R. R. Crammer,** Minneapolis, vice president; **C. A. McKinlay,** Minneapolis, secretary; and **E. C. Bayley,** Lake City, treasurer.

According to Arthur M. Calvin, executive director of the Minnesota Blue Shield, some 560,000 persons or one out of every six Minnesotans are now carrying medical insurance in the Minnesota organization. A total of $3,600,000 has been paid out in benefits to Blue Shield subscribers during the past five years.

* * *

Dr. J. H. Reinhardt, of Alexandria, left early in May for military duty with the Army Air Force. He reported to Guenther Air Force Base at Montgomery, Alabama, for training. During World War II, Dr. Reinhardt served with the army as a private, completing his medical education after his discharge from the army.

* * *

Dr. Byron Cochrane, of Saint Paul, was among those awarded useful citizen citations at the Macalester Alumni Association's annual meeting, held May 29, at Macalester College.

HOSPITAL NEWS

St. Joseph's Hospital in Brainerd opened its doors officially on April 20, 1953. It is one of the largest hospitals to have been built with federal assistance under the Hill-Burton Act, having a bed capacity of 129 beds and 24 bassinets.

The Hospital is operated by the Sisters of the Order of St. Benedict with Sister Adalbert, O.S.B., as superintendent. The new hospital replaces one which has been operated by the Benedictine Sisters of Brainerd for the last fifty-three years. The building is fireproof and its facilities are said to be as fine as those of any hospital of similar size in the country.

* * *

On Saturday and Sunday afternoon, May 9 and 10, 1953, the new wing of the *Charles T. Miller Hospital* in Saint Paul was open for inspection to contributors and friends of the hospital. The new wing has been named for Dr. Harry B. Zimmermann who has been

a member of the Board of Trustees of the hospital since its founding. This was a stipulation made by the late Louis A. Hill contingent on his contribution of $500,000 to the hospital.

As a result of the expenditure of $2,608,000 the new wing was built. This added eighty-seven new private rooms for patients, each with toilet facilities, air conditioning, oxygen, suction apparatus and communication system connecting patient and desk nurse. The addition furnishes new and spacious quarters for the laboratory and x-ray department, operating rooms, pharmacy and central supply department. The sixth floor has been extended and rebuilt for use as a psychiatric unit.

* * *

Dr. P. A. Mattison was elected chief of the *Winona General Hospital* for the coming year, at the May meeting of the medical staff. Dr. L. I. Younger was elected vice president; Dr. Philip Heise, secretary, and Dr. J. A. Tweedy, chairman of the executive committee.

* * *

Dedication ceremonies for the new million dollar *Bethesda Hospital* in Crookston were held Sunday, April 26. Featured speakers were Dr. Robert N. Barr, chief of special services, Minnesota Department of Health, and Dr. Helen Knudsen, also of the division of special services.

The new Bethesda Hospital with its seventy-seven-bed facilities, gives Crookston the maximum number of beds allowable by the Minnesota Department of Health. St. Francis Hospital, also comparatively new, has 140 beds.

* * *

The Yale University School of Medicine has obtained a grant of $2,500,000 from the Commonwealth Fund of Connecticut for the construction of a dormitory for both single and married medical students to be known as the Edward S. Harkness Memorial Hall. It will be located adjacent to the Sterling Hall of Medicine and the Grace-New Haven Community Hospital.

The Memorial Unit of the Grace-New Haven County Hospital which added facilities for 327 patients, a nurses' home, laundry, and dietary facilities for the entire hospital at a cost of $9,000,000, was completed and dedicated in February. This unit increases the bed capacity of the hospital to 805.

* * *

The Centennial celebration of *St. Joseph's Hospital,* Saint Paul, which occupied two days, Saturday and Sunday, May 16, 17, 1953, was most satisfactory in every way.

The scientific program which was held on Saturday was highlighted by visiting luminaries in the persons of Sir Alexander Fleming, the discoverer of penicillin, Dr. Philip S. Hench, the discoverer of cortisone, both Nobel prize winners, and Dr. Richard R. Trail, director of Papworth Village Settlement, London. The afternoon session was open to the public who took advantage of the opportunity to become informed. Names of the other prominent members of the profession who took part in the celebration both days appear in the complete program which was published in our April issue.

Some 600 friends of St. Joseph's Hospital assembled on Saturday evening for the banquet at the Saint Paul Hotel. The program following the banquet was carried out with ability and dispatch by the toastmaster, the very Reverend George E. Ryan, Rector of the Cathedral of Saint Paul. The group of songs by Lucine Amara, soprano of the Metropolitan Opera Company, were fully appreciated. Greetings from representatives of state, city and hospital organizations and addresses by Dr. Harold L. Foss, president of the American College of Surgeons and the most Reverend John Gregory Murray, Archbishop of St. Paul preceded the musical numbers.

The July issue of MINNESOTA MEDICINE will be devoted to addresses presented at the St. Joseph's Centenary.

* * *

The remodeling and expansion of *St. Luke's Hospital,* Saint Paul, which was completed within the year, cost $906,938. Of this amount, $706,958 was obtained by pledges. The balance was met by increasing the mortgage to $200,000.

The new wing which now houses operating rooms, x-ray department, laboratory, the obstetrical unit, and laundry, cost $405,335; the new heating plant, $144,481; new elevator, $42,825; and remodeling the old building, $157,754. One hundred thousand dollars was spent for new equipment.

* * *

The Ancker research unit was officially dedicated at 3 p.m. Monday, May 25, 1953. The one-story air-conditioned brick structure adjoining the Ancker Hospital in Saint Paul is windowless and consists of x-ray department, laboratory, operating room, office, and kennels. It represents an outlay of approximately $130,000 of which $60,000 was contributed by the Ramsey County Welfare Board, the balance by private subscription. The Welfare Board has also agreed to contribute $30,000 yearly for its support. Mr. George Vavoulis has been chairman of the fund-raising committee but Dr. Ivan D. Baronofsky, associate professor of surgery at the University of Minnesota, has spearheaded the project. This research unit at Ancker Hospital is the fifth to have been established in Minnesota. Already in operation are those at St. Joseph's Hospital, Saint Paul, the University Hospitals, Veterans Hospital, and the Mayo Clinic.

Participating in the dedication were Michael T. Ettel,

P&H ®

FOR THE MEDICAL AND HOSPITAL PROFESSION

Physicians & Hospitals Supply Company, Inc.

1400 Harmon Place • Minneapolis 15, Minnesota

chairman of the Welfare Board; Mayor John Daubney, of Saint Paul; Dr. T. E. Broadie, superintendent of Ancker Hospital; Dr. Victor Hauser, acting chairman of the surgical staff at Ancker Hospital; Dr. Baronofsky, and Mr. Vavoulis. Participating from the University of Minnesota were: Dr. Harold S. Diehl, dean of the University of Minnesota Medical School; Dr. Owen H. Wangensteen, chairman of the surgical department of the University; Dr. Maurice B. Visscher, head of the Department of Physiology at the University, and Dr. Frank Mann, director of medical research at the Mayo Foundation, Rochester, Minnesota, who made the principal address. He called attention to the epoch-making discovery of bacteria by Pasteur, the applications of the discovery to surgery by Lister, and the institution of anesthesiology a hundred years ago. These were the foundation stones that made modern medicine and surgery possible. It was animal experimentation, however, which contributed in large measure to medical advance during the past century. Dr. Mann told of the development of research in Minnesota and how his research began in the year 1913 at the time of the meeting of the American Medical Association in Minneapolis. He asserted that the main purpose of a research laboratory is to keep alive the spirit of research with emphasis on quality rather than quantity of the work performed.

Following the presentation of certificates to the project donors, those in attendance visited the new research unit.

* * *

MINNESOTA BLUE CROSS-BLUE SHIELD

The completion of the first quarter of operation in 1953 has provided an opportunity to evaluate the progress of Minnesota Blue Shield and to make a comparative study of the first quarter of 1953 and the first quarter of 1952. This analysis discloses that Blue Shield payments to doctors of medicine in the State of Minnesota were approximately 20 per cent higher during the first quarter of 1953 than they were during the first quarter of 1952. It also indicates that the load of claims being processed has now risen to a monthly average of approximately 12,000 claims. Factually, then, during the first quarter of 1952, approximately $914,000 was paid to doctors of medicine by Minnesota Blue Shield while for the same period of 1953 these payments amounted to $1,089,000. From this it is apparent that at least during the first quarter of 1953 Blue Shield benefits are averaging approximately $60,000 per month more than they did in 1952.

These increases in Blue Shield payments are to a large extent the result of the liberalization of the Schedule of Payments and the changes in the contract which went into effect on October 1, 1952. This liberalization has had the effect of increasing the benefits more than 10 per cent without any increase in the premium charged for the contract. Not only was the Schedule of Payments increased and broadened in scope but likewise certain revisions were made in the contract itself in order to keep pace with changes occurring in the practice of medicine. These modifications of the contract included coverage for some items not previously covered as well as providing protection against the possi-

bility of abuses so as to permit the income to be used in areas of greatest benefit to the subscriber.

The increase in the number of claims being processed now as compared with 1952 is also particularly illuminating inasmuch as the processing of these claims is being accomplished without additional administrative employes yet on a sound procedural basis with the continued elimination of "red tape."

With the increased number of claims resulting in a heavier work-load, acquisition of additional clerical personnel is neither contemplated nor considered necessary. Therefore, the cost of processing claims on a per claim basis is rapidly being reduced. This is also an indication that efficient methods are now in use and that the personnel in the Claims Department is productive. It should be pointed out that on October 1, 1952, the contract was revised and new benefits were added for services rendered on or after that date. This, in effect, increased the work load by requiring claims processing under two different contract clauses at times and two different Schedules of Payments. Fewer complaints and criticisms, relatively less correspondence, and a better understanding of the Blue Shield contract by physicians has resulted from the revised methods now in use.

Significant then are these facts: (1) Benefits in 1953 based upon the amounts paid in the first quarter may exceed four and one-half million dollars. (2) Costs of administration are now remaining stable in spite of an increased work load.

It can thus be noted that Minnesota Blue Shield as the doctor's instrument for providing high-grade prepaid medical care at a cost which people can afford is accomplishing its purpose at a more rapid pace than has previously been anticipated. The continued co-operation of Minnesota doctors of medicine through the constant promotion of Blue Shield and its enrollment will provide a sound basis for its further development.

"A total of $3,659,143 in benefits have been paid out for Blue Shield subscribers during the past year," Arthur M. Calvin, executive director of the Minnesota Blue Cross-Blue Shield plans announced at the Blue Shield annual meeting held at the St. Paul Hotel on Monday, May 18, 1953.

The executive director also announced that 560,000 persons—one out of every six Minnesotans, are now enrolled in the Blue Shield medical-surgical maternity plan.

Re-elected to the Board of Directors at the annual meeting of the members for a three-year period were: C. M. Bagley, M.D., Duluth; E. M. Hammes, M.D., Saint Paul; P. S. Hoeper, M.D., Mankato, and C. A. McKinlay, M.D., Minneapolis.

Re-elected officers of the Board of Directors at the annual meeting were: O. I. Sohlberg, M.D., Saint Paul, president; R. R. Cranmer, M.D., Minneapolis, vice president; C. A. McKinlay, M.D., Minneapolis, secretary, and E. C. Bayley, M.D., Lake City, treasurer.

The board of directors voted to increase benefits under the Blue Shield contract without any increase in rates. The Blue Shield benefits to be increased will be announced at a later date.

"Living in Balance" is written with a positive approach to understanding yourself and those about you.

It is very readable and will hold the interest of anyone wishing to improve personality.

F.A.

ROENTGENOLOGIC DIAGNOSIS OF DISEASES OF BONES. By David G. Pugh, Assistant Professor of Radiology, Mayo Foundation, Graduate School, University of Minnesota; Consultant, Section on Roentgenology, the Mayo Clinic. 316 pages. Illus. Price, $5.00. New York: Thomas Nelson & Sons, 1951.

The fact that this book is reprinted from Nelson's loose leaf "Diagnostic Roentgenology" alone speaks for its nature. Dealing with bone lesions other than those produced by trauma, the material covered is presented completely and concisely. Since the radiologist is primarily a clinical consultant, each subject is introduced by its clinical manifestations which in turn are reflections of the basic physiological and pathological aspects of each disease. This is a refreshing approach in a roentgenologic work. The material covered is clinically practical having been drawn from the files of the Mayo Clinic, and, while including descriptions of such rare conditions as ochronosis and Fanconi's syndrome, it gives adequate attention to arthritis, congenital dislocation of the hip joints and other lesions seen oftener by the doctor. The way in which each subject is presented more or less independently enhances the value of the book and the scarcity of elaborate tables and classifications adds to its readability.

The book has already established itself in radiological and academic circles and can be recommended widely to all those interested in the x-ray diagnosis of bone lesions.

Leo A. Nash, M.D.

BRAIN SURGEON: The Autobiography of William Sharpe. By William Sharpe, M.D., Director of Neurosurgery, Manhattan General Hospital, New York; Life Fellow American College of Surgeons and New York Academy of Medicine. 271 pages. Price $3.75. New York: The Viking Press, 1952.

It is good to see a doctor's autobiography again, since these works are first hand histories of medicine and, also, provide entertaining reading. In the case of the autobiography of Doctor William Sharpe, both of these conditions are satisfied. Beginning in the classic manner as the son of a minister who started his career at Harvard University with the then existing equivalent of an athletic scholarship about 1900, he takes the reader through a colorful professional life as student, teacher, pioneer neurosurgeon and humanist. Among his friends and professional contacts we find many of the great medical men, to mention only Bilroth, Waldeyer, Lassar, Cushing and Dandy among others. He was an undergraduate classmate of Franklin Delano Roosevelt and in his later years met both Hitler and Stalin. His experiences are world-wide and at times actually seem to rival those of Walter Mitty. Pioneering in the practice of neurosurgery in New York City and numerous very

human incidents are cited indicating a full life professionally and otherwise ending with the philosophies of a humanist. But, what else could one expect from anyone exposed to such experiences? Lay reviewers have described Dr. Sharpe as a connoisseur of living but this is only a lesser aspect of the man as we interpret his life. Aside from not having real literary value, the only criticism we find is the presentation of a controversial matter on the etiology and prophylaxis of cerebral palsy which lay readers cannot evaluate failing to understand that there are honest differences of opinion in medicine. This does not detract from the value of the book, however, and it is fully recommended as diversional reading for doctors, particularly by those who can be classed as his contemporaries.

Leo A. Nash, M.D.

ALLERGY IN RELATION TO OTOLARYNGOLOGY. French K. Hansel, M.D., M.S., F.A.C.A., Editor-in-Chief, Annals of Allergy; Director of The Hansel Foundation; Associate Professor of Otolaryngology, Washington University School of Medicine. Panel Discussion. 77 pages. Price $2.50. Saint Paul: Bruce Publishing Co., 1949.

This book consists of an initial discussion of the subject material by Dr. Hansel. Various aspects of the subject are then discussed in turn by a panel of nine other men who are well known otolaryngologists and allergists.

The importance of this discussion is brought out by the high percentage of patients reporting to these doctors with nasal symptoms, who were found to have an allergic etiology. Dr. Hansel has clearly described his technique for staining the nasal and sinus secretions for eosinophils. This is followed by colored plates and a method to be used in evaluating the results obtained from these stained smears.

This book is an official publication of The American College of Allergists, Inc.

Donald W. Koza, M.D.

HOW TO GET A DOCTOR—BOOKLET AVAILABLE SOON

A new pamphlet—"A Doctor for your Community"—will be published some time this month by the American Medical Association. This booklet, directed toward communities seeking a physician, describes briefly the problems involved in obtaining a doctor, the things a community can do to attract and keep a doctor, and examples of what has been done elsewhere. A joint project of the Council on Medical Service, Council on Rural Health and Department of Public Relations, the booklet will be available to state medical societies for distribution to communities listed with their placement services.

In addition, the Council on Medical Service has compiled information from numerous state placement services in a reprint which will be especially useful to state societies interested in expanding their activities in this field.

DOCTOR . . . *This is Your Hospital and Your School of Neuropsychiatric Nursing*

(By that we mean that not only have these institutions undertaken to constitute a haven of help for patients, but they form, in your interest a *remarkable facility for you professionally.)*

View of hospital, school, buildings and environs, 7 minutes from downtown Minneapolis

A COMPLETE NEURO-PSYCHIATRIC HOSPITAL

Up-to-date in all respects, new, functional buildings, set in spacious grounds, rehabilitation center, electroencephalography, therapies, laboratory. One of the largest neuro-psychiatric staffs in the United States. A voluntary, non-profit, non-sectarian institution of which this region may be proud.

SCHOOL FOR NEURO-PSYCHIATRIC NURSING

To offset the existing universal shortage of nurses, Glenwood Hills conducts a one-year course in neuropsychiatric nursing. You have observed the skill and attitudes of our graduates and trainees. Recruit one or two in behalf of your profession as a "contribution" stipulating that we send them back to you when trained. We will. Meanwhile tuition, room and board are free.

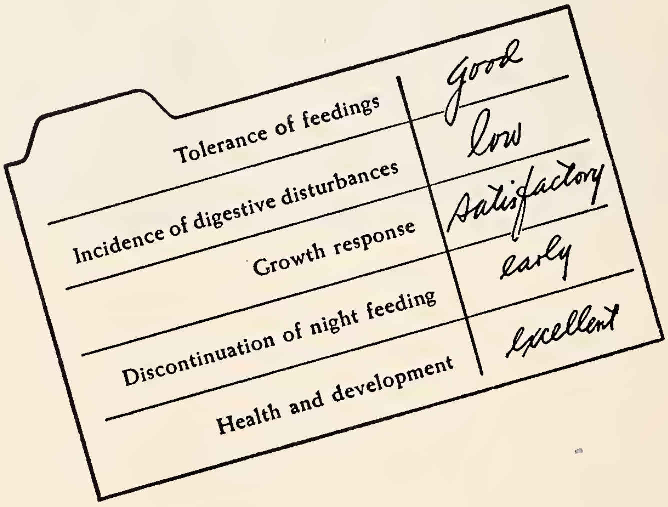
uncomplicated progress...



Tolerance of feedings	good
Incidence of digestive disturbances	low
Growth response	Satisfactory
Discontinuation of night feeding	early
Health and development	excellent

The uncomplicated nutritional progress[1] of infants fed Lactum® speaks for its sound rationale. Lactum is Mead's liquid formula made from whole milk and Dextri-Maltose.® It provides generous milk protein for sturdy growth and sound tissue structure, with sufficient calories to spare protein and meet the infant's energy needs.

Lactum is convenient and easy to prepare—simply mix equal parts of Lactum and water for a formula supplying 20 calories per fluid ounce.

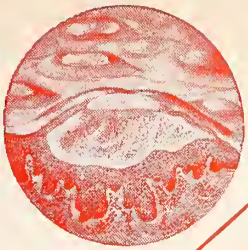
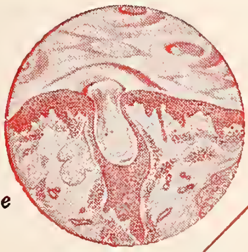
impetigo



skin infections and antibiotics

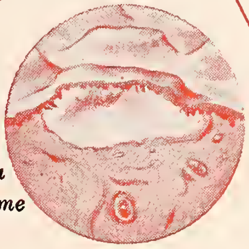
acne



pyoderma

folliculitis

erythema multiforme



Since cutaneous bacterial infections "probably account for more disability than any other group of skin diseases,"[1] the availability of broad-spectrum Terramycin has been particularly helpful in controlling these common disorders. This pure, well-tolerated antibiotic is markedly effective against the wide range of organisms often implicated as primary or secondary pathogens in skin disease. Successful clinical experience[2,3,4] in the treatment of impetigo, acne, pyodermas, erythema multiforme and other cutaneous infections recommends the selection of Terramycin as an agent of choice in common diseases of the skin. Terramycin is supplied in convenient oral and intravenous dosage forms.

Meat and its applicability in the Dietary Management of Atherosclerosis

Contrary to the former belief that serum cholesterol levels are primarily related to ingested animal fat and consequently to dietary cholesterol, it now appears that the total amount of fat in the diet, not its source or cholesterol content, is a more important factor in determining the blood cholesterol concentration.[1,2,3,4] Clinical observation has shown that ingestion of vegetable fat—which contains no cholesterol—will, like fats of animal origin, raise the serum cholesterol level.[3,5]

Recent basic research on the influence of fats and cholesterol on human health has done much to further progress in the fight against atherosclerosis. It will serve well in dispelling the mistaken fear that reasonable amounts of foods of animal origin predispose the individual to this vascular disease.[6] As a matter of fact, a dietary inadequate in essential nutrients but providing too many calories and too much fat from *any* source may well be an important factor underlying the deposition of fat and cholesterol in the arteries and liver.

Cumulative evidence indicates that lowered blood levels of cholesterol may be effected by restricting the total fat intake.[1] Except in instances of refractory hypercholesteremia, in which a daily fat intake as low as 10 Gm. may not reduce cholesterol levels to normal, diets containing 20 to 30 Gm. of fat, or even more, often produce low cholesterol blood levels. In the clinical application of this principle, various palatable, low fat diets which supply three servings of meat daily (containing 18 Gm. of fat) have recently been suggested for the dietary management of arteriosclerosis and for enlisting the cooperation of patients.[1] The meat servings were chosen from a large variety of cuts and kinds of meat (fat trimmed off, as lean as possible). Meat adds to the eating appeal of the fat-restricted diet and contributes important amounts of biologically complete protein, the B group of vitamins including B_{12}, and food iron—all of which are important for a good state of nutrition in the atherosclerotic patient.

To open congested air passages in hay fever

NEO-SYNEPHRINE®

HYDROCHLORIDE

. . . reduces nasal engorgement . . .

. . . promotes aeration . . . encourages drainage

A few drops of Neo-Synephrine 0.25% in each nostril will promptly check mucosal engorgement and hypersecretion, promoting greater breathing comfort over a period of several hours.

The resultant relief to the hay fever sufferer is decidedly gratifying. Prolonged action of Neo-Synephrine makes fewer applications necessary, consequently longer periods of rest and sleep are possible.

Neo-Synephrine does not lose its effectiveness on repeated application and may, therefore, be relied upon to give relief throughout the hay fever season.

Neo-Synephrine is practically free from sting and compensatory congestion; does not appreciably inhibit ciliary activity. Neo-Synephrine has been found relatively free from systemic side effects such as nervous excitation, cardiac reaction or insomnia even when tested on hypertensive, cardiac and hyperthyroid patients.[1]

Supplied in 0.25% solution (plain), bottles of 1 oz., 4 oz. and 16 oz.; 0.25% solution (aromatic), bottles of 1 oz. and 16 oz.; 0.5% solution, bottles of 1 oz.; 1% solution, bottles of 1 oz., 4 oz. and 16 oz.; 0.125 (1/8)% solution, bottles of 1/2 oz.; 0.5% water soluble jelly, in 5/8 oz. tubes.

WHEN DIETARY SUPPLEMENTATION IS NEEDED...

what more could a supplement provide?

If the concept of an ideal dietary supplement could be formulated, it might well be one that provides qualitatively every substance of moment in human nutrition. It would provide those for which human daily needs are established as well as others which are considered of value, though their roles and quantitative requirements remain unknown.

How Ovaltine in milk approaches this concept, and how well the recommended three glassfuls daily augment the nutritional intake, is shown in the appended table. The two forms of Ovaltine available—plain and chocolate flavored—are closely alike in their nutrient values.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

The Personalized Duplicate-Six Receipt Book is handy and simple to use. Each book contains 504 white receipts with the doctor's name, profession, address and phone number and 504 yellow duplicates. There are 6 receipts to the page, slot hole perforated for easy detachment. The book lies flat when opened. Size of the book is 8½" x 11" to fit into desk drawer or cabinet; size of individual receipts is 3" x 5". Two sheets of full-size carbon paper are included in each book.

NOTE: When ordering, please be sure to give name, profession, address and phone number, which will be printed on each of the 504 white receipts. Order a supply of M-753a P & H Duplicate-Six Receipt Books now.

1 *to escape pollens*

2 alternatives for the hay fever patient

2 *to relieve symptoms*

Pyribenzamine®
hydrochloride
(tripelennamine hydrochloride Ciba)

Once atop Pike's Peak, your hay fever patient can enjoy freedom from pollens. But for patients who must remain in a high-pollen environment, you can institute this effective therapy: one or two Pyribenzamine tablets, 3 or 4 times daily.

Alone and as an adjunct to desensitization, Pyribenzamine has proved effective in relieving hay fever symptoms, as evidenced by thousands of published case reports. On the basis of this evidence, no other antihistamine combines greater clinical benefit with greater freedom from side effects.

For your prescription needs, Pyribenzamine 50 mg. tablets are available in bottles of 100 and 1000 at all pharmacies.

'Carbo-Resin' Therapy Simplifies Control of Edema

- Permits more liberal salt intake, enhances palatability of diet
- Safely removes sodium from intestinal tract and prevents its reabsorption
- Decreases the frequency of need for mercurial diuretics by potentiating their effectiveness
- May be lifesaving therapy for patients who have developed a resistance to mercury
- Useful in congestive heart failure, cirrhosis of the liver, edema of pregnancy, hypertension, or whenever salt restriction is advisable

Eli Lilly and Company
Indianapolis 6, Indiana, U. S. A.

Suspended in orange juice

Lilly

Baked into brownies or cookies

Blended into gelatin dessert

Variety is the key to palatable 'Carbo-Resin' therapy.

'Carbo-Resin,' Unflavored, may be incorporated into cookies, fruit juices, and desserts. Printed recipes for your patients are available from the Lilly medical service representative or direct from Indianapolis. A book containing low-sodium diets is also available for distribution to patients.

CAUTION: 'Carbo-Resin' is supplied in two forms—flavored and unflavored. Only 'Carbo-Resin,' Unflavored, is suitable for incorporation into recipes.

ST. JOSEPH'S HOSPITAL
1853-1953

ROBERT ROSENTHAL, M.D.
Saint Paul, Minnesota

ANY INSTITUTION may be justly proud of a full century of unselfish devotion to the cause of humanity. This is especially true of an organization which began in a small, humble manner and, despite obstacles and periods of intense difficulty, persisted in growing with its community and in meeting demands made upon it.

With the exception of the military hospital at Fort Snelling,[1] St. Joseph's Hospital is the oldest institution dedicated to healing in Minnesota. St. Joseph's, for one hundred years, has served not only the thriving city of Saint Paul, but has also extended its benefits to the surrounding country. From the time when the great St. Croix valley was the mecca of lumberjacks to the present when a town has become a city and a wilderness valley has been transformed into a rich agricultural area, St. Joseph's Hospital has stood strong and steady to minister to the hurt and the sick.

The story of those four sisters of the Order of St. Joseph of Carondelet who had come to Saint Paul to teach the alphabet and to perpetuate the faith is well known. The names of Mother St. John Fournier, Sister Philomena Vilaine, Sister Francis Joseph Ivory, and Sister Scholastica Vasques are an imperishable symbol of man's humanity to man and form the very foundation stones of the institution we know as St. Joseph's Hospital. These nuns, together with His Grace Bishop Joseph Cretin—spiritual rector and philanthropist—these devoted servants of the Church recognized the need for a hospital in Saint Paul.

This need had become evident before 1853. The early 1850's in the North Country was a period of great immigration. Thousands of men and women and children disembarked from river boats at Saint Paul's lower landing to make new homes for themselves in a territory that soon was to become a state. Among these early arrivals was Dr. John Day.[2] His, perhaps, was the earliest vision for a hospital. Day even reached the point of securing a site and fencing it in. He purchased building materials and caused them to be hauled to the chosen location. But he never realized his dream, and when he knew that he could not go forward with his plans, he disposed of lot and materials to Bishop Cretin. And it was the Bishop who undertook to raise the structure, a four-story stone building that was begun early in 1853.

The erection of this hospital was no easy task in a frontier community. Saint Paul's population numbered less than 1,500 in 1853. The territory of Minnesota was sparsely settled, too. No railroad crossed the land. Goods and supplies had to be transported by ox carts, by stages, or on the

---

The writer of this history leaned heavily upon the excellent history of St. Joseph's Hospital by Dr. John M. Culligan and Dr. Harold J. Prendergast, "St. Joseph's Hospital in St. Paul," published in *Acta et Dicta*, Vol. VI, 1934, the "History of Medicine in Ramsey County" by Dr. John Armstrong, MINNESOTA MEDICINE, October, 1938 through October, 1939, and "The Asiatic Cholera in St. Paul" by the same author, MINNESOTA MEDICINE, December, 1942 through February, 1943.

[1] In 1855, the Christ Church Orphans' Home and Hospital opened on Park Place. After being closed for a period, it reopened in the early 60's and later reorganized as St. Luke's Hospital. Prior to 1870 St. Joseph's and St. Luke's Hospitals were the only hospitals in St. Paul. The Free Hospital for the Poor established about 1860 under the auspices of St. Paul's Episcopal Church was rather a home for infirm aged than a hospital. The City and County Hospital was opened in 1882.

[2] "The Catholic Church in the Diocese of St. Paul" by James Michael Reardon, P. A., 1952.

waterways.[3] But water routes were open only from late spring until the beginning of grey winter. Saint Paul certainly was a real frontier community, endowed with all the shortcomings and hardships of the primitive settlement, but also infused with the enthusiasm and hope that characterized the American West.

Under these pioneer conditions, Bishop Cretin raised his hospital in one and a half years. When, in the early months of 1853, His Grace laid the cornerstone, he was not quite certain in his own mind whether the building to come would house a hospital or a college.[4] It would be a hospital if sufficient sisters could be found to nurse the sick; it would be a college if nursing sisters were unavailable. Either way, the institution would serve a human need.

The question of hospital or college must have been answered toward the close of 1853, for in November the *Minnesota Pioneer* published a short business directory. This directory included "One Catholic Hospital," which, it cannot be doubted, referred to St. Joseph's. (The directory, you may be interested to know, also listed three newspapers, seven churches, fourteen physicians, two dentists and—two wholesale liquor stores.) Another issue of the *Pioneer* in the same month described the Catholic Hospital as a "large stone edifice near the Capitol built for the Sisters of Charity. It is not yet finished, but is nearing completion." By the beginning of winter in 1853, the building was enclosed and roofed. It appeared so large and ample that some individuals felt it could provide space not only for the hospital, but also for an orphan asylum and a separate and independent novitiate for the Sisters. Construction slowed during the heavy winter months and when spring came the structure still was not completed.

The first dramatic need for St. Joseph's came before accommodations were available. The Asiatic cholera made its appearance in Saint Paul. The disease was not entirely unknown, for sporadic cases had been seen and reported in 1849. But it was in 1854 that cholera attained almost epidemic proportions. In spite of the silence of newspaper editors, Saint Paul citizens knew what was transpiring and were apprehensive. A Board of Health was established, but very little is known of its deliberations and actions as only one report—that of June 11, 1854—has been preserved for us. Perhaps Saint Paul newspapers intentionally soft-pedaled the seriousness of the cholera epidemic in order not to interfere with the active immigration of the time.

No building was available in which to house victims of the disease. Bishop Cretin, therefore, proposed to the Board of Health that "the city could have the use at a reasonable expense, of ample apartments in the hospital now in process of erection under his superintendence as soon as it was finished, which he thought would be by the first of July." The need, however, was immediate, and an old log church on Bench Street, the original Chapel of Saint Paul which was erected in 1841 and which was being used as a school, was transformed into a small cholera hospital. We might, therefore, look upon this revered little log building as the real origin of St. Joseph's Hospital.

The makeshift hospital on Bench Street "scarcely sufficed for the wants of the neediest among the sick, and the generous labors of the Sisters of Charity were restricted."[5] Saint Paul, therefore, must have been unusually joyful when the new building was dedicated solemnly on September 19, 1854, and when it was promised that the hospital would be opened early in October.

The hospital was situated on Ninth Street, "on a beautiful plateau planted with trees." It possessed a "commanding view of the city and of the Mississippi River."[6] The hospital's location was described as "the most healthy and beautiful." Dr. Day had chosen the site well, for it was on a plateau high enough to rise above an area of swampy land bounded by West Fourth Street, Pleasant Avenue, St. Peter Street, and Ninth Street. A brook running from Rice Street passed near the hospital to angle off toward Seven Corners.

Photographs of the late 1850's and early 1860's show that St. Joseph's possessed a fourth story, which contemporary accounts sometimes referred to as the attic. This original building occupied the location of the main structure of the present institution. Here in this first hospital were arranged the early floor-plans. In the basement were utility rooms, the kitchen, a dining room for hired help, and the laundry. A vegetable cellar was handy. In addition to a parlor, community refectory, assembly rooms, and chapel, the first floor also had two wards. On the second floor were a ward for men and another for women, two private rooms, and a drugroom. Up a flight of stairs were to be found wards for women and the Sisters' dormitory. And the fourth or attic floor was reserved for mental cases (usually delirium tremens), but included also ward space. Along the front of each of the first three stories ran a porch. Two small brick buildings—one to the southeast and another to the southwest—served from time to time a variety of purposes: school, doctor's residence, contagion wards during epidemics, morgue, and ice house.

---

[3] The railroad came as far as Galena in 1854 and did not reach Saint Paul until about ten years later.

[4] Bishop Cretin had been designated Bishop of Saint Paul in 1851. It is believed that he contributed financially to the building of the hospital because he had received 10,000 francs from his family in France and there is no official knowledge or record of what he did with his money.

[5] *Minnesota Democrat*, September 20, 1854.

[6] *Weekly Pioneer and Democrat*, February 17, 1859, and Saint Paul City Directory, Newson and Barton Publishers, Saint Paul, 1858-1859 . . . Hospital of St. Joseph's.

This brand-new institution, although primitive by today's standards, was thought most modern in those far-away days of the 1850's. Comment was made on the hospital's neatness, its orderly arrangement, its air of comfort, its healthy cleanliness. And wonder of wonders—there were bathrooms on each floor.[1] Citizens of Saint Paul were most impressed, but the plain truth is that water was carried to each floor by means of a force pump of the antique type used on old fire engines.[7] It took four sisters to supply the force —and back-breaking work it was. Such were "modern" conveniences in the mid-nineteenth century!

An 1855 report tells that nine patients were being cared for in St. Joseph's and affirms that care was most satisfactory. The hospital was praised as a "work of charity and benevolence, which stands out in bold relief, a monument to the projector, of faith, hope, and good will to all mankind." This was as it should be, and the same words could well be applied to St. Joseph's today.

One of the curious sidelights of this story of a great hospital concerns a school for girls which was attached to the hospital and which opened on January 1, 1855. Apparently a brick building had been erected near the southeast corner of the hospital between 1853 and 1855. This was the school which was giving instruction to thirty pupils by February, 1855. The hospital itself was caring for the same number of orphans, the largest group of this type in any of the several institutions managed by the Sisters of St. Joseph.

It is a little difficult to find reliable figures as to the number of patients in the hospital in this pioneer period, but it is known that poor patients were received as far as money permitted and that a "skillful physician will visit the hospital at least every other day." Apparently, only one physician was in charge of the hospital at a time. The physician referred to here was Dr. S. Willey. Private patients, of which there were relatively few, paid eight dollars a week. This eight-dollar fee for a private room included physician's care, nursing by the sisters, medicines, and, of course, fuel and light.[8] This charge was considered reasonable even for the year 1855. Although St. Joseph's attempted to be incorporated, such an action did not become a reality until forty years later.

In 1855 cholera again was present in Saint Paul. Perhaps the number of cases even increased over those of previous years. Be that as it may, St. Joseph's hospital, as always, was the place to which victims of the dread disease were carried. A cholera victim, said a newspaper, was turned out of his hotel and put unceremoniously down on the inhospitable pavement. Eventually, the patient was removed to a physician's office and from there to "the hospital," which no doubt was St. Joseph's.[9] The wife of Dr. S. Willey remembered that a river steamboat came to dock with eleven victims of cholera. These unfortunates were loaded on wagons to be taken to St. Joseph's. It was ill luck, indeed, that these primitive ambulances had to pass through a swamp, where one of them mired down. Before it could be released, two patients died.[10]

Cholera patients were not sufficiently numerous during the months to come to keep the hospital supplied with ill human beings and, it must be said, relatively few individuals ill from other diseases came to be nursed. These were the days when hospitals were still suspect and when the average citizen preferred to remain at home when he was sick. Consequently, Bishop Grace and the hospital trustees decided in 1859 that "the interest of the hospital would be served by a temporary removal from the hospital building to those now occupied by the Sisters of St. Joseph."[11] This decision was determined upon in part because city and county patients who previously had been sent to St. Joseph's Hospital now were being cared for elsewhere.[12] Consequently, the log buildings on Bench Street (one of them the chapel) were put to use as hospital units. The building on Vine Street was turned into a school and opened in September, 1859, as St. Joseph's Academy for Young Ladies. Sixteen boarders and forty day pupils were registered during the autumn of 1859.[13] Although the St. Joseph's Hospital building was not used for hospital purposes, it must be pointed out that the *Minnesota Pioneer and Democrat* of July 12, 1860, published a statement saying that the institution still cared for "invalids of every nation and faith" and added that the Sisters always were ready to care for transients who had the misfortune to become ill. Thus, you see that the hospital situation was considerably confused.

[9] "The Asiatic Cholera in St. Paul," by John M. Armstrong, MINNESOTA MEDICINE, January, 1943, p. 110.

[10] "The Asiatic Cholera in St. Paul," by John M. Armstrong, MINNESOTA MEDICINE, January, 1945, p. 112.

This confusion was compounded during the next three years when the building of St. Joseph's Hospital was used to house the Sisters and, it may be said, that some patients were received and cared for. There is evidence of this in the form of a city council action which approved a bill for payment for the care of patients, but a council action of the same time affirmed that "in general, patients shall be sent to the County Poor Farm."

The date of October, 1863, however, brings a termination to the confusion of functions. It was then that the hospital moved back to the original building. This building has not been closed from that day to this. Slight changes were made in certain rules and regulations. For example, prices were set at five dollars a week for a private room and three dollars for a ward bed, but these charges did not include medicines and medical care. Patients now were given the privilege of choosing their own physician.

In December, 1863, a new structure appeared. This had been put under construction two years previously and was to house St. Joseph's Academy. The two cabins on Bench Street were abandoned. Thus, to make the picture perfectly clear, there were three buildings, each with a specialized function: St. Joseph's Hospital, St. Joseph's School, and an orphanage.

Although I have no desire to interpret the role of cholera as that of a hero, it is perfectly true that this disease, from time to time, did stimulate the activities of St. Joseph's Hospital. Such was the case in 1866, when once again the cholera came to Saint Paul. The city fathers, attempting to determine where these unfortunate victims might best be treated, thought for a time to erect a hospital, but better wisdom prevailed. It was decided to ask St. Joseph's Hospital to accept them. Under the leadership of Drs. Willey and Stewart, this plan almost materialized.[14] Unfortunately, residents close to St. Joseph's objected strenuously, even threatening to burn the institution if cholera patients were admitted. As a result, a quarantine station was built in Pig's Eye.[15] The entire situation, however, was favorable to St. Joseph's, for it brought the institution to public attention.[16]

After the Civil War, the services of the hospital were in more and more demand. A west wing was added in 1878, and this wing is the oldest portion of the building as it stands today. This is true because the original structure was torn down in 1893 and rebuilt in 1895. The east wing was added in 1885. Other innovations included a separate laundry building and the use of the Lick House by the Sisters who were teaching at St. Agatha's Conservatory. This Lick House, it may be said, had quite an unusual history. It was believed to be haunted as the result of a murder. The Sisters, however, took ghost-ridden houses in their stride and lived in this one until 1884.

---

[11] Quoted from "History of Medicine in Ramsey County," by John M. Armstrong, MINNESOTA MEDICINE, February, 1939, p. 110.

[12] The information is very indefinite as to where they were cared for, but as two years previously sixty acres of land had been purchased at Pig's Eye for a County Farm, it is assumed that this may have been the place where these patients were taken.

[13] "On Good Ground; the Story of the Sisters of St. Joseph in St. Paul," by Sister Helen Angela Hurley, 1951.

[14] Dr. Jacob Henry Stewart had come to Saint Paul in 1855 and very soon became a very popular physician. He was the first president of the newly organized (1856) Y.M.C.A. and county physician from 1856 to 1857. He was State Senator from 1859 to 1860 and Surgeon General of Minnesota from 1857 to 1863. He was Mayor of St. Paul in 1864, 1871, and 1873 and Postmaster from 1865 to 1870. Later he was associated with Dr. Charles Wheaton. He died in 1884.

[15] On August 21, the newly organized Board of Health reported that two buildings, 24 by 30 feet and 30 by 30 feet respectively, were almost finished to provide a quarantine station and that furnishings and drugs would be sent there the same day. Three days later, Dr. Charles Smith who had just come back after serving his internship, was made assistant to Dr. Thomas R. Potts, the newly elected city physician and health officer, and put in charge of these two buildings. By this time, however, the relatively mild epidemic had spent itself.

[16] After this outbreak, only very occasional cases were reported in Saint Paul, the last one in 1873, a case seen by Dr. Samuel Flagg and Dr. Stewart.

After many delays, the incorporation of St. Joseph's Hospital took place on April 16, 1895.[17] By then the staff of Sisters had increased considerably, and the institution was ready to modernize itself as modernization was known in the decades before 1900.

Medical teaching, begun in these early decades, always had been a firm objective of St. Joseph's. Thus it looked with favor upon the Saint Paul School for Medical Instruction which functioned from 1871 to 1879 and which later became the Saint Paul Medical School, which existed from 1885 to 1888. These medical schools used St. Joseph's Hospital for teaching medical students. A residency for an intern at St. Joseph's was established in 1885. By then a large amphitheater in the operating room had been constructed for the convenience of students. Since those early years, well over 350 medical students have received medical teaching at the hospital. The first intern was one whose name looms large in the medical history of the state.

Dr. Arthur A. Gillette was that intern of 1885, and he was destined to become one of the outstanding orthopedists in Minnesota. In 1895, he began his remarkable career as a medical educator at the University of Minnesota as instructor, clinical professor, and full-time professor of orthopedics, and finally as head of the orthopedic division. During his full life, he became president of just about all the Minnesota societies of which he was a member. The Gillette Hospital for Crippled and Deformed Children is an everlasting monument to his foresight as well as a pioneer achievement, for when it was built it was the first institution of its kind in the United States. "Success comes to many as it came to him, but success with distinction is won, as he won it, by few."[18]

St. Joseph's second intern was Dr. Harry J. O'Brien, who served in 1886. Like Dr. Gillette, Dr. O'Brien was destined to make medical history. With the assistance of Mother Bernardine Maher, Dr. O'Brien in 1894 established a school of nursing. For many years this school profited by his abilities as medical director and as lecturer. From Dr. O'Brien's experiences in teaching nursing came a text entitled "Medical and Surgical Nursing." Published in 1900, this volume approached nursing from the point of view of the physician and surgeon. It was a guide for graduate and student nurses and was full of practical wisdom including instruction in the art of cooking for the sick. Certain chapters were contributed by outstanding members of the medical profession of the day. When Dr. Burnside Foster reviewed O'Brien's volume in the *Saint Paul Medical Journal* for August, 1900, he wrote: "While we cannot say that the book contains all that the trained nurse should know, it certainly contains very little that she should not know, and in this respect it is to be preferred to most of the text books for nurses which we have seen and which contain a vast amount of information and instruction which is superfluous."

In addition to compiling his text on nursing, lecturing to nurses, and acting as medical director of the school of nursing, Dr. O'Brien was one of the outstanding surgeons of St. Joseph's Hospital. He was most generous to members of the medical profession. It is to be remembered that he presented the hospital with a horse-drawn ambulance when such vehicles were indeed a luxury. Dr. O'Brien died in 1931.

Of the twenty-nine young men who interned at St. Joseph's prior to 1901, there is at least one who is still practicing. He is Dr. George E. Sherwood of Kimball, Minnesota. Dr. Sherwood interned in 1894 and then practiced in Dassel for a few years. From there, he moved to his present location, where he has practiced for half a century and where the people of the community tendered him an enthusiastic celebration in appreciation of decades of unselfish labor. It is a pleasure to report that Dr. Sherwood is hale and hearty, that he travels a great deal, and that he still takes care of his practice.

When Dr. O'Brien helped establish the school of nursing in 1894, he could not know of the far-reaching influence of his work. The first class of sixteen nurses was graduated on July 7, 1896. Of this number, ten were nuns. Diplomas were given the graduates by Archbishop John Ireland, who is becoming known today as one of the great prelates of the Church of the United States. The Archbishop was assisted by Dr. Charles L. Smith. Archbishop Ireland, in the well-chosen words for which he was noted, commented upon the progress made by the hospital during the past quarter of a century and paid tribute to those physicians who cared for the sick and to whom the "hospital owed its prosperity of the present time in a manner." He enlarged upon the advances made in medicine, stressing the fact that medical science was paying more attention to the *vis medicatrix naturae* and leaning more toward expectant treatment. Archbishop Ireland compared the work of physicians with that of nurses and said that frequently the labors of devoted nurses were the more important. He admonished nurses, however, to realize that their studies were not completed just because they had finished a course and were being graduated. He cautioned them to continue to observe and thus to learn. In a relatively brief talk, Dr. Smith spoke of the duties of nurses, of the importance of tact, and of the necessity of medical confidence. The exercises were concluded with a literary and musical program.

---

[17] The articles are reprinted "St. Joseph's Hospital in St. Paul," by Dr. John M. Culligan and Dr. Harold J. Prendergast, 1934.

[18] Memorial to Arthur J. Gillette, MINNESOTA MEDICINE, Vol. IV, 1921.

St. Joseph's Hospital, recognizing the imperative need for nurses who were well trained, extended the length of the training course to three years before 1900. It was the first of many western hospitals to do so. Thus, once again, St. Joseph's was a leader, making the way for other institutions to follow.

During the years, some 2,285 nurses have been graduated from the institution. In 1942, the school of nursing of St. Joseph's was incorporated into the Department of Nursing of the College of St. Catherine. Under this merger, students may enter a three-year course which gives them a diploma or select a four-year program which results in the degree of Bachelor of Science. This latter course puts special emphasis upon training in the basic sciences. Clinical experience is provided either at St. Mary's Hospital or at St. Joseph's.

Although a few of the distinguished physicians who were connected with St. Joseph's have been mentioned, it would be most unfair to conclude even a brief summary of a great healing institution without mention of some of the earliest outstanding practitioners closely connected with the hospital or without reference to a few of the techniques that were introduced.

Dr. Samuel Willey, mentioned earlier, was one of the top medical men during Saint Paul's years of growth. Born in Boston, he attended Yale Medical College, and in 1850 was graduated from the Cleveland Medical College. He immediately secured a position at the Ohio Hospital for the Insane. There he remained, except for a brief period in Cincinnati, until he came to Saint Paul in October, 1852. There is a story told—although I cannot vouch for it—that Dr. Willey stepped off the steamer at Saint Paul's landing with only fifty cents in his pocket. But this poverty was not to be his for long. He associated himself with Dr. Brisbine and soon was one of the most popular physicians of his day. Though not present at the organizational meeting of the Minnesota State Medical Society, Dr. Willey was counted among the charter members by request. Through the years, he demonstrated great interest in the foundation of this society and worked conscientiously for its success. In 1869, when the society was reorganized, Dr. Willey was elected president and was re-elected the following year. In 1870, he was elected a vice president of the American Medical Association. Dr. Willey exerted great influence upon the policies of the Saint Paul Academy of Medicine, which had been founded in 1860. It is interesting to note that Dr. Willey's large practice and his poor health led him to introduce several innovations which we consider to be perfectly usual today. He was the first physician in Saint Paul to stop compounding his own medicines, to establish regular office hours, and to employ an agent to collect overdue bills. Dr. Willey retired in 1871 and died in November of the following year.

There were three other physicians whose services were important to St. Joseph's Hospital during the first year or two. These were Drs. Albert C. Brisbine, James Dinsmore Goodrich, and O. P. Marsh.

Dr. Brisbine was born in the Buckeye State at New Lisbon (now Lisbon) in 1825. He did not remain long in his native Ohio, however. After being graduated from Jefferson Medical College, he emigrated to Saint Paul, arriving in 1851. He was a founder of the Minnesota State Medical Society and of the Ramsey County Medical Society. He was first associated with Dr. Willey and later with Dr. E. J. Abbott and Dr. Clinton C. Miller. He died as the result of a fall in 1887.

The second prominent physician, Dr. Goodrich, had been born in Ripley, New York, in 1820, and had practiced in Cleveland before coming to Minnesota for his health in 1851. Thus he and Brisbine arrived the same year. There was a difference between the two men. Whereas Dr. Brisbine entered practice immediately after settling in

Saint Paul, Dr. Goodrich tried his hand as a sailor on the Great Lakes and did not begin practice until 1852 or 1853. He became the first health officer and the first city physician of Saint Paul and was named coroner in 1857. He left the city in 1859, after having been associated with Dr. Marsh. Two years later Dr. Goodrich died.

Although Dr. Marsh was the least prominent of the early attending physicians at St. Joseph's Hospital, he was a man of repute. He had come to this community in July, 1853. At the organizational meeting of the Minnesota State Medical Society, he was marked present by request. Although he is mentioned as a member of one of the Society's committees in 1856-57, he may have left the city before that.

As the years passed by and Saint Paul emerged from the role of a primitive community to a great urban center, practically all the outstanding physicians brought patients to St. Joseph's, and outstanding feats of medical history were performed. Dr. Justus Ohage, for example, performed the first cholecystectomy in the old operating room on the top floor of the east wing on September 24, 1886. This was the first successful operation of its kind in the United States. The patient outlived the operation for about forty-two years. Dr. Ohage's success was reported in the *Medical News* of February, 1887.[19] Prior to Dr. Ohage's attempt at St. Joseph's, this type of operation had been performed only eight times in Europe and with only one fatality. It is fitting, therefore, that St. Joseph's Hospital should have a bronze plaque commemorating the event in the lobby.

There were other noteworthy operative procedures. Dr. Arnold Schwyzer removed the entire transverse colon and repaired the torn superior and inferior mesenteric veins in 1898 in a case of intestinal obstruction by a pancreatic tumor.[20] This may have been the first performance of such an extensive resection of colon. And, it must not be forgotten that Dr. Schwyzer's operation was remarkable also by the very early use of a transfusion of physiologic salt solution to combat loss of blood.

On November 10, 1903, Dr. Schwyzer again made medical history and again made it at St. Joseph's. He performed what seems to have been the first bronchoscopy in America with a bronchoscope. He used a Killian instrument which he had obtained in Europe the previous summer and successfully removed a bone lodged in the right bronchus. His patient had a large goiter which had to be resected before the bronchoscopy, which was then performed through a tracheotomy wound.

It is important to remember also that Dr. Fred J. Plondke, a staff physician, introduced the use of spinal anesthesia. He used Stovain, which he had brought from Europe, in almost thirty cases between 1905 and 1906. Although a pioneer in this work, Dr. Plondke was forced to abandon it because Stovain could not be procured. Some twenty years later this method of anesthesia was revived.

Scientific apparatus and methodology kept pace with innovations in medicine and surgery. The first laboratory was set up in 1902 by Dr. James Ferguson in a meagre space located under the stairs which lead from the ground floor to the east wing. This early laboratory centered around a microscope, although Dr. Ferguson furnished in addition a microtome and a homemade atomizer utilizing ether to freeze sections. The next home of the laboratory was on the fourth floor,[21] and then in 1905 it was taken to the basement of the east wing and materially enlarged under the direction of Dr. Fred C. Schuldt.[22] In February, 1919, the laboratory once again took up its abode on the fourth floor in order to be closer to operating rooms.

St. Joseph's first x-ray machine, a motor-driven static model, was installed by Dr. Arthur Miller in 1902, only a few years after the x-ray had come into use in the city. About 1907, the department of x-ray and static electricity was moved to the ground floor. It was not until 1911, however, that a first-class x-ray, consisting of a 4 kilowatt Snook transformer with Keleket tube stand and table and a "stereoscopic illuminator,"[23] was installed. This equipment was located on the fourth floor near the laboratory, where it remained until about 1922 when the x-ray department was renovated and reorganized and, in the process, was moved to the north wing. In 1907 or 1908, St. Joseph's could also boast of a Turkish bath on the ground floor. In 1912, a Draeger pulmotor was added to the hospital equipment. This pulmotor was lent to any physician who needed it in his private practice.[23] Not until the 1920's were the operating rooms rearranged and remodeled. At this time, special space was provided for the exclusive use for surgery of the eye, ear, nose, and throat, and for cystoscopy. At this time, a special record room was established. The entire physical plant of St. Joseph's, indeed, had changed drastically since the early days. For example, a boiler house, providing some isolation rooms, went up in 1904; in 1915 the laundry and power house went into more ample quarters; the north wing was constructed in 1922; and the present home for nurses was completed four years later. In more recent years, the pediatric department, which originally began in one room on the second floor of the main building, was transferred to the west wing, where it occupied the entire first floor. The medical library, starting in the small space vacated by the pediatric department, was relocated in 1949 next to the Staff Hall. It now has over 4,000 volumes, including files of bound journals. Today, it serves doctors, interns, nurses, and all hospital departments with regularly received medical journals to the number of seventy and with some thirty educational and recreational magazines.

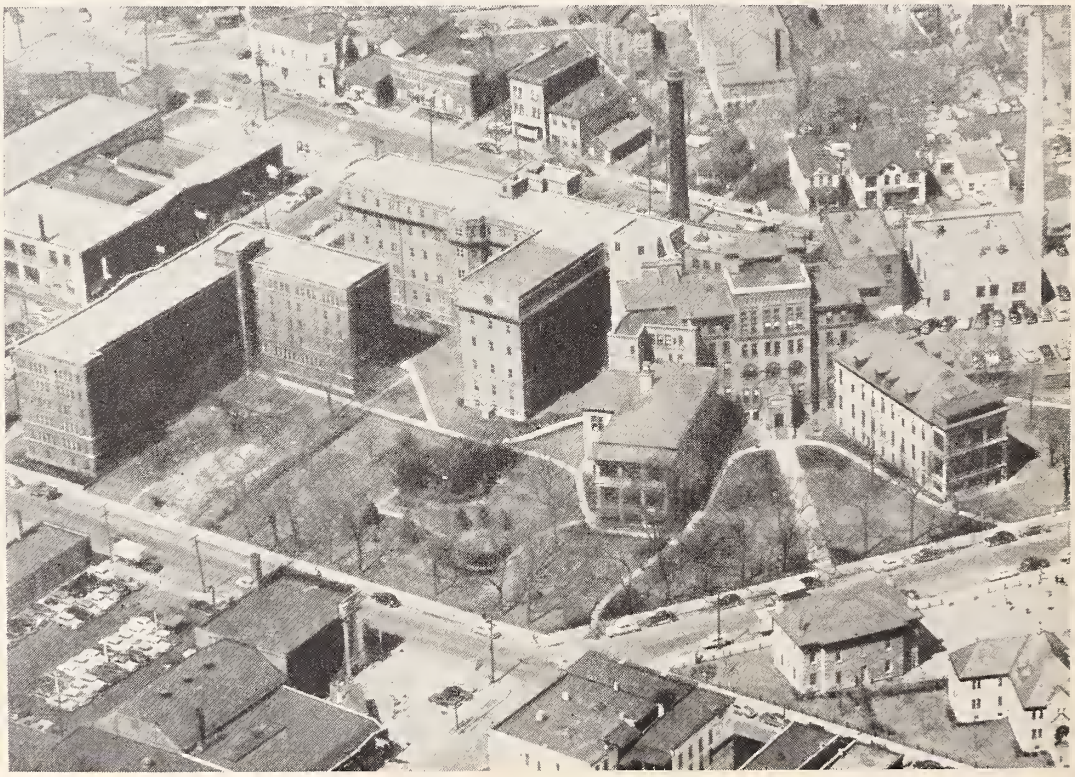
[23] 58th Annual Report (1912).

St. Joseph's Hospital always, whether the pace was slow or rapid, has moved forward and always has sought to serve the community in the best possible manner. But the need for enlargement is ever present. Not even the relatively new outpatient department, the recent remodeling of the laundry, the erection of a new power house, and the construction of new quarters for interns —not even all these—and more—advances can satisfy an institution dedicated to service and determined to advance with the times. St. Joseph's Hospital must continue to grow as it has matured during the past. Sister Edith catches the very spirit and soul of the institution when she lets the hospital speak for itself in these modest, but ringing, words: "It is a strange feeling to be one hundred years old. My brick and mortar attest my age, but I do not think my spirit does, nor that I ever will grow old and cold."[24] Yes, this is a centennial year for many institutions in Minnesota, but none of the others can look back upon such a span of service to alleviate human suffering as can St. Joseph's. All Minnesota is grateful!



St. Joseph's Hospital as it appears today.

SOME PERSONAL OBSERVATIONS ON THE USE OF ROUTINE CHEST RADIOGRAPHY

RICHARD TRAIL, M.D.
London, England

I AM deeply grateful for the signal honor you have conferred on me by designating me a St. Joseph's Hospital Centennial Lecturer. Of this honor I am the more conscious because I am addressing a community which is, in the truest historical sense, a descendant of the early foundations for the care of the sick, since you administer your hospital on the prime fundamental for success, a balanced combination of the spiritual and material in the treatment of chronic illness. Your proud record in medicine and surgery shows that you have had a continuing eagerness during the past hundred years to apply every scientific advance, but that you have never forgotten that the technique of things is ultimately useless without the technique of people, for the restoration of the spirit towards the renewal of living is something above and beyond the mere application of non-human technical processes, which can never achieve more than the preservation of existence.

As you were the first private hospital in Saint Paul to use it for the examination of all admissions, I have chosen to talk on routine chest radiography. I crave your indulgence to use this opportunity to say aloud some personal thoughts on the general deductions that have been made from its broad lessons, on its future application, and on the responsibilities that appear to me to follow for the physician, the radiologist, and the epidemiologist in the field of pulmonary tuberculosis.

What are the broad lessons of routine radiography? It can disclose an abnormal lung shadow, which may prove on full investigation, clinical, laboratory and radiological, to be phthisis of any extent from early to advanced, active or inactive, for which the individual has never felt compelled to seek advice. Thus, of the first eight million civilians who were mass x-rayed from the population of England and Wales thirty-four per ten thousand males, and thirty-five per ten thousand females were considered to have, at first examination, unsuspected active disease, while roughly double that number were considered to have unsuspected inactive disease. It has shown that the majority of exudative lesions in adult life are due to previous post-primary deposits of adolescence and early adult life, which had developed and reached quiescence without the knowledge of the individual. We now know that a chest found clear of any recognizable x-ray lesion up to the age of thirty is very unlikely to develop phthisis at any future examination, and also that while there is less than the average steady over-all improvement in the mortality and morbidity of young females, in males there is a progressive forward shift of mortality into age groups over forty-five. In our realization that no one over the age of forty with symptoms of chronic bronchitis should be labelled as such until he has been proved definitely non-tuberculous we have learned much about the sources of infection in young adults, and in particular in those closely exposed to contact, such as nurses and medical students. A study of the histories of unsuspected active cases has taught us that the evidence of morbidity progresses from the symptomless stage to the stage of systemic disturbance, in most cases in the order from cough to dyspnea on exertion, lassitude, loss of weight, pain, dyspepsia, night sweats and hoarseness. But routine radiography has done something which I consider even far more important to humanity. It has turned our thoughts towards a fuller understanding of the origin of many chronic illnesses, towards new ideas in the prevention of morbidity through the prevention of that breaking of the spirit that so often precedes it.

These broad lessons have had marked effects on the attitude towards prevention, diagnosis and treatment. The honesty of the chest physician has recoiled on himself. Because he knew that in its early stages a progressive disease can be a silent pneumonic process, possibly established for weeks or months before the sufferer is aware of its subjective and systemic effects, he pleaded for the introduction of routine x-ray examina-

tion of the supposedly healthy. He knew that to wait for added sounds, which the general practitioner had been taught to consider as the only finding to emerge from physical examination, was to wait in a large majority of cases for established fibrosis and cavitation. In records of patients seen between 1924 and 1933, I found over 20 per cent with a history of inefficiently treated hemoptysis or pleurisy three to five years before the appearance of positive sputum, which had apparently been taken as the only indication for the commencement of treatment. The anxiety for earlier diagnosis has had its reward, but with the result that the standing of the radiologist has been advanced in proportion as that of the chest physician has receded in the opinion of the public and of the general practitioner, while all three, practitioner, radiologist, and the lay public alike, have failed so far to realize the new problems of the chest physician over the disposal of the individual with an abnormal film. Meantime we have heard epidemiologists, alarmed at the discrepancy now disclosed between notification and incidence, demand that the law should enforce attendance at all public and special sessions for mass x-ray surveys, and should follow this with the compulsory segregation or isolation of every individual proven to have active disease. Others, recognizing that this new method has raised fears, both true and imagined, among nurses in sanatoria, have pleaded that it should not be extended unless we can give adequate hospitalization, which is already impossible for some 75 per cent of those known to require it.

For the trends against himself the chest physician must bear some of the blame. For years he had been undermining his own position. By his increasing reliance on serial x-rays for the conduct of treatment he had fostered the erroneous belief of the general practitioner that clinical examination is superfluous; in his growing preoccupation with physical and specific therapy he gave the impression that the men and women under his care were mere containers of disease; he has, therefore, now no ground for complaint against the deservedly high reputation of the psychologist in sanatorium practice. Thirty years ago the chest physician treated the patient who had disease; twenty years ago he begun to treat the disease in the patient; now he tends to treat the film of the disease of the patient. The experienced physician in the person of Dr. Pottenger realizes this when he says, in *The Fight Against Tuberculosis,* "Today the chief early treatment of so many patients seems to be x-rays." The view of the psychologist is equally aptly expressed by Harry Wilmer in *This Is Your World,* when he writes of the dangers of treating the patient,

> "As a case—a number
> A motionless object
> Upon a Procrustean bed.
> Limited at the beginning by an x-ray
> And at the end by another."

Little wonder the radiologist has stolen the thunder and that he often resented the appointment of a chest physician as director of the early mass radiography units. I admit that I am biased, but this is, I honestly believe, the bias of experience. I do not think we have yet arrived at the position where a general radiologist can be asked to view a film and to say whether it shows the presence of phythisis which is active and clinically significant. I believe it is for the benefit of the individual with an abnormal film, and for the benefit of research, that mass x-ray units should be under the direction of a physician who can write his film reports from both the descriptive and the interpretative aspects in the light of his clinical findings. So far, no film can be said to be typical of any one chest condition, in view of multitudinous and individual variations. We do not even know for certain the cycle of lung tuberculosis from primary focus to established sub-clavicular disease. What is far more important, we have no clear principles to guide us on the grave decision on when to change a person into a patient but must still rely on the personal experience of the observer. Great contributions to advancing knowledge on the significance of abnormal films and on living pathogenesis can be made by the physician who has full facilities in bed observation, and in laboratory equipment that can help him to reach a final diagnosis for every abnormal finding. On the other hand, I admit freely that the proper development of any specialism must depend on the prevention of its boundaries from becoming static and exclusive. If therefore the radiography unit director can call on the radiologist to aid with the mechanics of apparatus and darkroom technique, and to add his opinion in the anomalous and difficult case, both can work towards much needed national and international standardization. It is well known how often slight variations in technique cause great difficulties for both in the reading of serial films. Agreement on size of large film, on positioning, on centering, on distance of focal spot, on exposure factors and on developing processes would bring decided advantages. Descriptions of findings should bear a meaning similar to all who read them; radiologists, specialist physicians and surgeons, and general practitioners alike. At present, we have no common ground even on the localization of disease in description, and still less on the definition in interpretation of such terms in common use as mottling, reticulation, infiltration, fibrosis, emphysema, collapse and atelectasis. We have no international usage on the nomenclature of the main bronchi and pulmonary segments. Meantime, our difficulties increase. For example, it has become fashionable to use a new, purely radiological term, "minimal disease." Even if we could reach agreement on the size of the lesion it describes it would still remain far too indefinite; to the chest physician it conveys nothing of the components or nature of the lesion, and therefore nothing of prognosis, and we cannot blame the general practitioner if he concludes that it means in every instance disease of minimal significance.

The time is ripe also to attempt to see in proper perspective the impact of routine mass radiography findings on our knowledge of morbidity. The number diagnosed as active following any first survey cannot give a true assessment, as many of them reach without illness the quiescent stage found in double their number at that same examination. Some writers believe that although the death rate is only a poor index it is possibly the only one that can be comparable in the light of the conditions of the past twenty years, during which methods of diagnosis have developed so quickly. Even here there is a danger that in our new enthusiasm we are including cases where routine postmortem shows some small lesion that had no clinical significance during life, and no effect in accelerating death. There is no doubt, however, that we must have measures aimed at effective notification. As matters stand at present in Great Britain, no reliance can be put on notification rates as an indication of real incidence as long as the chest physician of a large county borough can report that in 1951 his clinics diagnosed 412 new cases, of whom only 158 were notified by their general practitioners. Naturally, if we now take this matter more seriously we shall get an apparent increase for some years, but this might well offset the unchanging figures of notification only at death, and so disclose more of those sources of infection over which we can at present take no action for the public good.

We must beware, however, of everything that will savour of unwarranted interference with individual liberty. It is well to remember Sir James Kingston Fowler's dictum, "Once notified, always tuberculous." I cannot believe that any good would come from attempts at forcible attendance at clinics or compulsory isolation of the infectious. Indeed, we have no criterion for infectivity as long as we continue to count as equally infectious the patient with bacilli demonstrated only to a single stomach washing and the patient with clusters of organisms to ordinary smear-slide examination. Theory and experience are entirely contradictory. Our anatomists tell us that the arrangement of the bronchi and their ciliary linings ensure that only rarely can droplets of sputum containing a very small number of bacilli reach the pulmonary alveoli, while we know as physicians that close contact can produce in tuberculin negative reactors both morbidity and mortality. Yet, in spite of our justified anxiety over infection, it still seems better to me to rely on the slower methods of education than on any form of compulsion, which I find abhorrent as giving only an official blessing to social ostracism of the tuberculous. All such measures can do is to produce a class of the tuberculous that will be frankly asocial, and to encourage in the mind of the adult worker the association of x-ray examination with disease, and of disease with economic disaster. If we must have legislation then let it be towards protection against victimization and loss of employment.

A far better course would be for us to use our energies for the wise adaptation of our resources. We know that the cost of surveying the whole population would be prohibitive but we could work towards two definite objects, first the examination in industries and groups known to give the highest proportion of positives, and the combination of routine radiography with tuberculin testing with the object of helping future generations. I believe we should now institute routine tuberculin testing of infants at welfare clinics, referring to the chest clinic for x-ray examination every positive case. With the knowledge that a recent positive would almost certainly mean recent infection, the family physician would be notified of the urgent necessity for the x-ray examination of all contacts. Where the child's x-ray is abnormal there would be immediate reference to a pediatric unit. Routine testing should be continued at intervals during school life and combined with full examination of all those, such as teachers, who come in close contact with organized groups of children. As finances allow and experience increases, the scheme might be extended into adolescence and early adult life, in its earlier stages including the routine examination in factories and offices of Senior Executives whose work brings them in close contact with adolescent employes. As Myers has so truly said, "As long as we are content to allow primary lesions to go unnoticed and to begin treatment after illness or demonstrable x-ray disease, we can hardly expect to cure tuberculosis." He goes on to say that we must find some antibiotic that can be given with saftey immediately after the appearance of a positive tuberculin test.

This is tantamount to say while we believe we know what might be done toward the prevention of primary infection, we have still a long way to go in the production of active measures towards the prevention of post-primary morbidity. I believe, however, that there are now indications of a possible solution of some part of this problem. Experience over the past thirteen years of the growing necessity to pay attention to the life history of the individual with unsuspected active disease has made me ask myself many questions. Why is phthisis still "The Captain of the Men of Death" at the ages most important for national economy? Have we become so intent on treatment, physical and specific, that we have ignored the forewarnings of morbidity disclosed in the stories of the hopes, fears, and spiritual outlook of our patients? Was Sir Robert Philip correct in his forecast that the tubercle bacillus would become "the new pet?" Are we to accept without humility and without speculation the known facts that morbidity decreased rapidly in America and Western Europe between 1850 and 1910 when no National Anti-Tuberculosis Campaigns existed; that, in spite of this, morbidity and mortality in adolescence and adult life continues; that two-thirds of all post-primary lesions attain arrest without our intervention and yet we fail with considerable numbers of those to accept it?

Six years ago I wrote what I still believe, that the sanatorium which relies on a fixed routine, however good, and believes that it has reached perfection merely by employing the latest mechanical aids of surgery, may succeed in preserving the lives of its patients but will not renew them. Such a sanatorium demands no faith from the patient and no moral standards in a physician; it is merely materialistic. What it lacks is the aid of the psychologist and the aid of the priest, each confining himself to his own sphere and working in full co-operation with the physician. In other words, I believe that we must retrace our steps in our attitude to all chronic illness, and in particular to phthisis, in the knowledge that "Where there is no vision, the people perish." Unless we get to know why some people become ill, while others keep well, we shall never understand the fundamentals of preventive medicine. Holding fast to what we have learned of the material aspects, and therefore avoiding the quackery of non-scientific so-called "Spiritual healing," we must again work through and beyond the intervening help of the psychologist toward the renovation of the spirit by the priest that was so well understood by the early Christian Church. Thus, we shall begin to study man in his wholeness, body, mind and spirit, and in regaining our position as physician-educators make a real contribution to the healing of the nations.

A REMINISCENCE OF CERTAIN EVENTS BEFORE, DURING AND AFTER THE DISCOVERY OF CORTISONE

PHILIP S. HENCH, M.D.
Rochester, Minnesota

IT IS AN alarming variation from the normal when a grand old lady on *her* one hundredth birthday welcomes a *somewhat* younger visitor and says: "Now do tell me all about yourself!" But that is more or less what your Vice-Centenarian, Dr. Briggs, has asked me to do.

Hanging in my son's room is a supposedly impressive copy of the Hench family coat-of-arms. It is beautifully drawn in bright colors, and if it isn't authentic, I'm out $20.00! My son's father gave it to him in an uncertain attempt to convince him of the "respectability" of his family, a proposition which nowadays young folks so often challenge.

Perhaps my son's incredulity is well founded. At least one rumor has it that our European ancestor of 1600 A.D. was euphemistically called "the Robber-knight" of Württemburg. In that case he was, I fear, more red-blooded than blue-blooded.

Although the color of my blood may be somewhat lacking in "quality," my spiritual inheritance has been definite and positive. The central faith of my fathers, though derived from several Protestant theological origins, has always been a strong and happy allegiance to the Christian faith. Thus, I have felt completely at home as I have spent all but one of the thirty-five years of my hospital life in institutions operated "For the Glory of God" by dedicated members of your great Catholic faith.

My Thirty-four Years in Catholic Hospitals

I began my career in Catholic hospitals in that terrible autumn of 1919 when my medical school was closed during the emergency, and when, with classmates, I was removed precipitously from the Medical Enlisted Reserve Corps to serve as a student-intern in a small hospital suddenly deprived of its graduate staff. At the old Pittsburgh Hospital, I certainly "practiced medicine." Were the worthy Sisters (the Sisters of Charity of Mother Seton) alarmed by my efforts? I never knew, for all they asked was that we do our best.

Then came training in Pittsburgh's Mercy and St. Francis hospitals, and in 1922, by an accident of fate, I became the first, and for a while, the only medical resident at St. Marys Hospital in Rochester, Minnesota. A little later, the Mayo Clinic's first service for rheumatic diseases was established at St. Marys Hospital where thousands of our rheumatic patients have been ministered unto by Sisters Joseph and Domitilla, Sisters Rebecca and Mary Brigh, and above all, by Sister Pantaleon, my invaluable colleague for twenty-three years (since 1930).

Now if one is careful enough, a man *can* serve two "masters." Despite my professional allegiance to St. Marys Hospital, I fell in love with the daughter of Mr. John H. Kahler, the founder and president of Rochester's other hospital system. Some of you may have known Mr. Kahler, a loyal and distinguished citizen of Rochester and of Minnesota.

In due time (it seemed an awful long time!), I became Vice-President of the Kahler Hospital and Hotel Corporation. Can I convince you that my appointment had nothing to do with inheritance, but was strictly a matter of merit? Despite this appointment, I have never for one moment been tempted to move our service from St. Marys to the Kahler Hospitals. Sometimes I've wondered whether, as an officer of the Kahler Corporation, I have not unconsciously thought that the Corporation would be better off if I stayed at St. Marys as long as they would have me.

Welcome to the Flemings

Sir Alexander and Lady Fleming: Mrs. Hench and I wish to add our own welcome to the warm ones you have already received. I believe this is Lady Fleming's first visit to Minnesota, but you, Sir Alexander, are no stranger here; we recall with pleasure your visits to Rochester in July, 1945, and in 1949.

And now Mrs. Hench and I share with you a very special experience: twenty-six years ahead of you, we also spent, at the St. Paul Hotel, part of *our* honeymoon.

You come from a wonderful country, one whose

From the Division of Medicine, Mayo Clinic, Rochester, Minnesota.

Remarks made at the Centennial of Saint Joseph's Hospital, St. Paul, Minnesota, May 16, 1953.

stability and propriety have been the admiration of the world. Happily, Mrs. Hench and I know it well and have many friends north and south of the Cheviot Hills. In exploring the cities and villages of Great Britain, Mrs. Hench and I tried to follow the prescription of Rarus which, I believe, every traveler would find invaluable. Said Rarus: "Pray tell me what sort of people you found them. What do they do? Are the men likable? What do the women look like? Of their inns and how they live. Of their work and how they do it:—if there be unusual rogues among them I care not, for well I know that honest men outnumber them. Then tell me of their good and valiant King and Queen, and if the country be prosperous—and how much my money will buy there, and I'll thank ye, and I'll seek the rest for myself."

We Americans ask of our distinguished visitors from London no more than that: With this formula they will find the friendly heart and firm faith of our country.

The Tragedy of Rheumatism and Arthritis

But I've been asked to talk about something other than travel, something less pleasant than honeymoons though hardly less common, namely rheumatism, the tragedy of rheumatism and arthritis, and also something of the discovery and clinical application of cortisone.

Most of you, whether you be physicians, nurses or laymen, have an interest in rheumatism because so many people have one kind or another. How many people? Well, more than 10,000,000 Americans have some sort of rheumatism (according to the latest Public Health Survey), of which about 7,000,000 have some kind of chronic arthritis.

That would make a huge city almost twenty-five times the size of St. Paul, in which every man, woman and child suffered from chronic arthritis, or a city about nine times the size of St. Paul and Minneapolis together (assuming, of course, that you can get St. Paul and Minneapolis together). Or it would be the same as if almost everyone in New York City or in London, England, had rheumatism or arthritis.

Think of the pain, disability, frustrated hopes and economic loss! But let's put it another way. Just suppose that chronic arthritis affected every American with our eleven most common names—Smith, Johnson, Brown, Miller, Jones, Williams, Davis, Anderson, Wilson, Taylor and Thomas. Think of everyone you know by those names. Put together every American so named, and that's how many people complain of chronic arthritis.

Of course, a lot of them have a mild form, osteoarthritis, which comes with age. But about 3,000,000 Americans have the form we worry about most, rheumatoid arthritis.

The Pessimistic Attitude Toward Rheumatic Diseases

When I was a medical student in Pittsburgh and a fellow of the Mayo Foundation, physicians were pessimistic about the rheumatic diseases, especially about rheumatoid arthritis. They shared the opinion of Sir William Osler, who is reported to have said: "When an arthritic patient walks in the front door, I want to run out the back door!"

Rheumatoid arthritis was considered a relentless progressive disease. Therefore, I too was not optimistic when, on April 1, 1929, I went to see another rheumatoid patient. But he was different from any I had ever seen before.

The Ameliorating Effect of Jaundice

For a long time, this patient's joints had been painful and swollen. Then one day yellow jaundice developed and almost immediately the painful swelling began to disappear. When I saw him a few days later, he had practically no rheumatism.

Thereafter, on the lookout for this phenomenon I saw it happen fifteen more times during the next five years. Only one conclusion was possible. Contrary to the belief of centuries, rheumatoid arthritis must be potentially reversible, and rapidly so.

But what unknown "antirheumatic substance X" developed during liver disease with jaundice? Attempting to identify it, my colleagues and I gave arthritic volunteers various products of the liver, singly and in combination. But nothing happened to the arthritis. Despite this, the conviction developed that substance X was something normally present in our bodies, of which substance the arthritic patient did not have enough.

Beneficial Effect of Pregnancy

Then I became equally impressed by a strange occurrence which we and others had noted previously but to which we had not paid sufficient attention. When a rheumatoid woman became pregnant, she usually lost her arthritis for several months. Over a period of eight years (1931 to 1938), we studied this phenomenon as it developed thirty-four times in twenty women. As a result we changed our ideas as to the probable nature of substance X.

During pregnancy, a number of steroid hormones of the body are changed profoundly. Assuming that the unknown substance X of pregnancy was the same as that of jaundice, we began to suspect that the mysterious substance was neither a product of the liver nor a female hormone but might be a steroid hormone common to both men and women. But what hormone? And from which bisexual gland? Among the possibilities listed in a 1938 paper, I included the adrenocortical substance, "cortin," but we did not try it till three years later.

Relief of Other Diseases by Jaundice or Pregnancy

Between 1929 and 1938, I regarded substance X as essentially antirheumatic. But then it came to my attention that pregnancy and jaundice sometimes relieved a number of other conditions, in particular certain allergic conditions, such as hay fever, asthma, migraine headaches and sensitivity to certain foods. This observation added excitement to the search because I now suspected that if substance X could be identified and prepared it would work against several diseases, so I began to speak and write of it as the "antirheumatic and antiallergic substance X."

Could Substance X Be An Adrenal Hormone?

I assume that you all know by this time that I am not a chemist, but a rheumatism specialist. Now, in the years I've been talking about, my title was, to be more correct, a "*mere* rheumatism specialist." In those days, that specialty had so little appeal that I'm sure many regarded our department as the "soft under belly of the Mayo Clinic!"

In any event, I very much needed chemical help, and sought it from various colleagues, especially Edward C. Kendall, chief of the Division of Biochemistry. Prior to 1938, my conferences with Dr. Kendall were infrequent and casual. But thereafter he became my chief collaborator. As we tried on innumerable occasions between 1938 and 1948 to conjecture what might be the chemical nature of substance X, neither of us knew that he and his associates, working on the adrenocortical compound E in his laboratory a few yards away, were at the very moment trying to isolate, identify and synthesize substance X or a reasonable facsimile thereof.

Let's Try Compound E

It would not be proper to infer that my confidence in the validity of these developing concepts was constant and unwavering. A few basic facts had been bound together with subtle suggestions and reasonable presumptions, but it was frankly recognized that the latter might be erroneous no matter how logical they appeared. Hence various possibilities were still entertained, and certain empiric procedures were carried out including the use of adrenal lecithin. But again the results represented "failures."

As time passed, our interest focused more clearly on the adrenal cortex as the possible source of substance X, and during one of our conferences in January, 1941, Dr. Kendall and I decided to administer to rheumatoid volunteers the substance, 17-hydroxy-11-dehydrocorticosterone. But our decision could not be carried out then, because in the whole world there wasn't enough of this material for a single patient. However, the decision to try it out was recorded in my notebook and remained attractive through the several years of waiting. We did not know then that almost *eight* years would elapse before we would have enough for our first volunteer.

In place of this substance, my colleague, Dr. Charles Slocumb and I, in 1941, gave to certain arthritic patients the adrenal cortex extract, "cortin," made for us by Dr. Kendall. Results were not impressive. With no likely product available to us, we then produced (with time out for military service) "yellow jaundice" by giving to a few arthritic volunteers a synthetic compound called "lactophenin." Temporary remissions developed but we could not identify the responsible agent.

The year was 1948, *nineteen* years since these studies on pregnant or jaundiced arthritis had been started; yet we could not be sure that we were a millimeter nearer any solution. For *ten* of those *nineteen* years, Dr. Kendall had been helping Dr. Slocumb and me in some of his spare time, "with his left hand," so to speak. But for *nineteen* years his right hand had been intensely preoccupied with a problem which at first seemed remote from ours, but which, as time passed, became more and more interrelated.

Isolation, Identification and Preparation of Cortisone and Hydrocortisone

Having been, in 1914, the first to isolate the thyroid hormone, thyroxin, and having been the first to announce, in 1929, the precise chemical nature of glutathione, Dr. Kendall made attempts, in 1930, to isolate, identify and synthesize the unknown hormone or hormones of the adrenal cortex—a problem which was to afford him his bitterest disappointments as well as his greatest satisfaction.

To the tremendous difficulties inherent in this problem, there was added from the very beginning an inescapable, ever-present tension, because other chemists had chosen the same objective. Thus began a dramatic scientific race, chief participants being Wintersteiner and Pfiffner, at Columbia University, Reichstein and his associates, in Switzerland, and Kendall, Mason, McKenzie and Myers, of the Mayo Foundation.

During the next four years, Kendall and his associates separated a very small amount of crystalline material which was at first hopefully regarded as the one compound, *the one* hormone of the adrenal cortex—probably cortin. To their surprise, the material turned out to be a mixture of several closely related crystalline compounds. Their chemical nature and physiologic effects (if any) were unknown.

Then, in 1935, what had started five years before as a competitive race, turned into a highly productive relay race as the participants "leap-frogged" each other with interrelated discoveries. Crystals began to precipitate out almost simultaneously in New York City, in Rochester, Minnesota, and in Switzerland. In all, twenty-eight compounds were separated but still only in relatively minute amounts, insufficient to give to human beings, for it took, for example, 3,000 pounds of adrenal gland to produce about 1 gm. of one of the compounds (Compound A), 1 gm. being the weight of three aspirin tablets.

It took ten years (1930 to 1940) for Kendall, Reichstein and their associates to separate and identify these compounds. Then when small amounts were given to animals, it looked as if only four of the twenty-eight compounds might be worth anything, that is that they might actually be "finished glandular products" or true hormones with physiologic potency. The four which seemed to hold promise of usefulness were: 11-dehydrocorticosterone which Kendall called "compound A"; corticosterone, which was Reichstein's "substance H" or Kendall's "compound B"; 17-hydroxy-11; dehydrocorticosterone, designated "compound F" by Wintersteiner and Pfiffner, "compound E" by Kendall and his associates and "substance Fa" by Reichstein and 17-hydroxycorticosterone, Reichstein's "substance M" or Kendall's "compound F."

The Preparation and Trial of Compound A: A "Dud"

Since it was impossible to separate from the glands of animals enough materials for practical use or even for any adequate trial in human beings, it became necessary to make them artificially, that is to prepare them "synthetically" from some more available source. This was the most difficult part of all, because no chemical so complex had ever been made by man. The only ones bold enough to begin and continue the task were Kendall and his associates in Rochester and the research chemists of Merck & Company. After five years of prodigious work, compound A was at last prepared, but when given to a patient with Addison's disease it proved to be useless.

Preparation of Compound E: First Usage

Disappointment was bitter in 1946. But these men of faith and fierce compulsion determined now to make compound E (Kendall) as the last try. Finally in May, 1948, using methods devised chiefly by Kendall, of the Mayo Foundation, and by Dr. Lewis H. Sarett, of Merck & Company, the company had on hand a few grams of compound E made from animal bile. The first precious supply of the new compound, ready after infinite labor, was given to three endocrinologists who found it useful in Addison's disease, a condition so rare that it alone did not justify continued production. At this point, Messrs. Merck, Kerrigan and their associates were men with a substance (compound E) hunting for some unknown condition which it might affect, while I remained a man with certain diseases hunting for an unknown compound (substance X) which might affect them.

For the moment, then, Merck & Company knew of no other sponsor and of no other use for compound E. Thus they had on hand a little unassigned compound E which Dr. James Carlisle and Dr. Randolph Major sent me (somewhat reluctantly) in answer to my letter of September 4, 1948.

For our first rheumatoid patient, Dr. Kendall and I decided to use the seemingly enormous dose of 100 mg. daily simply in order that we might not commit the error of underdosage. Thus on September 21, 1948, my colleague Dr. Slocumb began to administer this amount daily to our chosen patient. The antirheumatic effect was unlike that of any previous remedy, or of any agent except pregnancy or jaundice.

First Use of Pituitary ACTH (Corticotropin) and Hydrocortisone

Against Arthritis.—A few weeks later we requested and received from Dr. John Mote of The Armour Laboratories, a very small supply of another hormone which it had taken other scientists thirteen years (1933 to 1946) to isolate and prepare. This hormone, ACTH (now called corticotropin) derived from the pituitary gland, was supposed to stimulate a patient's adrenal glands to an increased output of cortical hormones, including compound E. We were concerned briefly lest the arthritic patient's adrenal glands might already be making an abnormal or toxic product: if so, the ACTH might aggravate, rather than help matters. When its effects resembled those of compound E, we were relieved (February, 1949).

A month later (March, 1949), Drs. Slocumb, Polley and I received from Dr. Harold Hailman of The Upjohn Company just enough compound F free alcohol (Kendall) to use for twelve days on one patient. Its effects were comparable to those of compound E and of ACTH.

Against Other Diseases.—Meanwhile remembering the old conjecture that our hypothetical "antirheumatic and antiallergic substance X" ought to be effective against, not one, but several diseases and types of diseases, my colleagues and I gave compound E to our first few patients with rheumatic fever, hay fever, lupus erythematosus and three or four other diseases, and were happy, but not too surprised, to note the results.

Wide Application to the Field of Medicine

Much of what has happened thereafter is, I believe, known to you. Writing a brilliant chapter in the history of pharmaceutical manufacturing, Merck & Company accomplished "the impossible," and within two years, compound E was available to every research worker and physician in the United States.

Incidentally, Dr. Kendall has reminded me of an expectant mother who is so preoccupied that she never gets around to choosing a name for her offspring. And so in the early days when I objected to using its chemical name (Can you blame me? I could hardly pronounce it.) and when I asked Dr. Kendall to suggest a permanent substitute for the nondefinitive term "compound E," he soon gave me, without enthusiasm, a piece of paper with the abbreviation "corsone" written on it. But he did not mind when I wrote underneath his suggestion my own amendment, "cortisone," and thus it was "baptized."

In the past four years the manifold effects of these new hormones, cortisone, hydrocortisone and corticotropin, have been studied by a host of scientists all over the world. These powerful substances exert a marked influence on many conditions. But just how they work is still, to use a churchillian phrase, "a riddle wrapped in a mystery inside an enigma." But their action differs from that of any other beneficial agent. They do not kill germs, nor do they "cure" the responsive diseases in the ordinary sense. But they protect in a peculiar way our tissues from the effects of a wide variety of toxic or irritating substances. Thus, they usually suppress markedly (but only as long as they are given) the symptoms of many diseases. I strongly objected to an early hyperenthusiast who compared these hormones with an advertised soap which supposedly "does everything." But they do appear to be of considerable value in about thirty or forty conditions, often providing results superior to those from any previous remedy. Thus they appear to have hit the Achilles heels of several diseases whose armor, heretofore, has been invulnerable.

Many chemical problems remain unsolved. A surprising number are in process of solution. Many clinical controversies are to be settled. But these hormones, perhaps the most powerful ones ever discovered, provide indispensable research tools for a myriad of fundamental investigations. Hence, I will prophesy with confidence that, like the Fuller brush man, we have only one foot in the door so far, and this is merely "the end of a beginning."

The preparations we are now using, and the way we are using them, though superior to those of even a year or two ago, will most assuredly be improved notably. Of course, everyone wants the future *now*. But the impatient, the frustrated and the faint-hearted should measure a remark by Dr. Kendall: "In the search for truth, time has no meaning."

And so, far into time, investigators will find and follow new clues related to the cortisones and the corticotropins. They will be in restless competition, not with each other but with yesterday's mind and truth. But as they, by time and testing, discover a new fact here and another one there, they must meet these truths with humility, not as cold scientists rewarded by cerebral self-satisfaction, but as men whose hearts keep step with their minds and as becomes the inquiring physician who realizes that any single truth, no matter how impressive or useful it may be, is only an infinitesimal fragment of what is the whole truth as it is known to The Great Physician.

The Nobel Prize and the Nobel Festival

During my last visit to Stockholm, friendly reporters asked all sorts of questions. One reporter asked me: "How do you go about winning a Nobel Prize?"

That reminded me of a story: A fifty-year-old man announced that he had $100,000 in the bank and was retiring. A friend asked him, "In these days of high taxes, how did you manage to save $100,000?" The man replied: Well, I've worked very hard for thirty years; I've rarely taken a vacation; I've saved every dollar I could, and I've just received from my uncle's estate $95, 000."

I think that's about the way one wins a Nobel prize, by having the right relationships. We live in a country where freedom of inquiry is still possible, where research is encouraged and supported, and is still a matter of free enterprise. My colleagues, Drs. Charles Slocumb and Howard Polley, and I, had the unfailing support of the Mayo Clinic and Mayo Foundation. But considering personalities rather than policies, I was fortunate in the selection of two people: a long-suffering, self-sacrificing, loyal and understanding wife who created a home of happiness and peace so necessary for an investigator (especially a frustrated one), and Nick Kendall, one of the world's preminent chemists, perhaps the one man in the world who could have given *both* the advice and the materials which were required.

The Nobel ceremony of 1950, which Drs. Kendall, Reichstein and I attended, had a special significance, for it commemorated the fiftieth anniversary of the awarding of the Nobel Prizes. About thirty of the 100 living laureates of previous years were on hand, among them Sir Alexander Fleming.

This "Solemn Festival of the Nobel Foundation" as it was called, was an occasion of outstanding dignity and beauty. For one of the newest laureates, it was also an event of spiritual significance. I found myself seated with four great chemists, an atomic scientist and two men who are supremely capable in the fashioning of words. Although we were separated by nationality, interests and the category of our prize, none of us was alone. The life of each of these laureates had been, or could be, profoundly influenced by the work and hopes and dreams of the others.

To me it was a living demonstration of the internationality and of the brotherhood of science, and of the essential unity of Truth. For any truth is everybody's business.

In Conclusion

In conclusion. let me refer again briefly to cortisone. To be useful, to perform its appointed function in the human economy, cortisone possesses a distinctive characteristic. It must have an oxygen atom at position 11. Without this it is not cortisone but a useless, inert substance.* With this character it is a thing of power. So too, of men and organizations: To fulfill a useful destiny, they must be distinguished by having character, above all a sense of responsibility to their Creator and to their fellow man.

Such an attitude must have been possessed in outstanding measure by the founders of St. Joseph's Hospital, and by those who have since given to it their accumulated devotion that it might accomplish its long century of service.

To come here today to pay my small tribute to the men and women of this institution and to its honored past, has been a pleasant and satisfying experience.

To St. Joseph's Hospital may I make this salutation: Alert centenarian, well postured by worth and justified pride, long may you continue your combat against suffering and diease, those twin indignities on the useful development and happiness of mankind.

---

*It would be "substance S," isolated by Reichstein.

PSYCHIATRY AND RELIGION

FRANCIS J. BRACELAND, M.D.
Institute of Living
Hartford, Connecticut

IT IS an honor to join with this distinguished group of scientists to celebrate the hundredth anniversary of the founding of a great institution, St. Joseph's Hospital, and to pay tribute to its valiant band of founding sisters and their spiritual descendants. We, as visitors, can know but little of the privation and sacrifice which goes into the building of a hospital of this renown, from its log cabin beginnings to its present honored status. We can only register our respectful appreciation of the great staff, religious and medical, whose privilege it has been to contribute their services to the hospital in the century of its existence. In tribute to all of them we reiterate with Sir William Osler that "there is no higher mission in this life than to serve God's poor."

When this subject matter was suggested to me, I wondered about the propriety of such a presentation on a program graced by world famous medical scientists, justly honored for their outstanding researches, and yet, as one considers it, such a discussion is not unseemly, for the problems to be treated under these headings are pressing and they require clarification and understanding. Here are involved the difficulties and differences of opinion of a medical discipline and religious belief treating of two aspects of a man's life which should never be at variance, for together in concerted action they have sustained man since the beginning of civilization. It is fitting to air these problems in this setting, which is dedicated to both medicine and religious belief and which, in the dignity that age has given it, is tolerant of new ideas as long as they are helpful to the physical and mental well-being and the spiritual growth of man.

In the era in which this hospital was founded but little attention was paid to mental disease, though its history was as old as man. There were no practitioners of psychiatry as such: there were alienists, a few of them, but they were concerned mostly with the legal problems which the mentally ill presented. The basic medical sciences were advancing rapidly and with them went a mechanistic and materialistic outlook, in which more often than not the disease process was sought out and the individual who had the disease was forgotten.

Definitive treatment and research in mental illness were unknown at the time and even the care of these patients was altogether in isolated rural institutions and on the outer fringe of medical practice. To be mad was to be mad, even as it was in Shakespearean times and even general hospitals under religious auspices were reluctant to provide for the mentally ill, who were regarded as a people apart. In some ways this was neglect of a heritage, for in the earliest city hospitals on record, those founded by Pope Innocent III, he had objured them especially to provide humane care for the insane in special "psychopathic" sections. It is noteworthy that only within recent years have psychiatric wards been re-established in general hospitals in response to the demands of the times and not infrequently with serious misgivings on the part of staff and administration alike.

This is not the place to recount the difficulties psychiatry has had in gaining acceptance as a branch of medicine nor to go into the reasons for it. Recognition was slow and suspicion of it has not been dispelled entirely even in the present day. Suffice it to say that the medical experiences in two world wars and the emergence of the concept of psychosomatic medicine have done much to effect closer rapprochement between medicine and what it has regarded as its errant adolescent daughter, modern dynamic psychiatry. This rapprochement comes none too soon, for there are at present several lay groups anxious to take over the medical art of psychotherapy, an eventuality which, should it transpire, would have devastating effects upon sick people and very seriously complicate the practice of medicine.

Psychiatry had had few problems and aroused little animosity in either practitioner or theologian as long as it remained behind large stone walls and cared for the the mentally ill—no one else wanted them. It was only when it emerged with concepts and a psychology of its own and

---

Real at the Centennial observation of the founding of St. Joseph's Hospital, Saint Paul, Minnesota, May 16, 1953.

entered into the treatment of emotional problems that it began to experience suspicion and distrust. This hospital had been founded for half a century before the ideas were promulgated which were to be the source of conflict, the advent of the doctrines of psychoanalysis, product of the genius of Sigmund Freud.

Brilliant pioneer that he was, Freud was a product of the materialistic society of the nineteenth century and there is little doubt but that he was strongly influenced by the zeitgeist of his time and its culture. A biologist who began as a neurologist, he was devoted to science, and yet, much of his work was unscientific. His ingenious observations and conclusions were made by intuitive interpretations, the least scientific of methods, and by his feeling for people rather than by quantification of controls and other hallmarks of the real scientific method. From his ventures into philosophy it was soon apparent that his orientation was materialistic and deterministic. Then, as Zilboorg notes, when he labeled religion as an illusion and regarded it as a compulsive neurosis, the theologians' worst fears were confirmed and the battle lines were drawn. Peculiarly enough, Freud arrived at his ideas about religion by an insistence upon the infallibility of his own methods and by elevating to the position of final causes the psychological mechanisms he was fortunate enough to discover.

Briefly stated, modern psychiatry has come under the anxious scrutiny of the theologians because they have been unable to correlate much of the philosophy of analytic doctrine with traditional Judaeo-Christian beliefs. This for them is no sterile philosophic quarrel; it is fundamental. In defense of their belief, some members of the clergy have attacked psychiatry, and particularly psychoanalysis, because they believe it teaches a destructive principle. Some psychoanalysts, in their turn, have questioned certain religious teachings and they profess to find in them the foundation of nervous disorders. They imply that in the light of their new findings the orthodox teachings of the Judaeo-Christian tradition should be examined and changed. Despite these apparently irreconciliable viewpoints, this conflict is not beyond satisfactory solution for it is difference of opinion between groups which are looking only at accidental segments of the problem. Should ever the representatives of these opposing ideas be able to meet, the possibilities of mutual enrichment are many and the resulting common agreements would go far toward healing some of the emotional ills of modern man. The ancient ideas of Thomas Aquinas would lend substance to the thinking of the modern psychiatrist, while modern psychological insight into normal and pathological reactions would be of aid to the theologian.

There is little disagreement with the statement that no single individual ever contributed so much to the knowledge of psychology and psychiatry as did Sigmund Freud. There is also general agreement that the methods of psychoanalysis, properly used, have opened a field which promises benefit to mankind of the magnitude of aseptic surgery and chemotherapy. The quarrel between analysis and religion stems not from the factual material or the techniques of psychoanalysis, for they are compatible with religious belief; rather the disagreement stems from the philosophico-religious overtones which accompany this psychological system. That the discoveries and methods of psychoanalysis can be used today without subscribing to the philosophy which accompanies it is an accepted idea among thoughtful scientists and theologians.

Karl Stern has pointed out that this dynamic and phenomenological approach to psychiatry, which arose out of the depths of nineteenth century materialism, can be Christianized, whereas many other psychiatric methods, which in themselves look bland and neutral, may contribute to the tools of nihilist society. "It is the duty," he says, "of every psychiatrist who holds a spiritual concept of man to avoid all purely negative attitudes." He should accept all that is genuine in the psychological insights of Freud, Jung and Adler, strip it of all of its accidental materialistic superstructure and use it as an instrument of healing.

The physician who is not a psychiatrist becomes impatient at about this time and wonders just how important these differences of opinion really are. In truth, they are fundamental, for the philosophic overtones of the original analytic doctrine imply a reductive principle. In this system the God of Judaeo-Christian belief becomes a father image. In a manner similar to Copernicus, Freud centered the universe of psychologic relationship about parental images. Before this, in a search for first causes man had seen God as the center of the universe. The Freudian doctrine saw the Oedipus complex as the center of human psychological affairs and thus, as Stern points out, with one change reversed the process and created God in man's image. Here was altered a monotheistic idea of almost 6,000 years' standing—it called into question the moralistic standards of a civilization and hung man precariously on the thread of a specious present. These concepts would set men adrift philosophically in what amounted to a psychological and spiritual revolution. It is easy to see that the appearance of these ideas would cause consternation.

On superficial examination it might seem easy to disentangle this philosophic superstructure from the facts which analysis demonstrates but in actuality it is not easy, for the doctrine has permeated deeply into the attitudes of the practitioners. It has been stated that, had Freud had a spiritual approach to the problem, it would not have shaken any of his fundamental discoveries, but rather with his genius he might have built a magnificent psychological structure. The fact remains that he did not and therefore, in the minds of many, the edifice which he began remained incomplete.

This rapid deviation of medical psychology into new channels found the philosopher and theologian unprepared for the empirical observations which it would present. Thomas Aquinas had left no special treatise on psychology in the modern sense of the term. Like his predecessors and contemporaries, he had no predilection for psychological facts as such. To him these facts were important only insofar as they related to the metaphysics of human nature or the ethics of human behavior. The reaction of the critics of this new doctrine was therefore of negative nature and, in the layman's mind, these problems were confused with psychiatry in general and the whole discipline became suspect. Some of the more zealous of the critics saw grave error and sin, even in psychiatric consultation, to the distress of patient, referring physician, and psychiatrist alike. Psychiatrists knew they were anxious only to practice a medical discipline and they had no desire at all to dabble in either philosophic or theological areas or to interfere with their patients' beliefs. Patients on their part knew that they were ill and more often than not, they were being helped. Their attitude towards the psychiatrist was like that of the man in the scripture who, upon being questioned, replied: "If he be a sinner I know not but this I know, I was blind and now I see."

This was the state of affairs until recently. Here was psychiatry, a medical specialty responsible not only for half of the country's hospitalized patients but for the neurotics of all kinds and description whose number is legion, and yet in some areas it was under suspicion. The specialty and its practitioners must of course share much of the blame for they, too, have a number of zealots whose pronouncements cannot bear too close inspection and whose truculence is in inverse proportion to their knowledge. Fortunately, at present the way toward understanding and rapprochement seems clear and the situation has been helped immeasurably by two allocutions by Pope Pius XII, delivered within a period of seven months and indicative of an intense interest and a broad understanding of the problem.

The discourse of September 13, 1952, outlined the moral limits of research and treatment. It set forth briefly the essential principles and left the application in specific cases to the doctor. "Because only the doctor understands the medical evidence thoroughly, both in itself and in its effects, and because without expert knowledge of the medical facts it is impossible to determine what moral principle applies to the treatment under discussion. The doctor therefore looks at the medical aspects of the case, the moralist the laws of morality." In this allocution the morality, the efficacy, and the correctness of the pan-sexual method of a certain school of analysis are denied. Most psychiatrists would have no trouble in agreeing with this pronouncement and this extreme school has had few adherents in late years.

In the discourse of April 15, 1953, addressed to delegates of the Fifth Congress of Psychotherapy and Clinical Psychology, the hearers were cautioned not to lose sight of the truths established by reason and faith nor of the obligatory precepts of ethics. This allocution spells carefully and in detail the safeguards necessary for the protection of the patient and for the ethical and moral practice of psychotherapy. In no place are psychiatry or psychoanalysis, as medical dis-

INDICATIONS AND PRECAUTIONS IN CHOLECYSTECTOMY

WARREN H. COLE, M.D.
Chicago, Illinois

I WISH to preface my remarks on indications and precautions in gallbladder disease with a statement on pathogenesis, because of its influence on therapy. During the past several years, I have come to believe firmly that the initial phase of development of cholecystitis is chemical in origin. Later on it appears that infection develops in the gallbladder, but by no means in all cases. Numerous authors have reported the low incidence of positive cultures in acute and chronic cholecystitis. Recently, Twiss and associates[7] have reported studies on 259 patients with chronic cholecystitis, coming to operation. They found a positive culture in the bile in only 28 per cent of cases. The predominant organisms were E. coli, salmonella, typhosus, non-hemolytic streptococcus, alpha hemolytic streptococcus, staphylococcus and proteus vulgaris.

The presence or absence of infection in the gallbladder wall determines to a certain extent the reaction which might develop following emergency operation in the presence of an acute inflammation. If the acute cholecystitis is due primarily to a chemical inflammation the infectious phase of postoperative convalescence is apt to be minimal. On the contrary, if infection is the predominant source of inflammation the operative manipulation in that area may give rise to considerable systemic reaction.

Precautions in Diagnosis.—One of the major precautions in gallbladder disease is obviously related to accuracy of diagnosis. We must always remember that the typical pain in gallbladder disease is located in the right upper quadrant, referred often to the scapula, but not of constant duration. Dyspepsia is often present, but since it is likewise present in innumerable other diseases it becomes of no significance in the diagnosis of gallbladder disease. Gallbladder attacks are so brief in duration that if pain is complained of day after day, the diagnosis of cholecystitis can be eliminated unless a hydrops or empyema is the explanation. As stated above, the attacks of gallbladder disease are usually of short duration. In a detailed study, made by Harridge and Helsby,[6] of 211 consecutive patients having cholecystectomy at Illinois Research Hospital, Chicago, during the past three or four years, 41.7 per cent of the patients had pain lasting less than one-half hour; 12.6 per cent of the patients had pain lasting less than fifteen minutes. In about one-half of the patients the pain was constant, whereas in the other half it was of an intermittent or colic type. Harridge and Helsby likewise noted that in 45.6 per cent of their patients the pain was located only in the right upper abdominal quadrant. Pain was located in the epigastrium alone in 27.2 per cent and in the epigastrium as well as upper right abdominal quadrant in 18.9 per cent.

A correct diagnosis is obviously necessary because cholecystectomy even though stones are present in the gallbladder will not relieve symptoms produced by some other disease.

The pain in the left upper quadrant as seen rather commonly in patients with gallbladder disease may be of gallbladder or pancreatic origin. Occasionally, the pain may be anginal, and may actually be relieved by cholecystectomy, as reported previously. In this presentation we will not go into detail of indications for cholecystectomy in the presence of anginal pain. However, I should like to emphasize that if the pain is unusually severe considering electrocardiographic findings and clinical manifestations of heart disease, gallbladder disease may be exerting a role in the anginal pain. Likewise if severe electrocardiographic findings are present with minimal exercise pain, the gallbladder may likewise be increasing the anginal pain. An extremely important precaution is that operation must not be performed in the presence of a recent coronary thrombosis. Fortunately, the cardiologist with his electrocardiogram can usually identify recent thrombosis, and thus prevent this serious error which so often will result in death.

Precautions in the Presence of Jaundice.—I wish to emphasize the great need for establishing whether or not jaundice is obstructive or hepatog-

From the Department of Surgery, University of Illinois, College of Medicine.

Dr. Cole is Professor of Surgery, University of Illinois Medical School.

Read at the centennial observation of the founding of St. Joseph's Hospital, Saint Paul, Minnesota, May 16, 1953.

enous in type. The surgeon must always bear in mind that the most common cause of jaundice is medical, namely, virus hepatitis. If the patient has an obstructive jaundice, operation will be strongly indicated, whereas in the presence of hepatogenous jaundice, operation is almost always strongly contraindicated. A common source of error is the failure of the clinician to appreciate the fact that stools may be acholic in the first two or three weeks of disease in virus hepatitis. The fact that patients with virus hepatitis complain of little or no pain, but extreme weakness, should be very important in preventing errors in diagnosis. With few exceptions, liver function tests are extremely helpful in this differentiation, and, in fact, will rarely fail the clinician. The author favors the thymol turbidity test as probably being the most valuable in differentiation, since it is practically always positive in patients with virus hepatitis if the disease is sufficiently serious as to produce jaundice. However, at least two more tests, such as the alkaline phosphatase and cephalin flocculation test, should be performed, since no one test is sufficiently accurate to be considered accurate.

Value of Cholecystography in Diagnosis.—A few axiomatic statements can be made regarding the use of cholecystography in diagnosis of gallbladder disease. In the first place, if no shadow of the gallbladder is obtained following use of the gallbladder test media, we can rest assured that the gallbladder is pathological with no exceptions, providing the patient received the test material, did not vomit it and did not have a severe diarrhea. The latter two complications are now completely obliterated. I wish to emphasize the importance of the first complication, namely, failure to get the dye, because only a short time ago, we were about to remove the gallbladder in a patient reported as having no shadow following cholecystography, but additional investigation revealed the fact that the patient did not get the dye, although he had the routine cholecystographic x-rays.

The most common error in cholecystography is found in the patient having a shadow (presumably normal) of the gallbladder but actually having a diseased gallbladder. Many of these patients will even have stones in the presence of a normally concentrating gallbladder. If the stones are small, and only one x-ray picture of the gallbladder is available, they may not be visible. Radiologists have now learned that having the patient stand while taking the x-ray picture may allow small stones to gravitate and thus be seen. On certain occasions, stones can be visualized only when two or three pictures are available with decreasing density of the shadow, thus allowing better contrast with the stones. The medias recently introduced for use in cholecystograms are very effective in production of a shadow in normal gallbladders with a small dose, and with practically no reaction. However, there is a possibility that these substances are concentrated so much in the gallbladder that many pathologic gallbladders may actually reveal a fairly good shadow. If this is true, roentgenologists will have to go back to the old custom of interpreting density of shadows, which obviously would be associated with considerable possibility of error.

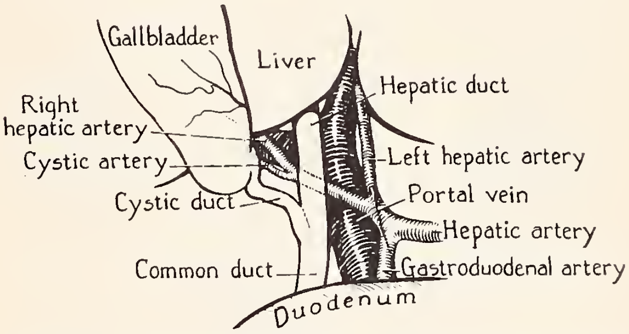

Fig. 1. Composite of the anatomical condition most commonly found in the biliary tract of the human being. Anomalies are probably more common in this area than in any other part of the body.

The great advantage of the media (Telepaque) most recently introduced is that it is concentrated so much in the gallbladder that when it is discharged by the gallbladder into the common duct the latter structure can often be visualized fairly clearly. On rare occasions, stones in the common duct will be demonstrable during the cholecystographic examination.

Historical Data

Since this is an historical meeting, being the Centennial Observation of St. Joseph's Hospital, it might be of interest to relate some of the historical features in the development of cholecystography. It is now just thirty years ago that Dr. Graham and I[4] began work on cholecystography in St. Louis. We first investigated tetraiodophenolphtalein, but the sample of the chemical which we had, turned out to be fairly toxic and we shifted our activities to the bromine compound, namely, tetrabromphenolphthalein. We first used the sodium salt of tetrabromphenolphthalein, but later adopted the calcium salt because the ion calcium is heavier than sodium and known to be impervious to the x-ray. We had Mallinckrodt Chemical Company prepare some tetraiodophenolphthalein, which upon trial revealed no greater toxicity than tetrabromphenolphthalein, but superior shadows. Accordingly, we then began to use it intravenously and orally. We tried out twenty-five or more compounds in our efforts to find the one most effective in producing a shadow. Seven or eight of these compounds produced satisfactory shadows of the gallbladder, but a few of them were moderately toxic. One of the less toxic compounds and one which we used for two or three years was phenoltetraiodophthalein.[5] We used this for a few years because it is a fairly stable dye, and also could be used as a test of liver function since the drug was excreted largely by the liver. Simultaneous readings on liver function could be obtained following the intravenous injection of this dye for cholecystography. It was following the use of the simultaneous test of liver function that we found an extremely high mortality rate in patients having cholecystectomy when a retention of dye beyond normal was found. For example, in a certain period of observation we found that all of our deaths following cholecystectomy occurred in patients having a retention of dye greater than 40 per cent (normal 5 to 10 per cent). Early in our experiments we likewise learned that the strontium salt of tetraiodophenolphthalein was effective in obtaining cholecystograms in animals. Strontium has a much higher atomic weight than does calcium or sodium, but we learned later that the positive ion in this compound was not the ion most responsible for the shadow, therefore the use of strontium was abandoned.

Fig. 2. It might be of historic interest to quote from our original manuscript on the exact method used in preparing material for injection into a patient.

> "A dose of 0.1 gm. per kilogram, when injected into a human subject, was found sufficient to cast a shadow. At present, 6 gm. has been the largest dose used. Six grams of tetrabromphenolphthalein is mixed with 1.2 gm. of calcium hydroxid, ground in a mortar with a few cubic centimeters of water, and dissolved in from 325 to 350 cc. of distilled water. Addition of calcium lactate was found to produce a more stable solution and slightly increase its solubility. Therefore, a solution of 2 gm. of calcium lactate in a few cubic centimeters of water is added. The solution has been sterilized by heating it to the boiling point under a flame, and heating in a water bath at from 95 to 100 C. for fifteen minutes."

The above quotation indicates the starting point in cholecystography. The person giving the dye made up the solution just as stated above.

Indications for Operation in Gallbladder Disease

Acute Cholecystitis.—There is still controversy as to whether acute cholecystitis should be treated by emergency operation or should be treated conservatively, waiting for the acute inflammation to subside. It is probable that the majority of surgeons favor immediate operation, but many excellent surgeons still choose to treat the condition conservatively. I, personally, am of the opinion that if the patient is seen within forty-eight hours of onset of symptoms of an acute attack, emergency operation should be performed. I, personally, prefer to treat patients who have symptoms longer than forty-eight hours, on a conservative basis, because the inflammation is apt to be so far advanced that cholecystectomy may be quite dangerous, and associated with a high mortality rate. One of the most significant drawbacks in the adoption of the policy of emergency operation is the fact that errors in diagnosis will be extremely common, and many cholecystectomies will be performed for manifestations produced by some other lesion.

If the conservative method of treatment is adopted it is extremely essential that the patient be watched very closely for the development of manifestations which may be a signal for impending gangrene or perforation. The important signs of impending gangrene or perforation are: (a) increase or persistence of pain; (b) increase or persistence of muscle spasm; (c) increase or persistence of fever, and (d) increase in leukocytosis. Of the four manifestations mentioned above, the first three are obviously the more important. If any of these three manifestations persist or increase, one should be suspicious of impending gangrene or perforation. If all three are present then perforation is so likely that emergency operation should be performed.

Utilizing these precautions, I have never seen a perforation of the gallbladder into the free peritoneal cavity. However, when the conservative method has been followed, I have operated on many patients as emergencies because some of the signs mentioned above developed or persisted. All clinicians have encountered on numerous occasions perforation of the gallbladder with local abscess formation. Often these patients reveal very few local signs.

When operation is performed for acute cholecystitis there will often be difficulty in determining whether cholecystectomy or cholecystostomy should be carried out. In general, attempt should be made to do a cholecystectomy, if inflammation is relatively mild, and the gallbladder can be removed without endangering structures around the common duct and major vessels. Therefore, the condition of the patient at the time of operation is an important factor and must be utilized in the discussion as to which of the two operative procedures shall be adopted. Often aspiration of the contents of the gallbladder will be helpful in determining which procedure shall be utilized. For example, if the contents of the gallbladder are shown, under microscopic examination, to be teeming with bacteria, and the patient exhibits considerable toxicity from the infection, then cholecystectomy may be inadvisable. However, as intimated earlier in this presentation, the causative factor in development of cholecystitis, even acute cholecystitis is often chemical rather than bacterial. If the contents of the gallbladder reveal pus cells but no bacteria, then cholecystostomy is permissible unless the patient's condition is quite critical. Elderly people with complicating diseases do not tolerate major operations very well; in such patients it is often advisable to do cholecystostomy rather than cholecystectomy.

Stricture of common duct
Stone in common duct
Chronic pancreatitis scar
Anomalies of ampulla of Vater
Biliary dyskinesia

Fig. 3. Diagrammatic sketch revealing possible causes of persistent symptoms following cholecystectomy; the lesions illustrated include only those located in the biliary system or in areas related to it. (After Cole in J.A.M.A., 1952).

Chronic Cholecystitis.—To a considerable extent indications for operation for chronic cholecystitis depend on the symptoms and their degree. It is always important to ask the patient if the symptoms are severe enough that he would wish to have an operation to eliminate them. However, this is by no means the only, or more important, factor in advising operation, because most clinicians now adopt the philosophy that a diseased gallbladder, particularly if containing stones, should be removed if many years of life are expected. I have adopted the principle of advising operation in patients with no symptoms but proven diseased gallbladder if the patient is under fifty or fifty-five years of age, and normal life expectancy exists. Obviously, we would not advise cholecystectomy in a patient with asymptomatic stones if he has a vicious hypertension with kidney disease, et cetera. Moreover, we do not often advise operation in the presence of asymptomatic gallstones in patients sixty-five or over, on the assumption that they will probably succumb to a natural death before complications of the gallbladder disease develop. However, one important point is almost axiomatic, namely, that if an elderly patient is having symptoms there are stronger indications for removal of his gallbladder at an early date, than in a younger person. The explanation of this statement lies in the fact that elderly people will tolerate cholecystectomy about as well as younger individuals, providing they do not have complicating disease, and providing complications of the gallbladder disease are not present. For example, in a survey[1] of mortality rate of 2,500 patients recently made at the Illinois Research Hospital, we found that the mortality rate in 169 patients under the age sixty having cholecystectomy was zero, and the mortality rate in fifty-four patients over sixty years of age was 1.6 per cent. This statistically is insignificant because there is only one death in the latter series. However, the mortality rate of all patients having cholecystectomy, choledochostomy or choledochoplasty does reveal a sharp difference in the mortality rate in the younger group as compared to that in the older group. The mortality rate for all patients having one or more of these three operations was 0.39 per cent in patients under sixty, compared to 3.9 in patients over sixty years of age. Therefore, it appears quite definite from our studies that the elderly patient can tolerate an operation like cholecystectomy about as well as younger people providing no complication exists.

Precautions in Operation for Diseases of the Biliary Tract

Cholesystectomy can be a very easy operation to perform, but when it is difficult, there is scarcely another operation in the field of general surgery which is as difficult or fraught with as much danger. The ill effect of errors in operative technique are so significant, particularly from the standpoint of danger of development of stricture of the common duct that numerous precautions must be emphasized.

1. *Good exposure* is essential to prevent damage to structures around the common duct and major vessels. Many surgeons prefer an oblique transverse incision for cholecystectomy or choledochostomy. I favor the use of the transverse incision wherever possible, but after using it in several patients for operation on the biliary tract, I have had the uncomfortable feeling that my exposure was inadequate. Accordingly, I, personally, prefer the paramedian incision and make it *long enough* to allow good exposure.

2. The surgeon must *be aware of congenital malformations.* (a) An accessory hepatic duct occurs in about 15 per cent of patients. The surgeon must watch for this accessory duct, and be sure it is ligated because in the absence of ligation considerable bile may pool in the abdomen giving rise to bile peritonitis, or if located only over the common duct may give rise to stricture. (b) An accessory cystic artery is found in 15 per cent of patients. If the surgeon is not aware of this after ligation of one cystic artery, he may hurry along and cut the second with so much resulting hemorrhage that the field is obscured before he has opportunity to control the bleeding. (c) The right hepatic artery lies anterior to the common duct in about 12 per cent of patients. If the surgeon is not aware of this, and cuts boldly through the posterior peritoneum and attempts to open the common duct, he may sever the right hepatic artery. If the right hepatic artery should be severed it should be anastomosed immediately. If not anastomosed successfully a great many of these patients, perhaps half, will die. (d) The right hepatic artery protrudes upward toward the liver parallel to the cystic duct in about 25 per cent of patients. This is a particularly significant hazard, as emphasized by my own experience, since on numerous occasions I have been about to place a clamp on the right hepatic artery, thinking it was the cystic artery. Delay at this point, and positive identification of the structures will save the surgeon much trouble.

3. The surgeon *must not be in a hurry* while dissecting the bile ducts. Damage to structures in this area are much more likely to occur when a surgeon is careless or is hurrying in his dissection.

4. The *junction of the cystic duct with the common should be isolated* before ligating the cystic duct. The reason for this precaution is obvious since the cystic duct can thus be ligated without jeopardizing the common duct.

5. The *cystic duct and artery should be ligated*

separately. If the cystic duct and artery are ligated together there is more danger of damaging the common duct, and of having the ligature slip off perhaps a few hours after operation. Moreover, the mass of ligated tissues with resultant necrosis is much smaller if the two structures are ligated separately.

6. The surgeon should *cut no structure until it is identified.* The importance of this precaution is readily understandable because the common duct and right hepatic artery may easily be damaged if proper identification is not made.

7. The surgeon should *ligate no artery until proven it enters the gallbladder.* Failure properly to identify arteries may allow ligation of or damage to the right hepatic artery.

8. It is usually desirable to *start dissection at the fundus of the gallbladder when adhesions are dense.* This precaution will prevent damage to structures in the floor of the operating field. When adhesions are dense, sharp dissection is almost imperative and therefore very dangerous. If the gallbladder is opened and dissection started at the fundus, the surgeon can keep his dissection confined to the gallbladder area, particularly if he has his finger in the lumen. It can usually be amputated flush with the cystic duct without endangering the vital structures in that area.

9. *Arterial hemorrhage should be controlled by pressure* on the right hepatic artery with a finger in the foramen of Winslow. When brisk hemorrhage develops it is very dangerous to attempt to clamp the bleeding point blindly through a pool of blood. With the right hepatic artery controlled by the right index finger and thumb, the field may be sponged dry of blood and the bleeding point found with gentle release of the artery. This precaution is important because a severed cystic artery retracts underneath the common duct at which point it usually arises from the right hepatic artery.

10. Always *remember that 75 per cent of strictures of the common duct are due to trauma inflicted during cholecystectomy.* It is very significant that very few strictures of the common duct are encountered in patients having had choledochostomy or cholecystostomy. This implies that in cholecystostomy the surgeon is not working deep enough to damage the common duct, and in choledochostomy, has isolated the common duct so that it cannot be damaged other than by the deliberate incision at the time for exploration.

Results

At the present time the mortality rate for cholecystectomy is probably less than 1 per cent. If figures are extended back ten or fifteen years, the rate will probably be in the neighborhood of 2 per cent. For choledochostomy plus cholecystectomy the rate now should be about 1.5 per cent and for studies extending back ten or fifteen years 3 to 3.5 per cent. In a study of causes of death following operations on the biliary tract at their hospital, Glenn and Hays[3] found that there was a decline in the number of deaths from hemorrhage and shock and intra-abdominal infections during the period between 1932 to 1950, but that there was a rise in deaths from degenerative diseases. Of the entire series, 30 per cent of the deaths were due to hepatic infection, cirrhosis or necrosis; the incidence of these complications remained fairly constant during the years through which the study was made. The overall mortality rate in their series was 1.8 per cent. In a four or five-year survey of surgical results recently made by the author[1] at Illinois Research Hospital the mortality rate for all types of operations on the biliary tract was 1.2 per cent (four deaths in 330 cases). As stated previously, in this study we had no deaths in 169 cholecystectomies performed in patients under sixty years of age and one death in fifty-four cholecystectomies performed in patients past the age of sixty, constituting a mortality rate of 0.45 per cent for cholecystectomies. Figures on symptomatic results following operation are related directly to the correctness of diagnosis, and inversely to the incidence of technical errors committed during the operative procedure. For patients having severe and typical pain in the right upper quadrant, good symptomatic results should be obtained in about 95 per cent of cases. For patients having mild symptoms including primarily dyspepsia, the percentage of good results will be no greater than 60 to 65 per cent. As stated, most of the persistent symptoms are related to erroneous diagnosis but in many instances the pain may truly have been of biliary tract origin, but the wrong or inadequate technical procedure was carried out. Residual stones constitute perhaps the most common single cause of persistent symptoms related to the biliary tract. Other causes of persistent symptoms including biliary dyskinesia,

HUMORAL VS. NEURAL REGULATION OF THE EXTRA-HEPATIC BILIARY TRACT

EDWARD A. BOYDEN, Ph.D.
Minneapolis, Minnesota

IT IS indeed a privilege to participate in this hundredth anniversary of the founding of St. Joseph's Hospital and to commemorate the first successful cholecystectomy in the Western Hemisphere—the one performed in St. Joseph's Hospital in 1886 by the late Dr. Justus Ohage.

While it is somewhat presumptuous to attempt to cover thirty years work in twenty minutes, I shall try to present the more important steps leading to our present conception of the mechanism of evacuation of the gallbladder.

Modern studies may be said to have begun in 1921 with the demonstration by Rous and McMaster[31] that the gallbladder of the dog concentrates the incoming hepatic bile from seven to ten times. Previous to this, Doyon[17,18] had postulated the simultaneous contraction of the gallbladder and relaxation of the sphincter of Oddi, Meltzer[28] had attributed diseases of the biliary tract to disturbances in the law of contrary innervation of these two end organs and Lyon[26] had developed a method of "non-surgical drainage" of the gallbladder by which a moderate discharge of "B-bile" could be induced by injecting a solution of magnesium sulphate into the duodenum. However, it was the precise study of Rous and McMaster that focussed attention on the physiological importance of the gallbladder.

Two years later, this writer[4,5] was able to show that in cats the gallbladder could be completely emptied by a meal of egg yolk and cream, of which egg yolk was found to be the most effective component. The next year (1924), Graham and Cole[19] published a method of visualizing the human gallbladder that revolutionized the diagnosis of cholecystic disease and opened the way for direct experimentation with the human gallbladder. In the fall of the same year a group of workers at the Peter Bent Brigham Hospital in Boston—unaware of the earlier work on the cat—first observed changes in the gallbladder shadow "after a meal." The cholecystograms were made by Milliken and Whitaker[29] on Whitaker's gallbladder. Subsequently, this work was expanded,[34] but previous to that the writer requested permission of the group to try the effect of egg yolk on his own gallbladder. This was done[5] (p. 334) and Whitaker also published this cholecystogram[36] confirming the observation that egg yolk is the most effective food.

Shortly afterwards, by applying an engineering method to the computation of gallbladder shadows in serial cholecystograms, Boyden was able to measure the rate of evacuation of the human gallbladder after a standard meal,[6,7] to determine its normal phases of contraction in different age groups[13,14] and its behavior under various test conditions[7]—thus paving the way for subsequent analysis of its rate of evacuation in pregnancy,[20] in peptic ulcer patients[11] and those suffering from pernicious anemia.[15]

Meanwhile, in 1926, three groups of investigators,[6,21,27,37] each unaware of the other's work and employing different experimental methods, had demonstrated that active contraction of the gallbladder is the force which expels gallbladder bile. At the same time Boyden[6] had shown that the gallbladder of a fasting animal could be activated by injecting into its leg vein 10 cc. of arterial blood from a cat which was digesting egg yolk, and that marked contractions could be induced even by transferring blood from a fasting animal to a test cat, or by autotransfusion. Two years later, Ivy and Oldberg[22] discovered that an extract of the duodenal mucosa (cholecystokinin) could evacuate the gallbladder of a dog when injected intravenously.

The question then arose as to whether the evacuation of the gallbladder is regulated solely by hormones or partly by these and the autonomic nervous system. Employing the Whitaker method[37] of filling the gallbladder of an experimental animal with lipiodol, Birch and Boyden[3] sewed shielded electrodes onto the gut tract of cats and found (in animals which had recovered and lay purring on the x-ray table) that the

From the Department of Anatomy, University of Minnesota Medical School.

emptying of the gallbladder could be reflexly inhibited by faradic stimulation of any part of the gut from stomach to cecum. However, this merely demonstrated the action of the nervous system in a laboratory mammal. Accordingly, in 1934, Boyden and Rigler[16] performed comparable experiments on volunteer medical students. When a faradic current was applied to the stomach or duodenum by means of swallowed electrodes, the resulting spasm and colicky pain completely failed to interrupt evacuation of the human gallbladder as it was being recorded at 10-second intervals on the x-ray table. These experiments seemed to point to the fact that the human gallbladder is not subject to reflexes originating in the gut tract.

Subsequently, our attention was focused on the sphincter of Oddi by anatomical studies[8,9,25,32] which proved for the first time that the human choledochal sphincter develops independently of the duodenal musculature,[32] and by physiological studies on T-tube patients (Bergh and Layne)[2] which proved that the sphincter can act independently of the duodenal musculature and even be the seat of spasms producing biliary colic. However, as a preliminary step, it was again necessary to analyze the innervation of the sphincter in animals. In 1943 Schulze and Boyden[33] discovered in cats the presence of a gastroduodenal nerve that innervates the choledochoduodenal junction. The cutting of this nerve in experimental animals (Johnson and Boyden)[23] retarded evacuation of bile. Section of the right vagus, which supplies a large component to this nerve as well as to the gallbladder, produced the greatest retardation, and section of the splanchnic nerves eliminated reflex inhibition of the gallbladder.[23]

There the matter rested until Johnson[24] was able to take advantage of a series of double vagotomies being carried out on male patients in the Veterans' Hospital for treatment of peptic ulcer. Series of cholecystograms were made preoperatively and at intervals of several months, postoperatively. The efficacy of the operation was tested by the Hollander gastric insulin test which is mediated by the vagus nerves. Also due consideration was given to the fact that in ulcer patients the gallbladder is evacuated much faster than in normal individuals[11]—a circumstance shown by Rigler and Boyden[30] to be due to the faster passage of egg yolk from stomach to duodenum, as revealed by fluoroscopic comparison of seventeen ulcer patients and an equal number of controls.

In the five ulcer patients in which double vagotomy was successful, the rate of evacuation of the gallbladder, as revealed by serial cholecystograms, merely returned to the rate characteristic of normal individuals.[24] In other words, double vagotomy had merely cured the ulcer condition since gallbladder and sphincter reacted normally after section of both vagi. It was noted, however, that the fasting volume of the gallbladder in these patients virtually doubled in the course of a year. This was interpreted to mean that loss of the vagi had affected the tonus of the fasting gallbladder, so that it failed to maintain its tonus against the influx of hepatic bile. It is too early to determine whether this has clinical significance.

Assuming, therefore, that the autonomic nervous system plays little if any role in evacuating the gallbladder, one may then ask what the factors are that regulate the flow of bile into the duodenum.

In healthy individuals, such evacuation would seem to be under the primary control of hormones originating in response to the presence of activating substances in the upper intestine. These vary quantitatively in their effects. Certain foods are more effective than others.[5,7] Moreover, evacuation is speeded up if these substances are introduced directly into the duodenum.[12] In addition, certain hydragogue cathartics (differing again in intensity of their effect)[12] mimic the first phase of contraction induced by food. Thus Boyden, Bergh and Layne[10] have shown that magnesium sulphate causes progressive relaxation of the sphincter for an average period of seventeen minutes and a drop in intraductal pressure from 14 to 11 cc. of water. The same salt induces a phase of contraction of the gallbladder that lasts for an average of thirty minutes and decreases the volume of the gallbladder by an average of 43 per cent. Similarly egg yolk causes progressive relaxation of the sphincter for an average period of seventeen minutes but a drop in intraductal pressure from 14 to 7 cc. of water. The same food induces a phase of contraction of the gallbladder which lasts for an average of thirty minutes but decreases the volume of the gallbladder by an average of 71 per cent.

These experiments indicate that the hormone produced by these substances acts simultaneously on the smooth muscle (or intrinsic nerve nets) of both the sphincter and the gallbladder. As McMaster and Elman noted in their experiments with dogs,[27] "There would appear to be a reciprocal response on the part of the two structures to the one stimulus." Additional evidence for this was found in our experience with seven pernicious anemia patients.[15] After the standard meal the gallbladder shadows diminished at the normal rate but the discharged bile filled the hepatic ducts first instead of passing into the duodenum. The administration of antispasmotics did not alter the situation; from which it was assumed that the biliary outlet was narrowed or fibrosed. Nevertheless, the gallbladder contracted normally. Similarly, in the T-tube patients of Bergh[1,2] the sphincter reacted normally in the absence of the gallbladder.

Finally, the retarded emptying of the female gallbladder in pregnancy[20] and the marked reversal of rate of the male gallbladder, postpubertally,[13] suggest that hormones other than those originating in the intestine may, at times, be operative.

In the diseased tract, other factors intervene. The presence of common duct stones, toxic substances, local tumors and inflammation can give rise to an "irritable sphincter." Significantly enough, this condition can often be relieved, temporarily, by antispasmotics but not by neuromimetic drugs—as has been so well shown by Bergh.[1] Has the time not come, therefore, to give up the concept of a biliary dyskinesia that is attributable to autonomic imbalance? This postulate[35] was based originally upon experiments with laboratory animals, in which species, admittedly, nerves have a regulatory effect on the contraction of both gallbladder and sphincter. In the human being, however, the absence of reflex inhibition[16] and the negative effect of sectioning the vagus nerves[24] would seem to favor the view that autonomic interference has virtually disappeared, thereby leaving the control of evacuation of the biliary tract to humoral substances.

ciplines, condemned as long as they do not contravene the moral and ethical principles mentioned.

The close of the discourse is of such importance that I am moved to quote it. "This is what we feel obliged to say to you. In addition be assured that the church follows your research and your medical practice with her warm interest and her best wishes. You labor on a terrain that is very difficult. But your activity is capable of achieving precious results for medicine from the knowledge of the soul in general, for the religious dispositions of man and for their development. May providence and divine grace enlighten your path."

Thus, armed on the one side with this blessing, which should go far toward allaying some suspicion, and on the other side the mellowing of various psychiatric doctrines and a closer relationship to medicine, there is hope that we might realize at least some of the precious results mentioned.

It is probable that the guests at the next centennial celebration here will not even have heard of these disagreements. People will go on with their religion; medicine will go on with its duty of healing and an important part of this healing will be in the emotional spheres, for it is as Paracelsus observed in the fifteenth century: "He who wants to know man must look upon him as a whole, not as a patched up piece of work."

CHOLECYSTECTOMY

(Continued from Page 719)

dilated stump of cystic duct, neuromata, et cetera, have been discussed elsewhere by the author.[2] Fortunately, most of these patients having persistent symptoms of biliary tract origin, following cholecystectomy, can be relieved if the proper operative procedure is performed.

WOMEN IN MEDICINE

BURGESS GORDON, M.D.
Philadelphia, Pennsylvania

ON THE SUBJECT of women in medicine, men find it difficult to mind their own business. Men started the first medical school for women in the United States, and here at this late date they again are agitating for women physicians These remarks appear facetious; yet they reveal a sincere desire to help women gain a full opportunity in all fields of medicine.

Medical education for women, in 1850, presented a challenging situation when William J. Mullen and three other men founded the institution now known as the Woman's Medical College of Pennsylvania. In that day, medical opportunities were beyond the scope of women. The background of the infant college was the neighborhood of tidy colonial architecture, floating ostrich plumes, and long voluminous skirts. The panorama inspired dignity and gentility—life for the ladies was languorous. No awful spectacle of a woman physician dashing out in high gear to answer a maternity call could be envisaged. The inspired Mullen commented realistically, "A woman, having received from her Creator the same intellectual constitution as a man, has the right to intellectual culture and development . . . and if women were properly educated, some new avenues to useful and honorable employment, in harmony with the gentleness and modesty of her sex, might be opened to her."

Today, the mode of life is changed; likewise the prerogatives of women. Those who are qualified may study and practice medicine without apology. They no longer reflect the harsh experiences of Mary Walker, who found it necessary, as Dr. Gulielma Alsop records, to wear man's attire to obtain adequate standing in the profession.

Since 1900, medical science has contributed richly to the betterment of human health through the control of communicable diseases, the elucidation of industrial hazards, the applications of chemotherapy, and rehabilitation. Implementing medical progress are numerous agencies that have mustered up forces to extend the arm of science. Increasing longevity has resulted. As Sir Arthur Newsholm remarks, "This is a response to the humanitarian sentiment against suffering."

With the increasing desire for better health, no thoughtful observer avoids the conclusion that new implementation of public health measures is essential. It is no longer sufficient for the doctor to be the healer of the sick—contrarily it is expected that he become the protector of the well individual and the community. Waste of lives is disastrous. As Dr. René Sand points out, "Governments are led to economize and cultivate this human capital." And better control of disease goes hand in hand with the promotion of national strength, a feature epitomized by Dr. Thomas Parran in the slogan of World War II: "Let's make our men as fit as our machines."

Statistical data indicate the population trends of the United States and emphasize the need for more physicians, especially women, for general practice and the specialties. The significant aspect is the disproportion between the increased birth rate, the wider participation of women in all fields of endeavor, and the number of physicians provided for their care. As for example, the national population rose from 131,669,000 in 1940 to 151,500,000 in 1950; the number of men in industry increased from 39,944,000 in 1940 to 43,268,000 in 1950, while the number of women rose from 12,845,000 in 1940 to 16,323,000 in 1950. The number of physicians in 1940 was 165,000, of whom 157,400 were men and 7,600 women. Between 1940 and 1952, 76,717 were graduated of whom 71,909 were men and 4,808 women. These figures do not reveal the number of physicians who discontinued practice or entered the armed forces, the veterans administration and government fields. It is apparent that the number for replacement and direct service to the public is relatively inadequate. A serious shortage has appeared in hospitals, both new and old. For example, in four hospitals of Luzerne County, Pennsylvania, there are only three interns; and throughout the United States at least 3,000 unfilled internships exist at the present time. More doctors must be found for all purposes.

The woman physician, by nature a home maker, fits precisely into the changing role of medical needs. Dr. Alice M. Pickett writes, "For gen-

Read before the Centennial observation of the founding of St. Joseph's Hospital, St. Paul, Minnesota, May 16, 1953.

erations, she has dealt with the tender things of life, the helpless, ill and handicapped . . . and her sympathetic understanding, acquired through the years, has been valuable in the fields of pediatrics, obstetrics, gynecology, general practice, teaching, and administration." Apart from her skills, there are the natural qualities of a common sense manner of dealing with the patient, hospital and home. She recognizes the futility of good health without cultivating the human aspects—the behavior, personality and adjustment of the individual to his community. As scores of patients will testify, women physicians, surcharged with the miseries of disease, are ever ready to speak to the sufferer of a way to peace and comfort. I cannot relate a single instance where the ceaseless panorama of suffering has dulled their finer edge of sympathy, or where womanly traits have become lost under the pressures of scientific doctrine. Though differing from men, as God intended, women are essentially equal to men in the practice of medicine. To their virtues I am dropping manna in abundance. To their faults—well, I'm a bit blind—and besides there is neither time nor place to search out man's tribulations.

The medical contributions of women in medicine have long been recognized and fully recorded. History unfolds the pioneer accomplishments of Elizabeth and Emily Blackwell, Ann Preston and Marie Zakrzewska, and the present-day services of Drs. Catharine Macfarlane, Ellen Potter, Florence Sabin, Helen Taussig, and Martha Eliot, to mention only a few. Their quest for basic knowledge and their desire to serve medicine wholeheartedly has attracted interest and glorified the entire medical profession.

The real problem of the woman physician is her unwillingness to limit her life to practice and the financial obligations to her family. No, she assumes the heavy responsibilities of wife, mother and citizen. And in so doing, as Dr. Alice M. Pickett remarks, "She elaborates woman's basic difficulty in becoming unduly burdened." Group practice, with the opportunities for part-time participation may change the pictures of women in medicine. As Helen Leopold, writing for the *Louisville Times, remarks,* "Group practice should give time for living;" and as it helps to emancipate doctors from the bondage of their profession, women may gain the opportunity to combine marriage and a medical career, or to follow their profession with unbridled freedom. It appears the success of her medical program will depend on the ability of the woman physician to prorate her time for the varied activities of home, office and hospital.

The medical needs of the people are apparent, and the education of more doctors is necessary, but the problem is complex. It has been suggested that a greater number of students could be trained if the medical schools merely increased their enrollment and utilized for the purpose existing facilities and personnel. Fortunately, or unfortunately, as it may appear to those beyond the walls of medical colleges, the human equation takes precedence over bricks and mortar. Indeed, academic expansion *per se* cannot be upheld by the techniques of the assembly line or the contrivances that cause jet bombers to travel 700 miles an hour. Competent teachers must be trained, sought out and engaged.

And, as the teacher plays a vital role in day-to-day instruction, he must also light the way for practice and inspire as well as assist those who would undertake programs of research. Nor does his work end there. Postgraduate education depends on his sustained interest in fundamental investigation and his ability to present pertinent data to the community for practical application. No wonder there is a fantastic situation in medical education that challenges deans, faculties and administrators to the very roots of their experience and ingenuity.

It is encouraging that the interest of prominent industrialists and philanthropists has been aroused in the formation of the National Fund for Medical Education. And no presentation on the needs in medicine should fail to commend Mr. Herbert Hoover, Mr. S. Sloan Colt, Mr. Alfred P. Sloan, Jr., Mr. Bernard Gimbel and the other trustees for their vision and effective leadership. Their support may very materially influence the course of medical education and the physicians who will serve the public.

While contemplating solutions for medical needs, an important asset has been overlooked. Women physicians have not been fully integrated into the field of medical education or service. Perhaps women have accepted the age-old view that men dominate the field of medical education and there is no important opportunity open to them. And perhaps men have considered women physicians as so definitely in the minority that their

NEWER CONCEPTS ON THE COAGULATION OF THE BLOOD

ARMAND J. QUICK, Ph.D., M.D.

Milwaukee, Wisconsin

IT MAY truly be said that the coagulation of blood is a subject of vital importance. Even at the very beginning of life, the Scylla of hemorrhage may bring disaster, while the Charybdis of thrombosis eventually may wreck often the sturdiest without warning. Yet withal, how little is known of this important physiological process in spite of long and ardent toil.

Historical

Several hundred years elapsed between the time that Malpighi noted white strands remaining after a blood clot had been washed and the recognition that these strands were derived from a soluble plasma protein, fibrinogen. The important concept of Buchanan that a specific agent of the blood was responsible for the conversion of fibrinogen to fibrin did little to stimulate progress until the same idea was reintroduced by the aggressive Alexander Schmidt. To him and others such as Hammarsten belongs the credit for establishing thrombin as the physiological clotting agent. Through the work of Schmidt, Pekelharing and others, it became recognized that thrombin did not exist in the blood but was formed from a mother substance, which is now known as prothrombin. Again it was Schmidt who contributed another important idea, namely, that prothrombin required for its activation an agent that he named zymoplastic substance which in modern terminology is thromboplastin. It remained only for Arthus and Pagès to show that calcium was indispensable for clotting to complete the basic facts which were established when the present century began.

Morawitz and Field and Spiro summarized the existing knowledge on the clotting of blood by the two well-known equations:

Prothrombin + calcium + thrombokinase = thrombin
Fibrinogen + thrombin = fibrin

It is of little moment now what precise interpretations these authors gave to the various clotting factors. Suffice it to say, that their simple equations furnished the most practical guide and served as the basis for methods to determine prothrombin quantitatively.

The writer, in 1935, devised a test now generally known as the one-stage procedure for determining prothrombin. The method consists in adding an excess of potent thromboplastin reagent and calcium chloride to oxalated plasma and then carefully determining the clotting time which becomes a measure of the prothrombin concentration. Almost simultaneously and independently Smith, Warner and Brinkhous also developed a method for estimating prothrombin. In their procedure, the prothrombin is converted to thrombin, and the amount of the latter measured by the speed with which it coagulates a standard solution of fibrinogen.

It was most opportune that vitamin K was discovered at the time when these two methods became available. With the recognition that vitamin K is essential for the synthesis of prothrombin, the cause of several important bleeding diseases, particularly the hemorrhagic disease of the newborn and cholemic bleeding, became apparent and the cure almost immediately forthcoming. In an incredibly short time a significant new chapter in modern medicine was completed.

The discovery that spoiled sweet clover hay caused a hemorrhagic disease by depressing the prothrombin level of the blood initiated a new phase in the study of blood clotting. The isolation of the toxic principle, Dicumarol, from spoiled sweet clover hay by Dr. Link supplied a new tool for studying prothrombin. A detailed account of the early historical developments may be found in the author's monograph on hemorrhagic diseases.[5]

In 1943 it was demonstrated that in addition to the known clotting factors another agent hitherto entirely unrecognized was essential for the production of thrombin.[6] This discovery was the result of a relatively simple experiment. It was known that the prothrombin time became prolonged in stored plasma and it was assumed that this was due to a loss of prothrombin. Signifi-

cantly, when to such stored plasma an equal volume of plasma from an animal in whom the prothrombin was depressed by Dicumarol was added, the resulting mixture had a relatively normal prothrombin time. The fact that the two plasmas mutually corrected each other clearly indicated that the agent which disappeared on storage was not the same as the one depressed by Dicumarol. Obviously, prothrombin was not destroyed by storage, but rather that a decrease of a new entity was responsible for the prolonged prothrombin time. This new factor was named component A of prothrombin but later renamed labile factor. At the time of its discovery, the prediction was made that a deficiency of this factor might be found clinically. Interestingly, in less than two years, Owren[4] reported such a case. While the discovery of the labile factor has not changed the fundamental concept of the coagulation mechanism, it did emphasize the ease with which an essential clotting factor can long be overlooked.

Another major advance in blood clotting was made in 1947, when it was demonstrated that the activity in blood which was generally named thromboplastin was the resultant of the interaction of a platelet factor and a plasma constituent which was named thromboplastinogen.[7] On the basis of this observation, a new test was developed which is known as the prothrombin consumption time. In this procedure blood is clotted under standardized conditions and the prothrombin remaining in the serum is determined. From this residual prothrombin, the amount of available thromboplastin in the blood can be estimated. A deficiency of either platelets or thromboplastinogen as occurs in hemophilia results in a deficiency of thromboplastin and, therefore, in a poor consumption of prothrombin. With this new test a means is now available to study quantitatively the group of diseases which can be classified under the heading of hypothromboplastinemias.

The Essential Thrombinogen Factors

Since thrombin is the keystone in the coagulation mechanism, it is imperative to know what agents are required for its formation. Experimentally and clinically, it is now well established that at least five agents are essential: prothrombin, labile factor, calcium, platelets, and thromboplastinogen. It is not unlikely that other factors will eventually be found to be required, but so far only the five named are sufficiently established to designate them as primary.

Prothrombin.—This clotting factor is accorded a position of pre-eminence in blood clotting, not because it is more important than the other basic agents, but because more is known about it. It is a plasma protein which is inactivated at about 58° C. It requires for its synthesis vitamin K. One may postulate that the enzyme responsible for the synthesis of prothrombin is composed of an apoenzyme (Æ) and a prosthetic group supplied by vitamin K (K) to form the holoenzyme (Æ K). Lack of vitamin K brings about a decrease of prothrombin production. This may occur in the newborn, in obstructive jaundice, and other conditions in which the body fails to secure a sufficient supply of this fat-soluble vitamin. Lack of apoenzyme is still hypothetical, but it satisfactorily explains certain hypoprothrombinemic states such as congenital low prothrombin which is completely refractory to vitamin K.

Much clinical interest is centered on the antivitamin K compounds of which Dicumarol is the prototype. The action of such compounds is most satisfactorily explained by postulating that they act by competitive inhibition replacing vitamin K in the enzyme system Æ K according to the law of mass action equation: $\text{Æ K} + \text{D} \rightleftarrows \text{Æ D} + \text{K}$. The resulting Dicumarol complex Æ D is inactive. By giving large doses of natural vitamin K_1, the reaction can be reversed and the hypoprothrombinemia of Dicumarol can be effectively counteracted.

Two interesting but generally unrecognized facts concerning prothrombin should be mentioned. The first is the apparent large demand of the body for this clotting factor. In twenty-four hours the quantity of prothrombin utilized is roughly equal to the total amount in circulation. The second is that in adult human blood a large fraction of the total prothrombin is in an inactive state, prothrombinogen, whereas in newborn blood, little or none of this inactive form is present, but the free or active is the same in amount as in the adult blood.[10]

Labile Factor.—Although this agent is equally as important as prothrombin, its very existence was not even suspected until the agent was discovered in the Marquette laboratory in 1943. This can be explained by the uncommonness of labile factor deficiency. It is sufficiently abundant in blood so that it rarely falls below the critical level. It may become diminished after severe liver injury, but neither vitamin K deficiency nor Dicumarol influences its concentration. Labile factor deficiency may be congenital and there is even evidence that this defect may be hereditary.[1] This clotting factor is a protein which like prothrombin is inactivated at 58°C. Whether it has any function other than its thrombinogenic activity, it is not known. Why its concentration is much greater in animal bloods such as that of the dog and rabbit than in the human likewise cannot be explained.

Calcium.—Contrary to the generally accepted view that calcium acts catalytically in the clotting reaction, the experimental evidence clearly points to the fact that it enters the thrombinogenic reactions stoichiometrically. It is likely that calcium is combined with one of the factors in the prothrombin complex. Since fatal tetany occurs at a calcium level of the blood that is still entirely adequate for optimal clotting, hypocalcemia as a cause of defective clotting is theoretically impossible.

Platelets.—Platelets do not contain thromboplastin but merely supply an agent which reacts with thromboplastinogen to form thromboplastin which in behavior is similar to the substance found in tissue extract. The platelet factor is probably a lipoid which is heat stable but deteriorates on storage.

Thromboplastinogen.—Since the evidence is fairly conclusive that the clotting defect in true hemophilia is a quantitative deficiency of thromboplastinogen, this agent is of great clinical importance. The control of the concentration of this factor in normal individuals is not known, but it apparently fluctuates widely and acquired hypothromboplastinogenemia may constitute a clinical entity that may account for a hitherto unexplained hemorrhagic state.

The Autocatalytic Reaction of Blood Clotting

Sufficient data are now available to express the over-all reactions of blood clotting in terms of chemical equations. It must be realized, however, that such equations are intended to serve as a general expression rather than as an exact and detailed presentation of the actual chemistry involved. Thus, the action of thrombin on fibrinogen is given by the simple equation: Fibrinogen thrombin fibrin. It is adequate and practical but according to recent findings is far from expressing the complete chemistry of the reaction. Instead of one step there is evidence that the process involves several including a splitting of a fibrinopeptid from the fibrinogen, thereby activating the latter and bringing about its polymerization.[2,3] While this new information is of theoretical interest, it had no immediate clinical importance. The simple equation continues to remain the best guide and the law that the speed of the clotting of fibrinogen is a function of the concentration of thrombin remains an underlying principle on which the whole concept of coagulation depends.

The equation that expresses the interaction of the factors that produce thrombin may be written as follows:

Thromboplastin + labile factor + calcium + prothrombin = thrombin. In presenting this equation there is no pretense that it is an accurate expression of the actual chemistry. It merely conveys the idea that four substances interact in a stoichiometric fashion without specifying how and in what sequence the reactions between the participating reagents occur. Of real significance is the fact that a decrease of any one of the four factors will cause a diminished production of thrombin and, if sufficient, will result in a hemorrhagic state.

It has long been known that the addition of tissue extract to blood hastens coagulation. The active agent in such extracts was first called zymoplastic substance, later thrombokinase, and in recent years more commonly, thromboplastin. It seems certain that blood contains no preformed thromboplastin, and that clotting does not occur until active thromboplastin becomes available. From the studies which were done in our laboratory, it was established that platelets and the plasma constituent, thromboplastinogen, together bring about thromboplastic activity in plasma. Significantly, however, if a potent extract of platelets is added to native plasma which has not been in contact with a wettable surface such as glass, little or no thromboplastic activity is generated; if, however, a very minute amount of thrombin is added to the native plasma, the reaction between platelets and thromboplastinogen proceeds rapidly.[9] Obviously, thrombin acting as a catalyst initiates the reaction and supplies the link in the chain reaction. Platelet extract cannot react with the thromboplastinogen in the state it exists in circulating blood. The first essential reaction in the cycle is the activation of thromboplastinogen by thrombin. As soon as this occurs, the reactions proceed unhampered to form more thrombin. The sequence of events may be summarized as follows:

1. Thromboplastinogen $\xrightarrow{\text{thrombin}}$ thromboplastinogen A (activated).
2. Thromboplastinogen A + platelet factor = thromboplastin.
3. Thromboplastin + labile factor + calcium + prothrombin = thrombin.
4. Fibrinogen $\xrightarrow{\text{thrombin}}$ fibrin.

According to this scheme, the autocatalysis is through the thrombin, and unless means exist to remove this agent promptly, even a very minute amount gaining entrance in the blood stream would be enough to clot all of the circulating fibrinogen. Nature, however, provides an ingenious device to control the reaction. Thrombin is promptly and effectively removed by the fibrin clot itself.[8] Fibrin surface adsorbs thrombin with avidity and since serum is dispersed in the fibrin reticulum, any thrombin formed is immediately removed due to the intimate contact of serum and fibrin surface. Since clot retraction disrupts this close contact between serum and fibrin, this mechanism reinitiates the chain reaction and therefore probably plays an important role in intravascular clotting.

The Relation of The Coagulation of Blood to Hemostasis

The coagulation of blood is a vital part of the hemostatic mechanism but is by no means the sole means that the organism has to achieve stanching. In primitive forms of life the reflex contraction of vessels following injury and the gluing property of irritated endothelium are sufficient by themselves to control and stop bleeding. These same reactions occur in the higher animals as well as in man and play a significant role in the control of bleeding. In the evolution of coagulation, one of the first steps is the development of a cell which possesses the ability to agglutinate, thus forming sticky masses that are utilized by the organisms to seal injured blood vessels. These primitive blood cells find their counterpart in the platelets of mammalian blood. The platelets have a threefold function in hemostasis: (1) they agglutinate forming white thrombi which may function as mechanical plugs; (2) they furnish the agent which reacts with thromboplastinogen to form thromboplastin; and (3) they generate a powerful diffusible vasoconstrictor, thrombotonin, which chemically is 5-hydroxytryptamine. Obviously, platelets have a central position in hemostasis, but their action can occur only when sufficient thrombin is available.

Thrombin is the key substance in hemostasis and true coagulability is synonymous with thrombinogenesis. It is now generally established what the primary agents are that are needed to form thrombin; and tests such as the one-stage prothrombin time, and the prothrombin consumption test, offer means for the quantitive estimation of some of these factors. The groundwork has been laid for developing a practical and integrated concept of hemostasis. Real progress in the exact diagnosis and the successful management of the hemorrhagic diseases should therefore be forthcoming.

MODERN HEALTH PROBLEMS OF THE UNITED STATES

ANCEL KEYS, Ph.D.
Minneapolis, Minnesota

THE Centennial Program of a great hospital should be a forceful reminder of the march of progress, of the differences in medical problems and practice over the years. The alterations are most obviously reflected in the physical facilities and the therapeutic tools at hand but more important are the changes in the patients themselves. The gamut of diseases to which man is heir may be the same but the relative incidence of these diseases reflects the age structure of the population as well as the enormous improvement in the control of infective and parasitic diseases. At the immediately practical level of individual diagnosis and treatment, the practice of medicine does not lag far behind the changing demands for individual medical care; competition within the profession and between the supply houses assures this. But the case is otherwise in regard to the larger issues of the health and disease of populations.

To a large extent, the whole paraphernalia of our medical and health organizations, of medical schools, textbooks, and public health systems, is slow to adjust to problems of health and disease that have changed radically in the past few decades. This is understandable but it also means that there is an urgent need for constant re-evaluation of the character and magnitude of our several health problems. And it is sensible to begin such an analysis at the most elementary level.

The most elementary criterion of the health of a country is obviously the death rate. But without further specification the crude death rate is almost meaningless. The so-called "expectation of life" is a popular method of expressing the over-all national health and it is agreeable to observe that in fifty years the expectation has increased from forty-eight to sixty-six years for white men and from fifty-one to seventy-two years for white women. Further analysis shows that this improvement in the expectation of life is primarily a reflection of better health in infancy and youth. Out of a thousand live births in 1900, about 140 were dead before the year was out. In 1949 the number was only thirty-three. But the improvement at older ages is much less impressive. This is apparent in Table I which summarizes the change in the expectation of attaining the age of 70 years.

TABLE I. PERCENTAGES OF U. S. WHITE MEN ("M") AND WOMEN ("F") EXPECTED TO ATTAIN THE AGE OF SEVENTY YEARS FROM VITAL STATISTICS FOR 1900 AND FOR 1949.

Alive at	Per Cent to Attain 70				Per Cent Gain	
	1900		1949			
	M	F	M	F	M	F
Birth	30.6	35.2	50.9	66.7	66.3	89.5
Age 20	40.1	44.6	53.7	69.4	33.9	55.6
Age 30	43.0	47.6	54.7	70.0	27.2	47.0
Age 40	47.2	51.8	56.1	71.2	18.9	37.4

It will be observed that 47.2 per cent of U. S. white men aged forty in 1900 could expect to be alive at age seventy and that, by 1949, 56.1 per cent such men had the same expectation. This is a gain of 18.9 per cent. In 1900 U.S. white women had a better expectation than the corresponding men and their superiority was still more marked by 1949. For the age of forty years the improvement in the females was about twice as great as in the males.

The data in Table I should be a cause for some gratification but we still cannot be content when barely half of our men who reach manhood can expect to reach the age of seventy. And why should American women be so much healthier than their husbands?

Comparison of the death rates from all causes for U. S. men and women to age seventy is shown on a logarithmic plot for the latest year of record, 1949, in Figure, 1.

This helps to show details in a situation where the relevant numbers cover such a large range but the particular virtue of the logarithmic plot is that on it a straight line means a constant rate of

---

Dr. Keys (Ph.D.) is Professor and Director, Laboratory of Physiological Hygiene, University of Minnesota, Minneapolis, Minnesota.

An address presented at the St. Joseph's Hospital Centennial, May 16, 1953.

Data cited here are the result of research supported in part by a grant H 10 (C 1-6) from the National Heart Institute, of the National Institutes of Health, Public Health Service and the National Dairy Council.

change. This plot shows straight and parallel lines for both sexes from thirty to seventy. One mathematical slope suffices to define the relationship of total death rate to age for both sexes, the women being constantly about five years "younger" than the man in this sense.

Now by the year 1949, in America we had reached the situation where the older biological hazards of man—starvation and contagion—had largely disappeared and the death rates over thirty were basically determined by self-generating metabolic diseases. Cardiovascular disease, mostly of the degenerative type, and neoplasms alone account for almost two-thirds of the deaths from thirty to seventy years of age. So it might be suggested that the straight lines in Figure 1 are the expression of the basic metabolic, "aging" character of man. This would correspond to the fact that the enormous progress of medical knowledge, public health programs, and in the practice of medicine, and medical care, has brought only a limited improvement in the total mortality of Americans beyond the age of thirty. But if this is the case in the United States, the richest and supposedly most advanced part of the world, what about the unfortunate people who live elsewhere? In Europe, for example, where race, climate and general culture are similar to our own?

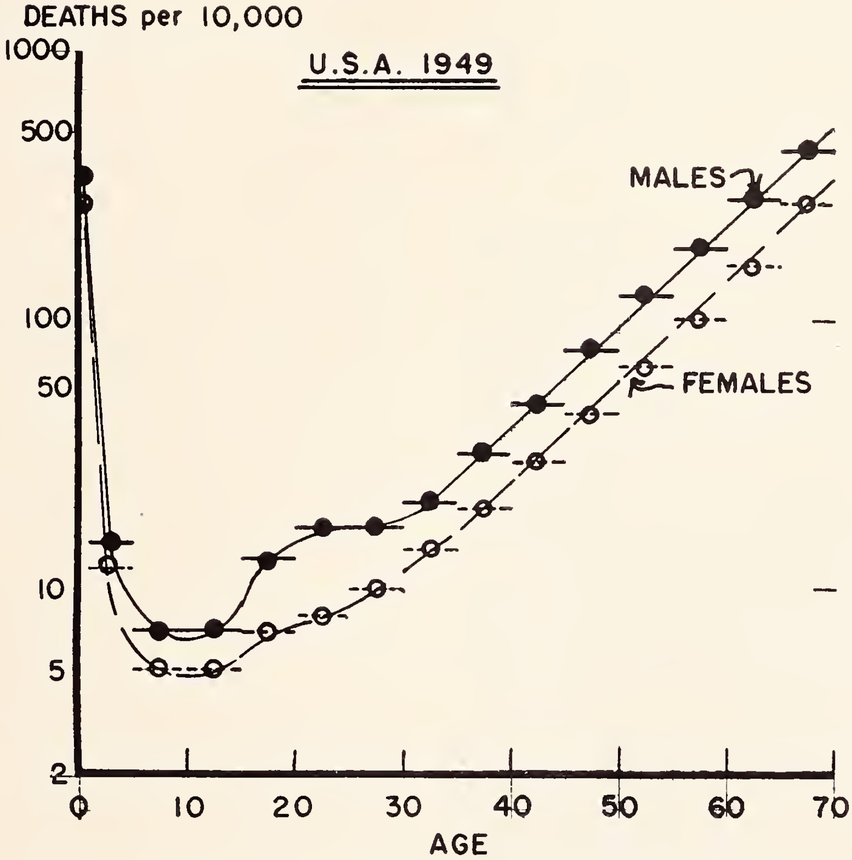

Fig. 1. Deaths from all causes, per 10,000 living persons of given age. The lines for the two sexes were drawn from age thirty-five to age seventy with parallel rulers.

Elsewhere[3,4,5] I have presented some of the current vital statistics data for various European countries as well as for Canada, Australia and New Zealand. These show the surprising, and disconcerting fact that the death rates from the total of all causes at equal ages tend to be substantially higher from ages thirty to seventy for American men than for men of many other countries of similar culture. Here a single example, that of Italy, is summarized in Table II.

The data in Table II show that from age thirty on our current mortality experience is progressively unfavorable as compared with Italy. This discrepancy is marked for men and relatively trivial for women. The effect on the numbers of survivors of these different death rates of men in

TABLE II. DEATH RATES, FROM ALL CAUSES, PER 1000 LIVING OF GIVEN AGE, FOR U. S. A. (1949) AND FOR ITALY (1948.)

Age	Men		Women	
	U. S. A.	Italy	U. S. A.	Italy
30-34	2.5	2.7	1.7	2.3
35-39	3.6	3.4	2.5	2.9
40-44	5.6	5.1	3.6	3.6
45-49	8.7	7.3	5.4	4.7
50-54	13.5	10.4	7.8	6.9
55-60	19.7	14.5	11.2	10.3
60-64	29.0	21.8	17.3	16.8

the two countries is negligible to about age fifty if we begin with equal numbers at age thirty. But the effect on survival to age seventy is not trifling. Starting with 1,000 living men aged fifty in each country, by age seventy the American group may be expected to dwindle to 573 while the Italians would be 662 strong. The Italian "health," in this regard, is very considerably better than our own. Why?

How can we explain this surprising fact that Italian men have this over-all superiority in mortality? If the vital statistics of other European countries are examined it appears that it is not so much that Italian men have a remarkably fine health record over a major part of the life span; the distressing fact is that the men in many other countries have lower mortality rates than Americans over the years from forty to seventy. The men in England and Wales, Holland, Denmark, Belgium, Sweden, Scotland, New Zealand, Australia, Norway, and even next-door Canada have notably better records than our own. But Italy is a particularly interesting example and it is illuminating to consider a few details.

Comparison of rates of deaths ascribed to specific causes is always risky but at least some possibly significant trends may be discerned if due precautions are observed and if the data are reasonably complete, as is the case in both Italy and the United States in recent years. Such comparison indicates that for many diseases there is no important difference between the age specific death rates in Italy and in the U. S. For men, the rates for intracranial lesions of vascular origin, for cirrhosis of the liver, for nephritis, for all neoplasms and for all violence are similar. As would be expected from our knowledge of the incidence of tuberculosis, the Italian death rate reported for infective diseases is considerably higher than that reported for the U. S. But the vital statistics inescapably lead to the conclusion that American men have a far higher death rate from circulatory diseases than do the corresponding Italians. For example, for men of fifty through fifty-four, the rate of deaths ascribed to diseases of the circulatory system is 5.7 per thousand in the United States as compared with 1.9 per thousand in Italy. A similar difference exists from age thirty to seventy.

Most physicians distrust vital statistics. They have seen too many cases where the death certificates recorded mere guesses—or worse. But healthy skepticism should not mean a refusal to analyze the evidence. It is easy, but not very intelligent, to dismiss the matter by saying that "heart disease" is a catch-all label for absent information and bad diagnosis or to suggest that Italian doctors do not recognize heart disease when they see it. The fact is that the statistics on heart disease in the United States and in Italy explain the otherwise inexplicable difference in the *total* mortalities.

It is particularly interesting that the big difference between Italy and America in circulatory disease mortality is in the "degenerative group," including coronary disease, angina pectoris, myocardial degeneration, chronic myocarditis, arteriosclerotic and hypertensive heart disease. Apart from this group, the mortality from other circulatory and cardiac disease is very much the same in the two countries. It is impossible to doubt that, compared with Italy, our men have a greatly excessive incidence of degenerative heart disease. Our women, on the other hand, are much less different from their Italian counterparts. For example, for ages fifty to fifty-four, the total death rate from all causes of white American women was 7.8 in 1949; for the comparable Italian women it was 6.9; for circulatory diseases the rates were 2.0 and 1.4.

It is widely agreed that for American men, atherosclerosis, the outstanding basis of most of this heart disease, is the leading health problem of our time. Argument waxes hot about the cause of atherosclerosis but there is rapidly building up a veritable mountain of evidence leading to several conclusions.

First, there is no doubt that cholesterol in the blood is involved in atherogenesis. The fact that the cholesterol is transported in the blood as lipoprotein aggregates is interesting but does not change this conclusion. And the material which

TABLE III. MEAN VALUES, FROM REGRESSION ANALYSIS, FOR SERUM TOTAL CHOLESTEROL CONCENTRATION IN CLINICALLY HEALTHY MEN IN NAPLES, AS PERCENTAGES OF THE CORRESPONDING VALUES FOR MEN IN MINNESOTA (TWIN CITIES.)

Age	Cholesterol	Age	Cholesterol
20	100	45	94
25	102	50	89
30	104	55	87
35	103	60	85
40	99		

TABLE IV. MEAN VALUES FOR SERUM TOTAL CHOLESTEROL CONCENTRATION IN CLINICALLY HEALTHY MEN IN MADRID, AS PERCENTAGES OF THE CORRESPONDING VALUES FOR MEN IN MINNESOTA (TWIN CITIES).

Age	Cholesterol	Age	Cholesterol
20	102	45	86
25	101	50	80
30	100	55	77
35	98	60	74
40	96		

makes up the atheromata is cholesterol, not beta lipoprotein or "giant molecules."

Second, the diet plays a major role in determining the amount of cholesterol in the blood. No other factor of comparable importance is yet recognized. The cholesterol itself in the diet is unimportant, at least in man, but the total dietary fats, vegetable as well as animal fats, have a dominant effect, as we have consistently found in many controlled experiments on man.[3,5,6,8]

With this in mind, it is significant that the American diet today is higher in fat than anywhere else in the world—and that includes the Eskimos.[3,4,5,11] Over 42 per cent of our calories come from fats as compared with the Italian national diet of just 20 per cent of calories from fats.

All of this being the case, it is not surprising to discover that the blood cholesterol picture in men in Italy differs from that in the United States. In the United States, at least in the urban centers studied so far—Minneapolis-St. Paul, Boston, New York, San Francisco—the concentration of the serum total cholesterol in clinically healthy men presents a characteristic and significant picture.[9] There are large individual variations but the trend is steadily upward from late adolescence until late middle age, with a downward trend thereafter. A closely similar age trend appears in the concentration of the lipoprotein-cholesterol complexes characterized in the ultracentrifuge by sedimentation rates of —10 to —20 Svedberg units.[2] In the sample of Neapolitan men studied, however, this trend is followed only in the younger men up through the thirties and thereafter the cholesterol concentration does not tend to rise further.[7] Table III summarizes the picture.

Is it coincidence that the mortality rates of men in the two countries begin to diverge at about the same age as the divergence in the serum cholesterol concentration? And is all this mainly a reflection of the differences in the habitual diets in regard to fats? The factor of relative obesity of the subjects is not involved because it was found that the Italian subjects closely corresponded to the Minnesota subjects in body fatness as judged from height-weight ratios and from measurements of the subcutaneous fat (skinfolds) in the two groups.

We have similar information from another low-fat diet country, where, in addition, many of the poor people are underfed. Table IV shows data from the poor population of Madrid and again the picture in the young men is similar to that in the U.S.A. but there is an increasing divergence after thirty years of age. The combination of a diet low in total fats and calories seems to be associated with a remarkably low level of blood cholesterol after age thirty.

Now in Spain, for the great majority of the population the diet is low in fats and meager in total quantity but the rich people, including the professional class, live very differently. Their diet is high in fat, like our own, and they eat enough of it to make their bodies at least as fat, in general, as those of Americans. A detailed study of a sample of these high-calorie, high-fat eating men in Madrid showed the cholesterol level in the blood of these rich Spaniards is at least as high as it is in Minnesotans. From age forty to age fifty-five, at least, the rich Spaniards on a high-fat diet exhibited much higher serum cholesterol concentrations than their poor compatriots who live on a low-fat diet. At age fifty, for example, the mean values for the serum from casual blood samples were 210 mg. per 100 ml. in the poor men and 265 in the rich men.

The wealthy and professional class in Spain represents only a very small fraction of the total population of the country so the national mortality rates are overwhelmingly dominated by the mortality of the general poor population. For the year 1949 the official statistics for the entire Spanish population indicate that, among men of fifty to fifty-four years, all heart diseases accounted for 18 per cent of the total deaths; the corresponding figure is 38 per cent for white American men of the same age.

Vital statistics in Spain are of dubious reliability but even casual inspection of hospital populations and the case records of leading physicians clearly indicates that coronary and related heart diseases are infrequent indeed in the general poor population but are very far from a rarity among the wealthy and professional classes.

Finally, the fact that Spain, like Italy, differs from the United States in regard to heart disease, is indicated by the sex ratio of cardiac deaths. At age fifty to fifty-four the cardiac death rate for men is almost three times that for women in the U. S.; in Spain the ratio is only 1.3 to 1.0.

Data on these questions of the diet, the blood cholesterol and the mortality from heart disease have also been collected from England. The English findings[3,4,5] indicate: (1) an average diet somewhat lower in total fats than in the United States but very much higher than in the diets of Italy and Spain; (2) serum cholesterol values resembling those in the United States; (3) for middle-aged men lower mortality rates from the total of all causes and somewhat lower rates ascribed to heart diseases. The indicated mortality from heart diseases is much more like that of the U. S. than like that of Italy.

All this evidence, and much more that could be cited in greater space, suggests a general rule that degenerative heart disease is directly related to the total fat content of the diet, the connection probably being through the effect of the dietary fats on the level of cholesterol and lipoproteins in the blood. This idea can be tested to some extent by a comparison of age-specific death rates and national diets in several countries for which reasonably acceptable data are available. For the countries studied so far there is a consistent and regular relationship between the two variables of percentage of dietary calories derived from all fats and the male age-specific death rates from forty to sixty-five years of age ascribed to "degenerative" heart disease (coronary disease, angina pectoris, myocardial degeneration, chronic myocarditis). Very much the same relationship holds when the total of all circulatory disease mortality is substituted for degenerative heart disease. The countries from which data have been obtained so far include, besides the United States and Italy, England and Wales, Canada, Australia, Sweden and Japan.

It is possible to question the final accuracy of the vital statistics involved in such analyses and it is possible to suspect errors in the dietary data. But the fact remains that, on national bases, what the physicians are labelling degenerative heart disease is closely related to what the agricultural and nutrition experts are reporting about fats in the diet. And this relationship is, in fact, in conformity with all of the previous discussion in this paper about diet, cholesterol, atherosclerosis and cardiac mortality.

As this paper was being prepared, I was privileged to see the manuscripts of two important articles from Johannesburg, not yet published, reporting findings on South African Bantu. Walker and Arvidsson[12] show that the South African Bantu, subsisting on very low intake of total fats, is strikingly different from Americans in serum cholesterol concentration resembling, in this regard, the Italians and poor Spaniards mentioned previously. Higginson and Pepler,[1] in turn, provide a careful study of post-mortem data on the Bantu from which it appears these low-fat diet, low-serum cholesterol people suffer singularly little from severe coronary artery disease and atheroma.

One further point should be noted. In the late World War several countries which were able to maintain good medical and public health systems revealed some remarkable changes in morbidity and mortality from arteriosclerotic heart disease. In Finland, Norway, and to a lesser extent in Sweden and Denmark, dietary fat decreased and within two years there was a distinct and progressive decline in arteriosclerotic heart disease (cf. e.g. 10). There was no such change in Britain but dietary analysis also showed that there was no decrease in the proportion of total fats in the British diet during the War.

Finally, it is pertinent to reflect on two sets of data and their possible relevance to our present problem of heart disease in American men. The first is the dietary trend of the United States over the past forty years. Since the beginning of record in 1909, an upward trend of fat consumption has continued, rising from an average of about 30 per cent of total calories to the current value of well over 40 per cent. In the light of all we know at present, does this trend constitute a medical and public health problem?

For the last point, it is interesting to consider the sources of our present dietary fats. By far the largest contributor is fats and oils as such, excluding butter; these account for 40 to 50 per cent of the total dietary fats. This means cooking and salad fats and oils are the main source of our fats in the diet. It is clear that there is ample room to reduce our total fat intake markedly without disturbing the real nutrient value of the diet. It would be readily possible to reduce our total fat intake by a third and still eat abundant amounts of meats, dairy products, fruits, green and leafy vegetables, cereals and eggs.

It should be observed that the main problem with which we are concerned in the present discussion is that of degenerative heart disease in the male. Information about the situation in the female is much less complete but it appears there are major differences between the two sexes in this regard, at least up to the age of fifty or a little later. At earlier ages the female tends to be protected, by some device yet unknown, from the high incidence of coronary disease which appears in men on high fat diets. Hence the apparent desirability of limiting the total fat content of the American diet is restricted, on the basis of present evidence, to adult males. It is in this segment of the population that the heart disease problem is most difficult and where the dietary effect is most clear.

In this paper there is presented only a highly condensed statement of many facts and relationships. Obviously, a great deal more research is needed before we can reach final conclusions and devise suitable application in a real program of public health. The challenge of degenerative heart disease is tremendous and, as yet, only trivial resources are devoted to a modern epidemiological approach such as indicated here. But it may be hoped that the significance of the data now at hand, and the need for further study on a greatly expanded scale, will be recognized and that appropriate action will result.

WOMEN IN MEDICINE

(Continued from Page 725)

services are immaterial. From my associations with the Women's Medical College, I would reply unhesitatingly that the time is long overdue when women physicians should enter more intimately into the program of modern medicine.

I believe women physicians bring the type of service that is greatly needed to bolster the resources in this period of doctor shortage. Young women with academic qualifications and scientific interest could do no better than enter the profession of medicine. They should be inculcated with knowledge that is invaluable for dealing with the particular social and health problems of our growing population. In compensation, they would find open to them the stimulating association of academic medicine and the gratifications of humanitarian works. It is believed that as women indicate their desire to study medicine, the Foundations and other interested groups as well as the medical colleges, in turn, will provide opportunities for their education. Among the doctors of the future, there should be a full complement of women physicians.

BLOOD BANKING IN SMALLER MINNESOTA COMMUNITIES

RUDOLPH W. KOUCKY, M.D.
Minneapolis, Minnesota

THOSE PERSONS responsible for present-day transfusion programs must be cognizant of two distinct situations, namely, the twentyfold to thirtyfold increase in the use of blood and plasma that has taken place relatively recently and the complexities of modern blood grouping and crossmatching. The modern surgeon, physician or obstetrician can and should require that an adequate supply of blood will be available when needed and that such blood will do no harm to his patient.

This great increase in the use of blood and plasma has occurred in smaller rural hospitals as well as in large central institutions. Not only has the volume of planned major surgery increased sharply in these small hospitals but also, due to mechanization of agriculture and greater highway traffic, the amount of emergency traumatic surgery has increased. This augmented amount of surgery in the local hospital has not eliminated, however, the very considerable movement of patients referred to various central institutions. Blood required by these referred patients must be replaced by friends and relatives at home. A modern transfusion program should supply this blood without requiring donors to travel long distances to the central points. Convenience and expense would dictate that the blood, not the donor, be transported from the local hospital to the patient where he is hospitalized.

It should be almost needless to point out that if the blood itself is to be shipped to the central institutions, it must be drawn under rigidly controlled conditions, such as those set up by the National Institutes of Health.

Those problems dealing with grouping and crossmatching have increased greatly in the past ten years. The technologist of today should have a clear concept of reverse (serum) grouping, 6-tube confirmation grouping, determination of subgroups of A, Rh-Hr slide and test-tube grouping, saline crossmatching, high-protein crossmatching and the use of Coombs' test as an adjunct to crossmatching. She must be able to recognize artefacts and nonspecific interferences. She must know how to provide blood for emergencies. Finally, she must understand why and how transfusion disasters occur. No transfusion program is safe in spite of any amount of blood on the refrigerator shelf if the technologist cannot cope with these laboratory problems.

These needs have been apparent for some time but until recently very little could be done to help the situation. With the organization of the Minneapolis War Memorial Blood Bank, however, there materialized an opportunity for great assistance to rural blood banks. Apprehensiveness of the Hennepin County Medical Society over possible political repercussions in the state organization and hesitation of the bank's executive committee concerning possible unfavorable financial obligations did exist. After careful study, both groups accepted these risks and gave their permission for the Minneapolis bank to proceed with the project of assisting rural blood banks. Dr. G. Albin Matson, director of the central bank, has devoted a tremendous amount of time to this program. Dr. A. H. Borgerson of Long Prairie organized the first rural blood bank of the affiliated system in 1950.

The small rural banks do not have difficulty in getting blood. An adequate stock for routine use can be easily maintained, and blood for emergency coverage is available from groups of standby donors, often spoken of as "walking blood banks." The details of procurement of donors vary somewhat in the different communities. At present, a total of nineteen community banks are affiliated with the Minneapolis War Memorial Blood Bank; space does not permit inclusion of a list of these banks but it can be obtained by communication with the central organization. A personal visit or at least a telephone call to a few of these banks is recommended for anyone organizing a program within his community.

Direction of the organizational phase of these plans for procurement of donors must remain with the medical group, but essentially all of the actual work and the subsequent maintenance of the project can be done by committees representative of various civic organizations.

A relatively large inventory of blood is maintained so that the local bank is thoroughly reliable. Blood unused within seven days is shipped to the Minneapolis War Memorial Blood Bank to be credited to the local rural bank.

This credit is used in a number of ways. The blood may be exchanged for irradiated liquid plasma. This plasma is controlled by the community physicians and hospital, and is commonly assigned to the hospital and also to physicians' cars, outlying physicians' offices and to sheriffs' and highway patrolmen's cars. This credit at the central bank may be used to supply blood at the various hospitals to which the community's people may be referred. It is used to provide blood for local people who become ill while traveling in distant parts of the country. The Minneapolis War Memorial Blood Bank acts as the clearing house in these activities. The transactions are carried out by wire or letter and actual shipment of blood is reduced to a minimum. Finally, the credit is used to provide rare types of blood or, more important, selected bloods in cases of crossmatching problems encountered.

The local procurement of blood, the shipment of blood and the management of credits are relatively easy and simple parts of the project. The introduction of standard methods, both those pertaining to biologic control and those dealing with typing and crossmatching of blood, is much more vital and also much more difficult.

Each technologist handling transfusions in the affiliated hospitals must come to the Minneapolis bank for indoctrination into every phase of blood banking. She learns the minimal requirements of the National Institutes of Health and of the American Association of Blood Banks. These girls, the equipment, the records and even the quarters where blood is drawn and processed remain under the control and supervision of both the Minneapolis bank and the National Institutes of Health. The rural banks are visited by both the director of the Minneapolis bank and a representative of the National Institutes of Health. In addition, blood received in the central bank from the affiliated banks is always inspected and the laboratory work done at the affiliated bank is repeated. This serves as an excellent check on the type of work done in each bank.

The technologists are urged to call or write to the central bank about their problems, to send specimens for confirmation or assistance in difficult cases and finally to return to the central bank for a week or two every year. It is hoped that some day the central bank can have one of its technologists go to each rural bank for a few days at a time to bring new methods and new ideas.

Emergencies cannot be foreseen. The few units of blood of each type customarily kept in small blood banks will not be sufficient when an emergency suddenly demands the use of 10 to 20 units. In such cases, it is not practical for blood to be hauled in from a distance. It is inevitable that every small hospital blood bank will be called on sooner or later to draw blood from local donors for an emergency. To do this properly, the technologist must have the equipment, the quarters and especially the experience to draw the blood quickly and efficiently and under stress. The day-by-day drawing of blood for routine use is the best insurance that this knowledge and equipment will be available in emergency cases.

Certain desirable side effects arise from a well-functioning community blood bank. The concept of blood banks as a part of modern hospitals and the modern practice of medicine is well fixed in the minds of the general public. A locally organized and locally controlled blood bank brings this phase of modern medicine to the community. By supervising and controlling this part of their practice, the community doctors and the community hospital gain in stature and prestige.

* * *

This is the seventh in a series of editorial reports sponsored by the Minnesota Society of Clinical Pathologists and designed to foster closer relationships between laboratory physicians and their colleagues. The administration of blood and of volumetric substances as blood substitutes has become almost a separate specialty in modern medical practice. The pathologist has played a vital part in this expansion because it is only through constant research and the betterment of laboratory procedures that the present degree of safety in use of blood has been attained.

It is important that adequate facilities for transfusion of blood be as widely available as is possible. The activities of Dr. Koucky, Dr. Matson and their associates have extended the opportunity for such service to a considerable number of communities throughout the state. It is hoped that this program can be expanded.

Case Report

SPINAL INJECTION OF BLOOD TO LOWER BLOOD PRESSURE IN ESSENTIAL HYPERTENSIVE PATIENTS

Report of Two Cases

J. J. HEIMARK, M.A., M.D.
R. L. PARSONS, M.D.
Monterey, Minnesota

A WELL-KNOWN observation among the medical profession is that many hypertensive patients who sustain a severe cerebro-vascular accident and survive, eventually develop a normal blood pressure. It is equally well accepted by the medical profession that the cause of the blood pressure's dropping down to normal in these same cases, is quite unknown. The authors of this report have wondered if introducing the blood of these essential hypertension patients into the spinal canal before they sustain a cerebro-vascular accident, might eventually have the same lowering effect on the blood pressure as it would had they had a cerebro-vascular accident. Immediately, many unknown problems presented themselves. In order to circumvent these unknown problems, we naturally thought of carrying out the tests on animals. However, immediately the question arose—how can one produce essential hypertension in animals? Hypertension can be produced in animals experimentally, but this form of hypertension is entirely different from what we know as essential hypertension. A new problem to produce essential hypertension in animals presented itself, a problem we felt we could not solve. The experimentation on animals seemed impossible in view of present known facts and therefore offered no immediate encouragement.

We recalled the observation on patients who had had accidents of different kinds which produced a bloody cerebro-spinal fluid as a result of the accident, and who suffered no deleterious after-effects from having had a bloody spinal fluid *per se*. In due time, the bloody spinal fluid cleared up and the patient suffered no ill after-effects.

It also occasionally happens that in performing a spinal puncture, blood enters the spinal canal and no ill after-effects are observed. Ventriclo and spinograms for diagnosis, and spinal anesthesia have been used for a long time. Neuro-surgeons operate on the spinal cord and brain with impunity. Medical as well as neurological textbooks describe no pathology, nor entity, nor syndrome, that is attributed to a bloody spinal fluid *per se*. In discussing the idea of injecting the patient's own blood into the spinal canal for hypertension with able clinicians, neurologists and a neuro-pathologist, they related that from their observations they could not recall any residual pathology produced by the blood in the spinal canal *per se*. This statement from these able men was indeed encouraging.

The summing up of the already mentioned observations on blood in the spinal canal, plus this final statement from these men gave us further encouragement to finally test the idea directly on hypertensive patients. Since there was no guide to follow, we naturally proceeded cautiously. The patient was admitted to the hospital in the morning without breakfast, put to bed, and allowed to rest at least an hour before the spinal puncture was made and the hypertensive's blood injected into the spinal canal. The patient remained in bed with the foot of the bed elevated until the next morning. Blood pressure readings were taken at different intervals during the day. By the following day when the patient was discharged, no ill after-effects had been observed, nor did she have any complaints differing from those on admission. In the following two cases described, the patients remained free of any ill after-effects following the intraspinal injection of blood, during the entire course of the tests. The syringe for aspirating the blood was not moistened with citrate solution. One of us performed the spinal puncture, and the other then withdrew the blood from the arm, and little time was then lost in injecting the blood into the spinal canal. At no time was the spinal fluid observed to be discolored from the previous blood injection; neither did there appear to be any increase in the spinal fluid pressure. Each blood injection seemed to be as non-disturbing to the patient as a spinal puncture for diagnostic purposes. The first injection in each case consisted of 1 cc. of the patient's own blood.

Case Reports

Case 1.—Mrs. J. F., aged sixty-three, the mother of several grown children, retired from the farm several years before, because of a blood pressure that varied from 200/120 to 240/140. There was no appreciable drop in the blood pressure after moving from the farm to a neighboring town for rest and quiet. On June 17, 1952, she had her first spinal injection of 1 cc. of her own blood. The blood pressures during her hospital stay were recorded as follows: 190/120, 218/120, 220/120, 212/118, 180/95, 180/90, 170/80, 170/80, 180/110.

On June 21, 1952, she had her second injection of 1 cc. of her own blood into the spinal canal. The blood pressure readings for that stay were as follows: 238/120, 240/120, 210/115, 194/96, 172/100, 172/90, 172/88, 172/68, 180/80, 184/84, 200/100, 190/100, 202/120.

On June 25, 1952, she had her third injection. This time 2 cc. of her blood was given and the blood pressure was recorded as follows: 242/130, 238/130, 246/140, 246/128, 238/126, 162/98, 220/120, 248/134, 250/134, 250/132, 190/130.

On June 30, 1952, she had her fourth and last injection. This time 4 cc. of blood was given. The blood pressure readings for the stay were as follows: 244/178, 254/140, 254/134, 274/138, 260/138, 248/150, 246/138, 240/138, 228/140, 214/80, 216/100, 210/110, 216/130, 210/127.

Case 2.—Mrs. E. S., aged thirty-eight, the mother of two children, lives in town. She had a long record of fluctuating blood pressure that ranged from 220/130 to 240/130. On October 10, 1952, she was given her first 1 cc. of blood into the spinal canal. Her day's blood pressure readings were as follows: 175/125, 160/100, 155/100, 166/98, 150/90, 170/110, 162/108, 160/112, 160/110, 168/112, 166/108.

On October 17, 1952, she had her second blood injection of 1 cc. of blood. The blood pressure recordings for the stay were as follows: 180/112, 142/88, 164/112, 150/100, 172/110, 144/90, 150/98, 132/80, 162/94, 160/120.

On October 30, 1952, she had her third injection, this time 2 cc. of blood was given. The blood pressure readings were as follows: 170/116, 188/118, 156/96, 128/74, 156/86.

On November 20, 1952, she was given 4 cc. of blood. The delay from the last injection on October 30, was due to the polio epidemic that was so prevalent in the state. The blood pressure recordings were as follows: 135/90, 180/100, 140/88, 120/80, 170/110, 160/100, 152/102, 120/88, 124/84, 166/118.

On December 2, 1952, she was given her fifth and last injection of blood. This time we gave 5 cc. of blood. The blood pressure recorded as follows: 180/132, 152/96, 164/100.

Discussion

These two cases have been diagnosed as essential hypertension as we understand that classification. The follow-up on Case 1 was not too satisfactory. On July 30, 1952, when the patient reported to the office, her blood pressure was 200/106. On September 30, 1952, it was 190/96. No further readings have been recorded. She volunteered the information she felt so different that she believed it was not necessary to report further. That she was less tense and calmer in every way, was quite evident. Her husband also commented on that condition. The pulse was likewise in accordance with that feeling on her part. She was quite sure she would continue to improve. She wanted to return to their farm this spring as she felt so much better. They have since returned to the farm. Indirectly, we have learned that she continues to feel improved.

The second patient has been very co-operative. Her blood pressure sixteen days after the last injection of 5 cc. of blood was 160/90 on December 18, 1952. On January 19, 1953, it was 148/90. February 12, 1953, it was 150/96. The same observation was made on this second case by both the family as well as by us. There was that very marked reduction in the nervous tension as well as increased calm so very noticeable in her behavior. The same was also true in regard to the pulse. The full bounding pulse was absent. If this absence of the tension and strain continues, it would seem logical to assume that the blood pressure will continue to drop to a still lower level in time to come. The second patient stated she was now attending church and was again able to mingle with crowds, something she had not been able to do for a long time. Our impression has been that if the injection of the hypertensive's blood into the spinal canal would simulate a stroke it would be some months before it would show any appreciable effect. The little improvement that we have observed seems to carry out this impression. If this should be so, it would appear that the blood so injected would have what might be termed a "self-immunizing" effect on the blood pressure.

Again, many questions present themselves. Possibly we were too cautious in the amount of blood we injected each time. Since there is around an average of 150 cc. of normal cerebro-spinal fluid in the central nervous system, it is possible that a larger amount of blood could have been used each time. Maybe more injections should have been given. But having no guide to direct us, we wanted to stay on very conservative ground. Well do we realize that no definite conclusions are justified from our experience with these two patients who have been reported. There are, however, certain aspects which are encouraging. The one observation that really stimulated us to report these two cases was the very noticeable calm and absence of tension in both of the patients following the treatment. Possibly the subsiding nervous tension and return to calm is a forerunner of the drop in blood pressure, even as the gradual drop in temperature and pulse rate observed in certain infectious diseases is a forerunner of improvement in infectious cases.

If beating the hypertensive cerebro-vascular accident to the draw, so to speak, could be accomplished by injecting blood into the spinal canal before such an accident should occur then we would have a comparatively simple therapeutic procedure for a disease for which at present we have no specific treatment. We believe that our experience indicates the desirability of further research at a center where much material is available and full time can be devoted to provide an evaluation of the procedure. It is not always convenient to carry on an extra program of extreme interest such as this, in addition ot the full day's work of a rural practitioner.

Tuberculosis is a completely unnecessary disease. It is a communicable disease caused by a specific micro-organism. Money spent on its control under the guidance of competent administrators is more than returned to the general economy through eliminating loss of production by those so protected and through converting tax dollar consumers into tax paying citizens. Although every person must die eventually of something, tuberculosis definitely is not included in that group of inevitable fatalities. Desirable though it is to spend money on research and control programs for heart disease and other non-communicable public health problems, it is poor economy to do so at the expense of tuberculosis control programs. Tuberculosis control, therefore, should continue to receive individual support from appropriating bodies, public health administrators, and the general public.—James E. Perkins, M.D., *Bulletin of the NTA,* April, 1953.

MEDICAL HISTORY OF THE COUNTY OF YELLOW MEDICINE

MILDRED B. LEE
Granite Falls, Minnesota

(Continued from the June issue)

First settlement was made near the site of the Agency, where half ruined buildings furnished some building material. Part of Dr. Wakefield's house was still standing and habitable and the Olds family moved into it for what was to be a long period of residence. Eventually Mr. Olds rebuilt the two-story brick house along its original lines, and it stands today, the oldest house in the county.

Lacking other building materials the first settlers built their houses of what was at hand; thick prairie sod, a few logs, and earth. The houses were of two kinds, dugouts and sod houses. The construction of a dugout is described by Gjermund O. Homme, an early settler who came in 1866, as follows:

> "First they dug a pit about five feet deep with a deeper pit in one corner to be used as a cellar or "cold well." After the pit was dug they fitted two logs, one on top of the other, about the edge, then fashioned poles across the top, and over this was put a covering of slough grass. On top of the slough grass went a couple of heavy layers of sod. That was a dugout, and that was the home common to this section of Minnesota in the early days." (Interview, *Granite Falls Tribune,* February 24, 1949.)

In 1895 a dugout of this description was still in use (for storage purposes) on the farm of Frank E. Bentley, in Rosewood Township, Chippewa County. It was about nine feet wide and ten or twelve feet in length, and was entered by a low door set in a wooden frame in the earth, and led down by stone steps to a floor of packed earth. Ventilation was supplied by the door and the chimney, and it was as nearly weather tight as anything could be.

> "The sod house" according to Rose, "was a little more pretentious and was all above ground. It was built of sods cut from the prairie, laid much the same as stones. The roof consisted of a rough frame of poles and a small window." (History of Yellow Medicine County.)

The early settlers found an abundance of fruit, nuts, berries and flowers which have since vanished entirely from the scene—wild plums and wild grapes, strawberries, gooseberries, chokecherries, huckleberries, hazel nuts, June berries; deep pink and yellow flowers resembling phlox, red prairie lilies and tiny blue grass flowers. The dandelion was not native to the country; it was imported by the settlers to furnish the "greens" for their tables. In the blooming season the dugouts could scarcely be distinguished in the vast expanse of grass and flowers.

Yellow Medicine was the first townsite to be platted. It was surveyed by George E. Olds and platted by John Winter in 1868. It was located on the south bank of the Yellow Medicine River on a part of what is now the Northeast Quarter of the Northeast Quarter of Section 31 and the Northwest Quarter of the Northwest Quarter of Section 32 of the fractional Sioux Agency Township. In the same year Robert H. Miller and T. Prentice Hill came to the county in search of possible water power sites, and filed on claims adjacent to Granite Falls. These claims were passed on to Henry Hill and Orange S. Miller, who platted the townsite of Granite Falls and built the first houses there; Hill in East Granite Falls, and Miller on the west bank of the river. The house built by Henry Hill eventually came to be the first hospital in the city of Granite Falls.

The first townships were organized while Yellow Medicine was still a part of Redwood County. In 1866, the Redwood County Board set off Yellow Medicine Township (of which Sioux Agency was a part), then Ree Township (later renamed Normania), Sannes (Sandnes) and Stony Run.

The inhabitants of these townships joined with new settlers in the western part of the county to agitate for the creation of new political units, although the population of the area was still small and scattered. A petition was circulated for the separation and creation of Yellow Medicine and Lac qui Parle Counties out of the western portion of Redwood, and this resulted in an act passed by the legislature and duly ratified by the voters in November, 1871.

The first county commissioners were John Winter, Ole O. Lende, and Leonard Hazelden, and they met for their first Board meeting on January 1, 1872, in a small brick building in Yellow Medicine City. The principal business transacted, according to the minutes, was the relief of the needy. The Board authorized payments totalling $190.00 to four individuals, and the expenditure of $25.00 "under the supervision of Commissioner Leonard Hazelden" for the benefit of one Maria Oleson who was "destitute of the necessaries of life."

Yellow Medicine City was designated as the County seat, for it was the largest of the settlements. But the choice was not considered a permanent one, and the villages began to compete for the honor in good natured rivalry. Governor Horace Austin and Park Worden owned a likely location at Minnesota Falls and there they at once platted a townsite. Water power could be developed there as well as at Granite Falls, and it had the further advantage of being "head of navigation," for steamboats then ascended the Minnesota and often touched at Minnesota Falls. By 1873 this village had stores, a flour mill, a saw mill, a blacksmith shop, a law office and several saloons, and a pontoon bridge to give access to the north bank of the river.

At Granite Falls Henry Hill was offering a free lot to anyone who would build and settle on it, and making plans for a dam at the falls and a flour mill. A ferry was put in operation on the river below the falls, and wagons loaded with wheat grown in the county converged at this point. While awaiting passage across the river they would form into caravans for the long journey to the nearest markets, each many days distant by horse and ox team. A trip to market and back required about a week's time. Food was usually taken along, and the nights were spent in the open. For several years New Ulm and New London were the nearest railheads.

During the early years mail was brought to the various post offices which served the scattered inhabitants by stage from Redwood Falls. The stage stopped first at Yellow Medicine City, then at Vineland, Stavanger, and on to Marshall. Later it was brought from Willmar to Granite Falls, then Vineland, Stavanger, Marshall, and Redwood Falls. Sometimes the stage would bring passengers also. Arrival of the mail was the event of the day, as described in the *Granite Falls Tribune:*

> "We recall the time, years ago, when the post office was kept across the river. The few settlers here then looked anxiously for the mail to come down the hill on its return trip from Willmar. When the team was spied a small boy was despatched to bring the mail over from the Post Office after its delivery. It would consist perhaps of a half dozen papers and a letter or two. The office was kept in the store run by Mr. George Daniels. There were perhaps a dozen boxes marked alphabetically, and the caller had only to reach around to get his mail. The postmaster was paid something like $12.00 a year. No massive vault and iron safe was required to secure the money and postage stamps; a cigar box was quite sufficient."

Railroad lines were now reaching into the state, but progress was slow, and often the work was unnecessarily delayed. The Hastings and Dakota railroad completed its line to Glencoe in 1873. In the same year the Winona & St. Peter pushed its way as far north as John Swenson's little claim shanty store which stood on the present site of Canby. For some time John Swenson had a post-office at that point, and he had given it the name of Canby in honor of General E. R. S. Canby who was killed in the west while attempting to negotiate peace with Indian tribes. Although the line was completed no service was begun until 1876.

Settlers were steadily arriving. They came on trains to the nearest railhead with stock and household goods, then went on foot or by team to the point of settlement; or they came from the East and South in covered wagons, or other conveyances, even on foot. Norwegians had come into the county as early as 1866, but the real wave of Norwegian immigration did not begin until 1870. Then they came, wave after wave, until the nationality outnumbered all others. In 1880 there were more than 2,000 Norwegians and only 198 Germans among the foreign born.

Among the new settlers attracted to the county were two members of the medical profession, Dr. E. N. Falk and Dr. William M. Stratton, who came to Minnesota Falls in 1873. Dr. Stratton came from Ortonville where he had begun his medical practice shortly after graduation from college. Of Dr. Falk very little is known. Both doctors were graduate pharmacists and soon collaborated in establishing a drug business in connection with their practice. And to help promote the interests of Minnesota Falls in its campaign for the county seat honor they also founded the first newspaper in the county, the *Minnesota Sentinel.*

A few copies of this paper are still in the files of the Clerk of Court of Yellow Medicine County. It was a six-column folio, the two outside pages printed locally and the inside pages of patent "filler." Some of the local advertisements are in the Norwegian language, indicating the extent of the Norwegian penetration in this remote region. The first issue appeared October 1, 1874.

In these papers we find professional cards of Dr. Stratton, Dr. Falk, the lawyers, Gorham Powers, W. E. Cook and C. A. Shannon. It is from this source that we also learn of a doctor at Granite Falls, Dr. N. M. Smith, although this title is not given him in any issue. He is simply referred to as N. M. Smith. According to Rose's History Dr. N. M. Smith lived in East Granite Falls in 1873; in 1874 a drawing shows his house in West Granite Falls about where Third Street now intersects Ninth Avenue (the Stoppe residence).

Dr. Smith was engaged in a controversy with the *Granite Rock,* first newspaper to be established in Granite Falls. The *Granite Rock* had printed comments upon Dr. Smith's methods which he considered libelous, and promptly had Editor Hogue clapped into jail. The editor succeeded in posting bond, and retained W. E. Cook for counsel. The case was scheduled for trial before the justice in Minnesota Falls, in the week of August 7, 1875. The following account of the trial is taken from the *Minnesota Sentinel* of August 10, 1875:

> As announced in the *Sentinel* last week, the trial of Smith against Hogue for libel took place in our Justice Court Thursday. The defense had a number of witnesses sworn to substantiate the statements made by the Rock in relation to N. M. Smith. They all seemed to have "cause to mourn" that they had ever beheld the face of the plaintiff. The testimony of the defense all seemed to verify the truthfulness of the song of the Immortal Burns that "man was made to mourn." Two physicians were called as expert witnesses to define the general acceptation of the term "unprincipled quack," but the attorneys for the plaintiff objecting, and being sustained by the court, it was determined to let that matter rest with Bovier, which relived (sic) the experts of the terrible necessity of defining quackery. They were next interrogated in regard to what they knew about "tonka beans," which was one of the main figure heads of the trial. The impression prevailed after they were duely (sic) examined that they were more conversant with the properties of navy beans. Mr. M. Gould, the druggist at Granite Falls, was brought to the witness stand to identify some prescriptions in his files that were written by the plaintiff, which were turned over to the expert witnesses. We believe the doctors were united in their opinion that they were not written according to "Hoyle" or "Gunter." One of the witnesses was called to the stand to testify to the competence of Mr. Gould as a druggist, but we believe the attorneys recalled that Gould run the "Reliable Drug Store" at Granite Falls, therefore it was not necessary for the expert to testify to his reliability as a druggist. The examination ended here, when the attorneys argued the case."

In the September following the trial the *Granite Rock* was sold at Sheriff's sale, and was succeeded by the *Granite Falls Journal* which purchased its stock and equipment but disclaimed all liability for the *Rock's* debts or policies. In the files of this paper are found professional cards of Dr. N. M. Smith, Eclectic Physician, who "will furnish all remedies which he prescribes."

In 1874 Granite Falls became the county seat by virtue of a legislative act which was duly ratified by the voters. Henry Hill donated a site, and the citizens raised enough money to build the new Court House, a building now in use on Tenth Avenue as a dwelling. To make doubly sure this effort was not in vain some Granite Falls partisans seized the county records and hid them until such time as the transfer could be made. The building and grounds were formally approved and accepted by the County Board in March, 1876. The Board also decided upon a levy of $600 for the poor fund, and provided that there should be no parties or dancing in the new court house.

Dr. Cyrus P. Fuller was the next doctor to locate in the county, and he opened offices in Granite Falls in 1877, "1 door south of drug store." He was also an experienced druggist, having operated a drug store at Hastings, Minnesota, both before and after taking medical training. In March, 1877, he was appointed the first County Physician, and in December his work won him this accolade from the local bard: (*Granite Falls Tribune,* December, 1887, reprint from issue of December, 1877).

"Dr. C. P. Fuller next we find,
And his medicines are pure,
If administered as ordered
They never fail to cure.

And Dr. Fuller as you all know
Is a blessing in our town,
No matter what your suffering from
He says "I'll make you sound."

To extract a tooth, trepan a skull,
Or set your limbs in motion,
I've heard it said he'd do it well
And use no sleeping potion."

The reference to a sleeping potion is interesting, in view of the number of cases of drug addiction found in these years.

The hopes of the citizens of Minnesota Falls for the future of that settlement were blasted both by the designation of a rival city as the county seat and by the failure of the Hastings and Dakota Railroad to build its line to that point. By 1878 the railroad line was completed to Granite Falls, and the first train rumbled over it in the late summer. Among the citizens who deserted Minnesota Falls for the more promising county seat town was Dr. William M. Stratton. He went into partnership there with Dr. C. P. Fuller, as appears from accounts filed against the estate after Dr. Fuller's death, on August 17, 1879, of blood poisoning. These accounts are for drugs and for livery hire for the two doctors and are supported by the affidavit of Marion Gould that they were partners.

Another doctor who located in Granite Falls in 1877 was Dr. Henry G. Townsend who opened offices in his home "opposite E. J. Fitch's Hotel" in East Granite Falls. He was a homeopathic "physician, surgeon, and obstetrician" who promised "special attention given to cronice (sic) diseases and diseases of women and children." After five years in Granite Falls he removed to Canby where he had an office "1 door south of P.O." and "will hold himself in readiness to attend calls at all hours, night and day." He also practiced in small settlements west and south of Canby.

At that time the medical profession was already well represented in Canby, with Dr. M. G. McLean and Dr. J. T. Billington in residence. Dr. McLean is a shadowy figure, for only a few items remain to show his existence; but Dr. Billington was in and out of County for many years, and is amply documented both by records and in the recollections of descendants now living in Canby and others who knew him. In 1879 Canby is reported as having a population of 110 people and twenty-two buildings.

The seventies were years of hardship in the county. A most disastrous prairie fire destroyed crops and homes in 1872, and the winter that followed was one of extreme severity. It was in that winter that Albert B. Sweet (later Dr. Albert B. Sweet of Hanley Falls) teaching school in Brown County, saved the lives of his pupils during the two days they were marooned in the school house by the great blizzard. The crops planted that spring were devoured, just before harvest, by clouds of grasshoppers which destroyed every vestige of vegetation over a wide area. This disaster was repeated in 1874 and 1875. The worst infestation was in 1876 when practically all the crops in the county were destroyed and the people were in such poverty that public aid was furnished them from state funds. In March, 1877, the County Board offered "premiums" for the best grasshopper-catching machines—first premium $40, second premium $20, third $10, all machines to be ready by May 4. Prizewinners were to permit the use of their designs free of charge by other settlers. The inventiveness of the settlers was not equal to the occasion, however; the machines offered were considered of doubtful value, and so the "premiums" were reduced to $15, for Henry Homme, the first prize winner, $10 to Anton Haroldson, and $5 to Charles Mooney.

During the grasshopper years the population of the county declined as many discouraged settlers gave up their lands and left the country. But in 1877 nature's splendid balance-and-check system came into operation; a tiny red parasite appeared to feed upon the grasshopper eggs, and the damage to the 1877 crop was light. The faith of the settlers in their new land had been sorely tried, but 1877 was the last of the "grasshopper years."

Death records of the county show that in 1879, and 1880 and 1881, diphtheria was prevalent in the eastern part of the county. They also seem to bear out Dr. Billington's statement that "Canby is the healthiest place I have even been in," for it escaped the epidemics of diphtheria, smallpox, and other serious communicable diseases from which the population of the eastern portion of the county suffered.

In 1879, Dr. Florado H. Wellcome settled in Granite Falls. With his very attractive wife he spent the summer in the home of J. S. Pound in East Granite Falls. In 1880 his brother-in-law, Dr. Franklin Judson Cressy, came from Howard Lake to open offices in the Neste building. During the epidemics of those years the doctors were busy night and day, and became well established in the community.

The townsite of Canby had been platted by the railroad in 1876, and that part of the county was attracting new settlers.

Dr. Herman E. Farnsworth, a young man of twenty-three years who had just finished his medical training, settled in Canby about 1880. At first he was in partnership with Dr. M. G. McLean. In 1881, Dr. Farnsworth was called to attend Michael J. Dowling, one of the victims of the great storm of October 15, 1880.

This storm was one of the severest and most disastrous ever to strike the area. It began after weeks of mild fall weather, on a day which dawned mild and sunny. People went to town, stock ranged the fields, and winter seemed many weeks away. In the afternoon the temperature began to drop and the snow was soon falling in thick, clinging flakes that covered all objects and blotted out all distances. The sky seemed to close in upon the earth like a great smothering cup. The wind came up in furious assault and soon a storm of blizzard proportions was under way.

On that day Michael J. Dowling, a homeless lad of fourteen who was working as a farmhand near Canby, went to town. In the afternoon he arranged for a ride home with two men who would be driving his way. When the party set out the two men were on the wagon seat and the boy in the wagon box behind. Before long the men found the storm so blinding that they decided to let the horses have their heads and find their own way home; the eager animals were soon making a beeline for home in complete disregard of the comfort of those riding in the wagon. As the wagon bounced over plowed fields in this headlong flight young Dowling was thrown out, and the men, a little befuddled with the day's round of sociability in town, did not notice that he was gone until they reached home.

Left alone upon the prairie in the blinding storm Dowling wandered for hours in search of shelter. Finally he burrowed into a strawstack. When the storm abated two days later he crawled out and made his way to a farmhouse where it was found that his limbs were badly frozen.

Dr. Farnsworth of Canby and Dr. Andrews of Marshall found it necessary to amputate both legs of the boy above the knees, the left arm at the wrist, and nearly all the fingers of the right hand. The boy made a remarkable recovery. The story of his triumph over his handicap is too well known to need repeating; with county aid he completed his elementary education, worked his way unassisted (except for the first two terms) at Carleton College and became successively a teacher, editor, banker, and member of the State Legislature. The school for crippled children bears his name, the Michael J. Dowling school.

The snow that fell in October, 1880, was the first of many great snowfalls of that winter. Farms were isolated for months at a time; railroad lines into the county were blocked for six weeks; food and fuel ran low. Many a farm family subsisted on grain ground in the kitchen coffee mill. Even the newspapers suffered; they ran out of paper, and so printed issues on wallpaper or even "tea paper." The townspeople of Canby were given permission to dig up the railroad fence for fuel in the emergency.

When the snows melted in the spring there were floods as all the rivers rose to unprecedented heights. The townsite of Minnesota Falls was entirely inundated, and many of its buildings were swept away or wrecked. Millrace and dam were destroyed, and all hopes for a permanent settlement at that place were abandoned.

In the summer of 1881 another kind of disaster struck Granite Falls when an epidemic of smallpox swept the town. The disease was prevalent in the state in that year, and it was brought to Granite Falls by a woman who became ill on the train and stopped off at Granite Falls. She was guided by Harmon A. Baxter, a local man, to the Saint Paul Hotel, a hostelry which then stood on Baldwin Avenue in East Granite Falls. The stranger's illness turned out to be smallpox. The disease spread rapidly through the hotel and through the town. Mr. Baxter and members of his family were stricken and died of it. The city authorities hastened to provide a pest house, choosing for the purpose an old log house which had been vacant in East Granite Falls for several years. This house was moved upon the hill overlooking the town; then the question arose as to who would take charge of it. There was but one volunteer for this job—a big, black-bearded veteran of the Civil War by the name of Berg who was a sort of town roustabout. He offered to take charge of the pest house and its patients at no cost to the city, provided the authorities would furnish him with a quart of whiskey a day. So the fifteen patients at the Saint Paul House were moved up to the pest house with that understanding. Whatever may be said as to the efficacy of whiskey in the treatment of smallpox, Berg at least was successful with it, for all but one of his patients came safely through to recovery.

Although the death register shows only three deaths from this epidemic, there were many others, particularly in East Granite Falls, which may have been recorded in Chippewa county. Mr. Fred Gillingham who lived in that part of town at the time remembers how the wagon went about the streets at night, like the tumbrils of old, gathering up the dead; and how as they heard its noisy passage the people would waken and say, "someone else is dead of the smallpox." Burials were made without ceremony outside the cemetery fence. The ten graves that remain, forgotten and untended, are mute reminders of that dreadful summer.

In 1881, Dr. Farnsworth was appointed county physician for the west end of the county, beginning the system of dividing the county into medical districts. The Commissioners also tried to shift some of the burden of caring for the poor upon the shoulders of the county physicians, ruling that it should be their duty to find suitable boarding places for the county sick and disabled, at the same time to "use his best endeavors to save the county expense." As one of these "disabled," Michael J. Dowling was shifted from home to home. The commissioners were men who took seriously their responsibility as guardians of the public purse and disbursers of its largesse. They tried to get value for every dollar spent. When Michael J. Dowling was ready for artificial limbs the commissioners agreed to pay $100 toward the purchase of two legs, the rest to be raised by private subscription. In this they relented somewhat, however, finally agreeing to pay an amount sufficient to get two artificial legs and one arm, after which Dowling was to "paint the Court House fence." When some years later Dowling again appeared before the Board to ask help in getting new legs the Board agreed at once, his case "being so well presented."

In these years Dr. Stratton was taking an active part in civic affairs. He had been a member of the first town council of Granite Falls, and then president of the council, and in 1881, he was County Physician.

In 1883, Dr. Alexander C. Dockstader came to Granite Falls and opened his office "over the bank" (Granite Falls Bank). His professional card specified office hours from 8 to 9 a.m., and from 1 to 4 p.m., and he lived in the house which is now 120 Ninth Avenue, known as the Foster house. He was an ardent baseball fan, fond of hunting, and both he and Mrs. Dockstader were musical, which made them distinctly an asset to the community.

In the same year Dr. Henry Townsend died of a heart attack and Dr. Farnsworth died of "inflammation of the bowels" at the age of twenty-seven years.

As long as railroad lines were under construction the settlements in the county were deluged with laborers in search of recreation. In spite of the ruling of the County Board that business places and saloons should close at midnights and on Sundays, many saloons simply darkened the front windows and continued in business. This was true both in Granite Falls and Canby, where noisy revelry and street fighting went on through the night, and it was considered unsafe for any citizen to be on the street after dark. After the departure of this transient population the towns became more law-abiding, although the local papers frequently commented on the "disgraceful conduct" of named citizens. Canby went through a period of being a "wide open town" where such desperadoes as "Black Jack" and "Texas Jack" and his gang sought refuge from the authorities on their trail.

Where the Granite Falls press inveighed against the evils of strong drink the *Canby News* carried on another kind of campaign. It decried the indiscriminate purchase and sale of dairy (home made) butter in the local market and throughout the state.

The farm wife who made more butter than the family could use would bring in her surplus, along with her basket of eggs, to market. If the butter tasted all right it was considered good butter, and both merchant and customers were glad to get it. Little thought was given by most people to the conditions under which the butter was made or how it was made. Milk was brought from the barns and placed in shallow milk pans to cool. When the cream had risen to the top it was skimmed off and set aside until enough cream had accumulated, and it was then churned into butter. Undoubtedly some of the best butter ever made was produced in this manner, but it was not one which insured the purchaser a quality product in every instance. Probably the story told by the *Canby News* of the woman who brought her butter to market wrapped in her head shawl was pure fabrication, but it could have been true.

It was also the custom for the merchant to turn over butter which was unfit for sale to an agent for a renovating company. He bought it and shipped it out for renovation.

In 1885 the Legislature passed an act prohibiting the sale of "unhealthy or adulterated dairy products," but this act was designed to cope primarily with the threat to the dairy industry posed by the many small oleomargarine manufacturing plants that had sprung up in the state. Without regulation these were a health hazard, and as a result of the enforcement of this law the manufacture and consumption of oleomargarine in the state fell off to a fraction of what it had been.

The *Canby News* also demanded meat inspection. Certainly the demand for beef in the local market must have fallen off when the *News* commented that beef ought to be plentiful and cheap since many cattle were dying of diseases in the south. The *News* repeatedly demanded the appointment of a meat inspector "as required by the meat inspection act."

Farmers could be sure of meat of good quality for animals were slaughtered in the fall and the meat preserved in various ways. It could be hung and frozen, if the weather permitted. Beef was dried or corned, pork "put down" in brine or cured for hams and bacon, made into sausage, head cheese, and other variety meats. The refrigeration offered by the oat bin was not to be overlooked, for meat products such as sausage would keep safely when buried under bushels of cold oats or wheat.

Nearly every village had a slaughter house and a butcher who could be relied upon to keep the townspeople supplied with meat, but here again quality depended upon the experience, reliability and skill of the butcher. The importance of care in the handling of meats was impressed on the residents of the western part of the county when twenty-four men of Minneota were stricken with trichinosis. Doctors and druggists were called from Canby to help out in the emergency. Dr. Billington's investigation revealed that the stricken men had repaired to the butcher shop to feast on ham after a pleasant evening spent in the tavern across the street.

The local press also devoted much space to the evils of the liquor habit. Liquor licenses were issued by the County Board beginning with 1876, when the license fee was fixed at $10. Liquor seems to have been handled much as any other merchandise, simply sold across the counter in both drug and general stores, for at its meeting on December 10, 1876, the Board rulled that "O. G. Veldey, William Stratton, and K. E. Neste" be notified to take out licenses for "retailing liquor" or "suffer the penalty." Even the smallest village boasted several saloons.

In the winter months when each village was in a measure isolated from the others, and from the outside world, entertainment depended upon the activity and ingenuity of its clubs and societies. There were debating societies, musical clubs, social clubs, and forums for the discussion or study of particular subjects in almost every settlement. The *Granite Falls Tribune* of October 5, 1886, mentions the Oxford League, the Scandinavian Debating Club, the Chautauqua Reading Circle, the Shakespeare Club, and the Young Men's Club, all committed to raising funds for a public reading room. Canby had a literary society which met every week, year after year, and presented programs of music, declamations, and debates. Hanley Falls had both a Literary Society and a Dancing Club, while Clarkfield had musical organizations and other activities.

Doctors and their wives were naturally prominent and in much demand at social affairs and in organizations of all kinds. Many of them had special talents. Dr. and Mrs. Dockstader were often the soloists of the musical club programs. Mrs. Cressy and Mrs. Fuller were active members of the Hesperian Club which studied Shakespeare's plays, and acted out parts of them for the public, although there were only eight members, all women. Dr. Chambers was often soloist on the Canby Literary Society programs and Mrs. Chambers obliged by giving readings or "declamations." It was a leisurely time; the small settlements offered little in the way of diversion and labor of every kind was cheap and plentiful. Nearly every household could have a maid who worked long hours for small wages. Lacking amusement, the people learned to amuse themselves. They read books, they played band instruments, they took part in whatever entertainment the community afforded, either as participants or spectators. It was not unusual to hire a hall for a social function and secure the services of the local band or orchestra for the entertainment of guests. For the men especially, there were billiards, and during the coldest months there were chess games going in nearly every public place.

From the earliest years great interest was shown in providing schools. The children of the first settlers in Granite Falls attended school in a log house about a mile west of the village; a building also used for church on Sundays. The first term of school in the city itself was taught in 1873 in East Granite Falls where a school house was built at a cost of $1500. In 1879 a new school district No. 21

was organized to include the part of Granite Falls which lay in Yellow Medicine County, and Dr. Stratton was a member of the first board of education which chose the site and built the first school building on the present school grounds. The first school building was ready for use in January 1880, and in 1889, an addition was built for a high school.

Similarly, the first school in Canby was a one-room school taught by Andrew Ouverson in 1877. The next school building was a frame store building at the corner of St. Olaf and Second Streets. In 1880 a two-room, two-story building was erected which was used until about 1895 when a large new school house costing $15,000 was erected.

One-room schoolhouses dotted the prairie as the population increased and moved westward. The school was the center of community life in the country, a convenient voting place, a meeting place for the town board, and a speakers' forum. The school teacher "boarded around" when tax moneys were insufficient for all school expenses, or lived at the most convenient home. The teacher was an important personage in the community.

The first public library in the county was founded in 1877 when the Granite Falls Library Association organized to provide a free reading room and circulating library. A few books were purchased and placed in one of the stores. It was moved around from place to place until finally room was found for it in the city hall.

Churches were organized in the county at an early date, beginning with the Methodist which in 1871 used the old log school house, or Mr. Fitch's bar room, for its meetings. Next in the field were the Congregationalists who built the first church building in the county; in 1876 the Norwegian Evangelical Lutheran, then the Baptist in 1881. Services for Catholics were held in homes from 1872 on. In Canby the first church was the Lutheran St. Stephan's, in 1876, followed by the Presbyterian in 1882, St. Paul's Lutheran in 1879, the Methodist Episcopal in 1886, and the Catholic in 1896.

In 1884 the Minneapolis and St. Louis Railroad entered the county at its southeastern corner, and platted as it progressed westward the townsites of Echo, Wood Lake, Hanley, Hazel Run and Clarkfield. In the western part of the county the Northwestern Railroad platted Porter and Burr, and a branch of the Great Northern came from the south to pass through Hanley and Granite Falls. Elevators for storage of wheat began to appear on the railroad right of ways, and through them passed the huge wheat crops grown in the county. Although other crops were raised, wheat was the cash crop on which the farmer depended year after year. The new railroad lines meant shorter trips to market for the farmer and added to the general prosperity.

The first of the new settlements on the Minneapolis and St. Louis to be chosen for a field of medical practice was Hanley, later called Hanley Falls. To this tiny village of less than a hundred souls came Dr. Albert B. Sweet in 1885. Dr. Sweet had been a pharmacist in Marshall and had not completed his medical training when he came to Hanley to open the first drug store there. A cousin, F. H. Sweet, assisted him in the drug business while he continued his work at the University and graduated in 1885. Dr. Sweet practiced in Hanley until 1891.

(To be continued in the August issue)

President's Letter

SUPPORT EQUALS IMPROVEMENT

The very core of medical education today is the economic structure of the individual medical school. Granted that considerable dependence is placed on the calibre of administrators, department heads and instructors, but without the proper financial support, medical education is to be found wanting.

Throughout the nation today, medical schools have found themselves in a financial dilemma; rising costs for construction and instruction, coupled with the skyrocketing demand to turn out more doctors, has forced many educational institutions to operate on limited budgets, and, as a consequence, seriously threatened the high standards of medical education previously developed.

Federal aid to medical education has been proposed as a partial solution to this problem.

But the medical profession foresaw the real danger of too much federal control entering into such a program, and sought to do something constructive to aid medical education. Thus, the American Medical Education Foundation was created, with the express purpose of collecting funds to be specificially used to aid medical schools. The American Medical Association, since the fund's inception, has contributed heavily as an organization to this worthy foundation.

In spite of this generous giving, the funds for medical education have not piled up as quickly as the need has developed. Only 11,000 individual doctors have contributed to the American Medical Education Foundation since the first of the year, and the aggregate funds amount to something over one million dollars.

This amount, divided among the nation's seventy-nine medical schools, obviously cannot begin to meet the need, in the light of the cost-of-living factors quoted above.

It must be evident to every physican that an individual effort is urgently needed. At the present time, doctors of Minnesota are being asked to consider this matter seriously. Letters have been sent to individual Association members asking for their immediate financial assistance. You, as one of those who has benefited from the high standards of medical education, have an obligation to lend your firm support to insure even higher standards for future practitioners.

We have a great challenge in this matter; it is squarely up to the medical profession itself to invest in improved medical education through active support of our medical schools.

THE INCREASING PERCENTAGE OF BACTERIAL-RESISTANT STRAINS TO ANTIBIOTICS

THE PRESENCE of Sir Alexander Fleming at the Centenary meeting of St. Joseph's Hospital in St. Paul, May 16 and 17, added further publicity to penicillin, of which he was the discoverer. His recognition of the significance of the effect of a chance contamination of a culture of staphylococci by a mold led eventually to the development first of penicillin and then the ever mounting list of other antibiotics. The therapeutic value of the antibiotics is incalculable and too much honor cannot be heaped upon the individual who had the intelligence and imagination necessary to develop the first antibiotic.

As is the case with many new products, several years of hard work were needed before penicillin became available for clinical use. Dr. Fleming's first observation and isolation of a pure culture of the fungus, *Penicillium notatum,* was accomplished in September, 1928. His first article on the subject appeared in the *British Journal of Experimental Pathology* in 1929. Cultures of *Penicillium notatum* were distributed to many workers in other countries but it took ten years before Florey and his associates at Oxford effected the concentration and purification of the active principle of the fungus, named, by Dr. Fleming, penicillin. This original culture of the fungus was the source of all penicillin until as late as 1943.

The remarkable therapeutic value of penicillin stimulated the search on the part of a number of commercial houses for other antibiotics which might be better than penicillin and might be effective against other bacteria. The success in the development of other antibiotics has been remarkable but it is interesting to note that the original antibiotic, penicillin, has proven the least toxic of them all, the cheapest, and the only antibiotic not patented.

It is strange that the first demonstration of the properties of the antibiotics as well as the sulfas was in connection with the staphylococcus. The first clinical demonstration of the value of a sulfa (prontosil) was in the case of a ten-month-old infant desperately sick from staphylococcus septecemia in which recovery resulted. The case was reported in 1933 in Germany by Foerster. Likewise the first observation of the effect of the mould—*Penicillium notatum*—on bacterial growth was on a culture of staphylococci. The early enthusiasm over the efficacy of both drugs in the treatment of staphylococcic infections had to be modified in view of later experience.

The sulfas did not prove to be the answer for the treatment of staphylococcic septicemia. In the pre-antibiotic period the mortality from this disease was over 80 per cent—according to one report.[1] With the advent of penicillin the mortality from staphylococcic septicemia in one series of twenty-eight patients reported at the University of Minnesota hospitals was only 28 per cent.

Since this period the strange phenomenon of the increase in the percentage of antibiotic-resistant strains of bacteria has been reported at various localities.[1] By 1948-49 it was found at the University of Minnesota hospitals that the number of penicillin-resistant strains of staphylococci were on the increase. Whereas the number of failures due to infection with penicillin-resistant staphylococci were at first rather insignificant, by 1950 over 50 per cent of some 104 strains of staphylococci were found to be resistant. Very few of the strains tested were found to be resistant to the other antibiotics such as Aureomycin, Terramycin and Chloramphenicol. Thus these antibiotics could be used for infections due to penicillin-resistant staphylococci. In 1952 another group of 100 strains of staphylococci were tested *in vitro* and 60 per cent were found to be penicillin resistant and a similar percentage resistant to streptomycin. In this same series it was rather startling to discover that 40 per cent of the strains were resistant to Aureomycin and Terramycin. Fewer strains were found to be resistant to Chloramphenicol and none to Bacitracin, Erythromycin and Carbomycin. Similar experience has been reported from the Mayo Clinic, the Boston City Hospital and from Sydney, Australia.

---

[1] Wise, Robert I., and Spink, Wesley W.: The Management of Staphylococcic disease. Bull. U. of Minn. Hosp. and Minn. Med. Found., 24:640 (June 12) 1953.

Just as the percentage of strains of staphylococci resistant to penicillin has been increasing since the use of the drug has become widespread, a similar increase in the percentage of strains resistant to other antibiotics has been taking place.

Strains of tubercle bacilli have been found resistant to streptomycin for a number of years. Some strains have been found resistant and others sensitive to streptomycin in the same patient and even in the same sputum specimen and the administration of PAS has been found to cause a strain of tubercle bacillus to become more sensitive to streptomycin.

There is evidence that there is a similar though less marked increase in the percentage of other bacteria resistant to the antibiotics.

The opinion as to the reason for this increase in percentage of strains sensitive to the antibiotics may not be unanimous but it seems reasonable to believe that the antibiotics destroy the sensitive strains and allow the resistant ones to cause morbidity. This seems more reasonable than that individual strains of bacteria actually develop resistance to the antibiotics. One recent survey[1] has shown that 54.5 per cent of hospital personnel were nasal carriers of Staphylococcus pyogenes, 80 per cent of the strains being penicillin-resistant. Cross infection with resistant strains can present treacherous problems for the hospitals.

In spite of the accomplishments of the wonder drugs—the antibiotics—which have been outstanding, the percentage of cures produced in a variety of infections seems to be diminishing. In a recent report[1] of twenty-two patients with staphylococcic sepsis, 54 per cent died and the outlook for three additional patients was poor. This was the result following the use of a number of different antibiotics and approximated the mortality in pre-antibiotic days.

Penicillin and also other antibiotics have been prescribed for a great variety of infections and doubtless for a large number for which they were not indicated. If our conception of antibiotic-resistance is correct, however, we fail to see how this use, though extravagant, can have proved detrimental to the human race.

"WATCH IT, DOC"

OUR ATTENTION has been called to an editorial which appeared in the June 22 number of *Life,* entitled "Watch It, Doc." The editorial is insulting to the profession, particularly to our AMA House of Delegates and the Medical Society of the County of New York. While the editorial is involved, it seems advisable that editorial comment be made to clarify the subject.

Admitting the wonderful advances in medical science announced at the AMA meeting held in New York in June, the editorial goes on to criticize the House of Delegates for seeming "to be against almost anything that threatens the profit of a doctor's private practice." As proof of this uncomplimentary criticism is cited the resolution passed by the House of Delegates branding the Federal regulation that provides free diagnostic services for crippled children as socialistic. That is all the evidence presented to back up the unkind criticism of the House of Delegates. The editor says the "public has become utterly weary and cynical from hearing the AMA snarl 'socialistic' at everything it doesn't completely approve of," and that the doctors do not know the difference between the terms "socialistic" and "social."

As a matter of fact, the terms "socialistic" and "social" have a variety of meanings in use and as defined in Webster's unabridged dictionary. However, when the term "socialistic" is used, it generally refers to collective or governmental ownership as developed by Karl Marx and as opposed to private ownership and management. The word "social" is used not only with the meaning of sociable but as pertaining to the welfare of human society, expecially of the lower-than-average income group, in such phrases as social service, social disease, et cetera. There should not be much room for difference of opinion as to where the line should be drawn between social services for the indigent and frankly socialistic governmental activities. It would seem that the ability of private industry to care for any need of the public should be the criterion as to whether socialistic governmental activity is necessary. Governmental activities which compete with private industry can be branded socialistic, and we have plenty of examples in our country today.

Now, the medical profession has shown itself conscious of the difference between the terms "socialistic" and "social," as ordinarily used. It has been conscious of the need of governmental assistance in meeting certain medical needs of the low income group and has contributed its services, gratis, in many such fields. It has approved the support by city, county, and state of charity hospitals, sanatoria for the tuberculous and mentally ill and even hospitals for crippled children unable to afford private medical care. The treatment of a crippled child is likely to be so prolonged as to be beyond the financial ability of most citizens to meet. Governmental assistance along these lines may be termed social in contrast to socialistic.

Crippled children appeal particularly to the sympathy of all. They appealed to the sympathy of Dr. Arthur Gillette and impelled him to induce the legislature to establish in Saint Paul a state-supported hospital for crippled children which was subsequently called the Gillette Hospital. The medical profession has given generously of its services gratis or for a nominal fee to its inmates for the past forty years or more. In addition, the Shriners have established and supported several hospitals throughout the country—one in Minneapolis—for the free care of crippled children.

For a number of years, federal funds have been appropriated for the diagnosis of the disabilities of crippled children throughout the states. An important point as regards the appropriation is that bureaucratic regulations from the Children's Bureau require that no means test be used in the selection of beneficiaries and that a state which does not submit to these regulations can have no federal funds allocated. No difficulties have been encountered in the administration of this federal activity in Minnesota because of a local provision that children must be recommended by their private physicians for examination and diagnosis. Thus, there is no infringement on private practice in Minnesota. Provision of this federal supported activity, however, irrespective of ability to pay, places it in the socialistic category, the *Life* editors to the contrary notwithstanding.

We are constrained to mention at this point that the care of veterans' non-service-connected disabilities by the Veterans Administration is another example of socialism. The AMA House of Delegates, meeting in New York, took a stand in opposition to government care for non-service-connected disabilities, except in the case of the tuberculous and mentally ill. This was a realistic attitude for such care in most instances is not in competition with private practice. The veteran holds a soft spot in the heart of his fellow citizens and many believe that nothing is too good for him—even medical and dental care the rest of his life. With a large fraction of the male population included in the veterans group, government medical care for all disabilities of veterans would eventually disrupt private medical practice.

The *Life* editorial takes the Medical Society of the County of New York to task for its public relations in respect to its attitude toward the proposal by Herman J. Stichman, the State Commissioner of Housing in New York, to provide clinical facilities to Mt. Sinai Hospital in New York City in return for free medical care to certain tenants. The editorial goes on to state:

> "This spring, *New York Medicine,* official publication of the society, declared that the plan would 'closely resemble socialized medicine if it is put into effect.' The Chairman of its Committee on Medical Economics, a Park Avenue obstetrician, in declaring Stichman's plan 'Utopian,' added for publication in the *New York Times*: 'He said the doctors at the Clinic would make house calls. . . . I suppose he'd like to serve them breakfast in bed, too! By 'them,' the chairman meant the patients who might be too ill to be moved. His little joke must surely be one of the greatest of its type since Marie Antoinette said, 'Let them eat cake.' "

This uncomplimentary picture of the medical profession in New York, spread throughout the country in an editorial in *Life,* we now learn was based on a falsehood. What are the facts?

In brief, Herman J. Stichman, the State Commissioner of Housing, published in the *New York Medicine* of April 5 his proposal to provide space for a clinic in connection with the building of a huge low-cost dwelling project in New York City, known as Carver Houses, in exchange for free medical service to be provided by Mt. Sinai Hospital. Following the article was a critical analysis which concluded that the occupants of such dwellings were not indigents, that the best way to provide medical care for them would be through medical insurance available for the low income group and from private practitioners, any indigents in the dwellings to avail themselves of free medical clinics already in existence and available; that such a plan would constitute encroachment by a hospital on private practice and the use of tax funds for the benefit of private

THE MEDICAL SCHOOL

Its Objectives and Organization

The Medical School of the University of Minnesota was established and is supported by the people of the state in order that they may have adequate and competent medical services. Initially this involved only the education of general physicians. This is still the primary objective of the Medical School. However, the complexities of modern medical care and the rapid advances in medical science have forced the Medical School to accept other responsibilities. Prominent among these are the provision of graduate medical education for the training of specialists, continuation education for the benefit of physicians in practice, the conduct of medical research, the provision of specialized medical services to the patients of the University Hospitals and the training of auxiliary medical personnel such as nurses, medical technologists, x-ray technologists, physical therapists, occupational therapists, medical and psychiatric social workers, hospital dietitians, clinical psychologists, hospital administrators, and various categories of professional public health workers.

The Medical School was organized approximately sixty-five years ago with twenty-nine faculty members, all of whom earned their livelihood by private practice. Today the faculty consists of 171 full-time members and 459 part-time members of the rank of instructor and above. Full-time faculty members have predominated in basic science departments for many years. In the clinical departments, on the other hand, full-time teachers are a relatively recent development, initiated in this country approximately forty years ago by Johns Hopkins University. Today a few medical schools have their entire faculties, in clinical as well as basic science departments, on a full-time basis. Others depend for clinical teaching upon part-time practicing physicians. Still others, such as the University of Minnesota, have a nucleus of full-time staff members in the clinical departments but utilize in addition the services of many practicing physicians.

It is the intent of the University of Minnesota to continue upon this basis, believing that to conduct an adequate educational program a medical school needs some staff members in all departments who devote themselves exclusively to medical teaching and research, but that clinicians, who are meeting the day-to-day problems of the private practice of medicine, have a very real and important contribution to make to the teaching of medical students.

The location of the University of Minnesota Medical School on the campus with the rest of the University and in a large metropolitan center, is indeed a fortunate one. In this situation the Medical School benefits from the atmosphere and associations of a university campus and still has available the wealth and diversity of clinical material and the services of a splendid part-time staff that are available only in a large metropolitan center.

For purposes of administration, the Medical School is divided into the following departments: Anatomy, Bacteriology, Physiology, Physiological Chemistry, Pharmacology, Pathology, Medicine, Surgery, Obstetrics and Gynecology, Pediatrics, Ophthalmology and Otolaryngology, Psychiatry and Neurology, Radiology, Physical Medicine and Rehabilitation, and Continuation Medical Education.

Closely affiliated with the Medical School, as divisions of the College of Medical Sciences, are the following instructional units. School of Public Health, School of nursing, Course in Medical Technology, Course in Physical Therapy, Course in Occupational Therapy, and Course in X-Ray Technology.

In this series of articles, we will attempt to give brief pictures of the organization and activities of most of these departments of the Medical School and divisions of the College of Medical Sciences.

AMA DELEGATES MEET, DISCUSS, DEBATE PLAN

The 102nd Annual Session of the House of Delegates of the American Medical Association convened at the Waldorf-Astoria in New York City on June 1. Comparatively speaking, discussions were mild, with action seemingly watered down somewhat in view of what was expected to be fire works.

However, after thoroughly studying some of the measures adopted, it can be seen that the House took positive steps in decisions on many matters under consideration.

A certain amount of clarification came out of the discussion on treatment of non-service-connected disabilities by the Veterans' Administration. The House gave unanimous approval to a recommendation from its Reference Committee on Insurance and Medical Service, which recommendation was submitted as a substitute for eight different resolutions concerning this matter.

In approving this recommendation, the House actually re-adopted a resolution originally presented at the Denver, 1952, Interim Session:

> "Your Committee recommends with respect to the provision of medical care and hospitalization benefits for veterans in Veterans Administration and other federal hospitals that new legislation be enacted limiting such care to the following two categories:
>
> "(a) Veterans with peacetime or wartime service whose disabilities or diseases are service-incurred or aggravated, and
>
> "(b) Within the limits of existing facilities to veterans with wartime service suffering from tuberculosis or psychiatric or neurological disorders of non-service-connected origin, who are unable to defray the expenses of necessary hospitalization.
>
> "Your Committee recommends that the provision of medical care and hospitalization in Veterans Administration hospitals for the remaining groups of veterans with non-service-connected disabilities be discontinued and that the responsibility for the care of such veterans revert to the individual and the community, where it rightfully belongs."

Service-Connected Plan Okay

The reference committee report further stated that it was in full accord with the present program of medical treatment for veterans with service-connected disabilities:

> "It is the belief of your committee that the medical profession must concern itself, not with the numbers of 'chiselers' in Veterans Administration hospitals nor with the efficacy of the Veterans Administration in the administration of enabling legislation, but rather with the broad question of whether such legislation is sound, whether the federal government should continue to engage in a gigantic medical care program in competition with private medical institutions and whether the ever-increasing cost of such a program is a proper burden to impose on the taxpayers of the country. A consideration of this problem must, of course, be predicated upon a concern for the health of the entire population and not just a particular segment."

Emphasize Ethics

Considering the eleven resolutions dealing with publicity on statements by official spokesmen of allied medical organizations, the House recommended no action, but firmly emphasized the supremacy of the American Medical Association's code of ethics to govern the entire profession. The reference committee's recommendation read as follows:

> "The Principles of Medical Ethics as formulated, interpreted and applied by the American Medical Association must be considered the only fundamental and controlling application of ethics for the entire profession. Any statement relating to ethical matters by other organizations within the general profession of medicine, advances views of only a particular group and is without official sanction of the entire profession as represented by the American Medical Association."

The report also condemned generalized statements regarding ethics of physicians:

> "Your reference committee believes that the harm done to the public and to the profession by the current articles which lower the confidence patients have in their doctors cannot be objectively evaluated. This highlights the

fact that, when individuals or groups without official status in the American Medical Association utter or publish ill-considered statements, the result too often is that the confidence of the public in the medical profession is placed in jeopardy."

While the committee reaffirmed its agreement with the right of free speech, it amplified its explanation of its action by stating,

> "Broad generalizations, ill-advised and poorly prepared statements that often fail to convey the intended meaning, are most unfortunate and are to be deplored."

Critical comments which are destructive can serve no useful purpose, the report declared

> "Your committee has the utmost confidence that the great majority of our members are entirely capable of avoiding these pitfalls without additional advice from this committee."

Osteopathy Discussed

One of the most controversial and prolonged discussions of the House session was action on the question of osteopathy. The final decision, after considerable heated and vigorous debate, was to postpone action until the annual meeting of 1954, thereby providing for further study by delegates and the individual state associations.

However, certain proposed principles were outlined for consideration with regard to the field of osteopathy and its relationship to the medical profession. Four points were presented by last year's Committee for the Study of Relations Between Osteopathy and Medicine, but these were not adopted by the House of Delegates:

1. That the House of Delegates declare that so little of the original concept of osteopathy remains that it does not classify medicine as currently taught in schools of osteopathy as the teaching of "cultist" healing.

2. That the House of Delegates state that pursuant to the objectives and responsibilities of the American Medical Association, which are to improve the health and medical care of the American people, it is the policy of the Association to encourage improvement in the undergraduate and postgraduate education of doctors of osteopathy.

3. That the House of Delegates declare that the relationship of doctors of medicine to doctors of osteopathy is a matter for determination by the state medical associations of the several states and that the state associations be requested to accept this responsibility.

4. That the Committee for the Study of Relations Between Osteopathy and Medicine or a similar committee be established as a continuing body.

The majority report of the reference committee felt that the committee's report was dealing with too controversial a subject to allow action without further study. It therefore recommended, and the House concurred, that the Committee be continued, that action be deferred until June, 1954, and that the House be prepared to answer then, the following questions:

1. Should modern osteopathy be classified as "cultist" healing?

2. Since the objectives of the American Medical Association include improvement in undergraduate and postgraduate education, should doctors of medicine teach in osteopathic schools?

3. Should the relationship of doctors of medicine to doctors of osteopathy be a matter for determination by the several state associations?

Next year's House of Delegates session in San Francisco will see decisive action on this important policy matter.

MORE SAVINGS, SPENDING REFLECT LIVING STANDARD RISE

Although most of the nation's substance has gone to defense programs for the past decade,

> "the United States has given a practical demonstration of the dynamic effect of rising productivity in the way it has continued to lift the living standards of the man in the street."

This statement prefaces a recent report on the higher living standards in America, reported by the Insurance Economics Society of America in its publication, "Insurance Economics Surveys."

A rise in both incomes and savings are the main factors in the over-all rise in living standard. The report states:

> "Over recent years, as the figures show, more Americans than ever before have enjoyed rising incomes, spent more for needs and wants, and saved more in life insurance and in other mediums of thrift."

Income increases are reported:

> "Total personal income has increased in every year except one out of the last thirteen. The exception was in the brief recession of 1949, but even then the decline

was small. The 1952 total of personal income amounted to more than $268 billions, as against less than $73 billions in 1939, an increase of nearly fourfold."

Consumer spending has also shown an increase of considerable proportions:

> "Consumer spending has increased in every year since 1939. There have, of course, been variations from year to year, reflecting such factors as the scarcity or abundance of goods, and the impact of changing domestic and international conditions on public psychology and individual buying impulses. Over all, however, the upward trend in personal spending has been uninterrupted from 1939 to date. Goods and services bought by the people in 1952, exceeded $216 billions, more than triple the pre-World War II figure."

The trend in personal savings has also climbed steadily, not only in amount, but in distribution. The report states that although savings have pursued a more zigzag course than either total income or consumer spending, they reached abnormally high levels during the last war, fell off for a few years thereafter as goods came into supply, and then moved steadily upward in the last five years.

> "Last year's total of personal savings, as compiled by the Department of Commerce aggregated $18 billions, some six and one-half times the 1939 savings figure."

Distribution Rises, Too

There are 24 million more owners of life insurance today than there were at the beginning of the last war, the report states. The total of insurance in force is about two and one-half times as great.

Unemployment Decreases, Taxes Increase

Also, the trend toward higher living standards has entered the employment field. More than 9.5 million persons, which is over a sixth of the American working people, were jobless in 1939. The report states that this nation has had, by contrast, full employment in recent years.

The biggest gain of all has been found in the tax field. Here, personal taxes in 1952 totaled a record high of $34 billions, half as high again as the World War II peak and fourteen times greater than the 1939 total.

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

230 Lowry Medical Arts Building
Saint Paul 2, Minnesota

Julian F. DuBois, M.D., Secretary

BELGRADE, MINNESOTA, PHYSICIAN SENTENCED FOR GRAND LARCENY

Re. State of Minnesota vs. George F. Engstrom

On May 4, 1953, George F. Engstrom, M.D., fifty years of age, was sentenced by the Hon. Arthur A. Stewart, Judge of the District Court of Ramsey County, to a term of one year in the Ramsey County Jail. The Court stayed the execution of the sentence for a period of one year upon the defendant's good behavior. Dr. Engstrom had entered a plea of guilty on July 14, 1952, to an information charging him with the crime of grand larceny in the second degree. At that time the Court continued the matter to October 10, 1952, and then to May 4, 1953. The purpose of the continuance was to give Dr. Engstrom an opportunity to make restitution for money that he had wrongfully obtained from various insurance companies and others as the result of fictitious, fraudulent and excessive claims for remuneration for professional services.

At the time Dr. Engstrom appeared in Court to be sentenced, the Court was advised that Dr. Engstrom had made full and complete restitution and that his license to practice medicine had been suspended by the Minnesota State Board of Medical Examiners on February 14, 1953, for a period of three years. Judge Stewart stated that, in the Court's opinion, Dr. Engstrom was being sufficiently punished for his wrongdoing, particularly by being deprived of his license to practice medicine.

MINNEAPOLIS PHYSICIAN AND ACCOMPLICE SENTENCED FOR CRIMINAL ABORTION

Re. State of Minnesota vs. George F. Schmidt and Maryllyn M. Dinsmore.

On May 29, 1953, George F. Schmidt, M.D., seventy-two years of age, was sentenced by the Hon. William C. Larson, Judge of the District Court of Hennepin County, to a term of not to exceed four years in the State Prison at Stillwater for the crime of abortion. The Court ordered the sentence stayed and placed the defendant on probation for a period of three years. Dr. Schmidt at the time of his arrest on April 21, 1953, maintained an office for the practice of medicine at 2707 Nicollet Avenue, Minneapolis. Dr. Schmidt was also a deputy coroner of Hennepin County. On April 28, 1953, Dr. Schmidt entered a plea of guilty to an information charging him with the crime of abortion and stated to the Court that he received $50.00 for doing an abortion on a twenty-one-year-old married Minneapolis woman. Dr. Schmidt admitted that he had performed "about a dozen abortions" prior to the one that resulted in his arrest.

On May 28, 1953, Mrs. Maryllyn M. Dinsmore was sentenced by Judge Larson to a term of not to exceed three years in the Women's Reformatory at Shakopee for the crime of abortion. Mrs. Dinsmore was the "go-between" in arranging the abortion that was performed by Dr. Schmidt. Mrs. Dinsmore admitted that she received $250 for her services. Mrs. Dinsmore denied that she was involved in any other abortions except one

STRANGULATION OBSTRUCTION DUE TO INTERNAL HERNIA

Inaugural Thesis

B. D. MITCHELL, M.D.
Minneapolis, Minnesota

The two types of mechanical small bowel obstruction differ because in the simple occlusion only one portion of the lumen of the bowel is obstructed by an intrinsic or extrinsic lesion; in strangulation, two loops of bowel are blocked, as well as the corresponding vessels of the mesentery.

As a rule, strangulation obstruction requires much more active and prompt treatment by the surgeon. This is true because a simple occlusion usually progresses slowly and a localized nutritional disorder may develop at the obstruction site, whereas strangulation is more rapid and severe and the incarcerated loop may become necrotic.

Strangulation obstruction of the small bowel composes about 45 per cent of the total number of mechanical obstructions of this organ. By far the greatest percentage of these are caused by external herniae which are relatively easy to diagnose. Obstruction due to strangulation of small bowel in an internal hernia is rare. It is estimated that these comprise .5 to 1.2 per cent of all strangulating obstructions of the small bowel. The mortality attending these cases is high, a recent review stating that the overall mortality is as high as 50 per cent. This figure would undoubtedly be reduced if figures were available for those cases treated in the past ten years.

Report of Cases

Case 1.—A sixty-seven-year-old white woman was admitted to St. Mary's Hospital on May 22, 1952. Five days previous to this she had been seized with a sudden attack of abdominal pain and emesis. She was unable to keep any food or fluids down and she was admitted suffering mainly from dehydration. The pain had entirely disappeared within the first few hours after the onset of her symptoms. The dehydration was corrected by parenteral fluids and by the next day she was able to take food orally without vomiting.

Examination on admission was essentially negative except that there was slight tenderness in the left upper quadrant of the abdomen. There was also a suggestion of a fullness in this area; however, a definite mass could not be outlined.

Two days after admission an upper gastrointestinal x-ray revealed that the stomach was displaced to the right from extrinsic pressure on the greater curvature. The displacement appeared to be due to numerous small bowel loops which were quite markedly distended. Follow-up studies revealed delay in passage of the barium through the small bowel. A barium enema on May 26, was essentially normal except for the above-mentioned small bowel distention which appeared to be localized mostly on the left side of the abdomen. The barium given two days previously had completely passed through the bowel. On May 29, intravenous pyelograms were made and were normal.

On May 29, exploration, with a tentative diagnosis of small bowel malignancy, probably metastatic, was carried out through a right paramedian incision. About four feet of dilated small bowel was found to be projecting through a hole in the omentum which was about 10 cm. in diameter. The bowel wall and mesentery was edematous but otherwise normal. The portion of the omentum distal to the opening was resected and the abdomen closed. There were no other abnormalities within the abdomen. The patient was discharged from the hospital five days after operation and made an uneventful recovery.

Case 2.—An obese sixty-two-year-old white man was admitted to St. Mary's hospital on April 9, 1952. Eight hours previous to admission the patient was moving some heavy furniture in the office of the lumber yard where he was employed; he had a sudden sharp abdominal pain followed in a few minutes by vomiting. He was seen about two hours after onset by his doctor who gave him a hypodermic injection which partially relieved his distress for an hour or two. However, he became worse and was brought to the hospital. The patient had had no previous surgical procedure.

On admission to the hospital the positive findings were as follows: There was moderate distension of an obese abdomen, generalized tenderness of the entire abdomen, more marked just to the left of the umbilicus and voluntary muscle guarding over the entire abdomen with slight but definite rigidity of the midportion of the left rectus muscle. The bowel sounds were normal except for some occasional high pitched sounds.

The leukocyte count was 10,300 with 91 per cent neutrophils. Electrocardiogram and chest x-ray were normal. Serum amylase was 70 units. Flat plate and upright x-rays of the abdomen revealed numerous loops of dilated small bowel and fluid levels within the small bowel loops.

Laparotomy was begun eleven hours after the onset of symptoms. There was a moderate amount of serosanguineous fluid in the peritoneal cavity. A large indurated mass was palpated just to the left of the midline which was easily brought out of the incision and was found to be the edematous tissues involved in a herniation of the jejunum through an opening in the omentum; this opening was about 5 cm. in diameter. The bowel proximal to this was dilated and the distal bowel was collapsed. The herniated bowel was dark in color, dilated and edematous, but definitely viable. The opening was enlarged, the hernia reduced and the involved portion of omentum resected.

The postoperative course was uneventful and the patient was discharged on the sixth postoperative day. He has been well since. The case has been somewhat complicated by the fact that the patient is claiming industrial compensation for his care and temporary disability.

Case 3.—A twenty-six-year-old white man was admitted to the hospital at 7:00 p.m. on June 9, 1949. Twenty hours previously he had had a sudden attack of severe abdominal pain and shortly after this he vomited. He was seen at home four hours later at which time his abdomen was soft, his temperature was 98° F. with no chills or upper respiratory or urinary tract complaints. The pain had almost disappeared. The pain and vomiting recurred six hours later, shortly after which he began having loose yellow stools.

On admission the patient was vomiting blood and he was obviously a very sick man. I saw the man at this time and during the examination he vomited dark blood on numerous occasions. The abdomen was markedly distended but was peculiar in that the distention seemed to be confined to the upper abdomen. This distention seemed to cause the patient to have difficulty in breathing. There was extreme generalized tenderness and marked rigidity, almost a board-like abdomen; these findings were more marked in the upper abdomen. The temperature was 101° F. and the white blood count was 17,300 with 87 per cent neutrophils. X-ray of the abdomen in the upright position did not reveal any gas under the diaphragm. There had been no previous abdominal surgery.

A guarded preoperative diagnosis of bleeding perforated ulcer was made and a laparotomy was performed. A right upper paramedian incision was made. There was a moderate amount of serosanguineous fluid in the belly. The stomach and colon with the stretched gastrocolic ligament between them puffed out of the wound. Further exploration showed that the colon and transverse mesocolon were pushed downward and a dark colored material could be seen behind the mesocolon and the gastrohepatic ligament. Most of the visible small bowel was collapsed; however, about three feet of the proximal jejunum was enormously distended and the distal end of this loop coursed up into the region of the gallbladder over the hepatic flexure of the colon. It disappeared into the foramen of Winslow. The diagnosis was made, of course, but reduction was extremely difficult and was accomplished only after incising through the gastrocolic ligament and slowly manipulating the bowel on each side of the foramen of Winslow, about eight feet of jejunum being reduced out of the lesser omental cavity. The patient's good condition at this point in the procedure permitted further careful exploration. There was no congenital defect that could give a possible explanation as to etiology.

The abdomen was closed in layers. Gastric suction was discontinued the next day and the patient left the hospital on the tenth postoperative day. He has been well since.

Small bowel obstruction due to strangulation through a congenital defect in the omentum or mesentery, while rare, has frequently been reported in the literature. However, since 1834, when Blandin reported the first case of herniation through the foramen of Winslow, there have been sixty-five cases reported. Most of these cases involved the terminal ileum, and the ascending colon in the strangulation, suggesting a defect in the rotation of the bowel as a possible predisposing cause of the condition. Other factors suggesting possible etiology are: (1) an extremely long mesentery and (2) a large foramen of Winslow. The patient presented here had neither of these findings.

The first operation for this condition was in 1888. The first patient to live following operation for this type of obstruction was in 1914. In none of the cases was the diagnosis made preoperatively and the high mortality has in most cases been due to the fact that operation was delayed too long.

These cases have been presented because of their relative rarity and high accompaning mortality and as a reminder that strangulation of the bowel by internal hernia should always be considered with small bowel obstruction even if the patient has not had a previous abdominal operation.

THE THYROTOXIC HEART

DALE CORREA, M.D.
Minneapolis, Minnesota

Hyperthyroidism is an important etiologic factor in the production of auricular fibrillation, cardiac enlargement and congestive heart failure, but there is still considerable uncertainty as to whether hyperthyroidism *per se* is responsible for these manifestations. In short, it is uncertain whether there is a specific type of heart disease caused by hyperthyroidism, or whether the latter is merely a contributory or precipitating factor in individuals already predisposed by coincident heart disease. The term thyrocardiac is restricted to cases in which the hyperthyroidism is associated with recurrent abnormal rhythm or with congestive heart failure. Since many symptoms, such as palpatation and tachycardia, dyspnea, and precordial distress, are commonly observed with uncomplicated hyperthyroidism, their presence is not in itself sufficient to warrant the diagnosis of heart disease. In the great majority of cases of thyroid heart disease, there has been found evidence of associated arteriosclerotic, hypertensive, rheumatic, or syphilitic heart disease. Hyperthyroidism as an exclusive cause of heart disease *does* exist. This results only after a prolonged and severe thyrotoxicosis, associated with auricular fibrillation and eventual heart failure.

Objective manifestations of the thyrocardiac are a rapid pulse with a tendency for a systolic elevation of blood pressure, usually a normal diastolic blood pressure, and an increased pulse pressure. In 10 per cent of patients with thyrocardia a transient or permanent auricular fibrillation occurs. The apical heart beat is often sharp and snapping and visible. A systolic murmur is best heard at the base of the heart or at the pulmonic area. The electrocardiogram discloses *no* distinctive features except for the usual nonspecific sinus tachycardia or the auricular fibrillation. The belief that the T waves become elevated in hyperthyroidism in contrast to the characteristically low T waves in myxedema has not been substantiated. The heart shadow on roentgen examination shows no distinct features except enlargement and vigorous contractility.

Thyrotoxicosis of itself does not cause angina pectoris, but when it occurs in a patient with coronary arteriosclerosis the increased oxygen needs of the heart may precipitate this disorder. The most serious consequence of hyperthyroidism is the development of congestive heart failure. This complication is rather uncommon before the age of forty, and as stated above, usually occurs in individuals who have already suffered from some other form of heart disease or have been in the state of auricular fibrillation for a long period of time.

In older patients recognition of underlying thyrotoxicosis in heart failure may be difficult. The eye phenomena and the enlargement of the thyroid gland may be absent; in addition, the tachycardia is attributable to the condition of the heart, the increased appetite is diminished by the passive congestion of the viscera, particularly the liver, the loss of weight is obscured by the gain due to edema; and the warmth and flushing of the skin and sensitivity to heat modified by the antagonistic effects of heart failure. Despite these difficulties, thyrotoxicosis should nevertheless be recognized or suspected as an underlying etiologic factor in patients with heart disease; especially those who have a persistent tachycardia that endures after prolonged rest, attacks of paroxysmal auricular fibrillation, particularly in the absence of mitral disease, auricular fibrillation in which the ventricular rate is resistent to the slowing effects of full doses of digitalis, and high output failure in the absence of any other recognizable cause. High output failure can be recognized by an increased venous pressure with a low or normal circulation time. Even when thyrotoxicosis is suspected as the cause of congestive heart failure, the firm establishment of a diagnosis is confronted with additional difficulties. Measurement of the basal metabolic rate becomes unreliable in the presence of heart failure. The increase in the basal metabolic rate up to a plus 25 to a plus 30 per cent cannot be taken as proof of existence of overactivity of the thyroid. In such cases of heart failure where the role of thyrotoxicosis is in doubt, determination of the serum iodine is of value in arriving at a decision. Also the radioactive iodine uptake test is helpful. Unfortunately, these laboratory procedures are not yet readily available. Some help may be obtained from the estimation of the circulation time which is usually normal in the thyrocardiac in spite of congestive heart failure. But the most important and practical clinical method of establishing the presence of thyrotoxicosis in such cases, is the favorable response to the administration of iodine or one of the thiouracil compounds. The treatment of cardiac thyrotoxic disease is a medical and surgical problem. The combination of rest, quinidine, occasional digitalization and the all-important use of antithyroid drugs with the later addition of iodine is necessary to establish eu-thyroid state and additional cardiac reserve before operation can be undertaken. Radio-active iodine has become part of the armamentarium in the treatment of the thyrocardiac, particularly the recurrent thyrotoxic patient who has had previous subtotal thyroidectomy. However, the accessibility to its use is limited. In addition the general advancement of surgical techniques and anesthesia has made it possible for surgery to be practically a definitive treatment for the thyrotoxic heart.

In the recent study of forty patients by Haines and Keating with exophthalmic goiter and cardiac dysfunction, a single dose of I-131 gave good results in twenty-seven cases, fair in eight and poor in five. Retreatment improved these results. Excellent results were also reported by Crile. It seems highly probable that this promising form of treatment will replace both thyroidectomy and antithyroid drugs in the treatment of thyrocardiacs. The method of quinidinization and digitalization has offered a problem. It seems to me that the use of quinidine and digitalis is secondary in the treatment of thyrocardiac disease unless a full blown congestive heart failure is present. It is a known fact that full doses of digitalis do not slow down the rapid heart rate until the effects of the excessive thyroid hormone have been eliminated. If auricular fibrillation and heart failure persist after the basal metabolic rate is reduced to normal either by surgery or antithyrotoxic drugs, then digitalis must be administered to make the heart as efficient as possible and quinidine to restore the normal rhythm. The other means for treating heart failure such as limitation of activity, sodium restriction, diuretics, and thiamine chloride should not be overlooked.

The dosage of digitalis varies according to the size of the patient, as well as to the time interval necessary for full digitalization. The newer and more purified types of digitalis have cut down the side effects considerably. In the older patient cedilanid seems the more desirable because of its faster excretion in case symptoms of overdigitalization occur. However, digitoxin is 100 per cent absorbed and full digitalization can be obtained in one dose. This procedure however is not without danger and is rarely used.

Procaine amide may be used in place of quinidine for persisting superventricular tachycardia. Its usefulness is limited more or less to this particular type of abnormal rhythm. Quinidine has been used more extensively and most satisfactorily in restoring abnormal heart rhythm to normal sinus rhythm. The toxic effects of digitalis or quinidine occur in the thyrotoxic heart as it does in any other cardiac disease when used in sufficient dosage.

IMMEDIATE CHOLANGIOGRAPHY IN SURGERY

HAROLD D. CAYLOR, M.D.

Bluffton, Indiana

In this study we plan to review the technical features of immediate cholangiography and discuss its uses and scope and urge its more widespread adoption as a routine procedure in gall-bladder surgery.

P. L. Mirizzi,[4,5] an Argentine Surgeon, first introduced cholangiography in 1931. Since his original observation this procedure has constantly increased in use and scope. Cholangiography has been usually classified as: (1) immediate, that done during the course of an operation on the biliary tract and in the operating room, and (2) delayed, roentgenographic study of the biliary tract performed after an operation by injection of radiopaque media through a T-tube, catheter or some other apparatus which had previously been inserted in the biliary tract. This latter study is usually made in the x-ray department of a clinic or hospital.

Our interest in this device as a useful adjunct to biliary surgery was stimulated by two cases which have been reported previously.[1] Both patients had congenital anomalies. In the first, the common hepatic ducts each contained many stones and did not combine until within about 3 cm. of the ampulla. Immediate cholangiograms would have given valuable information and saved at least one subsequent operation. In the second case the choledochus emptied into a duodenal diverticulum. Following our contact with these cases we became intensely interested in the possibilities of immediate cholangiography and its usefulness as an aid in avoiding difficulties such as we met in these cases.

In any discussion of cholangiography it is necessary that one set out his indications for exploration of the common bile duct during cholecystectomy and at other times.

In 1950, with Drs. Collett and Tirman, we published a study of the cases mentioned above. At this time our indications for choledochostomy were as follows:[1]

1. Jaundice or recent history of jaundice with or without history of chills and fever.
2. Palpable common duct stones.
3. Enlarged common duct.
4. Aspiration of dark muddy bile from the common duct.
5. Many small stones in the gall bladder.
6. Persistent biliary symptoms after cholecystectomy.
7. X-ray evidence of common duct stones.

With the passage of time and more experience the indications for exploration of the common duct have changed. For example, Glenn in October, 1952, gave these indications for exploration of the common duct for stones.[2]

Indications for exploration of common bile duct in combination with cholecystectomy:

1. Palpable stone in the common duct.
2. A history of jaundice preceded by or associated with pain or intermittent elevation of fever.
3. Thickened common duct wall with or without dilatation.
4. Contracted gall bladder containing stones.
5. Dilated cystic duct.
6. Enlarged head of the pancreas.
7. If the patient is over sixty years of age and has a prolonged history of biliary tract disease.

Our present criteria for opening the common bile duct are as follows:

1. History of jaundice with or without chills and fever.
2. Palpable common duct stones.
3. Enlarged common and/or cystic duct.
4. Many small stones in the gall bladder.
5. X-ray evidence of common duct stones.
6. Suspected congenital anomaly of biliary tract.
7. Persistent biliary symptoms after cholecystectomy.

Whenever the condition of the patient will allow after we insert a T-tube in the common duct during choledochostomy it is now our routine practice to do an immediate cholangiogram. The technique of this procedure will be discussed later when we are describing the so-called "screening" cholangiograms. Even with immediate cholangiography stones may be missed. On one occasion we inadvertently allowed a T-tube to overlie the ampulla and obscure a small stone at the distal end of the common duct. Before the T-tube is removed postoperatively another cholangiogram (delayed) is done in the x-ray department. Using the criteria above as indications for choledochostomy we have recovered

---

From the Caylor-Nickel Clinic and Clinic Hospital, Bluffton, Indiana.

calculi from the common duct in from 43 to 50 per cent of explored common bile ducts.

But what about common ducts we do not explore, what about the biliary dyskinesia cases, or persistence of symptoms after cholecystectomy—stricture, neoplasm, et cetera? What can we do to avoid these unpleasant situations for the patient and surgeon alike? Again quoting Glenn,[2] 'in all patients with stones in the gall bladder one in ten will have stones in the common duct."

We feel that what we call an immediate "screening" cholangiogram is an attempt to avoid leaving silent stones behind in the duct, recognizing stricture or anomalies or obstructions at the time of the original biliary tract surgical procedure when one has the best opportunity to correct these difficulties.

Many devices have been employed for cholangiograms without incising the common bile duct: (1) aspiration of the gall bladder and injection of the radiopaque material via a hypodermic needle into the gall bladder, cystic or common duct; (2) insertion of a catheter through the partly incised cystic duct and injection of the dye through this catheter. This method we have used and we will describe it in detail now.

Technique Employed for Immediate Cholangiography

1. Plywood cassette holder containing a 14x17 film on operating table under patient.

2. Make any type of incision which seems most feasible to the surgeon.

3. Sew on drapes.

4. Isolate the cystic duct and ligate it close to the gall bladder to avoid forcing stones out of the gall bladder.

5. Pass another ligature around the cystic duct close to common duct.

6. Incise the cystic duct widely enough to insert catheter.

7. After catheter (ureteral or urethral, usually size No. 6) has been inserted, ligate this catheter in place. Don't insert catheter too far or poor visualization will be obtained of the hepatic ducts and catheter may go through the ampulla.

8. Start injection of warmed 70 per cent diodrast and inject with gentle pressure 3-5 cc. and take a film. Be careful the catheter does not overlie the duct.

9. X-ray factors for films: Kv. 70-75, Distance 30 inches, Ma. 60, Time 1/4 seconds. Angle tube to avoid spine.

10. Inject diodrast at least 5 cc. more and take another cholangiogram.

11. Leave the catheter in place and do a cholecystectomy.

12. When films are developed and if they are unsatisfactory, repeat cholangiogram can be made because the catheter is still in the duct.

13. If the films are adequate and there is no reason for further procedure on the common duct the catheter is removed and the stump of the cystic duct ligated or sutured.

This technique which we have developed is almost exactly the same as that described by Mixter and colleagues in 1951,[6] although we were unfamiliar with his work when we were developing this technique.

Certain features deserve particular mention. Since we have been using this procedure and meticulously exposing the cystic duct we have been much more aware of variations in this organ and the structures adjacent to it; in other words, our exposure and visibility have been improved. With increasing practice only about ten minutes is added to the time of a cholecystectomy when immediate cholangiograms are performed.

The apparatus we have used is available in any well-equipped operating room. Probably better technical roentgenograms could be obtained with a built-in Bucky in the operating table or even operating on a urological table in the cystoscopic room as some workers have done, notably Dean MacDonald.[3] Using the technique we have described we have regularly obtained cholangiograms of diagnostic quality. It is important and necessary to have the close co-operation and teamwork of the x-ray department for successful immediate cholangiograms. One important feature in the technique described is using a high milliamperage which shortens the time of exposure to 1/4 second. Synchronizing the exposure with the end of exhalation, movement was reduced to a minimum.

Summary

We urge routine use of immediate cholangiography where it is applicable in gall-bladder surgery. Immediate cholangiography is not infallible but by using this device unsuspected stones, strictures, obstructions and anomalies of the biliary system may be discovered and treated at the optimum time, during the first surgical procedure on the biliary tract. The operating surgeon will have a greater certainty and sureness from the use of this adjunct to biliary tract surgery.

EXTENDED OR SUPER-RADICAL MASTECTOMY FOR CANCER OF THE BREAST

F. JOHN LEWIS, M.D.
Minneapolis, Minnesota

1. *Limitations of the Conventional Radical Mastectomy.*—The radical mastectomy operation for carcinoma of the breast, developed in the nineteenth century through a logical series of steps that culminated in the work of Halsted and Willy Meyer in 1894,[4,9] has been thought of as model operation to be emulated, if possible, in part of the body diseased with cancer. It is conceived to remove, in one continuous segment, not only the primary cancer but the most likely areas of lymphatic metastases as well. This concept has become a fundamental one in the entire realm of cancer surgery and yet it is now apparent that the conventional radical mastectomy itself does not fulfill this basic aim. Regional lymphatic drainage areas, which frequently harbor metastases, remain untouched by the conventional operation.

Doubtless the low cure rate which follows radical mastectomy for patients having cancers already metastasized to the axillary nodes is due, in large part, to the residual cancer left behind in these other regional areas. Failure among those with diseased axillary nodes must, in many instances, mean that some cancer has been left behind just beyond the area of dissection. In such cases, the areas most likely to be involved are the supraclavicular or parasternal lymph node chains.

The importance of the parasternal nodes has been emphasized by recent studies indicating the freqency with which they are involved in cancer of the breast. Using a short parasternal incision prior to the conventional operation, Handley and Thackray[7] removed nodes from the second intercostal space and found cancerous involvement in 38 per cent of all their cases.

Of those with axillary lymph node metastases, 52 per cent had parasternal involvement in addition. More recently Dahl-Iversen[2] has studied fifty-three cases and found the parasternal nodes involved with cancer in 19 per cent, while if only those with axillary involvement were considered, the percentage of parasternal involvement rose to 24 per cent. A further observation of interest in both of these series was the high percentage of parasternal node involvement in those cases with medially located cancers of the breast. In the English series metastases to the parasternal nodes were found in 71 per cent of the cases with medially located cancers but in only 21 per cent of those with laterally placed cancers. The parallel figures for the Dahl-Iversen series were 30 per cent and 12 per cent.

Residual cancer in the supraclavicular nodes may also be the cause for failure of the conventional radical mastectomy. Some recent evidence emphasizing the frequency with which these nodes are involved has been published by Andreassen and Dahl-Iversen.[7] They did a supraclavicular dissection in addition to the usual radical mastectomy in ninety-eight cases and found cancer involving the supraclavicular nodes in 17 per cent of all their cases while 33 per cent of those in the series with axillary node involvement had supraclavicular metastases as well.

The radical mastectomy is an operation that requires amendment. In its traditional form it fails to cure many so-called operable cases of cancer. Yet despite this fact, and further, despite the evidence that among many uncured patients who had the operation, cancer was present in the supraclavicular or parasternal nodes at the time of surgery, the operation for cancer of the breast has not, in the past, been successfully extended into these areas. As generally used today, it is an incomplete operation limited by two anatomical barriers: the clavicle and and bony chest wall.

2. *Suggestions for Extension of the Radical Mastectomy.*—Surgeons treating carcinoma of the breast have long been aware of the limited nature of the conventional operation and a few have tried to extend it to encompass more of the lymphatic drainage areas. The first of these was Halsted himself who added a supraclavicular dissection to the radical operation in over 100 cases.[5] Later Sampson Handley[6] removed some of the parasternal lymph nodes in a few patients with carcinoma of the breast but he did not recommend general adoption of this modification. A number of others have, more recently added either a parasternal or a supraclavicular dissection to the radical mastectomy but not both together.[1,2,7,10] The extended radical operation to be discussed here has been described previously by Wangensteen.[11] It adds, for the first time, both a supraclavicular and a mediastinal dissection to the usual radical mastectomy.

3. *Assumption Upon Which Use of Super-Radical Operation Is Based.*—Before describing the technique of this operation, it is important to consider some of the assumptions that are implicit in the use of this type of treatment for cancer of the breast. Though most, if not all, of these assumptions have been under attack at one time or the other, we feel that they are all tenable and at least sound enough to justify a trial of the present surgical approach.

(a) It must first of all be granted that cancer of the breast can be cured even after it has spread to the lymph nodes. The fact that the Halsted radical mastectomy cures many patients whose disease has spread to the axillary lymph nodes establishes this point. Many patients with lymph node involvement have been cured and perhaps more can be cured if more lymph nodes are removed.

(b) It must also be assumed that cancer of the breast

Inaugural Thesis presented to the Minneapolis Surgical Society on January 8, 1953.

From the Department of Surgery, University of Minnesota Medical School, Minneapolis.

spreads largely through the lymphatics and in a progressive manner. There should then be a number of cases in which it has spread beyond the areas of the conventional radical mastectomy, on to some of the supraclavicular or parasternal nodes, but still no further. This concept of an essentially progressive lymphatic spread is important not only for the acceptance of this operation; it is a basic one in most cancer surgery.

(c) The third and perhaps the weakest assumption we have made is that cancer of the breast can be cured by a discontinuous excision. In the operation under consideration it has been technically unfeasible to remove all the lymphatic drainage areas in direct continuity. It is felt that this factor in technique may not be of great importance, for a separate dissection of the regional lymphatics has been practiced successfully in other areas of the body, especially in the head and the extremities.

(d) Finally, we have assumed that surgical excision is a better way in which to treat cancerous lymph nodes than in roentgen therapy. Though McWhirter of Scotland,[8] especially, stands against this contention, it is a principle accepted by many cancer therapists and a basic tenent of most cancer operations.

Technique

1. *Extent of the Operation.*—The super-radical mastectomy may be done either as a one or two-stage operation. In either case there are three main areas of dissection. First, there is the conventional radical mastectomy and axillary dissection; this is followed by a supraclavicular and cervical dissection extending as high as the upper border of the thyroid cartilage; and finally, a parasternal and mediastinal dissection are done. This final part of the dissection includes not only an excision of the entire parasternal lymph node chain along with the internal mammary blood vessels, but a mediastinal dissection as well, which in turn includes a partial or complete thymectomy and a removal of the lymph node bearing tissue along the great vessels down to the heart.

2. *Incisions.*—The operative field is usually exposed through the two incisions. The conventional mastectomy and axillary dissection are done through an oblique incision encompassing the lesion and extending out on the anterior axillary fold while the cervical and mediastinal dissections are done through a second more medially placed incision extending from the neck down over the lateral edge of the sternum. Care is taken to see that enough skin is left to allow primary closure of these wounds.

3. *Elevation of the Clavicle and Division of the Sternum.*—Exposure of the subclavicular and mediastinal areas in a continuous and easily accessible field is made possible by dividing the bony framework of the thoracic inlet. The first rib is removed from its sternocostal junction laterally nearly to the angle after which the sternum is split in the midline from the jugular notch down to the level of the fourth interspace. To allow elevation of the clavicle, with its attached one-half of the manubrium, and spread of the sternum, the sternum is divided transversely at the first and fourth intercostal spaces. With retraction of the sternum, excellent exposure of the upper mediastinum is provided. After the dissection is completed, fixation of the sternum is obtained by wiring the divided portions tightly together.

4. *One or Two-Stage Operation.*—Though a one-stage procedure is obviously to be preferred as a more satisfactory cancer operation, there has been, in general, a smoother convalescence among those patients whose operation has been divided into two stages. Most of those who have had the operation done in two stages were patients for whom the extended dissection was not contemplated until the case was reconsidered after the conventional mastectomy, in light of the microscopic finding of diseased axillary nodes. However, in a number of more recent cases a two-stage operation was planned in the beginning. With this approach the morbidity and mortality have been lower but we are unable, as yet, to measure its relative effectivness in eradicating the cancer.

Indications

Surgery as extensive as that described here is not indicated for all patients with carcinoma of the breast. The increased hazard associated with operations of this magnitude dictates a carefully limited usage. There are obviously many patients with localized carcinoma of the breast in whom an extensive dissection is not necessary for cure. It is rather the patients who are most likely to exhibit extension of their cancer beyond the reach of the Halsted operation who should be selected for this more extensive dissection. As indicated by the evidence presented earlier, the best sign at present for detecting these patients is the presence of metastases in the axillary lymph nodes. Hence, the operation is primarily indicated for those patients who have unequivocal evidence of axillary metastases at the time of surgery. It has also been used, as a secondary procedure, for those in whom axillary metastases have been found on subsequent pathological examination of the operative specimen, though the metastases were undetected at the time of surgery. The extended operation has further been used for some patients who, after a Halsted mastectomy, have shown evidence of residual cancer, usually in the supraclavicular or parasternal regions.

Perhaps the presence of a medially located breast lesion, should be sufficient indication for the use of this type of operation, even if the axillary nodes are not involved. Certainly, the evidence of the Danish and English investigators, confirmed in our own experience, showing the high incidence of parasternal lymphatic involvement among patients with medial lesions, supports such a course of action.

Findings

1. *Involvement of Lymph Nodes Beyond the Area of the Conventional Mastectomy.*—The super-radical mastectomy has been used for the treatment of fifty patients with carcinoma of the breast and among these the most stricking observation has been the common

TABLE I. FREQUENCY OF CANCER BEYOND THE LIMITS OF THE CONVENTIONAL DISSECTION

Type of Operation	Number of Patients	No Cancer Beyond Conventional Dissection	Cancer Beyond Conventional Dissection
One Stage	28	10	18 (64%)
Two Stage	22	10	12 (55%)
Total	50	20	30 (60%)

TABLE II. PARASTERNAL METASTASES WITH MEDIAL OR LATERAL LESIONS

Site of Breast Lesion	Mediastinal or Parasternal Metastases:	
	Present	Absent
Medial	6	3
Lateral	11	16

finding of cancer outside of the limits of the conventional mastectomy (Table I). In the entire series of cases, lymph node involvement has been found beyond the areas of the conventional dissection in 60 per cent. Twenty-eight of the patients had their super-radical mastectomy as a one-stage procedure and of these eighteen or 64 per cent had cancer in nodes that would not have been removed by the radical mastectomy alone. Of the twenty-two patients who had a two-stage operation, for one reason or another, twelve or fifty-five per cent had cancer found at the second or super-radical stage of the operation. This is impressive evidence demonstrating how frequently the conventional radical mastectomy is an inadequate operation.

Since, as was mentioned earlier, a number of the operations were done in women with very extensive cancers, or for patients with residual or recurrent cancer, the percentage of those having cancer beyond the region of radical mastectomy in this series is probably higher than would be found among all patients with lesions generally considered to be operable. However, it is important to note that if just those patients operable by the criteria of Haagensen and Stout[3] are considered, cancer was still found beyond the range of the conventional operation in a high percentage of cases, in 49 per cent.

2. *Medial Lesions and Mediastinal Nodes.*—Another finding of importance is illustrated in Table II which shows the relative frequency of mediastinal metastases in medial as contrasted with laterally located breast lesions. A high proportion of patients with medially placed lesions have metastases in the parasternal or mediastinal lymph nodes. This is not a surprising finding; it suggests, as was mentioned above, that all patients with medially located cancers should have a mediastinal dissection.

Results

It is clear that the super-radical mastectomy, in a number of cases, removes cancer that would have been left behind by the conventional mastectomy alone. Still, it is not yet established that surgical removal of this additional cancer will result in any more cures than are obtained with less radical methods. The long period of observation that any evaluation of cancer therapy demands is not yet possible here. For the present we must concern ourselves only with the immediate results.

In addition to the fifty patients who have had the operation for carcinoma of the breast, four others have had it for miscellaneous conditions and in the entire group there were seven operative deaths, or an operative mortality rate of 13 per cent. All but one of these deaths were among those who had had the operation in one stage, a fact which at least for a while,, directed our attention to the possibility of doing an adequate operation in two stages. Deaths were also more frequent among the older patients and because of this we have not recently used the operation for patients over seventy years of age.

The operative deaths were caused by a rather wide variety of complications, some of which may in the future be preventable. Two patients died of convulsions in the early postoperative period, and, though the possibility of cerebral air embolism secondary to a pulmonary tear was considered, the explanation of their deaths is not clear. A third fatality was more obviously due to an undetected tear in the lung for this patient had a course complicated by a pneumothorax, atelectasis, and paradoxical breathing. One patient died suddenly in the early postoperative period with a hyperthermia in which the temperature reached 106° F. Two patients died of secondary hemorrhages from the subclavian and common carotid arteries, one five days postoperatively, and one thirty-one days postoperatively following a complicated course in which wound breakdown was a prominent feature, and finally, one patient died of a pulmonary embolism.

The mortality of an extended operation for cancer of the breast need not be high. In our own experience the technique and management have gradually improved with a consequent reduction in mortality. In fact, the last fourteen super-radical dissections have been done without any deaths. The morbidity of the operation is, and doubtless will continue to be, higher than that of the conventional radical mastectomy, yet the ultimate deformity is no greater.

Summary

Since the conventional radical mastectomy is demonstrably an incomplete operation, an extended or super-radical mastectomy has been devised. This operation adds cervical, supraclavicular, retrosternal and mediastinal dissections to the conventional radical mastectomy. Using this operation primarily for patients whose cancer has already metastasized to the axillary lymph nodes, a high proprotion (approximately 60 per cent) have been found to have cancer in regional nodes which would not have been removed by the more limited radical mastectomy. Since its ultimate worth cannot yet be evaluated, the extended operation is at present deserving of only a limited trial for patients whose disease would probably not be removed by less radical operations.

WATCH IT, DOC.

(Continued from Page 753)

hospitals. This viewpoint was taken by the Medical Society of the City of New York, by the King's County Medical Society of Brooklyn and the New York State Medical Society. The plan seemed to smack too much of socialized medicine, and the fear was expressed that such a scheme might be attempted elsewhere throughout the state where additional housing projects were being planned. It seems such attempts are being made.

It must have irritated every thoughtful physician to read that a member of his profession could be capable of saying what Dr. Joseph E. Corr, Chairman of the Committee on Medical Economics of the Medical Society of New York, is purported to have facetiously said. It is with a great deal of relief that we are informed that Dr. Corr never made any such remark and has written *Life* demanding a retraction. The *Life* editorial writer obtained his information from an article in the *New York Times* of April 7, 1953, in which Dr. Corr was so quoted. On that same date, April 7, 1953, Dr. Corr wrote the *New York Times* that he had been falsely quoted.

Here is a typical example of a smart-aleck reporter on the *New York Times* writing a false report and the *Life* editorial writer perpetuating the falsehood by failing to check the correctness of the report, to the detriment of the medical profession. Apologies are in order.

For the information of *Life,* let it be said that the medical profession can be counted on to continue to oppose socialism wherever it raises its ugly head and to support the American system of free enterprise. We are inclined to agree with Herbert Hoover that the American economy cannot exist part socialistic and part free.

Perhaps the most important factor in the incidence among hospital personnel is the undiagnosed case of tuberculosis. The only way to prevent contact with such sources is to discover these unsuspected cases earlier than seems possible in most general hospitals. It is suggested that the best means of offering this protection to medical personnel is to make routine chest films of every patient admitted to a hospital. WILLIAM A. ABRUZZI, JR., M.D., and RUFUS J. HUMMEL, M.D., *The New Eng. J. of Med.,* April 23, 1953.

TYPES OF VERTIGO:

Their symptomatic relief with Dramamine®

The disagreeable sensations of dizziness which physicians are frequently required to explain to patients have been described by Simonton[1] as varying from a slight sensation of confusion to severe vertigo.

While dizziness or giddiness is classified as a sensation of unsteadiness with a feeling of movement within the head, in vertigo the environment seems to spin (objective vertigo) or the body to revolve in space (subjective vertigo). Labyrinthine disturbances are likely to cause a sensation of rotation. Among the more common causes of dizziness or vertigo, this author lists: Damage to the vestibular nuclei or tracts in the central nervous system, involvement of the vestibular end organs by disease of the ear, Ménière's disease, toxicity of drugs, ocular vertigo from sudden diplopia, visual field defects, looking down from heights and motion sickness due to hyperactive labyrinthine reaction from riding in vehicles.

Dramamine (brand of dimenhydrinate) has proved effective in treating many of these disturbances. The indications for which Dramamine is now Council accepted include: Motion sickness, the nausea and vomiting associated with pregnancy, certain drugs, electroshock therapy and narcotization; vestibular dysfunction associated with streptomycin therapy; the vertigo of Ménière's syndrome, hypertensive disease and that following fenestration procedures, labyrinthitis and radiation sickness.

SEARLE *Research in the Service of Medicine*

In Memoriam

LEON MORRELL BOYD

Dr. Leon M. Boyd of Alexandria, Minnesota, died May 29, in a local hospital.

He was born in Chautauqua, New York, August 18, 1883. He was graduated from the Alexandria High School in 1901 and from the University of Minnesota Medical School in 1908. He took postgraduate work from the Philadelphia Polyclinic in 1909 and from the Manhattan Eye and Ear Clinic in New York City, the Bellevue Hospital Medical School and the Cornell Medical School in 1914. Later he studied at Tulane Medical School in New Orleans.

Dr. Boyd was a member of the Park Region District Medical Society, the Minnesota State Medical Association and the American Medical Association. He was a member of the First Congregational Church and a member of its Board of Trustees for many years. He had been a member of the Alexandria Public Library Board and served on the School Board of District No. 2 for twenty-four years.

Dr. Boyd served on the University of Minnesota Advisory Board and was a member of Alpha Tau Omega Academic Fraternity and Alpha Kappa Kappa Medical Fraternity. He was a member of the Masonic Lodge and a former member of the Kiwanis Club. He was also a member of the American Academy of Ophthalmology and Otolaryngology.

Dr. Boyd is survived by his wife and two children, James and John. One son, Leon Boyd, Jr., passed away in 1936.

HARRY W. CHRISTIANSON

Dr. Harry W. Christianson, of Minneapolis, died on June 11, 1953, at his home following a year's retirement due to heart disease.

Dr. Christianson was born at Belgrade, Minnesota, August 5, 1893. He earned his B.S. degree and also a degree in pharmacy before obtaining his M.D. from the University of Minnesota in 1920. He interned at the Swedish Hospital, Minneapolis, and was in private practice at Wykoff, Minnesota, from 1921 to 1929. He then took a residency in proctology at the Mayo Clinic from 1929 to 1932. In 1932 he began practice in Minneapolis, limiting his practice to proctology.

Dr. Christianson was clinical associate professor of proctology at the University of Minnesota Medical School, was proctologist for the Students Health Service at the University of Minnesota, a Fellow of the American College of Surgeons, and a member of the American Proctological Society. He was also a diplomate of the American Board of Surgery and Proctology. He was a member of the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Membership in other organizations included the Minneapolis Club, Athletic Club, Masons, Knights Templar and Scottish Rite.

Dr. Christianson is survived by his wife, the former Bessie Dawson Miller; a daughter, Mrs. Betty L. Anderson, and two sons, Harry J. and George Allen.

JOHN L. CRENSHAW

Dr. John L. Crenshaw of the Section of Urology of the Mayo Clinic, Rochester, Minnesota, passed away June 17, 1953. He was seventy-one years of age.

Dr. Crenshaw was born in Elizabeth, New Jersey, on January 2, 1882. He obtained his M.D. degree from the University of Virginia in 1906. He interned at University of Virginia Hospital in 1906 and 1907. From 1907 to 1910, he practiced medicine at Charlottesville, Virginia. He was an intern at St. Mary's Hospital, Rochester, Minnesota, in 1910 and 1911 and then was appointed associate in urology in the Mayo Clinic. Under the Mayo Foundation, Graduate School, University of Minnesota, he became assistant professor of urology in 1920 and associate professor in 1923.

Entering the field of urology when he did, Dr. Crenshaw contributed to its development; he was author or co-author of about twenty articles on his specialty. Those who worked with him and who came under his care, however, valued him even more as a practitioner. He always was where he was supposed to be, doing what he was supposed to do, with superb, down-to-earth judgment and bluff humaneness.

Dr. Crenshaw was certified by the American Board of Urology in 1935. Besides membership in the American Medical Association, he held membership in the American Association of Genito-Urinary Surgeons and in the American Urological Association, of the North Central Branch of which he was secretary-treasurer in 1924-25 and president in 1925-26. He also was a member of Sigma Xi and of Phi Rho Sigma.

In World War I, Dr. Crenshaw was commissioned captain in the Medical Corps, United States Army. He was chief of the urological service at Embarkation Hospital, Camp Stuart, Newport News, Virginia.

Few men of Rochester were more enthusiastic fishermen, hunters and gardeners than was Dr. Crenshaw. It was, therefore, saddening to his friends that the illness which caused his retirement in 1944 was a rheumatic condition which immobilized him. To see this vigorous, irrepressible man confined to a wheel chair was touching. The doctor, however, was not a seeker of sympathy for himself, and the lines of humor were not erased from his face.

Dr. Crenshaw and Nell Bryant were married in 1919. Their son, John L. Crenshaw, is a physician in Salt Lake City and their son, William B. Crenshaw, also a physician, is at the University of Michigan, in Ann Arbor. Their daughter is the wife of Dr. G. R. Diessner, of Rochester.

HENRY DUNCAN

Dr. Henry Duncan, of Marietta, Minnesota, died on May 22, 1953, at the age of eighty-five years.

Dr. Duncan was born near the village of Boyfield, Ontario, Canada, on November 1, 1867. At the age of four he came with his father to Maryville, Missouri. He was graduated from Maryville Seminary and after several years of teaching school and farming, studied medicine at Rush Medical College in Chicago, graduating in 1900. He came to Marietta in 1902 where he practiced for thirty-two years, retiring at the age of sixty-eight.

Dr. Duncan is survived by his wife, the former Clara Olson. They have four children: Donald of Galveston, Texas; William of Webster, South Dakota; Mary (Mrs. L. M. Hammer) of Mankato; and Charles of Eugene, Oregon.

CARL O. ESTREM

Dr. Carl O. Estrem, of Fergus Falls, died on June 5, 1953, of heart disease. Although he suffered the first attack of coronary occlusion in 1940, he maintained an active interest in his practice of medicine and other activities, and continued to attend medical meetings regularly until a few weeks prior to his death.

Dr. Estrem was born in Willmar, Minnesota, May 30, 1880. His preliminary education was obtained at the Willmar High School and the Willmar Seminary. He received his B.A. degree from Luther College, Decorah, Iowa, in 1901. He then was the assistant cashier of the New London (Minn.) State Bank for two years but resumed his studies and was graduated from the University of Minnesota School of Medicine in 1907, followed by internships in Deaconess Hospital and General Hospital in Minneapolis.

In 1912, Dr. Estrem married Edith Beatrice Thorpe. The seven children born into this family include two sons who are members of the Park Region Medical Center, which Dr. Estrem founded, as the Estrem Clinic, in 1939. Dr. Robert D. specializes in Surgery and Dr. Ralph L., in X-ray and Internal Medicine.

Dr. Estrem practiced medicine at Madison, South Dakota, from 1908-09, and at Detroit Lakes from 1909-14. He specialized in surgery after moving to Fergus Falls in 1914.

Dr. Estrem was a member of the Park Region District and County Medical Society, the Minnesota State Medical Association, the American Medical Association, the American College of Surgeons, Kiwanis Club, and the First English Lutheran Church, of Fergus Falls. He had been consulting surgeon to the Fergus Falls State Hospital staff since 1929. He was an ardent sportsman and conservationist and was especially fond of fishing and duck hunting.

Dr. Estrem was always keenly interested in all phases of church work, and, after becoming a Fellow of the American College of Surgeons, he devoted much of his time and efforts to raising all the standards of hospital service at St. Luke's Hospital, Fergus Falls, which he

The Knox Gelatine Diet and the Convalescent Child

Convalescence is associated with protein loss of serious magnitude, yet little is known of the fundamental nature of the loss.[1] Loss of nitrogen cannot be prevented; however, nitrogen balance can be maintained, wound healing enhanced, and convalescence shortened, by a high protein diet.[2]

Otherwise the patient uses his own "available" nitrogen stores to accomplish the healing defect.[3]

The patient "is better off before his nitrogen stores have been wasted than after. Surgeons have long noted that chronically debilitated patients are poor operative risks."[1] Decubitus ulcers heal quickly in heavily protein-fed patients.[4]

These facts are clear, as is also the fact that Knox Gelatine, which is pure protein, offers a useful method of supplementing the ordinary dietary protein.

Knox Gelatine is easy to digest, while its supplementary dietary nitrogen will furnish protein without other substances, especially salts of potassium which are retained during convalescence; without excess fat and carbohydrate, which are not needed especially; and without a food volume which may interfere with intake.

served as Chief of Staff for many years. It was Dr. Estrem who conceived the idea of establishing the Northern Minnesota Medical Association and he devoted much effort towards its formation and development. In his passing, Medicine has lost a capable surgeon, a real leader and a Christian gentleman.

JAMES LAWRENCE McLEOD

Dr. J. L. McLeod of Grand Rapids, Minnesota, passed away on June 8, 1953, at the age of fifty-two.

Dr. McLeod was born in Estevan, Saskatchewan, Canada, on May 19, 1901. He obtained his M.D. from the University of Manitoba Medical School in Winnipeg in 1926. After interning at St. Boniface Hospital in Winnipeg he practiced at Bovey, Minnesota, from 1926 to 1932, when he moved to Grand Rapids where he became senior partner in the Itasca Clinic.

Dr. McLeod was president of the Independent Progressive Voters Association of Minnesota and was a member of the state central committee of the Farmer-Labor party in 1933. He served as state senator from 1934 to 1937 from the 52nd District. He was elected District Governor of Rotary International at Denver, Colorado, in 1941. This district included Minnesota, North Dakota, Wisconsin and Ontario.

He was an outstanding athlete in his youth and obtained nine M's in undergraduate days at the University of Manitoba in football, track and basketball.

He was a member of the St. Louis County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Dr. McLeod is survived by his wife, Janet; a son, Robert, and a daughter, Mrs. Diane Stackle.

WILLIAM REGINALD McCARTHY

William R. McCarthy, for many years a surgeon in St. Paul, died on June 22, 1953, in Van Nuys, California. He was sixty-six years of age and died of carcinoma of the bronchus.

Dr. McCarthy was born in Saint Paul May 19, 1887. He attended St. Thomas Academy in St. Paul, the University of Minnesota Medical School and Marquette Medical School where he was graduated in 1911. He interned at the City and County hospital in Saint Paul.

Dr. McCarthy was a Fellow of the American College of Surgeons. He was president of the Ramsey County Medical Society in 1943 and was a First Vice President of the Minnesota State Medical Association.

In 1945 he became the medical director for the Eighth United States Civil Service medical service for rehabilitation of veterans and civilians. He had an appointment to the State Hospital in Anoka for a brief period before he became ill in March, 1953, and moved to California where his son, John R., lives in Tarzana, and his daughter, Mrs. A. W. Osborn, Jr., lives in Van Nuys.

Dr. McCarthy was a fine athlete and obtained his M in baseball at the University of Minnesota. Of great pride to him was the acquisition by his son, Lt. John R. McCarthy, in 1942 of the Navy Cross for extraordinary heroism in the battle of Coral Sea and at Mid-

way. He piloted a scout bomber in the Midway battle and after shooting down two Jap Zero planes, ran out of gas and had to bail out. He suffered a broken nose and a lacerated scalp but was picked up in his rubber raft. On the morning of December 7, 1941, he was flying toward Pearl Harbor in company with another plane piloted by Lt. Charles Dickinson when he was shot down and fractured his leg in bailing out. Fortunately he was rescued on this occasion also.

Besides being a member of the Ramsey County Medical Society, the Minnesota State Medical Association and the American Medical Association, Dr. McCarthy was a member of the Clinical Club of Saint Paul and the Staffs of St. Luke's and Miller Hospitals.

Dr. McCarthy had a wide circle of friends within and without the profession. His friendly manner and sociable qualities made him most popular with his many acquaintances.

Dr. McCarthy lost his wife several years ago but he is survived by his son and daughter.

EDWARD T. REEVE

Dr. Edward T. Reeve, a physician of Elbow Lake, Minnesota, since 1900, died June 5, 1953, at the age of eighty.

Dr. Reeve was born in Minneapolis June 17, 1872. In 1883 he moved with his parents to Buxton, North Dakota. He was graduated from Hamline Medical School in 1897. After interning at St. Mary's Hospital, Minneapolis, he took postgraduate work at the Polyclinic in New York and at the Chicago Postgraduate School.

He practiced at Parker's Prairie, Minnesota, from 1898 until 1900, and at Alexandria and Elbow Lake for short periods before locating at Elbow Lake in 1900.

Dr. Reeve was a member of the Park Region Medical Society, the Minnesota State Medical Association and the American Medical Association. He was honored in 1948 by the people in his community for his completion of fifty years of practice. He took an active interest in the affairs of his home town and was a member of the Civic and Commerce Association, the Lions, and Park Region lodge.

He is survived by his wife and two sons, Edward, and Charles, a student at the University.

Dr. Reeve was an able surgeon and physician and a man of energy and resolution, whose qualities won him the admiration and respect of those who knew him.

It is a matter of well authenticated experience that in both world wars, where large segments of the population of some countries usually offering adequate food supplies were insufficiently nourished, the incidence of and mortality from tuberculosis in such areas definitely increased. Possibly some of these patients suffered from primary infections, but no doubt in many of them reduced resistance led to reinfection or the reactivation of quiescent lesions. George Blumer, M.D., *Conn. State Med. J.*, May, 1952.

◆ Reports and Announcements ◆

SECOND INTERNATIONAL CONGRESS OF CARDIOLOGY

The Second International Congress of Cardiology will be held in Washington, D. C., September 12-15, 1954. It will be immediately followed by the Annual Scientific Sessions of the American Heart Association, September 16-18, 1954. The opening session will be held in the auditorium of Constitution Hall at 10:30 a.m. on Sunday, September 12, 1954, with addresses of welcome. A reception will be given at the Mayflower Hotel at 5:00 p.m. on the same day for all members of the Congress and their families. A banquet will be held September 15, 1954, at 7:30 p.m.

The Scientific Sessions lasting for three days will include formal papers, panel discussions, clinical pathological conferences and visits to important medical centers in Washington and Bethesda. The program will be printed in French, Spanish and English. Immediate translation of some of the papers and discussions will be made in three languages.

A series of Post-Congressional conferences and visits to at least twenty of the leading cardiac clinics in different parts of the U. S. and Canada has been arranged by special committees of local Heart Associations in the various cities.

INTERNATIONAL COLLEGE OF SURGEONS TO MEET IN NEW YORK IN SEPTEMBER

The Eighteenth Annual Congress of the United States and Canadian Sections of the International College of Surgeons will open at the Waldorf-Astoria in New York on Sunday evening, September 13, with a session open to the public on the "International Surgeons' Hall of Fame" with Dr. Richard H. Shryock, Director of the Institute of the History of Medicine of Johns Hopkins University, Baltimore, speaking on "Fame in Surgery." The scientific program will open on Monday morning, September 14, with a session on "Advances in the Treatment of Cancer," with Doctors Charles S. Cameron, of the American Cancer Society; Cornelius P. Rhoads, of the Sloan-Kettering Institute for Cancer Research; George N. Papanicolaou, of Cornell University Medical College; T. A. Watson, of Cancer Services for Saskatchewan; Komei Nakayama of Chiba (Japan) University Medical School, and George J. Papayannopoulos of Athens, Greece, among the speakers. Themes for the other general assemblies will include "Teamwork in Rehabilitation"; "Advances in the Treatment of Cardiopulmonary Diseases," "Advances in Thyroid Surgery," "Surgical Treatment of Intervertebral Disc Lesions," "Advances in Surgery of the Stomach and Intestines," "Advances in Surgical Treatment of Diseases of the Esophagus" and "Advances in Vascular Surgery."

Surgical specialties which will be represented by special sessions are the following: Colo-proctology, Neurosurgery, Obstetrics and Gynecology, Occupational Surgery, Ophthalmology, Orthopedic Surgery, Otolaryngology, Plastic Surgery, and Urologic Surgery. There will also be five sessions for Operating Room Nurses.

A Film Forum will be held on Monday evening; a Forum on Pharmacology in Surgery on Tuesday evening; the annual banquet on Wednesday evening; and the annual Convocation on Thursday evening. All of the sessions will be held at the Waldorf-Astoria except the Convocation which will be held in Carnegie Hall.

Dr. William R. Lovelace of Albuquerque, New Mexico, is President of the United States Section of the International College of Surgeons and Dr. Douglas U. McGregor of Hamilton, Ontario, is President of the Canadian Section. Dr. Horace E. Ayers of New York is General Chairman of the 1953 Congress and serving with him as co-chairmen are Doctors Henry M. Scheer of New York and Lyon H. Appleby of Vancouver, British Columbia.

INDUSTRIAL HEALTH INSTITUTE

The Institute of Industrial Health of the University of Cincinnati announces a course of instruction in *Occupational Skin Problems* to be presented jointly by the Division of Occupational Health of the Public Health Service, the Department of Preventive Medicine and Industrial Health, and the Department of Dermatology and Syphilology of the University of Cincinnati. It will be given during the week of October 12-16, 1953. The objective of this course is to give physicians a greater understanding of cutaneous problems of occupational origin.

The program will be divided into three daily sessions, consisting of morning lectures and clinical demonstrations, afternoon field instruction in industrial plants, and evening panel discussions. The didactic presentations will include a review of the anatomy, physiology and chemistry of the skin. Consideration will be given to the etiology, clinical appearance, diagnosis and treatment of occupational dermatoses. This will be supplemented by

discussions of specific measures of prevention and control. The evening sessions, in panel form, have been designed to present current information on the subjects of cutaneous cancer, cutaneous allergy, and medico-legal problems.

Dr. Louis Schwartz, former Chief, Industrial Dermatoses Section, U. S. Public Health Service, will be the guest speaker at the one dinner meeting. He will describe his personal experiences with these problems during the past twenty-five years.

Physicians interested in attending the course should write for application blank to Secretary, Institute of Industrial Health, Kettering Laboratory, Eden and Bethesda Aves., Cincinnati 19, Ohio. A registration fee will be charged and early application is advised since attendance will be limited.

AMERICAN COLLEGE OF SURGEONS

The Thirty-ninth Annual Clinical Congress of The American College of Surgeons will be held in Chicago, October 5-9, 1953.

The program will include scientific papers, panel discussions, symposia, surgical forums, medical motion pictures, color television, and exhibits. Headquarters will be the Conrad Hilton Hotel.

Dr. Harold L. Foss, president of The College for 1953, will preside at the opening evening session at which Dr. Fred W. Rankin, Lexington, Kentucky, will be installed as president for the year 1954. Dr. James Paterson Ross, of London, will give the Eighth Martin Memorial Lecture entitled "Science and Surgery."

UNIVERSITY HOSPITALS OPEN MULTIPLE SCLEROSIS CLINIC

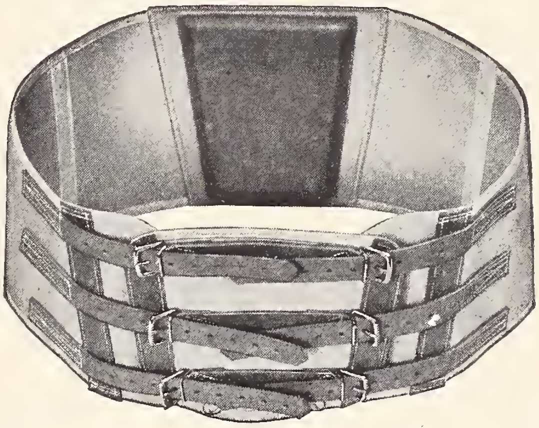
A new clinic for diagnosis of a "mystery" disease which affects from six to eight thousand Minnesota citizens opened July 1 at University of Minnesota hospitals.

The disease—multiple sclerosis—is a puzzle. It usually strikes suddenly at any part of the nervous system. Symptoms vary, making it extremely hard to diagnose. In one person, it may cause double vision, in another, weakness of the arm or leg. Nobody knows what the cause is.

Most often multiple sclerosis hits young adults between eighteen and thirty-five. Attacks of the disease are generally temporary, but they recur from time to time. Dr. Abe B. Baker, head of the neurology division in University hospitals, the man who will direct the new clinic, points out that multiple sclerosis is not usually a fatal disease and in most cases causes only passing disabilities rather than complete invalidism of the patient.

"Our hope," Dr. Baker says, "in establishing this clinic is to make an accurate and early diagnosis of the disease. Multiple sclerosis is the hardest diagnosis in neurology. Because it's such an imposter, often resembling other diseases of the nervous system, it's even difficult for a specialist to detect."

The clinic—set up as a service rather than as a research center—will be in charge of Dr. Charles Van Buskirk, assistant professor of neurology. In addition



Popular Type SACRO-ILIAC BELT

This high-grade sacro-iliac support is made of orthopedic webbing, 6 inches wide, well reinforced and supplied with perineal straps.

To determine size needed, take measurements around hip, 3 inches below the iliac crest. Stock sizes 30 to 44. Extra sizes available on special order.

Professional Price $5.95

to diagnosis, prescription of treatment and periodical check-ups, the center will also try out new treatments and diagnosis methods. It will use all facilities available at University hospitals.

The 1953 Minnesota legislature appropriated $10,000 a year for this year and next to the Minnesota chapter of the National Multiple Sclerosis society for establishment of the clinic. Mrs. Gordon Butler, Duluth, is chairman of the state group.

POSTGRADUATE ASSEMBLY IN ENDOCRINOLOGY AND METABOLISM

The Endocrine Society and the University of Minnesota announce a Postgraduate Assembly in Endocrinology and Metabolism for Physicians, the Sixth Annual Assembly sponsored by The Endocrine Society, which will be presented on the University of Minnesota campus from September 28 to October 3, 1953. Lectures will be held in the Museum of Natural History Auditorium, while the facilities of the immediately adjacent Center for Continuation Study will be available for demonstrations and for the accommodation of registrants for the course.

All aspects of clinical endocrinology and metabolism will be taken up, and recent important advances in the field will be stressed. Informative demonstrations and illustrative clinical cases will be presented, and ten panel discussions will provide registrants with opportunities to bring up special problems and questions. Each registrant will receive a booklet containing abstracts of all lectures.

Faculty for the Assembly includes outstanding authorities in the field of endocrinology from various parts of the country as well as members of the faculty of the University of Minnesota Medical School and the Mayo Foundation. The program will be presented under the direction of Dr. Edward C. Reifenstein, Jr., General Chairman for The Endocrine Society, and Dr. C. J. Watson, Professor and Head, Department of Medicine. Chairman of Local Arrangements on behalf of The Endocrine Society is Dr. Edmund B. Flink.

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

(Continued from Page 757)

performed on herself by Dr. Schmidt. Mrs. Dinsmore was placed on probation for three years.

The records of the Minnesota State Board of Medical Examiners show that Dr. Schmidt was born at Montrose, Minnesota, on May 20, 1881, and graduated from Hamline Medical School in 1908. Dr. Schmidt was licensed to practice in Minnesota in 1908. Dr. Schmidt appeared before the Minnesota State Board of Medical Examiners on May 22, 1953, in response to a citation requiring him to show cause why his medical license should not be suspended or revoked. The matter was taken under consideration and the action of the Medical Board will be announced at a later date.

◆ Of General Interest ◆

Dr. William F. Braasch, retired staff member of the Mayo Foundation and Mayo Clinic, was named chairman of the national campaign for the Greater University Fund drive of 1953. The drive got under way in May, with a goal of $130,000.

* * *

Dr. Lyle Benson, of Tracy, left in June to practice at Springfield, Oregon. **Dr. Norman Lee** and **Dr. W. G. Workman,** with whom Dr. Benson had been associated, will continue to operate the local clinic without the addition of a new doctor for a time.

* * *

Dr. L. J. Hoyer, of Windom, was named chief of staff of the Windom Hospital, and **Dr. L. Sogge,** secretary, at the meeting held May 13 to elect officers for the coming year. The Windom Hospital staff includes all of the Windom doctors and **Dr. Robert R. Sawtell,** of Jeffers.

* * *

Dr. John K. Grotting, Minneapolis, has opened a new office at 948 Medical Arts Building, Minneapolis, for the practice of plastic and reconstruction surgery.

* * *

Dr. Walter S. Neff, staff member of the Lenont Peterson Clinic in Virginia, was elected May 19, to three years as one of the Directors of Independent School District No. 22.

* * *

Dr. William Sawyer Eisenstadt, of Minneapolis, addressed the Southeastern Section of the American Academy of General Practice, May 26, at Lake City Dr. Eisentadt's topic was "The Management of Status Asthmaticus."

* * *

Dr. E. F. Beyer, of Braham, who recently left to serve with the Army Medical Corps, was honored by the Braham community May 11, at a smorgasboard. Dr. Beyer left May 26, to report to Brook Army Medical Center at Fort Sam Houston, San Antonio, Texas. **Dr. W. T. Nygren,** with whom Dr. Beyer was associated, will practice alone for several months until a young doctor from Duluth joins him.

* * *

Dr. J. Y. Feinstein, Minneapolis, spoke at the "60-Over Club" held at the Minneapolis Public Library, May 22. Dr. Feinstein's topic "Guard Your Health," included the showing of a film.

* * *

Dr. Victor Johnson, of Rochester, was named a member of the committee on medical education and hospitals until 1958, at the annual election of the American Medical Association, held June 4, in New York, New York.

* * *

Twenty ex-presidents of the Minnesota State Medical Association were honored at the Association's annual meeting held May 17, 18, and 19. The honored physicians were: **Drs. W. F. Braasch,** Rochester, president in 1927; **S. H. Boyer,** Duluth, 1930; **L. L. Sogge, Windom,** 1931; **M. S. Henderson,** Rochester, 1932; **N. O. Pearce,** Minneapolis, 1933; **F. J. Savage,** Saint Paul, 1934.

Also **Drs. W. W. Will,** Bertha, 1935; **J. M. Hayes,** Minneapolis, 1938; **George A. Earl,** Saint Paul, 1939; **B. S. Adams,** Hibbing, 1940; **H. Z. Griffin,** Rochester, 1942; **S. H. Baxter,** Minneapolis, 1943; **W. Mendelssohn Jones,** Saint Paul, 1944.

Also **Drs. E. L. Touhy,** Duluth, 1945; **Edwin J. Simons,** Saint Paul, 1946; **Louis A. Buie,** Rochester, 1947; **E. M. Hammes,** Saint Paul, 1949; **E. J. Elias,** Duluth, 1950; **J. F. Norman,** Crookston, 1951, and **R. L. J. Kennedy,** Rochester, 1952.

* * *

Dr. F. Donald Bucher, of Starbuck, was called to active duty with the U. S. Navy, in June. Dr. Bucher, who has practiced in the Starbuck community since July 1949, reported to Norfolk, Virginia, June 8.

* * *

Dr. Walton Lillehei, associate professor of the Department of Surgery, University of Minnesota Medical School, was the featured speaker at the meeting of the Southwestern Minnesota Medical Society and Auxiliary, held May 11, at Ehlers Steak House in Worthington. Dr. Lillehei's topic was "Considerations in the Diagnosis and Surgical Treatment of Heart Disease."

* * *

Dr. C. S. Donaldson, of Foley, was presented with a plaque by James Tillet at a testimonial dinner given in honor of the doctor, May 7. Tillet was the first of over 2 000 babies delivered by Dr. Donaldson in his twenty-six years of service in the community.

* * *

Dr. C. O. Lindberg, formerly of Grantsburg, Wisconsin, joined the Federal Hospital at Sandstone in May.

* * *

Dr. Robert D. Letson, of Minneapolis, became engaged to Patricia Andersen also of Minneapolis, in May. Dr. Letson was graduated from the University of Minnesota Medical School and is completing his internship at Minneapolis General Hospital.

* * *

Capt. Francis L. Stutzman (MC), Newport, recently a staff surgeon at the Minneapolis Veterans Administration Hospital, arrived in Germany in May where he has been assigned as chief surgeon for the Port U. S. Army Hospital.

* * *

Dr. J. G. W. Havens, and **Dr. Garfield E. Hertel,** of Austin, and **Dr. George R. Melzer,** of Lyle, were granted life memberships in the Minnesota State

(Continued on Page 778)

ABOUT MUNICIPAL BONDS

Investors who have purchased Municipal Natural Gas Revenue Bonds and have been enjoying generous "Tax-exempt" income from their investments are familiar with the progress and operating results of their systems. Those who have adopted a "wait and see" attitude concerning gas revenue bonds might be interested in some results.

ATMORE ALABAMA issued $325,000 bonds in 1946, completed the first year of operation in 1948. By the *second* year net income was equal to the average annual amount necessary to pay bonds and interest and income is now more than *twice* that amount. An estimated 418 customers would keep the system on a paying basis —there were 1078 users last December.

BREWTON ALABAMA issued $530,000 bonds simultaneously with Atmore, is also now earning more than *twice* the annual amount necessary to cover bond and interest payments.

TALLASSEE ALABAMA issued $355,000 bonds in 1948, completed its first year in 1949. The number of customers is already *three* times the minimum estimated number and last year's income was almost *three* times the annual amount necessary to pay bonds and interest.

PLEASANT GROVE ALABAMA issued $700,000 bonds in 1948, completed its first year in 1950. It is running far ahead of minimums and has retired $25,000 bonds in advance of maturity by calling them in at the call price ($1,040 each).

DICKSON TENNESSEE issued $385,000 bonds in 1949, completed its first year in 1951. In its second year the system had net revenues well in excess of the average amount necessary to pay bonds and interest each year.

MONROE GEORGIA issued $345,000 bonds in 1951, will not complete its first fiscal year until December, 1953. Net earnings for eleven months, however, are reported equal to the average annual amount of bond and interest payments.

MENA ARKANSAS issued $1,423,000 bonds in 1951 and the system was completed officially in February, 1953. By April there were almost as many gas users as the minimum number required to meet all payments over the life of the bonds.

THE DEKALB-CHEROKEE COUNTIES GAS DISTRICT ALABAMA issued $2,100,000 bonds this spring and the system is now under construction, The engineer estimated 1877 gas users would provide sufficient income to meet minimum payments and the District has now received applications for service from more than 2,175 potential customers.

We have recently purchased a new issue of $610,000 Cochran, Georgia, Natural Gas Revenue Certificates to provide natural gas to the City and the surrounding area—an estimated population of 5,800.

Cochran is the county seat and largest community in Bleckley County; the City enjoyed a population growth of 48% from 1940 to 1950. The City has received over 600 applications for service, each accompanied with a $5 deposit. The engineer estimates that only 550 are required to pay bonds and interest as they mature.

THESE BONDS ARE CURRENTLY AVAILABLE TO RETURN FROM 4.00% to 4.50 %.

This return or income is exempt from present Federal Income Taxes. We suggest you write or call for specific maturities available.

Medical Association, having completed at least forty years in medical practice and having attained the age of seventy or older.

Dr. Harold J. Anderson, president of the Mower County Medical Society, presented the three doctors with their life certificates at a banquet held in their honor, May 13. Three Rochester doctors who took part in the ceremony were: **Dr. John Waugh,** district representative of the State association; **Dr. John Stickney,** who will soon become district representative, and **Dr. R. L. Kennedy,** past president of the County Society.

Local fellow physicians spoke, giving summary biographies of the three honored doctors. **Dr. Paul Leck,** of Austin, for Dr. Hertel; **Dr. P. A. Lommen,** Austin, for Dr. Havens, and **Dr. Conrad B. Frydenlund,** Lyle, for Dr. Melzer.

* * *

Recipients of Special Hospital Awards presented at the 100th Anniversary dinner of St. Joseph's Hospital were: **Dr. George E. Sherwood,** Kimball, who interned at St. Joseph's Hospital from 1893 to 1894; **Dr. James C. Ferguson,** Saint Paul, who served fifty years on the hospital staff; **Dr. F. C. Schuldt,** Saint Paul, forty-two years on the staff, and **Dr. E. C. Eshelby,** Saint Paul, sixty years of service on the hospital staff. **Dr. L. A. Nelson,** Saint Paul, unable to attend in person, also received a special service award.

* * *

Mrs. Henry W. Quist, Sr., of Minneapolis, took office May 19, as the new president of the women's auxiliary to the Minnesota State Medical Association, succeeding **Mrs. C. L. Sheedy** of Austin. **Mrs. P. S. Rudie,** Duluth, was named president-elect to follow Mrs. Quist in 1954. Other officers named were: **Mrs. C. L. Oppegard,** Crookston; **Mrs. Andrew Christianson,** Saint Paul, and **Mrs. L. P. Howell,** Rochester, vice presidents; **Mrs. David Halpern,** Brewster, recording secretary; **Mrs. C. W. Froats,** Saint Paul, treasurer, and **Mrs. J. K. Butler,** Cloquet, auditor.

* * *

Dr. G. V. H. Kleifgen, of Park Rapids, closed his office June 15, to leave for duty with the Army Medical Corps.

* * *

Dr. Randall G Sprague, of the Mayo Clinic, was elected president of the American Diabetes Association, in New York, June 4.

* * *

A random selection of family doctors—**Dr. E. E. Dady,** Minneapolis; **Dr. Frank Naegeli,** Fergus Falls; **Dr. R. E. Flynn,** La Crosse, Wisconsin; **Dr. T. J. Jensen,** Duluth; **Dr. L. L. Sogge,** Windom, and **Dr. Johannes C. Jacobs,** Willmar—interviewed as they visited exhibits at the 100th annual meeting of the Minnesota State Medical Association, all said that they would choose the same profession if they had it all to do over again—even with their week

Winners of first place awards in the Physicians Art and Hobby show on display at the 100th annual meeting of the Minnesota State Medical Association were: **Dr. J. P. Wendland,** Minneapolis, photography; **Dr. Daniel deGallier,** Minneapolis, water color; **Dr. Harold Rothschild,** Saint Paul, drawing; **Dr. James Benepe,** Saint Paul, oils; **Dr. James Berens,** Rochester, handicraft; **Dr. Robert Wilder,** Minneapolis, sculpture, and **Dr. Alex Ratelle,** Saint Paul, popular vote of convention visitors for his "Portrait of a Lady."

* * *

Dr. John L. Emmett, of the Mayo Clinic, spoke at the Upper Peninsula Medical Society (Michigan) meeting, held June 19 and 20, in Escanaba, Michigan.

* * *

Dr. Bernard Zimmermann, University of Minnesta Medical School cancer co-ordinator, has been awarded a three-year grant for study, by the American Cancer Society. The grant totalling $18,000, will permit Dr. Zimmermann to carry out research under the direction of **Dr. Owen H. Wangensteen,** head of the department of surgery, University of Minnesota Medical School.

Dr. Zimmermann will conduct studies of the endocrine physiology and metabolic balance in relationship to clinical cancer and cancer surgery.

Dr. Bryson McHardy joined **Dr. R. B. Skogerboe** on the Karlstad Hospital staff, July 1. Dr. McHardy replaces **Dr. Robert Hines** who left the community to return to school and the study of internal medicine.

* * *

Speakers on the program at the Olmsted-Houston-Fillmore-Dodge County Medical Society meeting, held May 6, in Rochester, included **Dr. D. T. Carr,** speaking on "Prognosis in Sarcoidosis;" **Dr. O. E. Hallberg,** "Points to Remember When Treating Severe Epistaxis," and **Dr. J. M. Waugh,** "The 1953 Budget of the Minnesota State Medical Association."

* * *

Drs. A. B. Baker, Donald W. Hastings, William Schofield, Conrad I. Karleen, Lawrence R. Boies, Sidney K. Shapiro, Harry B. Hall, Edward T. Evans, Joseph A. Resch, and **Frederic J. Kottke,** were guests of the Minnesota Chapter, National Association of Claimants' Compensation Attorneys, at a dinner meeting, held May 23, in Minneapolis. The physicians answered questions concerning medical aspects of injuries which are frequent subjects of litigation.

* * *

Dr. Robert T. Patrick, of the Mayo Clinic, spoke to the anesthesia group at the national convention of the Catholic Hospital Association and the meetings of nine associated groups May 23 to May 28, in Kansas City, Missouri. Dr. Patrick's topic was "The Post Anethesia Observation Room."

Dr. A. P. Goblirsch, of Sleepy Eye, was elected president of the Redwood County Community Chest,

The Birches Sanitarium, Inc.

2391 Woodland Avenue
Duluth 3, Minnesota

A hospital for the care and treatment of Nervous and Mental disorders. Quiet, cheerful environment. Specially trained personnel. Recreational and occupational therapy.

Dr. L. R. Gowan, M.D., M.S., Medical Director

at the meeting held May 14, at Wabasso, to elect officers and make campaign plans for the fall drive.

* * *

The first annual B. B. Vincent Lyon Award for the best paper presented at the meeting of the American Gastroenterological Association by an associate member, was given to **Drs. W. H. Dearing Jr., F. R. Heilman,** and **W. G. Sauer,** all of Rochester. Their paper was entitled "Micrococcic (Staphylococcic) Enteritis Following the Use of Aureomycin or Terramycin," and was presented by Dr. Sauer at the meeting of the Association held early in May at Atlantic City.

* * *

Dr. Maxwell M. Barr, Minneapolis, was elected medical director of the Hennepin County League for Planned Parenthood, May 19. He succeeds **Dr. C. J. Ehrenberg,** who retired after fourteen years as medical director of the planned parenthood group.

* * *

Dr. Henry B. Blumberg, of Fairmont, was appointed chairman of the Fairmont Youth Activities Assembly Health Committee, May 21. Dr. Blumberg's duties center around local health promotion based on the Youth Conservation Commission report and suggestions made to his committee.

* * *

Dr. Richard O. Juliar closed his office in St. Clair early in June, after fifty years of practice in the community. Living in the St. Clair community as a child, Dr. Juliar attended country school and was graduated from Mankato High School in 1896. He was graduated from the University of Minnesota Medical School in 1903. Dr. Juliar practiced ten years in the northern Minnesota communities of Mahnomen and Middle River before again settling in St. Clair in 1913. Dr. Juliar left June 10, for Los Angeles, California, where he and his wife will make their home.

The St. Clair community is now without a physician.

* * *

Physicians from the Mayo Clinic cited for their exhibit on diseases of the mitral value at the American Medical Association convention in New York, New York, June 1-5, were **Drs. T. J Dry, R. L. Parker, J. E. Edwards, J. W. Kirklin, R. D. Pruitt, G. W. Daugherty, C. H. Schiefley, A. J. Bruwer, R. G. Tompkins,** and **A. H. Bulbulian.**

Dr. Carleton B. Chapman, associate professor of medicine, University of Minnessota, left early in July to become a professor of medicine at Southwestern University Medical School at Dallas, Texas. Dean at Southwestern is Dr. N. George Aagaart, former director of continuation of medical education at the University of Minnesota.

* * *

Dr. C. W. Mayo, of Rochester, presented awards and scholarships at the St. Mary's School of Nursing graduation, held June 7, in the St. Mary's Hospital auditorium.

* * *

Dr. Thomas Smersh, of Minneapolis, is assuming the practice of **Dr. F. Paul Kortsch,** of Prior Lake, during the latter's convalescence. Dr. Kortsch is in St. Barnabas Hospital, Minneapolis, after suffering a heart attack late in May.

* * *

Dr. R. F. Pierson, of Slayton, attended the Cook County Graduate School of Medicine during the week of June 15.

* * *

Dr. Stephen M. Brzica, of Worthington, left his practice there to become associated with Dr. Robert Quinn in the Sioux Falls Clinic, Sioux Falls, June 10.

* * *

Dr. George Van Rooy was named president of the medical staff of Northwestern Hospital at Thief River Falls, at the regular meeting held June 8.

He succeeds **Dr. John O'Leary. Dr. Theodor Bratrud** was named vice-president, and **Dr. William Feigal,** secretary-treasurer.

* * *

Dr. Barbara Anne Burke, of Minneapolis, who recently graduated from Women's Medical College of Pennsylvania, Philadelphia, received the Albert Einstein Medical Center award for having the highest scholastic average in the graduating class over a four-year period. Dr. Burke is interning at Philadelphia General Hospital.

* * *

Dr. Victor Johnson, of Rochester, director of the Mayo Foundation, has been named a member of the American Medical Association's committee on medical education and hospitals. Dr. Johnson was named to the committee, June 4, at the annual election of the American Medical Association, held during the 1953 convention in New York, New York.

* * *

Dr. Miland E. Knapp, chief of physical medicine and in charge of training and treatment at the Kenny Institute, presented certificates to eleven physical therapists, June 9, at the Elizabeth Kenny Institute graduation exercises held at Westminster Presbyterian Church.

* * *

An award of merit from the Minnesota Heart Association was presented June 2, to **Dr. and Mrs. B. J. Cronwell,** of Austin, by the organization's executive secretary. The citation was in recognition of their "public spirit in working for reduction of the ravages of heart disease." Others who received the merit awards from the Heart Association are **Dr. and Mrs. Herman Miller,** Grand Meadow; and **Dr. C. B. Frydenlund, Lyle.**

* * *

Dr. Albert I. Balmer, of Pipestone, left his practice to begin a residency in radiology at the Charles T. Miller Hospital, Saint Paul, July 1. **Dr. Russell J. Kotval,** who has practiced in Pipestone since 1948, took Dr. Balmer's place in practice with **Dr. C. A. Williams.**

* * *

An award for "distinguished service in medicine" was presented by the alumni association of the University of Kansas, to **Dr. Elwood A. Sharp,** director of clinical investigation for Parke Davis and Company. Dr. Sharp developed Ventriculin for the specific treatment of pernicious anemia and played an important role in the development of other medicines, including Antruitrin and Thielin.

On June 1, 1953, **Dr. Lillian L. Nye,** of Saint Paul, was presented a Certificate of Merit from the University of Minnesota for her valuable contributions to the University. The Certificate was presented by the president of the University, Dr. J. L. Morrill, at the Coffman Memorial Union, in the presence of relatives, colleagues, and friends. The presentation ceremonies were recorded and broadcast in the evening over station KUOM.

From 1907 to 1915, Dr. Nye was on the School of Chemistry faculty of the University, and from 1921 to date, has been on the faculty of the Medical School in the Department of Pediatrics, successively as clinical instructor and Clinical Assistant Professor of Pediatrics. From June 30, 1953, she had held the rank of Emeritus Clinical Assistant Professor of Pediatrics.

* * *

Dr. E. Mendelssohn Jones, chief of the surgical division of the staff of the Ancker Hospital, Saint Paul, since 1948, was recently elected chief emeritus of the section by the staff members. Dr. Jones has been a member of the Ancker Hospital surgical staff since 1918 and has given devoted service to the hospital for the past thirty-four years. In 1951, Dr. Jones was honored at a testimonial dinner tendered him by the surgical staff of the hospital.

Dr. Jones is a past president of the Ramsey County Medical Society (1928), the Minnesota State Medical Association (1944), and the Minnesota Academy of Medicine (1937). He was recently elected secretary of the State Board of Medical Examiners.

More than one million dollars has been donated to medical education by physicians in the United States since the first of the year. Reports released by the American Medical Education Foundation indicate that approximately 11,000 physicians have contributed $800,000 to the Foundation since January 1. At the same time, records from thirty-three of the nation's seventy-nine accredited medical schools show that 8,217 doctors have contributed $301,426.42 directly to their alumni organiza-

Dr. Douglas Perkins, recently graduated from the University of Minnesota Medical School, joined the staff of the Alexandria Clinic, July 1. The association of Dr. Perkins with the clinic brings the number of staff physicians to seven, with one, **Dr. Peter M. Geiser,** now on leave of absence with the Army Medical Corps.

* * *

Guest speakers at an "alumni reunion" of former patients of Ah-Gwah-Ching Sanatorium, included **Dr. F. F. Callahan,** former superintendent of the sanatorium and now director of medical services of the State Division of Social Welfare; **Dr. T. J. Kinsella,** Minneapolis surgeon who pioneered many of the surgical techniques now used in the treatment of tuberculosis, and Helmer Gunnarson, of the State Rehabilitation office.

* * *

Dr. Richard Nicholson, of Peterson, Iowa, began medical practice in Heron Lake, July 1. Dr. Nicholson was graduated from Harvard Medical College and has spent seventeen months in military service during World War II.

* * *

Dr. J. L. Emmett, of the Mayo Clinic, presented several papers at the fifty-eighth anniversary meeting of the Upper Peninsula Medical Society, held in Escanaba, Michigan, June 20.

Dr. Russell A. Johnson of Grand Rapids, recently graduated from the University of Minnesota Medical School, began July 1, a year of service with the United States Public Health Service. Dr. Johnson has been assigned as assistant surgeon at the U. S. Public Health Service Hospital in San Francisco, California.

* * *

Dr. Fred W. Rankin, of Lexington, Kentucky, formerly of Rochester, will be installed as president of the American College of Surgeons, at the meeting to be held in Chicago, October 5-9.

* * *

Dr. A. A. Schmitz, head of the staff of the new St. Joseph's Hospital, Mankato, presented a gift from the staff to Sister Margaret, Sister Superior who left June 18, for a new assignment in New Jersey. An informal reception was held in honor of Sister Margaret, in the hospital cafeteria.

* * *

MINNESOTA BLUE CROSS-BLUE SHIELD

Never before has the attendance or interest of physicians or their office personnel reached such high levels as were experienced in the Blue Cross-Blue Shield booth at the recent annual meeting of the Minnesota State Medical Association. The records show that 258 participating physicians visited the booth and signed cards requesting a Blue Shield plaque, and a great many more doctors stopped at the booth for information or discussion of their Blue Shield problems. Besides the professional group which included many residents, interns, and out-of-state doctors, quite a few members of doctors' office staffs visited and were able to obtain specific information regarding the procedures involved in filing Blue Shield claims. In attendance for Blue Shield during the entire convention were either the manager of the Claims Department or the manager of the Professional Relations Department to discuss all of the problems or questions which the doctors or members of their office staffs might raise. In addition, a member of the claims examiner staff was present much of the time to answer questions regarding filing and processing of Blue Shield claims. A member of the Blue Cross personnel was also in attendance at the booth during the convention, and it was very encouraging to note the interest shown by the doctors for adequate Blue Cross protection both for their patients and themselves. Interest was especially shown on the new $25 Deductible Blue Cross contract.

During the meetings, the Professional Relations Department displayed a new Blue Shield plaque which is being offered without charge to all participating physicians or clinics for their offices or reception rooms. The plaque consists of a blue shield with a central caduceus on a gray wooden background, and on the face of the shield are printed the words, "Participating Doctor of Medicine, Minnesota Medical Service, Inc." The plaque met with a very gratifying and enthusiastic acceptance from the doctors who visited the booth and 258 of them signed cards requesting a plaque for prominent display in their offices. Frequently, it was mentioned that very often people want to know whether or not a doctor is a participating physician in Blue Shield. This is corroborated by the relatively large number of inquiries received at the Blue Shield office from subscribers asking, "How can I tell if a doctor is participating or not?" It appears that more patients are asking this question every day. The use of the participating physician plaque provides the answer and does it in a manner which is attractive.

Since it is the desire of Blue Shield that every participating physician have the opportunity to obtain a plaque, those doctors who were unable to visit the Blue Shield booth during the recent meeting may now send either a letter or post card to the Professional Relations Department, Minnesota Medical Service, Inc., 2610 University Avenue, St. Paul 14, Minnesota, requesting a plaque for prominent display in their office. Delivery of the plaque will be made just as soon as they are received from the manufacturer.

The meeting also provided a good opportunity for the Professional Relations Program of Blue Shield to initiate a free exchange of ideas, suggestions, and information between Blue Shield and the participating doctors of medicine. Discussion with the many and various physicians was extremely encouraging in demonstrating the solidarity of the medical profession in support of the Blue Shield Plan. The importance of Blue Shield in modern medical economics as well as its future development and goals were frequently stressed by the doctors themselves, and valuable information and suggestions were obtained from the visiting doctors. In addition to obtaining suggestions from the physicians, the primary theme at the Blue Cross-Blue Shield booth was one of service to the doctors and their staffs. In this regard, a wealth of information and data was provided not only to practicing physicians but also to those who are now engaged in residencies and internships and soon will be in private practice.

During the month of April, Blue Cross enrolled 13,699 participant subscribers bringing the net enrollment to 964,140 Blue Cross participant subscribers.

During the month of April, Blue Cross paid $1,234,967.90 to hospitals for the care of Blue Cross subscribers bringing the total amount paid for the first four months of 1953 to $4,851,512.25.

During the month of April, Blue Shield enrolled 14,712 Blue Shield participant subscribers bringing the net enrollment to 568,406 Blue Shield participant subscribers. For the month of April, Blue Shield paid $376,269.98 to doctors for the care of Blue Shield subscribers bringing the total amount paid for the first four months of 1953 to $1,465,119.05.

Blue Cross and Blue Shield are now sponsoring the Charles McCuen "News At Noon" over WCCO-TV, Monday through Friday. Blue Cross sponsors the Saturday night 10:00 p.m. Cedric Adams newcast on WCCO radio.

Both Charles McCuen and Cedric Adams are proving their worth as Ambassadors for Minnesota Blue Cross-Blue Shield and are achieving results in securing inquiries which have been converted into new Blue Cross and Blue Shield subscriber contracts.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

VIRAL AND RICKETTSIAL INFECTIONS OF MAN. Edited by Thomas M. Rivers, M. D. Director of the Hospital of the Rockefeller Institute for Medical Research, with the collaboration of a group of 29 distinguished authorities. Cloth. $7.50. Second Edition, 736 Pages with 74 illustrations and seven color plates. Philadephia. J. B. Lippincott Company, 1952.

Rapid expansion of knowledge of virus and related infections has made a compact, yet fairly comprehensive text necessary for the practicing physician, resident, and medical student. This second edition follows the first by only four years. The thirty-nine chapters can be divided into two sections, the first ten of which concern themselves with the technical aspects of virology. These chapters should be particularly interesting and informative to the physician who is more than ten years out of medical school, for they describe the use of the electron microscope, the ultra centrifuge, and other techniques used in the purification of these infective materials. Tissue culture, embryo culture, serologic reaction, hemagglutination, and propogation of viruses and rickettsiae are discussed, in a language which the practicing physician and student will have no difficulty in understanding. The remaining chapters for the most part include the diagnosis, prognosis, and current treatment of choice of the various diseases, resulting from infection by these agents. Individual chapters are devoted to most of the common virus infections and where these are related one to another they are discussed in a unit. Each unit of the book is written by a contributor of authority. Integration of the medical aspects presented throughout the book is emphasized in the chapter "Diagnosis of Viral and Rickettsial Infections," by Sabin, Horsfall, Meyer, Scott, and Snyder. Of interest is a chapter on "Infections of Minor Importance" which includes cat scratch disease epidemic viral gastroenteritis, and generalized salivary gland virus infections.

The second edition includes new chapters on "The Coxsackie Group," "Hemagglutination by Viruses," and "Interference Between Animal Viruses." The pediatrician, neurologist, and internist, will be interested in the section on "Viral Encephalitides."

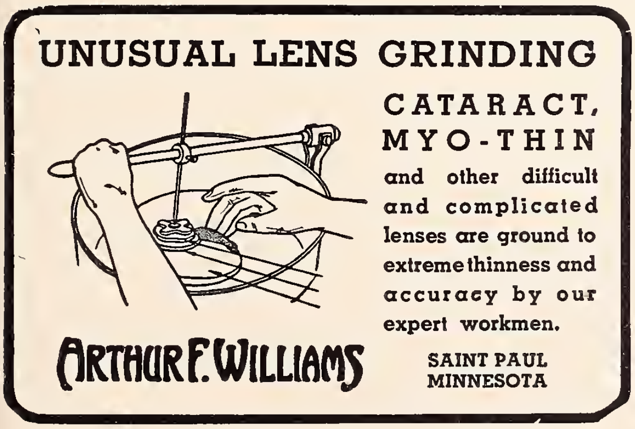
The work attempts and succeeds to a large degree in integrating the practical aspects and therapeutic problems in the viral and rickettsial diseases of man. One of the most delightful things about this large volume and its equally large companion volume reviewed below is the price. These books sell for approximately one third of the usual cost made possible by a grant from the National Foundation for Infantile Paralysis. The reviewer enthusiastically can recommend this volume not only as a reference text, but for lively informative reading on an important medical subject.

G. J. S.

BACTERIAL AND MYCOTIC INFECTIONS OF MAN. Edited by Rene J. Dubos, Ph. D., The Rockefeller Institute for Medical Research, with the collaboration of a group of thirty-six distinguished authorities. Second edition, Cloth. $7.50. 900 pages with 98 illustrations. Philadelphia: J. B. Lippincott Company, 1952.

This is a companion volume to "Viral and Rickettsial Infections of Man" reviewed above. For those not familiar with the first volume of this text it should be made plain that this is a textbook on bacteriology and mycology. In it one will find the usual material of this basic science, the morphology and the physiology of bacteria, serology, immunology, and related properties of bacteria which enable them to cause disease and which permit the host a defensive response. The principle pathogens are taken up by groups according to their usual classification. Under each group the history, morphology, cultivation, and toxin if any, is disclosed. The bacteriological laboratory diagnosis is outlined and the pathogenesis in animals and man considered. The clinical picture of the disease in man is briefly and only briefly touched upon. There follows then the usual discourse on prevention, control, and treatment, including modern antibiotics.

New contributions to the second volume include, recent advances in chemotherapy, blood groups, bacterial genetics, and bacterial physiology. The chapter on medial mycology is extremely brief and would not be very



UNUSUAL LENS GRINDING

satisfying to an experienced clinician seeking information.

For the medical student it would appear to make a good textbook in this basic science. It relates the clinical aspects and the therapeutic problems in a way which should be helpful to the student. To the resident and general practitioner who still maintains his scientific curiosity and pride in maintaining up-to-date knowledge in the basic sciences, this volume can be recommended enthusiastically. The mechanics of the book are good. It is printed in double columns in readily understandable language. Like most modern texts it contains an ample bibliographic as well as subject index. The price is extremely modest.

G. J. S.

THE TOXEMIAS OF PREGNANCY, by William J. Dieckmann, S.B., M.D.; Mary Campau Ryerson, Professor and Chairman of the Department of Obstetrics and Gynecology of the University of Chicago, Chief of Service of The Chicago Lying-in Hospital and Dispensary, Attending Gynecologist; Albert Merrit, Billings Memorial Hospital of the University of Chicago, Associate Editor of the *American Journal of Obstetrics and Gynecology.* 2d Edition. 710 p. Illustrated. St. Louis: C. J. Mosby Co., 1952. Cost $14.50.

The second edition of *Toxemias Of Pregnancy* is a tremendous volume devoted to a complete study of the history, classification, incidence, pathology, physiology, etiology, clinical manifestation, treatment, maternal and fetal prognosis, and prenatal care of the toxemias of pregnancy.

After reviewing this textbook I feel that most of the world literature regarding toxemia of pregnancy has been reviewed and included in this book plus the results of the author's observations and experiments. The material has been well organized and presented. At the end of each chapter there are available the necessary references of which there are many.

It is not for me to criticize a work of this type and caliber, and I think that there are only a select few individuals in this country who are in such a position. In my mind there is no doubt that anyone interested in obstetrics as a clinician, teacher or research worker will obtain a considerable amount of useful information from Dr. Dieckmann's *Toxemias Of Pregnancy.*

JOSEPH F. MELANCON, M.D.

NOMENCLATURE AND CRITERIA FOR DIAGNOSIS OF THE HEART AND BLOOD VESSELS. New York: Published by the New York Heart Association, under the chairmanship of Dr. Harold E. B. Pardee, 1953. Price $4.95.

A completely revised and greatly expanded edition of a unique medical handbook, *Nomenclature and Criteria for Diagnosis of Diseases of the Heart and Blood Vessels,* has been prepared by the New York Heart Association, and is now being offered to general practitioners, cardiologists, medical students, and interns throughout the country by the American Heart Association and its affiliates. Some entirely new concepts and viewpoints in the cardiovascular field are included in the latest edition. The previous edition was published in 1939.

The illustrated handbook is intended primarily to clarify and standardize the language used by the medical profession in diagnosing cardiovascular diseases. By enabling physicians to record their findings more precisely, it assists them in communicating vital information to other physicians or to hospital or clinic personnel who co-operate in the management of the patient.

First published in 1929, *Nomenclature and Criteria* has come to be accepted as the standard work in its field. All editions have been prepared by the Criteria Committee of the New York Heart Association, under the Chairmanship of Dr. Harold E. B. Pardee.

For the first time, the handbook includes a section on diseases of the peripheral vessels, which comprise the smaller arteries, capillaries, and veins. This group of diseases has only recently come to be recognized widely as an entity in the cardiovascular field and as an important cause of disability and death.

Extensive revisions have been made and new material added to the sections on x-ray and electrocardiography to conform with recent advances. The criteria for the diagnosis of rheumatic fever, an important cause of heart disease, have been amplified and made more exacting, and the criteria for diagnosis of congenital abnormalities have been expanded. New information has been added on injuries of the heart and great vessels.

The new edition also contains a revised Chart of Functional Capacity and Therapeutic Classification to help the physician prescribe the amount of physical activity he feels the patient may perform. This chart, which was developed by the Criteria Committee of the New York Heart Association, is generally accepted as standard throughout the United States. For the convenience of doctors and other professional persons using the chart, the American Heart Association has reprinted it on a handy 4" x 9½" card to be kept for quick reference in a desk corner, or a jacket pocket, or for use as a book mark. Among other advantages, the classification chart offers a uniform terminology for transmitting information needed by the employment counselor and rehabilitation worker.

Nomenclature and Criteria may be purchased through The Minnesota Heart Association or book stores. The Minnesota Heart Association headquarters are at 532 Endicott Building, Saint Paul, Minn.

CARDIAC THERAPY. By Harold J. Stewart, M.D., F.A.C.P.; Associate Professor of Medicine, Cornell University Medical College, New York; Attending Physician, New York Hospital; Head of Division of Cardiology, Department of Medicine, New York Hospital-Cornell Medical Center. 622 pages. Illus. Price, $10.00. New York: Paul B. Hoeber, 1952.

Each chapter of this book contains a wealth of information for all physicians. The author has drawn heavily from his own medical practice and from that of his medical associates. The result is a very desirable, finely outlined plan of treatment for each cardiac problem.

The large table of contents would suggest that every cardiac manifestation of disease has been considered. The latest developments in cardiology have been dealt with in this treatise. The author has given adequate discussions to cardiac surgery and to the effect of electrolyte changes in the blood on the heart and circulation.

The final chapters include two that will be valued highly. These are, "What to Tell the Patients About their Heart Disease" and "Diets in Heart Disease."

Donald W. Koza, M.D.

tops for tots

For infections in children caused by staphylococci, streptococci, or both . . . the palatability, low allergenicity, and relative freedom from gastro-intestinal upsets make 'Ilotycin,' Pediatric, a prescription favorite. Youngsters (with an occasional incorrigible exception) take it without a struggle. "Tablet-shy" oldsters like it, too.

Lilly

THE ORIGINATOR
OF ERYTHROMYCIN

Formula:
Each 5 cc. (approximately one teaspoonful) contain 100 mg. 'Ilotycin' as the ethyl carbonate.

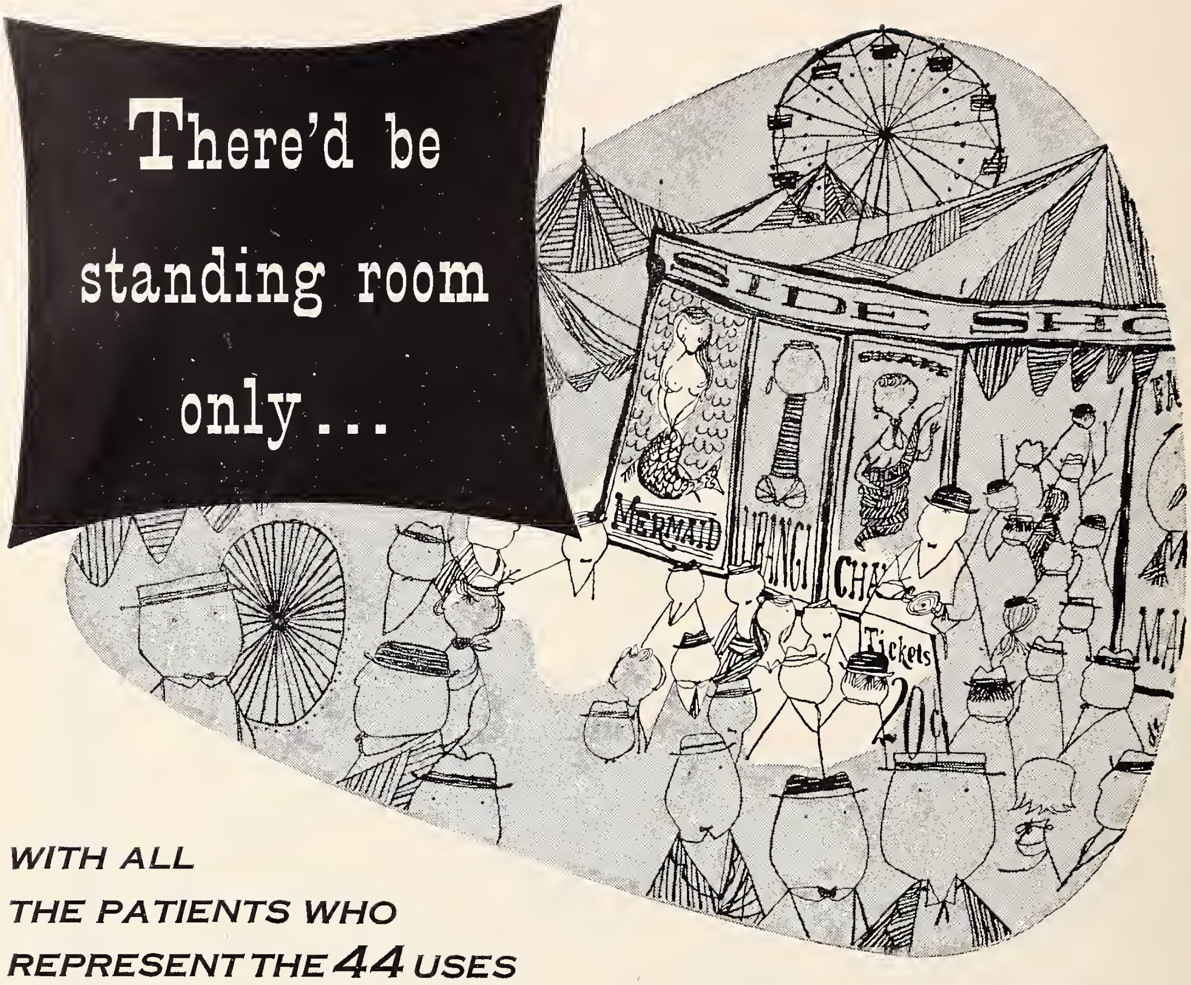
Dosage:

15 pounds—1/2 teaspoonful every six hours

30 pounds—1 teaspoonful every six hours

60 pounds—2 teaspoonfuls every six hours

How Supplied:
Each package consists of one bottle containing 1.2 Gm. 'Ilotycin' as the ethyl carbonate in a dry, pleasantly flavored mixture; 45 cc. of water are added at the time of dispensing to provide 60 cc. of an oral suspension. After mixing, the suspension is stable for two weeks at room temperature.



WITH ALL THE PATIENTS WHO REPRESENT THE 44 USES FOR SHORT-ACTING

Nembutal®

From report to report on short-acting Nembutal, these are the facts that you'll find the same:

1 *Short-acting* Nembutal (*Pentobarbital, Abbott*) *can produce any desired degree of cerebral depression—from mild sedation to deep hypnosis.*

2 *The dosage required is small—only about half that of many other barbiturates.*

3 *There's less drug to be inactivated, shorter duration of effect, wide margin of safety and little tendency toward morning-after hangover.*

4 *In equal oral doses, no other barbiturate combines quicker, briefer, more profound effect.*

All are sound enough reasons for your prescription to call for short-acting Nembutal. How many of short-acting Nembutal's 44 uses have *you* tried?

Abbott

FOR BRIEF AND PROFOUND HYPNOSIS

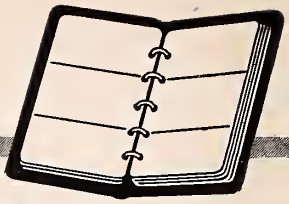
NOTES: TREATMENT OF ANAL PRURITUS



New!

SOOTHING, READY-TO-USE PADS REPLACE HARSH TOILET TISSUE

What are they?

Tucks are pure, soft outing flannel pads moistened and mildly medicated with a special solution containing witch hazel and glycerin.

Gentle, thorough

Being moist, Tucks clean the pruritic area completely, removing all vestiges of contaminating fecal material. Being soft, they cannot irritate sensitive anal tissue and cause further aggravation.

Majority improve

Numerous clinical reports indicate that a majority of cases of anal pruritus will show appreciable improvements when Tucks are prescribed to replace toilet tissue. Tucks have been recommended further as a prophylactic measure against all forms of anorectal disease which may be caused or aggravated by improper anal hygiene. We suggest you try Tucks for your next case of anal pruritus.

How supplied

Tucks are provided in jars of 100. A supply for trial will be sent you upon written request. Address Dept. M-3, Fuller Pharmaceutical Co., 715 So. 10th St., Minneapolis 4, Minn.

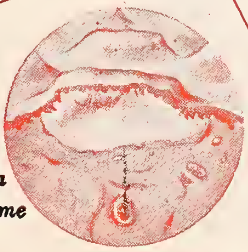
folliculitis



erythema multiforme

Since cutaneous bacterial infections "probably account for more disability than any other group of skin diseases,"[1] the availability of broad-spectrum Terramycin has been particularly helpful in controlling these common disorders. This pure, well-tolerated antibiotic is markedly effective against the wide range of organisms often implicated as primary or secondary pathogens in skin disease. Successful clinical experience[2,3,4] in the treatment of impetigo, acne, pyodermas, erythema multiforme and other cutaneous infections recommends the selection of Terramycin as an agent of choice in common diseases of the skin. Terramycin is supplied in convenient oral and intravenous dosage forms.

Cordelia

ACCEPTED FOR ADVERTISING IN PUBLICATIONS OF THE AMERICAN MEDICAL ASSOCIATION

AWARD WINNING BRASSIERES!

Cordelia surgical brassieres have won the Blue Ribbon for five consecutive years. Now, Cordelia has won BOTH the GOLD MEDAL and BLUE RIBBON AWARDS at the 1952 California State Fair Fashion Exhibit.

When she asks...

HERE ARE THE FACTS!

Most corrective, surgical and maternity brassiere problems have been scientifically solved by the staff of Physiospecialists at Cordelia of Hollywood.

THE GOLD MEDAL WINNER!

Each Cordelia brassiere is planned and made for easy, individual fittings by experts in local stores.

THE BLUE RIBBON WINNER!

Every Cordelia brassiere is a luxury in fashion fabrics — beautifully, youthfully designed. These are the facts judges took into consideration — then awarded *Cordelia the winner!*

NEW! Current MEDICAL BOOK GUILD Selections

ANY TWO OF THESE MEDICAL BOOKS $9.45 Only

(Value up to $19.50 in publishers' editions)

If You Join
The MEDICAL BOOK
GUILD Now!

WHY WE MAKE THIS UNUSUAL OFFER

The MEDICAL BOOK GUILD OF AMERICA—the *only* Book Club exclusively for the medical profession—was founded a short time ago. The enthusiastic response was most gratifying. These are the types of books GUILD members are offered each month. We offer you any two *for only $9.45* PLUS FREE MEMBERSHIP—because we want you *to prove to yourself* that you can get practical, up-to-date, authoritative medical books at *substantial savings.*

NATIONALLY FAMOUS EDITORS

The MEDICAL BOOK GUILD offers you *newly-published* books in all specialties—selected by an editorial board that is eminently qualified—*Dr. Morris FISHBEIN,* Chairman; *Dr. L. T. COGGESHALL,* Dean, Division of Biological Sciences, University of Chicago; *Dr. Wilburt C. DAVISON,* Dean of the School of Medicine, Duke University; *Dr. Chauncey D. LEAKE,* Vice-President of University of Texas, Medical Branch; and *Dr. Arthur OSOL,* Director of Chemistry Department, Philadelphia College of Pharmacy and Science.

TAKE AS FEW AS 4 BOOKS IN 2 YEARS

You pay no dues of any kind. You do not even have to take a book every month. Just 4 books in twenty-four months—yes, only 4 books during your first two years as a member—are all you agree to purchase! You buy *only the books you want*—when you want them. Many of the GUILD selections are books you'd probably buy anyway at their regular retail price. Why not join now—get the special member's price—and begin to enjoy member's bargain privileges.

SEND NO MONEY—JUST MAIL COUPON

Accept this special introductory offer now. We will send you any two books you choose from this page—value up to $19.50 in publishers' editions—but we will bill you *only $9.45* (we pay postage). Thereafter you will receive the GUILD'S "New-Book Bulletin" describing the forthcoming selection. But remember: *take only the books you want—when you want them.* If not completely satisfied with your two introductory books, return them and your membership will be canceled without further obligation. *You take no risk* whatsoever, so mail your coupon today. The MEDICAL BOOK GUILD OF AMERICA, Garden City, New York.

CHOOSE ANY 2 BOOKS YOU WANT—THEN MAIL THE COUPON BELOW!

SURVEY OF CLINICAL PEDIATRICS—L. B. Slobody, M.D. A concise, inclusive outline reference for the GP. Covers all important aspects with emphasis on the child as a whole. Also valuable preparatory aid for Board Exams. Publisher's edition, $7.50.

Blakiston's **NEW GOULD MEDICAL DICTIONARY**—The new "standard" in medical dictionaries that incorporates all recent advances in medicine and allied fields. "An exceedingly useful tool" (J.A.M.A.). Publisher's edition, $9.50.

1953 MEDICAL PROGRESS ANNUAL—Ed. by M. Fishbein, M.D. (Formerly Ed. J.A.M.A.). Significant advances in research, diagnosis, treatment and trends in the past year. Sections by outstanding contributor-specialists. Publisher's edition, $5.00.

PAIN SENSATIONS and REACTIONS—J. D. Hardy, Ph.D., H. G. Wolff, M.D., and H. Goodell, B.S. A comprehensive review of traditional concepts and the newer data on the ever-important subject of pain. Another outstanding contribution. Pub. ed., $6.50.

VAGINAL INFECTIONS, INFESTATIONS AND DISCHARGES—J. B. Bernstine, M.D. and A. E. Rakoff, M.D. Only book available covering all aspects for every age group. Strictly clinical approach. Pub. ed., $10.00.

ENDOCRINE TREATMENT IN GENERAL PRACTICE—Ed. by M. A. Goldzieher, M.D. and J. W. Goldzieher, M.D. A most useful clinical guide for the GP. Focuses on the patient, complaints and symptoms, differential diagnosis, and specific therapy. Pub. ed., $8.00.

THE ROOTS OF PSYCHOTHERAPY—C. A. Whitaker, M.D. and T. P. Malone, M.D. Integrates psychotherapy with general medical therapy. Stresses doctor-patient relationship, includes clinically-proven techniques for the GP, and pitfalls to avoid. Pub. ed., $4.50.

To open congested air passages in hay fever

NEO-SYNEPHRINE®

HYDROCHLORIDE

. . . reduces nasal engorgement . . .

. . . promotes aeration . . . encourages drainage

A few drops of Neo-Synephrine 0.25% in each nostril will promptly check mucosal engorgement and hypersecretion, promoting greater breathing comfort over a period of several hours.

The resultant relief to the hay fever sufferer is decidedly gratifying. Prolonged action of Neo-Synephrine makes fewer applications necessary, consequently longer periods of rest and sleep are possible.

Neo-Synephrine does not lose its effectiveness on repeated application and may, therefore, be relied upon to give relief throughout the hay fever season.

Neo-Synephrine is practically free from sting and compensatory congestion; does not appreciably inhibit ciliary activity. Neo-Synephrine has been found relatively free from systemic side effects such as nervous excitation, cardiac reaction or insomnia even when tested on hypertensive, cardiac and hyperthyroid patients.[1]

Supplied in 0.25% solution (plain), bottles of 1 oz., 4 oz. and 16 oz.; 0.25% solution (aromatic), bottles of 1 oz. and 16 oz.; 0.5% solution, bottles of 1 oz.; 1% solution, bottles of 1 oz., 4 oz. and 16 oz.; 0.125 (1/8)% solution, bottles of 1/2 oz.; 0.5% water soluble jelly, in 5/8 oz. tubes.

THE USE OF RADIOISOTOPES IN TREATMENT

J. E. RALL, M.D., Ph.D.
New York, New York

THE WIDESPREAD use of radioisotopes in research represents one of the major advances in investigative techniques in several decades. The use of radioisotopes for treatment, however, is so difficult that great and important successes have been attained with only one isotope in the treatment of one disease.

Radioisotopes differ from non-radioactive elements in their instability which can only be relieved by the emission of some type of radiation and consequent transformation into another isotope. Hence, treatment with radioisotopes is really treatment with radiation. Radiation is a relatively old weapon of destruction, but in spite of much investigation and use, surprisingly little is known of how radiation can kill living tissue with a most astonishing efficiency. It can be calculated that a fatal dose of whole body x-ray, if it were entirely changed into heat would warm a man less than 1.0° Centigrade. This is certainly a frightening kind of efficiency. Ionization in the nucleic acids, disturbing the orderly synthesis and degradation of these most necessary cellular elements, is probably the mechanism by which such a deadly effect is obtained.

In the past, the naturally occurring radioisotopes of radium and x-rays have constituted the means of obtaining the radiation. Since radium decays into the gas, radon, it is a somewhat inconvenient material to manipulate and it has been suggested that, had the present gamut of radioisotopes been available when radiation was first discovered, radium would have been the element least likely to be used for its radiation.[5] Since radioisotopes can be used for treatment only because of the radiation they emit, let us first discuss the application of radioisotopes to conventional radiotherapy, secondly describe the possible use of radioisotopes by selective localization, and, finally, using as an example the treatment of carcinoma of the thyroid with radioiodine, examine the problems in the use of radioisotopes when selective localization is attempted.

I. The Application of Radioisotopes to Conventional Radiotherapy

With the incredibly complete arsenal of radioisotopes now provided it is possible to obtain any type of radiation with any degree of penetrating power one desires.

(a) *Radioisotopes as a substitute for X-ray treatment.*—It is now possible to obtain such very large quantities (2,000 curie sources) of radioisotopes which emit energetic gamma rays that the isotope can be heavily shielded and a beam of radiation directed toward a patient several feet away. There are certain technical and economic advantages to such a unit and several using cobalt 60 are now in use.[2] Cesium and iridium are also suitable for such a use and units utilizing these isotopes are under construction or in use.[4] It is also possible to utilize gamma radiation from these sources to take diagnostic radiographs. Except for independence from electric power

---

Dr. Rall is Associate Member of the Sloan-Kettering Institute, New York, New York.

From the Department of Clinical Investigation of Sloan-Kettering Institute and Memorial Center, New York, N. Y.

Read at the Centennial Meeting of the Minnesota State Medical Association, St. Paul, Minnesota, May 19, 1953.

sources, there are few advantages to the use of radioisotopes in this manner.

(b) *Radioisotopes as a substitute for superficial radiation.*—Radioisotopes can be obtained which emit only beta particles. They may be used absorbed in blotting paper or in any of a wide variety of applicators. Used this way they are considerably more efficient and are easier to handle than soft x-ray. Phosphorus 32 which is a pure beta emitter enjoys considerable popularity for this purpose.

(c) *Radioisotopes as a substitute for radium.*—Radioisotopes with strong gamma radiation may be used as solutions, as suspensions and as metals. This is a great advantage over the use of radium which has such a complicated decay scheme and which includes a gas as one of its products. Cobalt is particularly suited for use when needles or unusually shaped devices more efficiently and completely irradiate a desired area. Cobalt can be molded into any shape desired, irradiated in a reactor and almost any degree of radioactivity obtained. The finest individualization of each patient's particular problem is secured.

Gold 198 in colloidal suspension may be used somewhat differently. It may be injected into a tumor mass whose limits cannot be well defined or which involves essential structures that cannot be sacrificed surgically.[6] It has, for example, been used for the treatment of cancer of the prostate by injection directly into the area where the tumor lies.[3] This appears to be one of the more promising additions to the therapy of inoperable cancer.

(d) *Radioisotopes for intracavitary radiation.*—Patients with widespread peritoneal or pleural metastases frequently accumulate large amounts of fluid in these spaces and fluid accumulation and the results of repeated withdrawal of fluid cause the most distressing symptoms. The introduction of a radioactive material directly into the cavity frequently is a valuable palliative measure when it decreases or prevents further fluid accumulation. Gold 198, albumen labeled with iodine 131, chlorine 38 and krypton 87 have been used in this manner after the limit of tolerance by the skin to external radiation has been reached.[9,13] Cure of such cancers treated in this manner cannot be expected but valuable symptomatic relief is frequently obtained.

Another variation of this technique has been explored for the treatment of certain types of cancer of the bladder. A balloon is inserted in the bladder and filled with an isotope such as sodium 24 and any amount of radiation will then be conveniently administered.[14]

These uses of radioisotopes as just detailed, to supplant and extend radiation as it has been previously employed, are not spectacular but are of real utility. Furthermore, these uses will probably prove to be the main field in which radioisotopes will be employed in medical therapy. The dream of the physicists of the last decade was much more hopeful and had it materialized, would have revolutionized therapy. The hope entertained was that a substance could be found which would accumulate in tissue in high concentration and be retained there for a long time. Labeling of the substance with a radioisotope would then permit selective and destructive radiation of the tissue involved while the host was spared. This dream took two forms as follows:

II. (a) Concentration of Elements in Biological Systems

The more complex forms of life have learned to take advantage of the differing chemical properties of the elements and use some elments only for certain purposes. It is occasionally possible to capitalize upon this fact and substitute a radioactive isotope for the naturally occurring element. The classical situation is the thyroid gland and its undying affection for iodine. The use of iron as the respiratory pigment and of calcium for skeleton are examples of other uses of an element for either a single or a major purpose.

The outstanding example of the successful use of a radioisotope in treatment is, of course, the use of iodine 131 in the treatment of hyperthyroidism. The reasons for this success are the remarkable affinity of the thyroid for iodine, the relative scarcity of iodine in the diet, and the unusually long time that any iodine atom remains stored in the thyroid. These, and other considerations will be examined in more detail when we recount the problems in using iodine 131 for the treatment of cancer of the thyroid, since such treatment more clearly illustrates the general problems that are met in the attempted use of any radioisotope for treatment when we administer the isotope internally.

Phosphorus is concentrated to a certain extent in bone marrow and has been used in the treatment of polycythemia vera and leukemia. Unfortunately it does not selectively damage either the erythropoietic or the leukopoietic systems and its use, particularly in leukemia, results in little more than general body radiation. Many hematologists, however, consider that phosphorus 32 is the treatment of choice in polycythemia vera.

The use of neutron induced radiation is an interesting variant of this technique. Javid has presented the theoretical considerations that are involved in the use of boron in the treatment of brain tumor.[7] When boron is exposed to a high flux of neutrons of a certain energy it captures the neutrons with an efficiency greatly exceeding that of the elements normally present in tissue. Boron then becomes boron 11 which disintegrates very rapidly into lithium with the emission of a very energetic alpha particle. The radiation from the alpha particles is highly destructive. The limitation in this method of treatment is the degree of localization of boron that can be achieved in the tumor. Furthermore, a high intensity source of neutrons which is only found in a reactor, is necessary. The advantage of this technique is that localization of boron in tissues other than those exposed to the neutron beam is of no consequence. The usefulness of this rather complicated procedure has yet to be fully evaluated.

II. (b) Concentration of Organic Compounds in Biological Systems

Most organic compounds are metabolized by the human organism in an extremely widespread and complex fashion. Certain compounds, however, are handled in a specific manner by specific tissues. Tetraiodophenolphthalein, for example, is secreted into the bile by the liver in a most rapid and efficient manner. The second dream of many investigators has been to develop a compound that will be localized in any given tissue in a very high concentration so that this compound may be labeled with a radioisotope and selective radiation accomplished. A study has actually been made of tetraiodophenolphthalein labeled with iodine 131 for the treatment of cancer of the gall bladder.[1] Unfortunately no definite therapeutic results were obtained. Amino acids known to be used by rapidly growing tissues have been studied as have purines used in the synthesis of nucleoproteins. A large body of important information regarding the metabolism of normal and neoplastic tissues has been obtained but it appears more and more certain that tumors utilize the same compounds in synthesis that normal tissue does and any biologically useful organic brick will be used for construction both by tumor and by normal tissues.

A somewhat different approach has been investigated very carefully by Pressman and his associates.[8] They first found that antibodies could be labeled with a radioisotope (sulphur 35 and iodine 131 were used) and retain their biological activity. They then found that tissue antibodies actually localized to a certain extent in the tissue against which they were prepared. Now they have found that chemical purification of the globulin fraction of the plasma containing the antibody caused an increased concentration of antibody in the tissue studied. The application of these studies in animals to therapy in man is a long and uncertain step and is surely one that will require some time for even preliminary evaluation. The crucial factor is the ratio of integrated tumor concentration of antibody to the integrated concentration of antibody in blood.

III. The Treatment of Cancer of the Thyroid with Radioiodine

The treatment of cancer of the thyroid with radioiodine, sometimes useless, sometimes brilliantly successful, illustrates more clearly the problems that are met with in the use of radioisotopes in such treatment. First is the problem of localization of iodine in the tumors. Cancer of the thyroid is subject to a certain degree of physiological control so there are several measures we can adopt to increase the degree of localization.[11] Figure 1 shows the results of thyroidectomy and thiouracil treatment in stimulating the uptake of radioiodine in metastases. These results are as good as can be obtained, since over 90 per cent of the isotope was finally localized in the cancer. In this particularly favorable and rather uncommon case, the problem of localization was solved, but further problems remained.

How much iodine 131 can we give this pa-

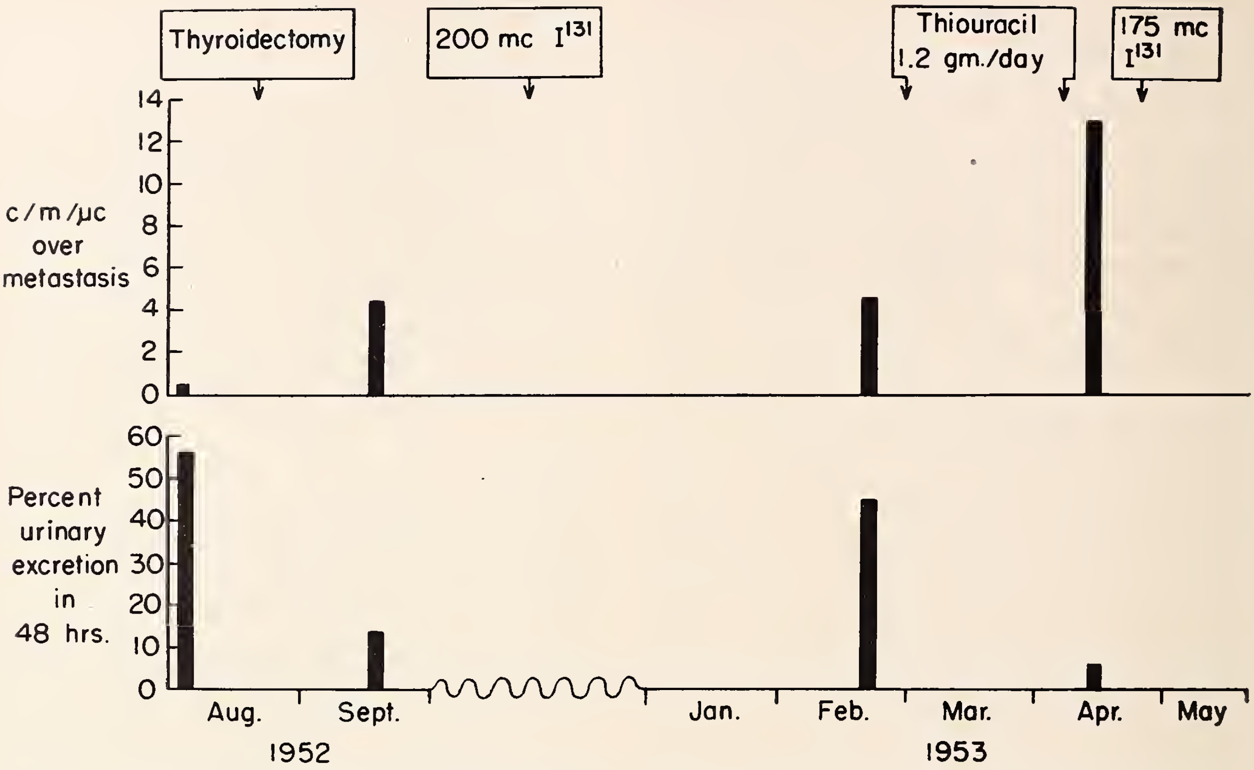

Fig. 1. The effects of thyroidectomy and thiouracil on the uptake of I^{-131} in a patient with cancer of the thyroid.

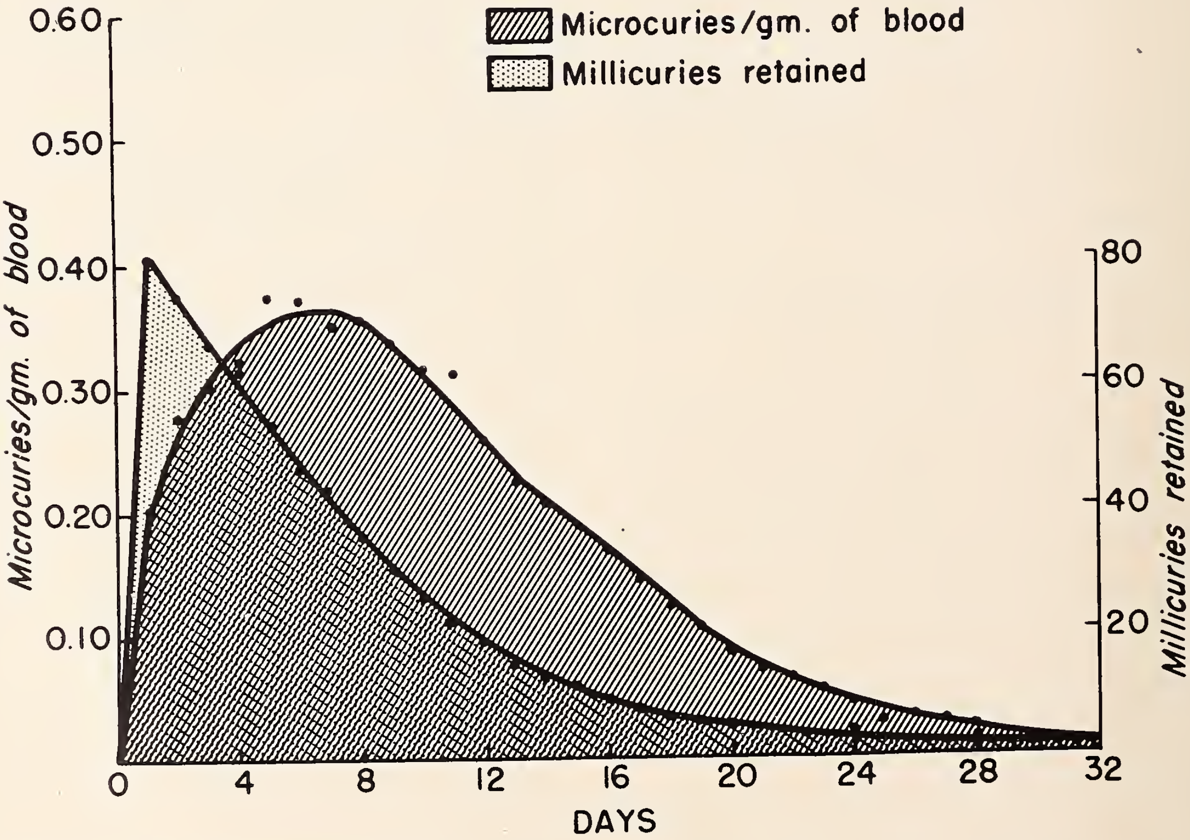

Fig. 2. The relative concentration of I^{-131} in the tumor and in the blood of a patient with cancer of the thyroid, given 107 millicuries I^{-131}.

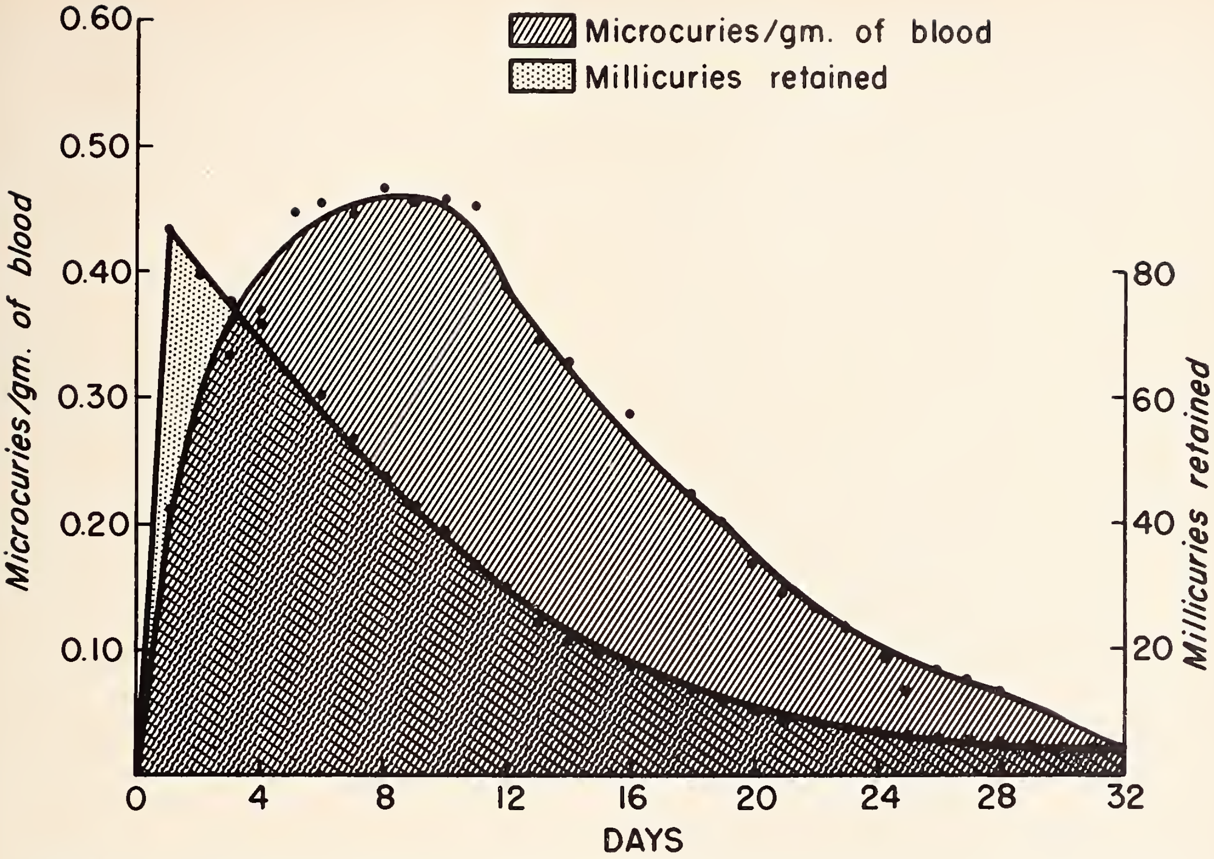

Fig. 3. The relative concentration of I-131 in the tumor and in the blood in the same patient as in Figure 2 except for change in decay rate of isotope (13 day, half life).

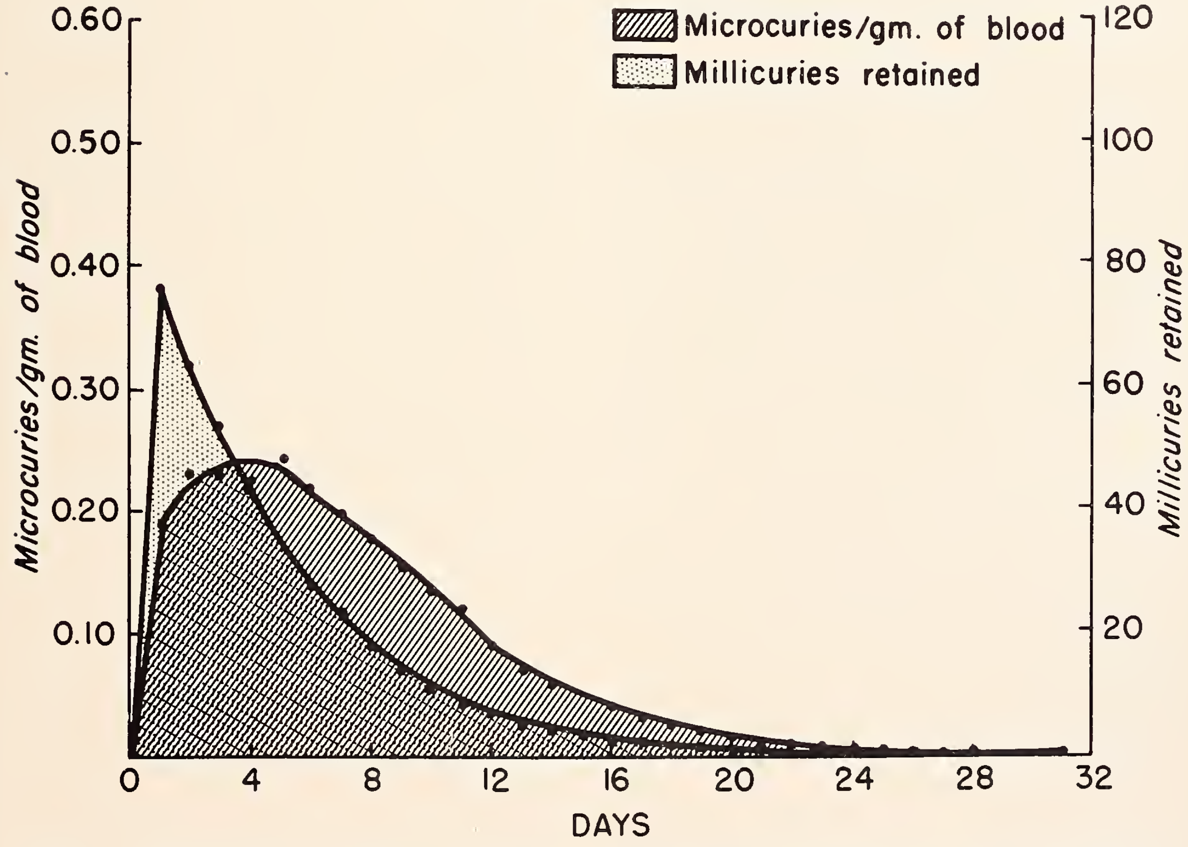

Fig. 4. The relative concentration of I-131 in the tumor and in the blood in the same patient as in Figure 2 except for change in decay rate of isotope (4 day, half life).

tient? Radiologists tell us that generally, one millicurie of radioiodine delivers about one roentgen of general body radiation and we know that the lethal dose of such radiation for man is approximately 400 r. Unfortunately we have seen several patients in whom this convenient rule failed completely. Since damage to the hematopoietic system is the most serious complication of treatment with I^{-131}, we have tried to correlate one of the more sensitive indicators of hematologic activity, depression of the level of circulating lymphocytes, with the millicuries of radioiodine administered. This results in rather inconsistent and erratic correlation. If one, however, really attempts to calculate the radiation to the blood-forming organs by using the integrated blood level of radioiodine plus a relatively small factor which takes into account the gamma radiation from iodine concentrated in the tumor, a quite satisfactory correspondence between cause (radiation) and effect (lymphocyte depression) is found. We cannot only measure the blood level of radioiodine and with somewhat less accuracy, the tumor retention of the isotope, but we can, from prior tracer study, predict these values for any given therapeutic dose. Patients with functioning carcinoma of the thyroid show a great variation in the way in which they metabolize iodine, so we find that the maximal safe dose of iodine 131 will vary for any single dose from 100 millicuries to 400 millicuries. The main reason for this difference is that some patients turn over iodine in the tumors so rapidly that the level of organic iodine in the blood rises to very high values. This organic radioiodine in the blood disappears rather slowly and meanwhile radiates the hematopoietic organs. Other patients discharge the organic iodine from the tumors into the blood stream quite slowly and the level of radioactivity in the blood is so low that a much larger dose may be tolerated.

The relationship between blood level and tumor level of isotope is complex and the precise relationship between the two will be changed by the decay rate of the isotope used. It is obvious that the most therapeutically promising situation is obtained when the area under the curve of blood level is the lowest and the area under the curve of tumor retention of isotope is the highest. Figure 2 shows these data for an actual patient with carcinoma of the thyroid and pulmonary metastases who picked up about 80 per cent of the 107 millicure therapeutic dose of I^{-131} which he was given. Figure 3 shows the relative areas under these curves if the patient had been given I^{-123} with a half-life of thirteen days and Figure 4 shows the same curves decayed with a physical half-time of four days which corresponds to the half-time of I^{-124}.

It is apparent that in this particular case the blood would have received slightly less radiation with respect to the tumor had the patient been given iodine 124. Similar calculations, assuming a twelve-hour half-life for iodine (iodine 130) suggest that the tumor dose would be very small and the blood dose quite high. There is, therefore, for each patient a particular decay rate of isotope which will result in the maximum tumor and the minimum blood radiation.

None of these calculations have taken into account the various energies of the beta rays and gamma rays emitted by these isotopes. These variations in energy will also produce changes in the blood/tumor radiation ratio. Furthermore, these calculations assume that differing rates of radiation do not affect physiologic processes involved. We know that therapeutic radiation very seriously affects iodine metabolism. If the radiation is of sufficient intensity, the release of thyroglobulin will drastically increase the blood level of radioiodine.[12]

These problems in such a relatively simple situation as radioiodine treatment of cancer of the thyroid are now, at least in part, understood but are by no means solved. The very complexity of this situation, however, points to the serious difficulties in the use of other radioisotopes from a therapeutic standpoint. Nevertheless, from the extensive experience with the use of iodine 131 for the treatment of cancer of the thyroid, the quantitative aspects of metabolism which must be met by an internally administered radioisotope for which a therapeutic effect is desired, have been delimited.

Summary

The advantages and the problems inherent in the use of radioisotopes have been described. The adaptation of radioisotopes to conventional radiotherapy is proceeding rapidly and will probably be the most useful field for radioisotope therapy. The possible use of radioisotopes for

selective destruction by localization in tumors has been discussed. The use of radioiodine in the treatment of cancer of the thyroid as a prototype for such a situation has been reviewed and the serious problems inherent in such a procedure have been mentioned.

SUBCUTANEOUS CLYSIS FOUND USEFUL IN TERRAMYCIN THERAPY

Administration of terramycin by subcutaneous clysis in infants and children, a previously unreported mode of antibiotic therapy, has been described by Farley and Konieczny† of St. Michael's Hospital, Newark, N. J. Use of the antibiotic in this fashion was considered a worthwhile therapeutic adjunct in children in whom oral or intravenous administration is contraindicated or not feasible.

Thirty-six patients from three days to four years of age received a total of 254 clyses with the intravenous form of the antibiotic. Most children were given 10 mg. per Kg. of body weight every twelve hours in a 1 mg. per cc. concentration. This concentration was considered an adequate dose offering a "wide margin of local toleration and safety." Concentrations above 5 mg. per cc. were not advised. All clyses, the authors report, were well tolerated and no untoward local or systemic reactions were observed.

Terramycin was found to be stable and compatitble in physiological saline, dilute dextrose solution or 1/6 M sodium lactate and Darrow's solution, and may be added to these solutions when they are needed for electrolyte repair.

The authors recommend a terramycin concentration of 1 mg. per cc. with a dosage of 10 mg. per Kg. of body weight every twelve hours. In more serious conditions: 20 to 25 mg. every eight to twelve hours.—Abstracted in *Currents in Infant Care,* May, 1953.

DIAGNOSIS AND TREATMENT OF POSTPOLIOMYELITIC CONTRACTURES

MARCEL H. VANDEMOORTELE, M.D., and PAUL R. LIPSCOMB, M.D.
Rochester, Minnesota

THE diagnosis and treatment of the disease, anterior poliomyelitis, has undergone a significant evolution in the last twenty years. Early diagnosis, hospitalization, and subsequent early treatment have eliminated a great number of postpoliomyelitic complications. A fixed contracture means a deformity which, once present, cannot be corrected by conservative measures. Surgery then offers the only means of treatment. It is, therefore, of the greatest importance that in the early care of patients who experience this infection, treatment should be directed against the development of deformities. Prevention of postpoliomyelitic contractures is still one of the most important goals in the treatment of poliomyelitis.

Prevention of Contractures in the First Two Stages

Acute and Recovery Stage.—In the early treatment, rest in bed is indicated. The mattress should be firm, with boards between it and the springs. A correctly used foot board will maintain dorsiflexion of the feet and prevent shortening of the gastrocnemius and soleus muscles.[1,9]

Eventually it may be advisable to use sand bags, pillow supports, rolled towels, splints or plaster shells[13] to support and maintain the physiologic position of the muscles of the lower extremity. Tightness or spasm of the back and hamstring muscles is frequently encountered. Treatment with heat is advocated. Later on, muscle re-education and exercises should be instituted to relieve contracture or shortening of the muscles until a normal range of motion has been restored. This restoration of length of shortened or spastic muscles is essential regardless of whether or not there is demonstrable paralysis. Passive or active movements should never be carried to the point of producing pain. The aim must be to help the patient's ultimate recovery by maintaining the muscles, bones and joints in as good physiologic condition as possible.[12]

Convalescent Stage.—As soon as the patient is allowed to be up, braces are often required as temporary aids in the recovery of weakened muscles. Not only must the weakened, paralytic muscles have protection against overstretching and overwork, but the strong and often unopposed normal muscles must be supervised to prevent contractures and distortions occasioned by imbalance. This is especially true in the involved lower extremities, and braces used as supports to allow earlier ambulation must be constructed in such a way as to prevent deformities.[11,14] As a matter of fact, it is often difficult and sometimes impossible to control the development of contractures, especially at the level of the hip, foot and ankle joints.

The four most common deformities which may occur alone or in combination during the convalescent period at the level of the foot and ankle are the equinus, calcaneus, valgus, and varus deformities. The tendency to an equinus deformity can be controlled by the use of an ankle brace consisting of two irons hinged at the ankle with a posterior catch to prevent foot drop. A similar brace with an anterior catch will prevent calcaneus gait. Lateral motion in the foot may be controlled by a single or double iron with a broad T-strap fastened to the side of the shoe and strapped to the opposite heel bar. Generally a single iron will be sufficient. In other cases with marked lateral instability, a double iron may be required. A valgus foot needs an inside T-strap and a varus foot an outside T-strap.

Contractures of the upper extremity are rare. Only 30 per cent of the poliomyelitic patients who have paralysis show evidence of involvement of the upper extremity. Moreover, paralysis of the deltoid muscle is common among the lesions of the upper extremity[2] and results generally in a flail shoulder. Occasionally an adduction deformity of the shoulder may occur, and use of an airplane abduction splint is then indicated. Most of the time, however, the latter support will be need-

ed in preventing over-stretching and over-fatigue of weakened or partially paralyzed muscles. An opponens splint may be very helpful in preventing an adduction deformity of the thumb.

In brief, then, it may be said that the patient should have no appreciable deformities if he has had efficient treatment in the first two stages of the disease.

Efficient prevention cannot be achieved if the extent of the disease and the degree of muscle damage have not been recorded. Ghormley emphasizes the importance of giving every patient with poliomyelitis a muscle test as early as possible during the convalescence in order that the possible development of deformities may be detected. However, some contractures which are due to shortening of muscles and fascia and sometimes to strong-muscle imbalance are inevitable, and they become more evident and more severe after the patient has become ambulatory.[5,7,8]

Treatment of Contractures in the Residual Stage

The four more common deformities which will be mentioned are contractures of the forearm, hip, knee and foot.

Forearm.—A severely fixed supination deformity is best corrected by osteotomy of the radius in its midportion.

More frequently, a pronation deformity of the forearm will necessitate an operation. If the pronator teres muscle is sufficiently active, transplantation of this tendon to replace the function of the paralyzed supinators, the procedure advocated by Tubby, is used.[4]

Flexion Contractures of the Hip.—In the lower extremity, the contractures around the hip joint are the cause of numerous deformities. Several forms of treatment for extra-articular contractures of the hip have been described in the past but none has been fully successful. Soutter in 1914 published his method of correction of flexion contractures of the hip, which consisted of stripping the flexor muscles subperiosteally from their original position. This treatment was based upon the concept that these contractures were the result of contraction of the tensor fasciae latae and the iliopsoas and rectus femoris muscles. While the immediate result of the operation was often satisfactory, there were a great number of recurrences.

In 1923 Campbell advised a modification of the Soutter operation. His procedure, called transference of the iliac crest, consisted of transference of the anterior superior spine and the anterior portion of the crest together with their attached muscles to a lower level. However, as Yount observed in 1926, "no case having a flexion contracture of the hip has been observed in which there was not also a flexion contracture of the knee joint together with some lateral distortion." It was obvious that the cause of the flexion contracture of the hip was also the cause of the flexion contracture of the knee.

Deforming Factors of the Contracted Iliotibial Band.—As a result of several observations, Yount stressed the importance of the iliotibial band as the main deforming factor. This fact has been given little attention in the past twenty-five years. Yount advised transverse fasciotomy of the iliotibial band above the patella. In 1928 Forbes wrote on the same subject. It was only in 1948 that Irwin emphasized again the tremendous number of deformities occurring in the lower part of the trunk and the lower extremities as the result of an almost insignificant contracture of the iliotibial band.

Pathogenesis.—The deformities around the hip joint are caused not so much by contractures of the muscle tissues as by shortening or contracture of the intermuscular septa and fascial envelopes. Irwin pointed out "that this fact can be easily demonstrated by dividing the contracted fascia covering the normal muscle tissue and after the cut edges of the fascia retract an inch or more, the (normal) underlying muscle tissue can be picked up with a tissue forceps in a relaxed condition whereas the muscle was tight prior to section of the band."[10] However, as Ghormley pointed out, "If for some reason muscle exercises have been neglected and the (normal) muscles have been at rest or if the member has been in a cast, the smooth surface and the normal glistening appearance of the normal muscle belly may be gone. Adhesions may form between the muscle and its fascial sheath, so that movement is limited." Moreover, muscles that are partially involved can become shortened because of contracture of the involved connective tissue surrounding the normal fibers. This is a kind of vicious circle and it explains, in part at least, why these deformities occur in flail extremities and why, when unilateral, they involve the extremity with the greater weakness. As a result of the connections of the short fascia and fibrosed muscle tissue, extending from the crest of the ilium distally to the head of the fibula, it is easy to understand how this short fibrous mass can produce as much deformity distally about the knee as it can proximally around the hip.

Pathomechanics.—The anatomic location of the iliotibial band in a plane anterior and lateral to the axis of the hip, and lateral and posterior to the axis of the knee, explains the mechanics of the production of contractures.

At the level of the hip joint a shortening of the iliotibial band gives rise to a flexion and abduction deformity of the hip. External rotation is the position of comfort and if this position is allowed to remain, the hip rotators will contract secondarily.

At the level of the knee, the iliotibial band acts as a taut bowstring across the joint. Through the opposing influences of fascial shortening and bone growth, the tibia becomes flexed and abducted on the femur, producing genu valgum and flexion contracture of the knee. Furthermore, in the presence of a strong short head of the biceps, the lateral attachment of the iliotibial band rotates the tibia and fibula externally on the femur. The extreme deformity consists in a subluxation of the tibial condyles on the external condyle of the femur, with the head of the fibula lying in the popliteal space.

With the patient standing and the contracted extremity in weight-bearing position, the pelvis tends to become oblique, causing a secondary scoliosis. Correction of the flexion deformity of the hip with the patient upright tilts the pelvis forward, increasing the lumbar lordosis.

Patients who attempt to walk may show a secondary equinovarus position of the foot as a compensatory result of shortening and external torsion of the leg. There is discrepancy in length of the two extremities, and there is external torsion of the femur.

Treatment.—Early recognition and prevention of shortening of fascia and muscles constitute the best treatment against the development of deformities around the hip joint. On the other hand, once the contracture of the iliotibial band is present, conservative measures such as attempts at correction by traction or extension will only increase the obliquity and hyperextension of the pelvis regardless of the age of the patient or the duration of the deformity (Irwin).[10] Surgical treatment is then indicated and consists in division of the iliotibial band together with the lateral intermuscular septum. In long-standing flexion-abduction contractures of the hip, the division of the iliotibial band must be supplemented by a Soutter fasciotomy. Postoperative treatment consists of use of a double spica cast with increased correction by wedging or traction.

Knee.—The two main deformities seen in the knee joint are bent back knee (genu recurvatum) and flexion contracture. The latter is more frequently seen because of the fact that the quadriceps muscle is most likely to be involved by poliomyelitis. Flexion of the knee is caused by shortening of the iliotibial band and by overaction of the hamstring muscles. This may result in thickening and shortening of the posterior capsule of the knee joint. If the knee cannot be extended by conservative means, division of the iliotibial band and the intermuscular septum and posterior capsulotomy as suggested by Wilson may be necessary.[4]

Foot and Ankle.—If, in the early stages of the disease, prevention of deformities of the foot and ankle has been unsuccessful, or if the correction by conservative measures such as use of braces, irons or orthopedic shoes has been insufficient, surgical procedures may be indicated. The primary function of the lower extremity is locomotion and the chief requisite for locomotion is stability. It is, therefore, essential to consider stabilization of the foot as the most important step in the treatment of a weak or paralyzed foot which is essentially unstable. Tendon transference has its place, but it is usually an adjunct to the stabilization operation. The operation which has proved to be of the greatest benefit is that form of stabilization which is called triple arthrodesis (fusion of the talonavicular, calcaneocuboid and subastragalar joints). This operation insures lateral stability and corrects different deformities of the foot. The amount of bone removed from the various midtarsal joints is dependent on the kind and grade of deformity.

After triple arthrodesis, plantar motion and dorsiflexion of the ankle joint are still possible. If there is also foot drop, some modification is necessary in order to limit motion of the ankle joint (Lambrinudi).[4]

1. Clawtoe and Clawfoot.—A clawtoe deformity consists of hyperextension of the metatarsophalangeal joint and flexion of the interphalangeal joint. This clawtoe deformity is sometimes only apparent on dorsiflexion of the foot and ankle and is caused by overaction of the extensor or weakness of the flexor muscles. Clawtoe is very often a part of or associated with the cavus or clawfoot and is then secondary to the drop of the fore part of the foot. Correction of the clawfoot should be undertaken first, since the contracture of the toes may be relaxed when the longitudinal arch is restored to its normal height and the fore part of the foot is elevated. Correction of the clawtoes is obtained by lengthening of the extensor tendons and dorsal capsulotomy of the metatarsophalangeal joints. Since the short extensor to the great toe does not affect the interphalangeal joint, it is necessary to arthrodese this (interphalangeal) joint in the extended position.

In mild cavus, subcutaneous plantar fasciotomy may be sufficient, and for more pronounced deformities a Steindler stripping may be performed. If the correction of the cavus is still insufficient, anterior wedge osteotomy of the tarsal bones may be combined with the Steindler stripping technique. Another procedure in which the disproportion of muscle power may be equalized and which may prevent its recurrence is the Hibbs tendon transfer of the long extensors of the toe to the cuneiform bones (together with plantar fasciotomy).

2. Varus.—Evertor insufficiency caused by loss of power of the peroneal muscles results in a varus deformity. Transference of the tibialis anterior tendon into the cuboid bone is the operation of choice and, according to Campbell, perhaps one of the most uniformly successful of all tendon transferences in the region of the foot.

3. Valgus.—If the tibialis anterior muscle is paralyzed, the action of the peroneal muscles leads to abduction of the fore part of the foot, eversion of the heel and depression of the longitudinal arch. Tendon transference alone is rarely sufficient. To realign the fore part of the foot and restore the normal longitudinal arch, triple arthrodesis is often necessary.

4. Equinovarus.—If paralysis of the anterior tibialis muscle is associated with weakness or paralysis of the peroneal muscles and if the gastrocnemius and posterior tibialis muscles are normal, the foot will be pulled into an equinovarus deformity. Active dorsiflexion may be restored by forward transference of the posterior tibialis tendon.

5. Calcaneus.—Weakness or paralysis of the triceps surae or gastrocnemius may produce pes calcaneus. A simple method of correction of plantar flexion has been recommended by Bickel and Moe.[3]

After-treatment.—As a rule, the after-treatment of tendon transferences is as follows: The foot is held at a right angle and placed in a boot cast. If the operation has consisted of tendon transference alone, the cast is bivalved at the end of three to six weeks and physical therapy is started. At the end of six weeks, an ankle brace is fitted with a catch to prevent plantar or dorsal flexion. At night and between exercise periods, the back half of the bivalved cast or splint is worn to keep the foot at a right angle.

If tendon transference was associated with arthrodesis of the foot, muscle re-education and physical therapy are delayed for eight to twelve weeks.

CANCER OF THE TONGUE

ARNOLD J. KREMEN, M.D.
Minneapolis, Minnesota

CANCER of the tongue poses the most pressing therapeutic problem of all intraoral cancer. Although in terms of incidence it is not the most common cancer in the area, it causes more deaths than any other cancer of the head and neck. Reports of highly selected early cases of cancer of the tongue suggest cure rates as high as 56 per cent.[2,5] However, most clinics reporting their over-all results observe five-year survival rates in the area of 14 to 28 per cent.[1,3,6] Survival falls off even more precipitously in those cases with involved regional lymph nodes so that under these circumstances Gibbel, Cross, and Ariel[3] were able to report only a 4.6 per cent survival rate, and Sir Stafford Cade[2] a 9.2 per cent five-year survival.

Radiation, cautery excision or conventional surgical excision of the primary growth have all had their advocates. For permanent control of metastatic cancer to the regional cervical lymph nodes, however, there is broad agreement that radical neck dissection is the procedure of choice. For the most part these modes of therapy have been applied in a discontinuous fashion with attention being directed to the cervical glands only after the primary growth had been treated with reasonable assurance of permanent eradication. In 1948, I first attempted, and subsequently published,[4] a technique of surgical management of cancer of the tongue which applied classical concepts of cancer surgery to this lesion; namely, a primary combined en bloc resection of the tongue, floor of the mouth and cervical lymphatics. To date twenty-three patients have been operated upon by the technique described. This communication concerns itself with an investigation of the findings and subsequent course of these patients. It should be stressed that additional time is necessary before a final appraisal of the results can be arrived at. However, evaluation at this time seems appropriate to assess the achievement to date.

Material

All cases of tongue cancer seen by the tumor clinic and staff at the University of Minnesota since June, 1948, that were deemed suitable for surgical care were operated in the fashion described. Criteria for operability were as follows:

1. That the lesion be confined to one-half of the tongue and/or floor of the mouth and did not grossly extend beyond the midline.

2. Lesions arising primarily in the base of the tongue were excluded since these are highly undifferentiated growths and are ordinarily quite radiosensitive. Moreover, satisfactory reconstructive techniques after sacrifice of the base of the tongue are not as yet available. However, resections as far posterior as the epiglottis have been carried out in this group of patients.

3. Clinical evidence of regional lymphatic involvement was not looked upon as a contraindication unless the nodes were massively enlarged, agglutinated and fixed.

4. Age in itself was no contraindication. Four of the patients were over seventy years of age.

Lymph Node Involvement

If cancer in any site is to be treated surgically it is desirable that a complete excision of the regional lymph draining area be effected at the time of definitive therapy if at all possible. This concept as applied to cancer of the tongue has been the subject of considerable debate. Martin and associates[5] have stated that over 60 per cent of unselected cases of cancer of the tongue metastasize at some time during the course of their disease. However, the same author noted in a highly selected group of cases of cancer of the tongue who had no demonstrable cervical metastases at the time of therapy and in whom the lesion remained permanently controlled, that only 22 per cent later exhibited metastatic cancer. On the other hand, Roux-Berger,[7] in 1949, reported a study on 173 patients with cancer of the tongue who had radical neck dissections when there was no clinical evidence of cervical gland envolvement. In this series he was able to dem-

Presented before the Minneapolis Surgical Society, November 6, 1952.

From the Department of Surgery of the University of Minnesota and the University Surgical Service of Mount Sinai Hospital, Minneapolis, Minnesota.

onstrate metastatic cancer microscopically in eighty-one patients or 46 per cent of the group.

In the present study fifteen of the twenty-three patients had no clinical evidence of lymph gland involvement at the time of surgery. In six of these fifteen cases, or 40 per cent, it was possible to demonstrate metastatic lymph node involvement on routine microscopic study of the specimens. Since these specimens were not studied by a serial section technique, this 40 per cent is a base line figure and in actuality the incidence of metastases may be considerably higher. Saphir and Amromin,[8] in 1948, studied by serial section thirty cases whose axillary lymph nodes were removed by radical mastectomy and were reported as negative on routine pathologic study. By the enormous labor of serial section examination, they were able to demonstrate nests of cancer in the lymph nodes of ten specimens or 33 per cent of cases judged to be negative on routine sampling of the specimen. In the light of our experience with cancer of the tongue showing that at least 40 per cent of clinically negative cases have metastatic involvement, it would appear that radical lymph node dissection should be an integral part of any plan of treating cancer of the tongue surgically.

There were eight cases in this series where physical examination revealed enlarged palpable submaxillary or cervical lymph glands which were considered clinically to be involved with metastatic cancer. On microscopic examination of these specimens, five of eight cases, or 62 per cent, revealed cancer in the lymph nodes. This experience is similar to that of operable cancer of the breast when the axillary nodes are felt clinically to be involved.

Results

To date there have been five recurrences noted in the entire group of twenty-three patients who probably will, or already have, died of their disease. Only one of these recurrences has been in the oral cavity; the others have all been in the neck. All of these patients had positive lymph nodes.

Table I shows that the average number of months to the appearance of recurrence was ten months. However, this figure is overbalanced by the one case that went twenty-one months. Four of the five cases had evidence of recurrence by six months after the operation or earlier.

TABLE II.

No. of Cases	Month Since Surgery	Status
1	40	l & w
1	32	l & w
2	28	l & w
3	24	l & w
1	18	l & w
1	12	l & w
3	less than 12	l & w
Total 12		

Of the entire group of twenty-three patients, seventeen, or 74 per cent, are living and free of demonstrable disease. Five developed recurrent disease and one died postoperatively of unexplained fever. Nineteen patients had been operated upon over a year prior to the period of evaluation. Of these, thirteen, or 68 per cent, are living and free of demonstrable recurrence.

In the eleven patients with histologically positive lymph nodes, six are dead or living with a recurrence (including one postoperative death). Five patients are alive and well forty-eight, thirty-three, eighteen, twelve and ten months from the time of their operation. Of the twelve with histologically negative lymph nodes, all are alive and free of recurrence. The number of patients living and well and the time from operation to their last evaluation are shown in Table II.

Discussion

The operation as described has been shown to yield acceptable cosmetic and functional results. There has been some difficulty with speech in the early postoperative period but after a period of adjustment these people have regained sufficient proficiency to be able to converse satisfactorily. Most of those that had been gainfully employed were able to return to their previous duties. Similarly the ability to eat and swallow poses a problem in the early postoperative period. However, with time they have been able to take enough by mouth to satisfy both their nutritional requirements and their gustatory desires with minor restrictions.

Transection of the mandible, to provide the exposure necessary to do an adequate incontinuity operation has not posed any problem. Accurate coaptation of the severed mandible with stainless steel wires placed through drill holes, leads to prompt healing of the bone with preservation of the mandibular arch. This technique is designed for management of cancer of the tongue where involvement of the mandible is not a consideration. If one suspects that the mandible is invaded by the tumor, the bone should be sacrificed without question and removed en bloc with the rest of the specimen. However, in the usual case of cancer of the tongue, the lesion is well away from the mandible and its sacrifice is unnecessary and unjustified. It is transected and retracted to provide exposure and permit an en bloc excision of the primary lesion and the cervical lymphatics and then is returned and fixed in position to preserve the contour of the face.

Summary and Conclusions

1. Twenty-three patients have been operated upon for cancer of the tongue in the fashion described. There was one postoperative death.

2. Of the entire group of twenty-three cases, seventeen, or 74 per cent, are alive and well. Of nineteen cases treated from one to four years ago thirteen, or 68 per cent, are alive and free of recurrence.

3. From this preliminary appraisal of results, which is too early for final conclusions, the results appear encouraging and strongly justify continuation of the study.

SOLITARY NONPARASITIC CYSTS OF THE LIVER

DAVID GAVISER, M.D.

Minneapolis, Minnesota

SOLITARY nonparasitic cysts of the liver are rarely encountered, but are not uncommon. Up to the present time 196 cases of solitary nonparasitic cysts of the liver have been reported. In 1929, Stoesser and Wangensteen[12] reported the presence of 102 recorded cases in the literature, and added two cases of their own. In 1937, Davis[7] presented an extensive study of nonparasitic cysts of the liver and reported the existence of 187 recorded cases in the literature, to which he added an additional case. Ochsner[11] reported a case in the same year. Jennings and Attix[2] each reported an additional case in 1939, and Montgomery[9] added two cases to the existing number in 1940. Monroe[10] reported a case in 1942. Caravati[5] added a case in 1950, and Abolfathi,[1] added another case in 1951, bringing the total to 196. At this time, I am reporting a patient who came under my care, and through the courtesy of Drs. O. H. Wangensteen and F. John Lewis, I have the privilege of reporting two additional patients who were operated upon at the University Hospital. In only three previously reported cases has a correct preoperative diagnosis been made.

Case 1.—The patient, a fifty-one-year-old white woman, was admitted to the hospital on October 3, 1952, with the history that five days prior to admission she had developed a pain in her lower abdomen. On the following morning the pain shifted to the right upper abdomen and remained there. The pain was quite severe and aggravated by breathing and movement. There were no other associated symptoms. The patient had no chills or fever. The aching pain in the right upper quadrant of the upper abdomen persisted without any appreciable change. On the morning of her admission there was some diminution in the severity of her pain.

In May of 1952, the patient had felt tired and generally run down and consulted her private physician who found what appeared to be an enlarged liver. Colon study, gall-bladder study as well as gastrointestinal x-ray were done at that time and were reported as normal. The liver was reported as being enlarged.

Physical examination at the time of admission revealed marked tenderness in the right upper quadrant with muscle spasm and rigidity. There appeared to be a tender mass lateral to the midline on the right side below the costal margin and about 4 cm. from the midline. The mass appeared to be about 2 cm. in diameter and felt as though it was within the abdominal cavity. The liver appeared to be greatly enlarged extending down to the umbilicus and across to the left costal margin. The surface of the liver felt smooth and the edges sharp and firm. The liver itself did not appear to be tender. The spleen was questionably enlarged below the costal margin. The patient was seen in consultation by an internist, and it was the clinical impression that a cirrhosis could possibly account for the hepatomegaly and splenomegaly. The possibility of a metastatic lesion to the liver had to be considered since there was a mole on the dorsum of the left hand. (The lesion on the left hand was biopsied and proved to be a benign blue nevus.)

X-ray examination on admission: chest, right diaphragm enlarged; heart and lungs, normal (Fig. 1.) Flat and upright plates of the abdomen showed the right upper quadrant occupied by a large mass which was confluent with the liver or could be a markedly enlarged liver (Fig. 2.) This displaced the hepatic flexure downward. An intravenous pyelogram showed the right kidney displaced downward and rotated. There was no intrinsic lesion within the kidneys (Fig. 3.) X-ray following a barium enema showed the hepatic flexure of the colon displaced medially and anteriorly (Fig. 4a.) Gastrointestinal study showed displacement of the second portion of the duodenum (Fig. 4b.) could indicate that the mass in the abdomen was partially retroperitoneal so as to displace both the kidney and the duodenum.

Due to the presumptive diagnosis of cirrhosis of the liver, the internist felt that a liver biopsy should be done. There was some difference of opinion on this, because it was felt that a liver biopsy would not provide any more information than an exploration, which was contemplated in a few days. However, on the insistence of the internist, the biopsy was attemped in the anterior axillary line below the costal margin. On insertion of the needle, clear fluid was returned through the needle. A total of 600 cc. of clear fluid was obtained. This established the presumptive diagnosis of a solitary nonparasitic cyst of the liver. Examination of the fluid obtained revealed: specific gravity, 1.011; 18 erythrocytes (this was considered due to the puncture), and no leukocytes. There was 1 gram per liter of protein according to the Esbach method. There were no parasites or amebae found. No echinococci were found. On routine culture for bacteria and fungi, no growth was reported after four days. Amylase activity was 0.

Operative Report.—The abdomen was entered through a long right paramedian incision which extended from the xiphoid process to just below the umbilicus. The anterior rectus sheath was incised in the same direction and the rectus muscle was dissected from the sheath and

retracted laterally. The posterior rectus sheath was incised vertically. There was a small mass of infarcted fatty omentum attached to the round ligament of the liver. This accounted for the tender mass in the right upper quadrant felt preoperatively and was possibly due to the displacement of the liver against the anterior abdominal wall. The liver was obviously enlarged. However, the cyst was not immediately visible. The palpation of the right lobe of the liver revealed the presence of the cyst high up under the costal margin. The liver was retracted downward and medially and a large cystic area which was confluent with the remaining surface of the liver was found occupying the superior, lateral, and posterior surface of the right lobe of the liver. The surface of the cyst was smooth, shiny and had a bluish appearance. Coursing within the wall of the cyst were many dilated veins. The site of the previous puncture of the cyst was a bare 0.5 cm. from the edge of the cyst. The exploration of the remainder of the abdomen revealed no abnormality. There were no cystic changes in the pancreas, kidneys, or spleen. It was obvious because of its position high under the costal margin that any attempt to marsupialize the cyst or drain it would be impossible. An attempt was then made to establish a cleavage plane between the cyst wall and the surrounding liver. Because it appeared that this would be difficult, it was decided to empty the cyst of its contents. An incision was made into the cyst, 3 cm. from what appeared to be the cyst wall edge and the contents were aspirated. The fluid was clear and colorless. The inner surface of the cyst was finely trabeculated; 2,000 cc. of fluid were aspirated before the cyst completely collapsed. A good cleavage plane was then found between the liver and the cyst wall and it was possible by mainly blunt dissection to completely excise the cyst. As the dissection proceeded it was found that many large vessels were firmly attached to the outer cyst wall, and these required ligation. Upon completion of the dissection a large defect remained in the liver measuring approximately 16 cm. in diameter. It was possible to obliterate the major portion of the cavity by suturing the thinned out areas of liver surrounding the cyst into the defect, and then approximating the remainder of the liver to itself. A Penrose drain had previously been placed in the depths of this closure. A large Penrose drain was placed above the liver and both drains were brought out by separate stab wounds on the lateral side of the abdomen. The abdomen was then closed in layers. The patient withstood the operative procedure well and left the operating room in good condition.

The pathological report was "large simple cyst of the liver, congenital in origin."

The postoperative course was uneventful except for a persistent low grade fever for two weeks postoperatively.

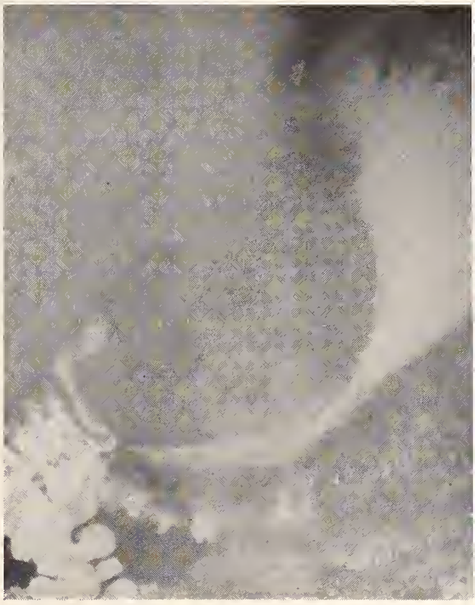

Fig. 5. Gastrointestinal study: a mass pressing on the lesser curvature of the stomach.

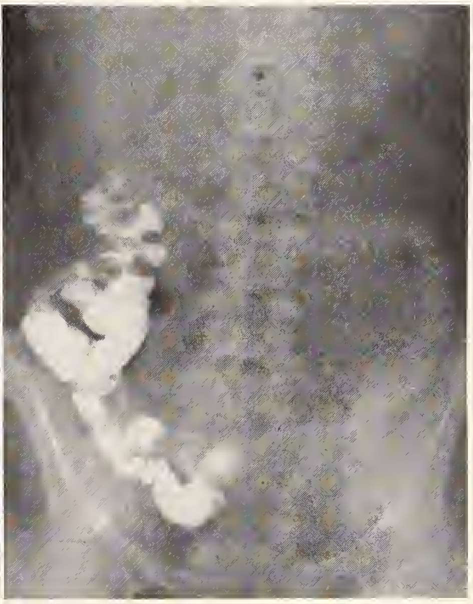

Fig. 6. Colon study: a large oval mass in the abdomen and displacement of the transverse colon.

Case 2.—This forty-seven-year-old white woman was first studied in the Cancer Detection Center because of vague symptoms of upper abdominal distress consisting of gas pains, belching, and slight distention following eating, particularly of fatty and fried foods. On the basis of these findings a cholecystogram and upper gastrointestinal x-ray was done. The cholecystogram was normal. The upper gastrointestinal study, however, showed the presence of a smooth rounded symmetrical defect of the lesser curvature of the stomach and the duodenal bulb (Fig. 5.) This finding suggested pressure from an extrinsic mass. Because of its position and the symmetrical contour of the defect a pancreatic cyst was considered to be the most likely possibility. X-ray examination of the colon showed on the post-evacuation study that the transverse colon was displaced somewhat inferiorly (Fig. 6.) In addition, a large oval shaped mass could be made out in the upper mid-portion of the abdomen. This finding also suggested the presence of a large cyst of the pancreas.

Her past health had been good. In 1928, an appendectomy had been done, and in 1930, a subtotal thyroidectomy had been performed. Her systemic review was entirely negative except for the fatty food intolerance. Physical examination revealed only the presence of fullness in the upper abdomen which was interpreted as the mass in the upper abdomen seen on x-ray. A preoperative diagnosis of pancreatic cyst was made. Due to the obesity of the patient she was placed on a reduction diet prior to the operation.

On July 3, 1950, the patient was operated upon. Through a midline upper abdominal incision and sternal

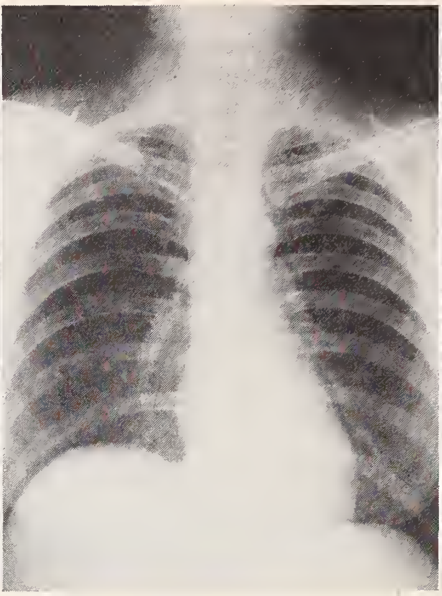

Fig. 8. Chest x-ray shows elevation of the right diaphragm.

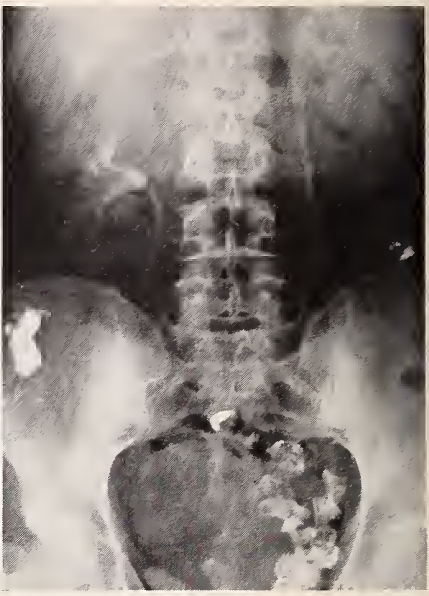

Fig. 9. X-ray of the kidneys shows downward displacement of the right kidney.

splitting incision, the abdomen was entered. It became apparent that there was a large cyst of the left lobe of the liver, largely replacing this portion of the liver. The cyst was then opened and its fluid contents aspirated. Most of the cyst wall right down to the liver edge was then excised. Because of the possibility that this might be a choledochal cyst, the common bile duct was opened and explored to see if there was any communication between the common bile duct and the cyst itself. The common bile duct did not enter the cyst, nor was there any connection with the bile duct itself. Some bile oozed out from the liver edge. In order to circumvent a bile peritonitis, catheters were placed within the defect produced by the excision of the cyst and the defect was closed by coaptation of the liver edges. Penrose drains were also placed within this area, down into the liver substance, and the catheters and Penrose drains were brought out through a stab wound in the abdominal wall. A T-tube was left in the common duct and brought out through a separate stab wound. The sternal incision was closed with stainless steel wires and the abdominal wall with interrupted silk.

On the following day the patient appeared to be quite dyspneic. X-ray examination revealed the presence of a pneumothorax on the right. There was subcutaneous emphysema over the right side of the chest and the anterior surface of the neck. Thoracentesis was done through the right third inter-space anteriorly and 700 cc. of air was removed.

The patient improved clinically after the aspiration of the chest. X-ray showed full expansion of the right lung. The T-tube and the drains were removed by the fourteenth postoperative day and the patient was discharged on the following day. The aspirated fluid was not subjected to analysis. The patient was last seen on August 14, 1951, and then had no subjective complaints or abnormal objective findings.

Pathological report was "benign non-parasitic cyst of the liver."

Case 3.—This fifty-six-year-old white woman came to the Cancer Detection Clinic on July 5, 1951. During the course of the routine examination a mass in the pelvis was found. The patient was then referred to the gynecologic clinic, having previously been a patient at the University Hospital.

Her past health had been poor. She had had an appendectomy in 1921. She had suffered from a migraine type of headache and also complained of intermittent abdominal distress. ' She had suffered frequently from backache and lower quadrant distress. In 1950, an x-ray diagnosis of duodenal ulcer had been made. In 1926, the patient had had an episode of painless jaundice which was not diagnosed. She also complained of nocturia and urinary frequency. Her last menstrual period was in 1944, when x-ray sterilization had been done for abnormal menstrual bleeding. She had had no bleeding or discharge since that time.

Physical examination revealed tenderness in the right lower quadrant. On pelvic examination a firm mass about the size of an orange lay behind the uterus and could not be separated from the fundus. The mass extended into the cul de sac and was somewhat mobile. The right ovary appeared somewhat larger than normal; the left could not be separately felt. The clinical impression was the probable presence of a left ovarian tumor.

X-ray examination of the colon was done and this showed some deflection of the lower sigmoid to the left as by a pelvic mass (Fig. 7.) There was likewise downward displacement of the hepatic flexure of the colon and there was a suggestion of a mass present in the right upper quadrant. Chest x-ray showed the right hemidiaphragm somewhat elevated (Fig. 8.) An intravenous pyelogram showed that the right kidney was lower than normal (Fig. 9.) The conclusions from the x-ray examinations were that the liver was enlarged, elevating the right diaphragm, and seemed to be depressing the right kidney somewhat. There was also a mass in the mid-line of the pelvis which displaced the left ureter laterally and depressed the superior aspect of the bladder.

On July 17, 1951, the patient was operated upon by the gynecologic service. Exploration of the abdomen revealed a large cyst of the right lobe of the liver. The remainder of the liver, the spleen, and kidneys were normal. Examination of the pelvis revealed the left ovary completely replaced by a large cystic mass. The right ovary was likewise involved. A hysterectomy was done for bilateral serous cystadenocarcinoma of the ovaries.

The patient was then treated postoperatively with x-ray therapy to the pelvis. Because the cyst of the liver appeared to be asymptomatic and because of the presence of the malignancy in the pelvis, nothing further was done to the cyst of the liver. The patient was followed in the surgical and gynecologic out-patient departments. During this period she began to complain of increasing right upper quadrant pain unrelated to meals. A cholecystogram and upper-gastrointestinal series showed no evidence of abnormalities.

Although it was not felt that the cyst of the liver was the cause of her distress, she was admitted and subjected to abdominal exploration on December 12, 1951, with the idea in mind of removing the cyst of the liver. Exploratory laporatomy revealed no evidence of recurrence in the pelvis of the serous cystadenocarcinoma. A large cyst occupying the major portion of the right lobe of the liver was found. A wall of the cyst was thin and translucent. The cyst was evacuated of 1700 cc. of clear colorless fluid. The cyst was unilocular and occupied the anterior surface of the right lobe of the liver and extended down to the right border of the gall bladder. The postoperative course was uneventful and the patient was discharged on her sixth postoperative day.

Pathological report was "benign cyst of the liver."

Discussion

Nonparasitic cysts of the liver occur either as single or multiple cysts. Multiple cysts occur in the liver alone, but are usually associated with cysts of the pancreas, kidney, spleen, lungs and brain. Monroe (Sonntag)[10] suggested that cystic disease and solitary cysts of the liver were but different variations of the same disease. No definite proof of this contention has been produced. Stoesser and Wangensteen[12] stated, "It is generally accepted that the solitary cyst in nonarteriosclerotic kidneys is but another expression of polycystic disease." A corresponding similarity would appear to extend to the manifestation of the disease in the liver. In several cases reported of solitary cysts of the liver, there have been small cysts in the proximity of the large cysts. This contention is a debatable one and in most reports the two conditions have been reported as separate entities. Monroe[10] feels that until more is known about the solitary cysts of the liver, these two conditions should be treated as separate entities. The incidence of the disease is higher in women and is roughly three to four times as frequent as in men. Solitary nonparasitic cysts of the liver have been observed at all ages. The oldest case was that of a man aged seventy-five years of age reported by Bland-Sutton.[3] The contention that these cysts are congenital in origin is substantiated by their occurrence in the new-born. Witzel[13] reported a case of a large liver cyst in the new-born which complicated labor. Other investigators have reported similar instances. The cysts are more commonly found in the anteroinferior portion of the right lobe of the liver. The quadrate lobe and the left lobe are sometimes involved and with less frequency the central portion of the liver. The size of the reported cysts and the amount of liver destruction present have varied considerably. Some of these cysts reported have been microscopic and others have filled the entire abdomen. Cousins[6] reported a cyst of the liver which contained 2.5 gallons of clear yellow fluid. The external surface of the cyst is usually smooth, shiny, and grayish-blue in color showing many dilated veins. The internal surface may be finely trabeculated. The thickness of the cyst wall is variable, being reported as varying from 0.5 mm. to 2 cm. in thickness. The microscopic appearance of the wall according to different authorities consists of three layers of connected tissue. An inner layer rich in cellular element, a circularly arranged dense layer poor in cell nuclei, and containing a few blood vessels with thickened intima, a loose outer layer with elastic fibers, muscle bundles rich in cells, many blood vessels, and bile ducts. The cyst is lined with cubical, cylindrical, or flat cells, but the epithelium is much desquamated. The bile ducts found in the wall of the cysts are usually lined with the same kind of epithelium which lines the cysts. The fluid contents of the cysts vary from a clear watery, sometimes yellow-brown fluid, having a specific gravity varying from 1.007 to 1.024, to a semi-solid material resembling an organized clot. The cyst fluid may contain albumen, mucin, cholesterol, blood and occasionally bile. Boyd[4] explained the presence of bile in some cysts by stating that as the cyst increased in size, large bile ducts ruptured into the cysts, their walls being destroyed by pressure. The etiology of solitary nonparasitic cysts, however, is unknown. Monroe[10] quotes the classification of Sonntag as being the most generally accepted.

A. Blood and degenerated cysts
B. Dermoid cysts
C. Lymphatic cysts due to obstruction or to congenital dilation of the lymphatic
D. Endothelial cysts
E. Cysts due to bile duct obstruction
F. Proliferative cysts (cystadenoma)

No classification of nonparasitic cysts of the liver has yet been presented which has found general acceptance. This may be due to the fact that there is a discrepancy in regard to the pathological interpretations of the histological findings.

Clinical Findings

There are a few identifying symptoms or signs which would lead one to suspect the presence of these solitary cysts. This may be due to the fact that these cysts grow so slowly that the abdominal contents accommodate themselves to their presence. Many of the cases remain asymptomatic and are discovered incidental to the investigation of other suspected or actual intra-abdominal disease. Others may present themselves with painless abdominal swelling. Mild gastrointestinal symptoms such as nausea, occasional vomiting, and diarrhea have been reported. It appears that pain directly related to the cysts is an uncommon complaint. In those cases in which pressure from the cyst has resulted in extrahepatic obstruction, biliary tract symptoms and jaundice have been the presenting complaints. Very few of these solitary cysts of the liver have been recognized clinically, most having been mistaken for cysts of other abdominal organs, that is, ovarian cysts, mesenteric cysts, hydrops of the gall bladder, pancreatic and renal cysts. When symptoms were present they were due either to pressure, tortion of the pedicle or rupture of the cysts.

Most observers feel that diagnosis preoperatively is almost an impossibility. Abdominal swelling is probably the most frequent pathognomonic sign. The presence of a mass in the upper abdomen is extremely suggestive. The roentgenologist may be of considerable aid in the establishing of a diagnosis. Large tumors of the liver depress the hepatic flexure of the colon. With neoplasms of the kidney, the colon usually lies over this swelling. Intravenous pyelography may reveal the downward displacement of the kidney by an enlarged liver. Gastrointestinal study may show the displacement of the kidney to the left of and anteriorly to the duodenum as well as evidence of external pressure on the lesser curvature of the stomach. Ordinary chest x-ray may show elevation of the diaphragm if the liver is sufficiently enlarged.

Treatment

The only satisfactory treatment for solitary cysts of the liver in which relief is required is surgical intervention. Complete excision of the cyst should be attempted if feasible. Frequently this procedure cannot be done without jeopardizing the patient. Marsupialization or just simply drainage has been reported as producing very satisfactory results.

Summary

Three cases of solitary nonparasitic cysts of the liver have been presented. These cysts are obscure in their origin, appear to be congenital in nature, occur more frequently in women, seldom give rise to any symptoms except as they exert pressure on the adjacent organs. They occur more commonly in the anteroinferior portion of the right lobe of the liver and in this position x-ray findings of downward displacement of the right kidney and medial displacement of the duodenum may suggest the diagnosis. Large cysts of the left lobe may simulate a pancreatic cyst in the x-ray findings. The correct preoperative diagnosis is rarely made. Only three cases have been previously reported in which the correct preoperative diagnosis was made. The last reported case in the literature where a correct preoperative diagnosis was made was by Caravati when during the performance of a punch biopsy of the liver, the cystic cavity was entered. In the case which came under my care, a similar fortuitous circumstance occurred. Surgical treatment consists of removal of the cyst when the nature of the attachment permits, marsupialization, or simply drainage if excision is not feasible.

THE USE OF THE KUNTSCHER NAIL FOR FRACTURES OF THE FEMORAL SHAFT

DANIEL J. MOOS, M.D.
Minneapolis, Minnesota

SURGEONS have been disappointed so often by the end results of new spectacular techniques that it is indeed refreshing to review a subject that leaves one more enthusiastic than seemed possible at the initiation of the method. In the fall of 1944, intramedullary nails used in the treatment of fractures in the femoral shaft first came to the author's attention. These nails had been used in Germany in Prisoner of War Camps and seemed to us at the time to represent a dangerous method of treatment which was perhaps dictated by the necessities and lack of facilities incident to wartime. The sharply ingrained dictum of adequate immobilization of fractures after any type of internal fixation tended to induce rejection of this concept which allowed free motion of the fractured extremity postoperatively with full weight bearing.

Precedents of the past, of course, amply supported a pessimistic attitude. The pendulum of popularity following Lane's description[5] of internal fixation had already swung back almost to the point of the method's disrepute when the introduction of electrolytically inert metals[6,8] plus realization of the necessity for co-existing external immobilization again revived the employment of an essentially sound technique. With the spectre of wasted muscles and stiffened joints which so often follow long-continued immobilization in plaster, reminding us constantly that normal active motion in a fractured extremity would be extremely desirable, further examination of Kuntscher's method[4] seemed to be indicated.

Hey Groves[3] in 1918 described intramedullary fixation of several complicated fractures in the femoral shaft by the insertion of massive metal nails into the medullary canal. For this purpose he devised tubular, cruciform and solid nails placed by a surgical technique quite similar to that employed today. His results were poor probably not through fault of the method or technique but rather in the selection of cases which were severe, badly infected compound wounds of war, which may well have proved refractory to any method of therapy. We hear no more of the method as applied to fractures in the femoral shaft until Kuntscher,[4] in 1940, described the use of a clover leaf shaped hollow metal rod inserted over a guide through the greater trochanter down the medullary canal of the proximal and distal femoral fracture fragments. His method necessitated prolonged fluoroscopy or multiple x-ray film control for closed reduction of the fracture and blind insertion of the nail. Bohler[1] of Vienna immediately adopted the technique and devoted a volume of his book to the use of intramedullary nailing not only in femoral fractures but in fractures of the other long bones. Prominent in the reports of Kuntscher[4] and Bohler[1] was the ever present fear of complicating infection associated with surgical exposure of fractures. Undoubtedly, during wartime, crowded facilities and inadequate material augmented this danger which for many years has been peculiar to continental European operating theaters. In other parts of the world, surgeons do not share this experience and report the overall incidence of postoperative infection in clean cases to be under 1 per cent.[4] Hazard to operating room personnel and the patient from excessive irradiation due to repeated fluoroscopy or film exposure during reduction of a femoral fracture and blind insertion of a nail is very real. The danger of rupture of the femoral artery should the nail miss the distal segment exists and has occurred. The impossibility of dealing with severely comminuted fractures is readily apparent. Marked interposition of soft tissue cannot be corrected by closed methods. These hazards when compared with the accuracy, safety, and ease of open reduction and insertion of the nail under direct vision indicate the open technique to be the method of choice. With the modern surgical complements of controlled anesthesia, blood transfusion, proper instruments and antibiotic drugs, experienced surgeons can approach this procedure with confidence. So again we see an old method which was abandoned

Read before the Minneapolis Surgical Society, November 12, 1952.

because of improper application rise in popularity to a point where its employment must be considered in all cases of fracture in the shaft of the femur.

In considering the various indications for the use of the intramedullary nail in the femur, it is necessary to be concerned with the anatomical characteristics of that bone which relate to the mechanical problem of insertion of a Kuntscher[4] nail. The most pertinent factor is the transverse diameter of the medullary canal at different levels in the femur. For all practical purposes, we may consider it broad in the upper and lower thirds and in the mid portion to narrow down to the so-called isthmus. It is at this point that the nail to be inserted must have snug clearance. It is precisely at this point also that fractures are most amenable to firm fixation by the nail. Average transverse diameters of femoral medullary canals in their narrowest portion are about 10 to 11 mm. They vary, however, from 8 to 15 mm. and must in every instance be determined preoperatively by careful measurement of the uninjured side. A description of these methods of measurement will be included in a later paragraph. Stability is afforded the nail and concomitant additional fixation of the fracture also occurs at the point where it passes through the cortex of the greater trochanter. From the foregoing we may state that in all cases the nail may be very firmly fixed in the upper two-thirds of the femur. It then follows that fractures present in the upper two-thirds of the femoral shaft may be suitable for this type of fixation and that fractures in the lower third of the femur are unsuitable because of the inability of the nail to afford firm fixation in the broad flaring medullary area there. Therefore, transverse or short oblique fractures from the subtrochanteric region to the lower third of the femoral shaft lend themselves well to this form of internal fixation. Comminuted fractures in the same region provided they may be reconstructed are not a contraindication. Firm fixation of large loose pieces is accomplished after reduction and fixation of the two major fragments with the nail by insertion of tangential screws through the cortical portion of the femur. Segmental fractures in which two to three inches or more of the femoral shaft may be displaced as a separate fragment are well treated in this way especially because remaining periosteal attachments can be allowed to remain undisturbed thus aiding in maintainance of viability of the segment. As a matter of fact segmental and comminuted fractures with marked displacement of fragments represent extremely difficult problems of management which are greatly simplified by this technique. Pathological fractures from primary or metastatic malignancies often doom their hosts to enforced bed rest and traction throughout the few months which remain to them. Firm intramedullary fixation of these fractures allows the individual to be ambulatory in a pain-free fashion thus solving a most distressing problem. Healing of this type of fracture occurs at the usual rate as well demonstrated in *Case 3* (Table I) (Fig. 3). Obviously in primary malignancy of bone without demonstrable metastasis in which pathological fracture has occurred, appropriate attempts at curative therapy should be employed. It is the opinion of the author that dissemination of malignant cells by the intramedullary nail in the individual with a pathological fracture through an area of metastatic malignancy is an entirely academic question which is of no importance in relation to the practical problem which such an individual presents. Fractures through bone cysts are well treated by the Kuntscher[4] nail with or without curettage and placement of bone grafts as may seem indicated. In fragilitas osseum intramedullary nailing has been employed for therapy of the fracture at hand and as prophylaxis against future fractures. Epileptics with femoral shaft fractures are advantageously treated by Kuntscher's method.[4] When individuals who have sustained bilateral fractures of their femoral shafts are treated in this way, they escape the long trials of traction, suspension, or heavy spica casts which are usually associated with severe disability in the soft tissues of both lower extremities from the long continued immobilization. Multiple fractures in the same individual can be handled in far simpler fashion if the femoral shaft fracture can be fixed firmly and thereafter handled as if the fracture had not occurred. There are few contraindications. Locally extreme comminution over a distance renders intramedullary fixation insecure. Fractures in the lower third of the shaft cannot be securely fixed by the intramedullary nail. The occurence of local sepsis suggests the use of an alternative method. Compound fractures are successfully handled with the intramedullary nail if one observes the necessary and usual precautions which apply to immediate or delayed open reduction and internal fixation in that type of injury. Individuals who are not suitable operative risks by reason of their general condition are excluded. Age is not a contraindication. However, in childhood, femoral shaft fractures are handled so readily by more simple methods with little resulting disability that one would be reluctant to damage the trochanteric epiphyses or subject the individual to an unnecessary surgical procedure. Fractures in the upper third of the femoral shaft which are notoriously difficult to control because of persistent flexion, abduction, and external rotation deformity of the proximal fragment are particularly suitable for treatment by this method. Finally in view of the generally excellent results obtained in the hands of many different groups, one might add that any fracture in the upper two-thirds of the femoral shaft should at least be given the benefit of consideration of this method. Pseudarthroses and delayed union are treated in satisfactory fashion by intramedullary nailing either with or without supplementary bone grafting. Kuntscher states that even infected fractures with delayed union lend themselves well to this plan of management; however, we would be reluctant to employ this procedure under those circumstances. From the foregoing it is apparent that the indications are broad and undoubtedly encompass a far greater array of femoral shaft fracture problems than any other single method hitherto used.

We object to the closed method of insertion of the nail under radiographic control for reasons outlined previously. In a suitable candidate, general preparation is carried out by appropriate sterile preparation of the thigh and groin for twenty-four hours preoperatively. In many instances a Kirschner wire will already have been inserted in either the tibial tubercle or distal femur. This may be left for traction if needed during the operation. General anesthesia in a light plane employing sodium pentothal, nitrous oxide and oxygen, supplemented by 1 per cent novocaine directly infiltrated over the fracture site is used. The patient is placed on the sound side supported by sand bags on the regular operating table. Special thigh holders for the fracture table have been devised and are useful but not necessary. Prior to the day of surgery, a Kuntscher nail of known diameter is strapped to the lateral aspect of the sound thigh in the same plane as that in which the femur lies and x-ray films made with whatever technique yielding the least distortion, that is available. The isthmus of the medullary canal is then carefully measured and likewise the diameter of the nail as projected on the x-ray film. With the actual nail diameter known calculation of the exact size of nail to use can readily be done. It is advisable to leave about 1 mm. for clearance in order to obtain a snug fit. Proper nail length is calculated in the same way. After suitable preparation of the skin and application of sterile drapes to the lower extremity in such fashion that it may be moved freely in any direction, the fracture is exposed through an anterolateral incision between the rectus femoris and vastus latralis muscles with division of the relatively avascular and small vastus intermedius. This approach to the femur can be almost bloodless and in our experience is far less likely to produce shock than the rather brutal lateral muscle splitting incision. The fracture is identified and mobilized by minimal periosteal stripping. The proximal segment is elevated to the surface of the wound. This is aided by adduction of the thigh distal to the fracture. At this point it is well to temporarily insert the selected nail into the medullary canal especially if the fracture is near the isthmus, as a last check for size. In extremely small medullary canals a reamer of appropriate diameter may be used for enlargement to proper size and in very large medullary canals two nails may be interdigitated in such fashion that a fit may be obtained. In the majority of instances, however, the transverse isthmic diameter will lie between 8 and 12 mm., and more often between 9 and 11 mm. A sharp firm metal skewer 50 cm. long over which the hollow nail readily fits is then passed into the medullary canal of the proximal fragment and driven towards the greater trochanter until it passes through that structure and is palpable beneath the skin of the buttock. This maneuver is facilitated by adduction of the proximal segment at the hip joint.

A note of warning may be sounded at this point in relation to the type of tip which is most suitable for the guide rod. Some are made with a drill point tip—these are dangerous in that they may engage the muscles and fascial planes in the buttock and be deflected up into the back. A sharp spear point is desirable. When the tip of the skewer is palpable under the skin of the buttock, it is cut down upon and allowed to emerge. A cannulated trephine is slipped over the point of the skewer emerging from the buttock and pushed to the greater trochanter which is then perforated to allow subsequent passage of the nail through the cortex. Efforts to pass the nail through this area without preliminary trephining are often successful but may be attended by linear fracture through the upper portion of the femur, therefore, it is deemed advisable not to omit this step. The trephine is then removed, a nail of suitable size slipped over the guide and insertion begun into the medullary canal through the greater trochanter by hammering. As soon as it is apparent that the nail is well started the skewer is removed from below to prevent jamming. The nail is slowly advanced until it is visible at the distal end of the proximal fragment.

A word of caution may be inserted here in regard to the most serious operative complication—namely, impaction of a nail in the medullary canal. Reports indicate that impaction has occurred to a point where extraction or advance of the nail was impossible. Such a problem will not occur if careful preoperative measurements are made. Short temporary retrograde or distal insertion carried out when the fracture is opened readily yields information obviating such a catastrophe. Firm regular advance during final insertion of the nail from above with each hammer blow should occur—if it does not, immediately extract the nail and substitute a smaller size. Stout extraction equipment should always be available in the operating room before this procedure is begun. No nail should be used that does not have adequate provision at its end for attachment of such a device. When the nail has appeared at the end of the proximal segment, the fracture is reduced and the nail driven well down into the distal segment to a point one inch above the articular surface of the knee. It is not advisable to leave more than one-half inch of nail protrude from the greater trochanter for motion of the nail in that region produces bursae which may calcify, distend with fluid, and form rice bodies. A check roentgenogram will at this time prove valuable in determining nail length.

If one is dealing with a comminuted fracture, reduction of the fragments with as little detachment of periosteal attachments as possible should be carried out before the nail is inserted past that area. Firm fixation with screw clamps during passage of the nail followed by insertion of cortical screws for maintenance of position secures good architectural relationship of all fragments. The operative wound is closed, sterile dressings applied, the Kirschner wire removed, if present, and the patient returned to his bed with no additional support. If fixation is precarious because of factors beyond control of the operator, suspension in a Thomas splint is advisable. As experience with the method increases, it becomes apparent that the need for external support rarely exists unless one is dealing with a fracture situated extremely low in the femur. In fractures which are not comminuted and are in the upper two-thirds of the femur, regardless of their obliquity, immediate ambulation is initiated. In communicated fractures or those low in the femur, consideration should be given to modification of the above program. Active exercises of all joints through all planes of motion is mandatory and in fact it is precisely because of this and the safety of immediate full weight bearing that the whole procedure gains its value. Antibiotic therapy is a valuable supplement especially in compound fractures either old or new. As is well known, substitution of antibiotic drugs for sound surgical principles invites disaster. In uncomplicated cases, hospitalization need not exceed seven to ten days.

Theoretical and actual complications of this method of treatment should of course be avoided by intelligent management. Infection has not been a problem in this series of cases. In case number eleven, very slight drainage appeared in the left thigh after the third month which subsequently ceased following extrusion of some bone chips which had been placed about the fracture at the time of fixation. In a previous paragraph, the dangers of improper nail size were discussed. Injury to the patient or attendants may ensue from careless exposure to x-rays during a closed nailing. Similarly, injuries to vital structures may occur during blind nailing. Extrusion of the nail has been reported finally necessitating a small cross screw to hold the intramedullary nail in place. Breakage of the nail at the fracture site as the result of improper construction of the nail has been reported. Violent injury to the nailed femur has resulted in bending of the nail with angulation at the fracture site. In the cases reported, manipulation of the femur resulted in correction of the deformity in both nail and femur.[7] Atrophic thin bone may allow the nail to drive through the cortex of the distal segment. A nail which protrudes too far from the greater trochanter interferes with gluteal function and often forms a painful calcified bursa. This latter complication was noted in four cases in this series and necessitated removal of the nail in each instance. With the exception of minimal drainage in *Case 11* and painful gluteal bursa formation in *Cases 14, 10, 9, and 4* (Table I) no complicating factors relative to the operative procedure were encountered in this group of patients. The question of fat embolism from marked interference with the bone marrow has been a theoretical question raised by many.

The only individual in this series with demonstrable fat embolism developed it in the classical manner twenty-four hours after his initial injury *(Case 14,* Table I, Fig. 2). The severity of his symptoms due to this complication prevented insertion of a Kuntscher[4] nail for twenty-two days. The circumstances under which evidence of fat embolism was discovered were fortuitous because this patient had already been taken to the operating room where the presence of slight hypotension before the procedure started initiated further examination which revealed conjunctival petechiae, mental confusion, and diffuse pulmonary physical and radiographic signs compatible with fat embolism. How tempted would we have been to report fat embolism as a complication of intramedullary nailing had the procedure been completed that day!

Is it feasible to leave these massive foreign bodies in place indefinitely? At the present time, that problem is solved by experience relative to other buried prosthetic appliances which dictates removal only if their presence is detrimental to the host after their initial function has been accomplished. Nails, therefore, have been removed to date on four of these patients. The indication for removal in each instance has been the formation of a painful calcific bursa in the gluteal region. One must recall that electrolytically inert metals are universally used for making these nails and that there has been no evidence of reaction in the host bone in any instance. Extraction, of course, is not indicated until adequate bony union has occurred. It is readily accomplished at that time by exposing the proximal end of the nail which is easily palpable in the buttock through a one-inch incision and pulling the metal out. In our experience removal has been readily accomplished with slight traction using only a Kocher forcep. The bursae present probably should be excised although we know of one instance, *Case 14* (Table I), where spontaneous resolution took place following removal of the nail without excision of the bursa.

Fifteen patients in whom sixteen Kuntscher[4] type intramedullary nails (Table I) were inserted for treatment of femoral fractures have been reviewed. The patients ranged in age from sixty-four to eighteen. Ten men and five women were treated. Two compound fractures, both of which united uneventfully with no evidence of sepsis in bone or soft tissue are included in this group. Two pathological fractures, one secondary to carcinoma of the breast, and one associated with a primary sarcoma of the femur with multiple metastases were immobilized by intramedullary fixation with Kuntscher nails. One epileptic, a patient with a transverse fracture through the mid femur is included. Two individuals with segmental fractures of the femur, one in the upper third and the other at the juncture of the lower and middle thirds, both obtained excellent results with survival of the large detached femoral fragments. Bilateral femoral fractures occurred in a thirty-five-year-old woman in whom several other severe injuries were present. This operative procedure after two months was followed by sinus formation in the left thigh with slight drainage which ceased after several bone fragments were extruded that had previously been introduced as grafts. Four closed transverse fractures in the middle third of the femur were electively treated by this method as well as three oblique comminuted fractures, one of which was in the upper third of the femoral shaft in a below-the-knee amputee.

The postoperative day on which patients were allowed to bear weight varied from the second to the sixtieth. This great variation was due in large part to the high incidence of associated injuries and to a lesser degree in certain cases because of instability in those fractures occurring low in the femur. One must also add to this in the early portion of the series a certain reluctance on the part of the surgeon to throw caution to the winds and allow full weight bearing with complete reliance on a new untried method.

TABLE I

Patient	Age	Sex	Site and Type of Fracture	Post-operative Day of Ambulation without Weight	Weight Bearing Days Postoperative		Callus by X-Ray Days Postoperative		Complications	
					Partial	Full	First Seen	Adequate for Weight Bearing	Operative	Postoper
1. O.P.	57	M	Left simple transverse midshaft comminuted	2	82 (against advice)	131	15	150	Loose fragment difficult to reduce. Once reduced, felt secure so no screw used for fixation	Ileus loose slipped 10 Placed in sion till postoperat
2. E.K.M.	64	F	Left simple transverse mid-shaft	4	10	30	20	162	None	None

At present it can be stated that in the absence of severe comminution, or site of fracture in the lower third of the femur, weight bearing can be started as soon as the patient's general condition permits. Study of the rate at which union took place in these fractures is interesting because one of the criteria upon which clinical union of a fracture is judged, namely, stability, was unreliable because of the presence of the immobilizing nail. Similarly tenderness of the callus elicited by springing the fracture failed to assume its usual significance. From a practical standpoint, the exact time of bony union sufficient to bear weight was of little importance because all patients walked well long before this time. In an effort to establish the healing rate, the appearance of enough well calcified callus bridging the fracture capable of bearing weight with no support either internal or external was designated as the time of the union. Difficulty in determining the exact day of union appeared insurmountable because x-rays in almost serial fashion every two to three weeks would have been necessary. It must also be understood that these determinations of union time in femoral shaft fractures treated by this method are conservative and err on the side of marked callus formation. With these things in mind one must accept the given time as an approximation only. It would be possible to state, however, that by the fifth month, union had progressed to a point in all fractures where beginning weight bearing would be considered had the fracture been treated by other methods.

It is interesting to note that one of the most rapid unions occurred in *Case 5* (Table I), a patient with a pathological fracture secondary to carcinoma of the breast where, as is well illustrated by Figure 1, union was strong after three and a half months. As described by Bohler, Kuntscher, and others, a very early cloud of so-called periosteal callus developed often by the tenth or fifteenth day. In all cases in which nails were removed, dense callus approaching the appearance of cortical bone was present (Fig. 1).

There were no complications encountered during the operative procedures and no deaths in the group of patients reported occurred either during the postoperative period or hospital stay. All patients were discharged from the hospital. In two patients, mild ileus was noted. In one individual, a loose fragment reduced at the time of surgery but not fixed by screws became displaced in the postoperative period. Union, however, occurred in the usual length of time. Firm bony union occurred in each case. In only two patients were no concomitant injuries, sequelae of injury, or other disease states absent. Many of these individuals were severely injured patients with multiple fractures and severe head or thoracic traumata. The smallest nail used measured 9 mm. in diameter by 39 cm. in length. The largest was 16 mm. in diameter and was obtained by interdigitating a 12- and an 11-mm. nail. One closed reduction and blind insertion of the nail was done in an oblique fracture in the upper third of the femur in a patient who had a previous amputation of that extremity below the knee. The remainder were open procedures. The etiology of these fractures varied from insignificant injury in the pathological cases to severe injuries sustained in motor vehicle accidents. In determining the optimum time of operation, one must be well aware of the fact that femoral shaft fractures rather rapidly become firmly fixed in positions of displacement and shortening. Three weeks of delay may increase the difficulty of open reduction to a considerable extent. For that reason without exhibiting undue haste, one should attempt to reduce the fracture and insert the nail as soon as possible. Considerable delay was present in many of these cases between the time of injury and intramedullary fixation because of poor general condition due to associated injuries in these individuals. Compound fractures if seen early may be operated upon safely by this method as soon as adjuvant therapy has stabilized the patient. Whether the compound wound will be closed after proper debridement and cleansing with employment of a new incision for reduction and insertion of the nail, or enlarged and used for that purpose, will depend on the location and nature of the wound.

Several of these cases present features especially pertinent to the method being discussed and are presented below:

Case 5.—M. W., aged sixty-two (Fig. 1), was admitted to the Minneapolis Hospital on October 5, 1949, with the complaint of severe pain in the right thigh occurring suddenly as she rolled over in bed. She stated that eight months previously a right radical mastectomy for carcinoma had been performed. X-ray examination of the pelvis and femurs revealed a fracture in the upper third of the right femur through an area typical of carcinomatous metastases. Numerous other areas of similar bony metastasis were seen in the pelvis, ribs, and skull. Shortly after admission to the hospital, a Kirschner wire was passed through the lower portion of the femur and skeletal traction in a Thomas splint instituted. On October 19, 1949, open reduction of the fracture was carried out with insertion of a Kuntscer[4] nail for fixation. Postoperatively all support was discarded and the patient immediately became ambulatory. Full weight bearing on that extremity without pain was possible. Administration of testosterone was started and the patient was discharged from the hospital. Subsequent x-rays reveal far advanced bony union on January 1, 1950. This is indeed a marked contrast to the tribulations of long-continued skeletal traction with prolonged recumbency necessitated by closed treatment.

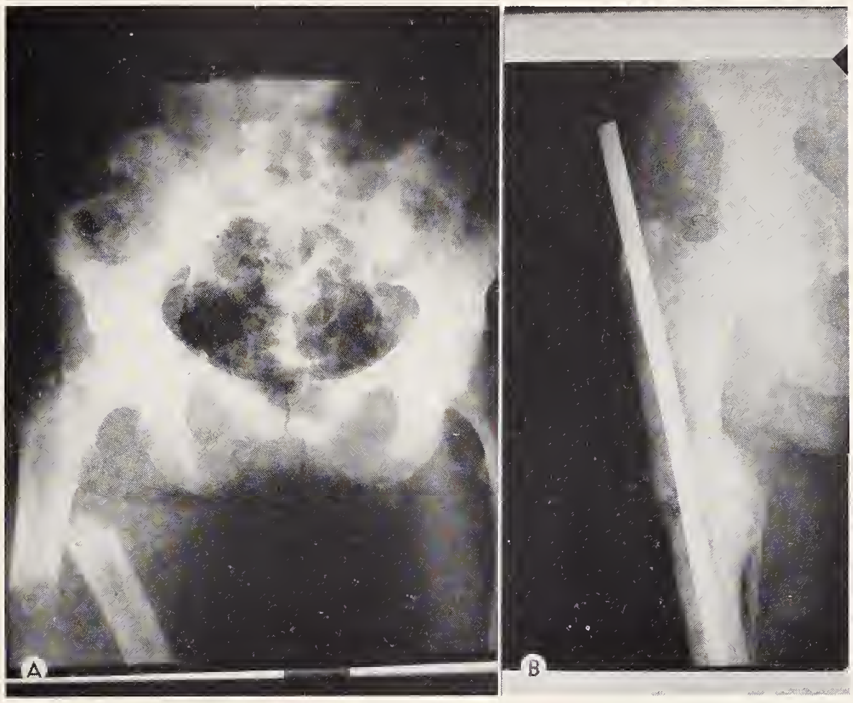

Fig. 1. M. W., aged sixty-two. (A) Pathological fracture right femur, October 5, 1949; intramedullary nail inserted October 19, 1949. (B) Bony union is well advanced by January 1, 1950.

Case 1.—O. P., aged fifty-seven, was admitted to the Minneapolis General Hospital, October 4, 1951, having sustained a transverse fracture through the mid portion of the left femoral shaft after being run over by a truck. On the day of admission to the hospital, open reduction and internal fixation of the fracture with an intramedullary nail was carried out. During the surgical procedure, a loose fragment was found which had not been visualized on the preoperative film. Manual replacement of this fragment was carried out. Fixation at the time of surgery did not appear to be adequate for immediate weight bearing because of this loose fragment. A review of postoperative roentgenograms on the tenth day after surgery persuaded us to place the patient's thigh in suspension for a period of fifty days. This conservative attitude may appear unnecessarily extreme but does indicate that in an occasional case some additional support must be at least considered if mechanical factors relative to fixation of the fracture are such that loss of position may otherwise ensue. Examination of subsequent x-rays on December 26, 1952, and July 23, 1952, show progressive bony union.

Case 7.—P. Z., aged sixty, was admitted to the Minneapolis General Hospital on January 17, 1949. This patient had bilateral below-the-knee amputations and while negotiating a stairway, he fell, sustaining a fracture in the subtrochanteric region of the right femur. The extremity was placed in skeletal traction after admission to the hospital. However, in addition to the difficulty encountered in obtaining and maintaining reduction of this fracture, it soon became apparent that the long-continued immobilization necessary for healing would result in disability so great in the fractured limb and in the rest of the patient's body as to jeopardize gravely future active ambulation. Intramedullary nailing appeared to readily solve this problem and on February 4, 1949, this was carried out employing closed reduction and insertion of the nail by the blind method. The patient began to walk on the fifth postoperative day and at the end of the fifth month was bearing full weight on his prosthesis. On May 1, 1950, the nail was removed because of a painful bursa which had developed in the gluteal region. Good bony union was

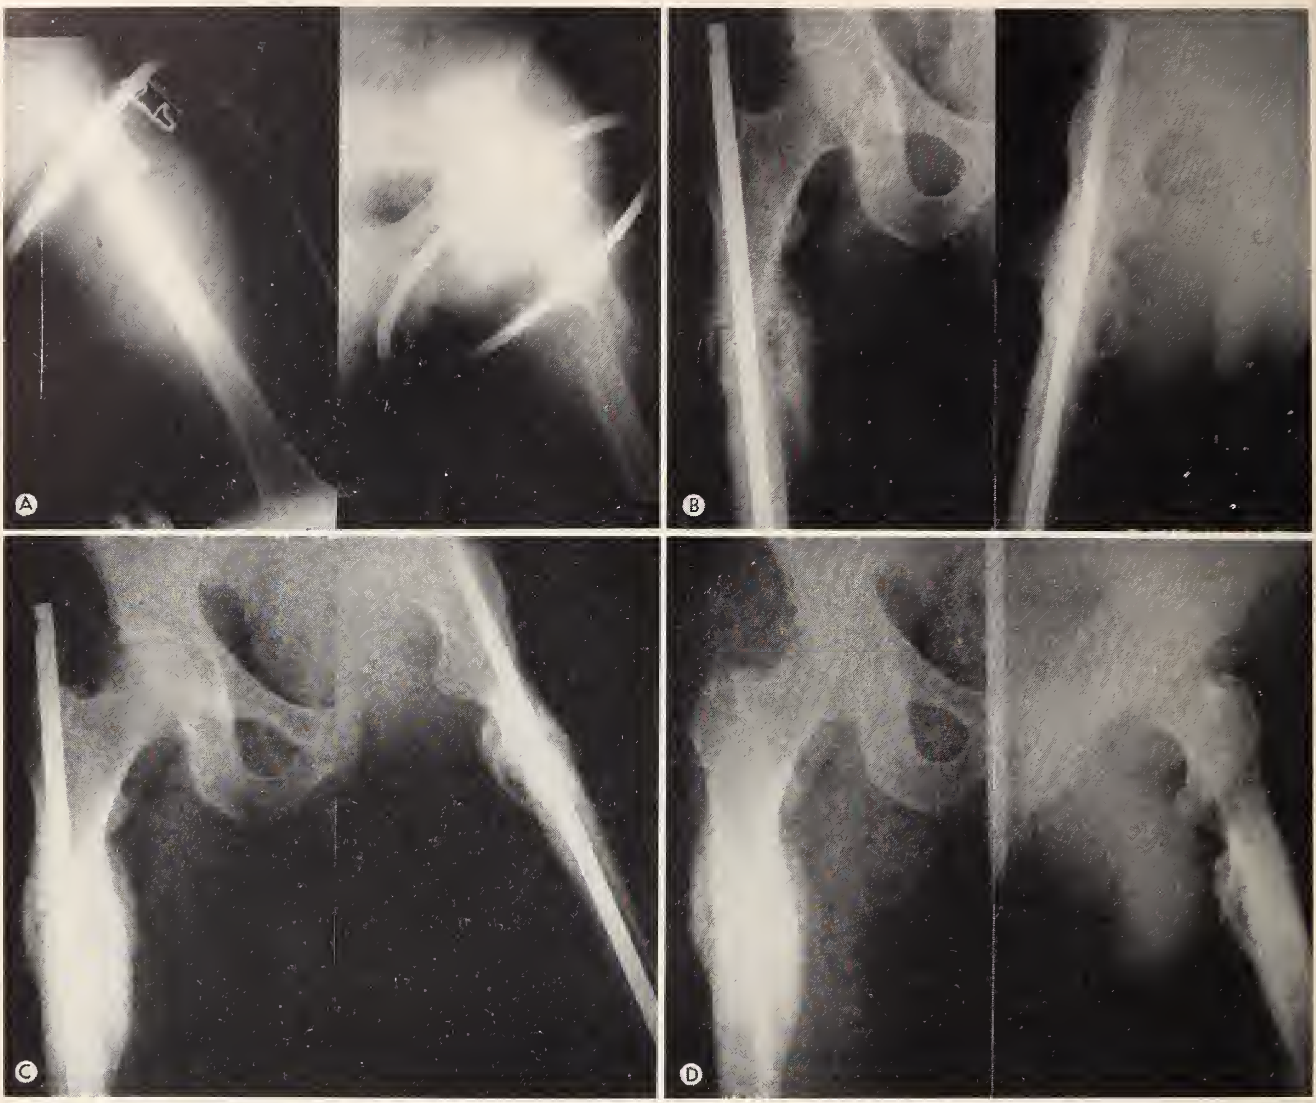

Fig. 2. F. F., aged fifty. (A) Fracture through upper one-third, right femoral shaft, November 5, 1951. (B) Note formation of substantial callus by January 18, 1952, following intramedullary fixation. (C) Healing of the fracture is almost complete, April 25, 1952. (D) The nail has been removed. Note calcified bursa above greater trochanter, July 3, 1952.

apparent by x-ray in this fracture by the end of the fourth month. In restrospect, we are convinced that much earlier weight bearing would not only have been possible and safe but advisable in this instance.

Case 14.—F. F., aged fifty (Fig. 2). This man was admitted to the Northwestern Hospital on November 5, 1951, eight hours after an automobile accident. Exposure on the roadside during cold, inclement weather for three hours occurred before aid was rendered to the patient. He sustained a fracture in the upper third of the right femur which was somewhat comminuted and slightly oblique. Treatment of this fracture by insertion of an intramedullary nail was considered feasible and on the second hospital day, he was taken to the operating room for that purpose. Arterial hypotension was noted in the immediate preoperative examination by the anesthetist. Further investigation revealed conjunctival petechiae fine rales throughout both lungs and drowsiness of greater degree than expected from the preoperative medication. The operation was, therefor, postponed. X-ray examination of the lungs showed the presence of diffuse hazy infiltration throughout both fields. On the following day skin petechiae and mild delirium were noted. A clinical diagnosis of fat embolism was made and for the time being this fracture was treated by skeletal traction. Penicillin was administered because of the pulmonary findings. The signs and symptoms described disappeared gradually during the next ten days. Preparations were again made for insertion of an intramedullary nail when giant urticaria associated with periodic incomplete laryngeal obtsruction was noticed. Treatment with epinephrine and antihistaminic drugs proved ineffectual for control of this problem. Eventually cortisone was administered which promptly controlled the allergic reaction thought to be due to penicillin. Meanwhile good reduction of the fracture was difficult to maintain and callus began to appear with the bony fragments in poor position. Cessation of cortisone therapy was followed by return of severe allergic symptoms on

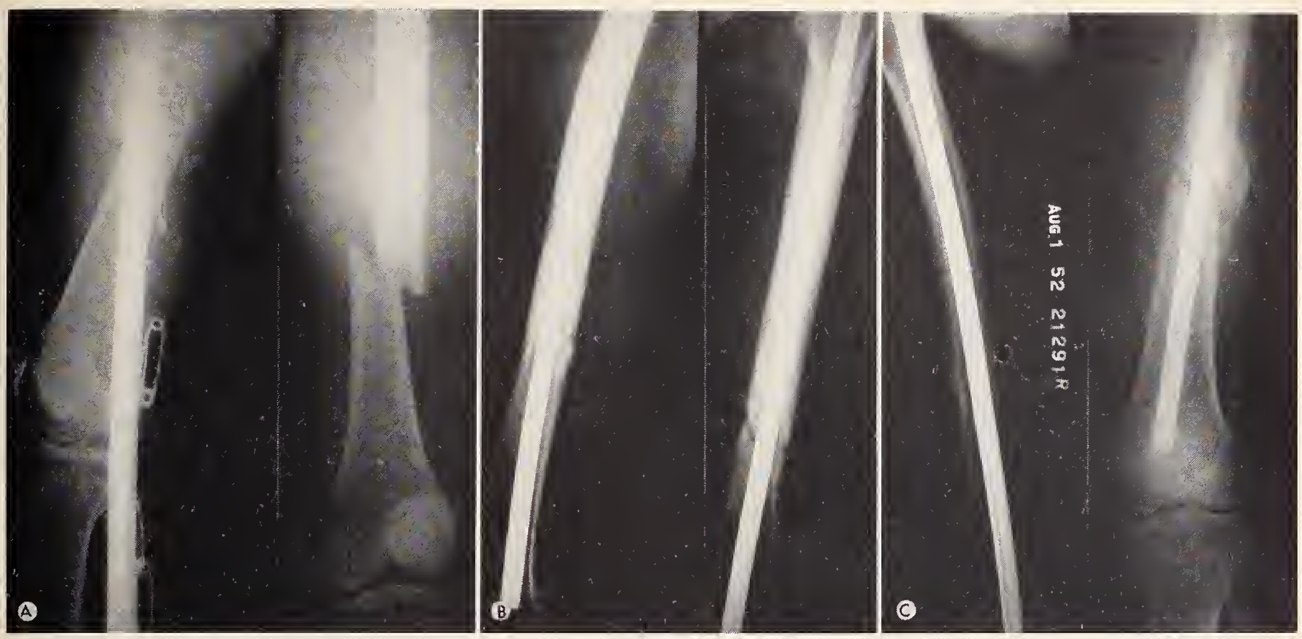

Fig. 3. J. C., aged twenty-six. (A) Short oblique fracture through lower one-third right femoral shaft, December 8, 1951. (B) Fracture line is still apparent, callus formation not marked, March 28, 1952. (C) Union of the fracture is advancing, August 1, 1952.

several occasions. On November 24, 1951, open reduction and internal fixation of the fracture by a Kuntscher[4] intramedullary nail was carried out with no untoward incident. Cortisone therapy was continued for approximately fifteen days following surgery. Wound healing occurred normally. The patient became ambulatory on the fourth postoperative day and immediately was allowed to bear full weight. Subsequent radiographs (Fig. 2) reveal rapid union of the fracture. Painful bursa formation in the gluteal region necessitated removal of the nail on June 12, 1952, with excision of the bursa. Normal function returned to the lower extremity. It is interesting to note that in the entire series, this case of fat embolism is the only clinically apparent one.

Case 3.—J. C., aged twenty-six (Fig. 3), was admitted to the Minneapolis General Hospital on November 30, 1951, for treatment of an oblique fracture in the lower third of the shaft of the right femur sustained several days previously in an automobile accident. Open reduction with insertion of a Kuntscher[4] nail was carried out on December 9, 1951. The patient was allowed to become ambulatory on the second postoperative day. Weight bearing was not allowed until the sixth week because of a cautious attitude which arose from the location of the fracture in the lower third of the bone together with the obliquity of the fracture. Subsequent radiographs revealed increasing bony union. Normal function ensued in that extremity. Inclusion of this case illustrates the lowest practical level at which one may expect to secure reasonable fixation by the intramedullary nail.

Case 13.—J. H., aged thirty-seven, was admitted to Minneapolis General Hospital on July 18, 1952, following an automobile accident in which he sustained a comminuted fracture in the lower third of the left femoral shaft. Initial examination appeared to indicate closed treatment of this fracture with skeletal traction in suspension because the location and comminution of the fracture would render internal fixation insecure. Reduction, however, proved difficult and on August 5, 1952, open reduction was carried out with the thought that if the fragments of the distal segment were not too loose intramedullary and screw fixation might be used. If this should prove undesirable, standard methods of internal fixation could be relied upon. Measurements of the medullary canal showed its smallest diameter to be 15 mm. The largest nail obtainable at the time was 12 mm. It proved possible to use intramedullary fixation in this instance by interdigitating two Kuntscher[4] nails of 12 mm. and 11 mm., respectively, and inserting both into the femur. Supplementary screw fixation in the cortex of the femoral shaft was used, thus fixation which was clinically firm was secured. Radiographs depicted the large medullary canal and the two nails in place. This patient is ambulatory at the present time bearing about one-half his full weight.

Case 9.—A. F., aged eighteen, was admitted to the Minneapolis General Hospital on July 10, 1949, following a motorcycle accident in which she sustained a comminuted (segmental type) fracture in the middle third of the left femoral shaft and a compound comminuted fracture of the left tibia with extremely extensive lacerations of the leg. Shortly after admission to the hospital, debridement, open reduction, and internal fixation of the tibial fracture with primary closure was carried out. The femoral fracture presented a loose fragment two and one-half inches long which lay transversely. This fragment represented a segment of the entire femur at that point. Conventional methods of closed reduction with sustained skeletal traction obviously were inadequate for treatmnt of such a fracture. Internal fixation with application of a plate would undoubtedly have resulted in much periosteal stripping of all fragments jeopardizing the already precarious blood supply to the central fragment. Intramedullary fixation was readily accomplished with minimal operative disturbance of blood supply to the involved bone. Radiographs taken on July 14, 1950 (one year later) show complete bony union to have occurred. It is interesting to note the atrophy which has occurred in the free segment. Subsequently the tibial fracture required application of an iliac bone graft in order to secure union. Two difficult fractures occurred in a single extremity in this instance. Intramedullary fixation of the unusual femoral fracture permitted that fracture to be almost immediately disregarded when considered in relation to the patient's other injuries. In addition, necrosis of the central fragment with its attendant great disability was avoided.

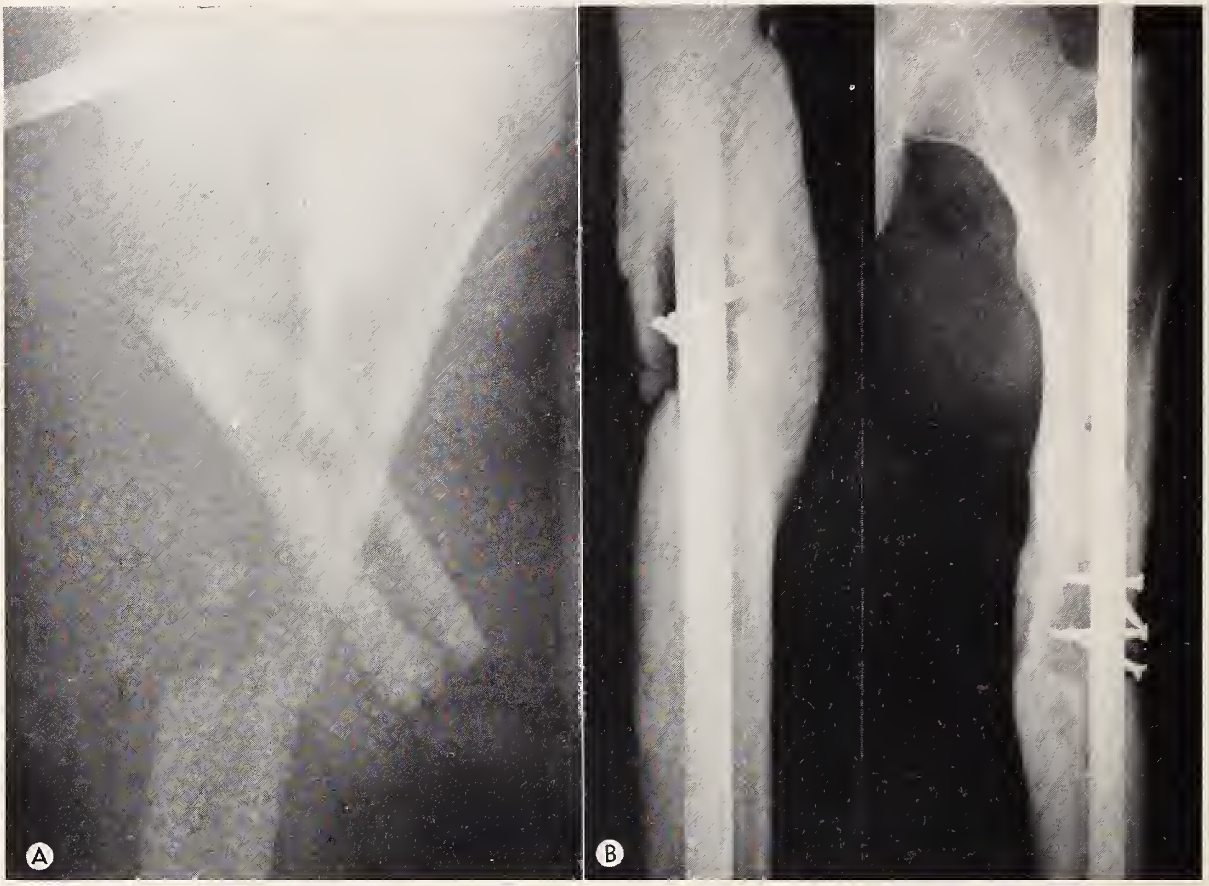

Fig. 4. D. J., aged nineteen. (A) Radiograph December 14, 1949, illustrating comminuted fracture with a large piece of the femoral shaft markedly displaced. (B) Radiograph December 11, 1951, reveals bony union. Note atrophy and marked absorption of bone in the region of the loose fragment.

Case 10.—D. J. (Fig. 4) was admitted to the Minneapolis General Hospital on December 14, 1949, following an automobile accident in which he sustained a comminuted fracture of the left femur in its upper one-third and a comminuted fracture of the left patella. The femoral fracture presented a large fragment which lay obliquely. Closed reduction with long continued skeletal traction for maintenance of position was unlikely to result satisfactorily for the femoral fracture and would certainly enhance future disability in the knee joint which was the site of a patellar fracture. Solution of this problem by fixation with a Kuntscher nail and several cortical screws in the loose fragment on December 28, 1949, allowed independent treatment of the fractured patella. Excision of the loose fragments and suture of the patellar tendon was carried out ten days later with appropriate postoperative mobilization of the joint in the same fashion as if the femoral fracture were not present. X-rays on December 11, 1951, show good bony union of the fracture with much atrophy of the loose segment which at operation was found to have been stripped completely free of its soft tissue attachments by the injury and was replaced as a free fragment. Subsequent bursa formation in the buttock necessitated removal of this nail.

Case 4.—A. C., aged twenty-five, was admitted to the Minneapolis General Hospital on November 5, 1949, following a fall from a porch in which he sustained a transverse fracture of the right femur, a closed fracture of the left patella and a fracture of the right carpal navicular bone through its waist. The occasion of this fall was an epileptic seizure, to which the patient had been subject for many years. Patients with epilepsy present special problems when necessity arises for treatment of fractures, especially in the long bones. Displacement and refracture are ever present hazards when convulsions occur. Intramedullary fixation seemed to afford good protection to this patient as well as the other benefits which accure following its use. Accordingly on November 15, 1949, a Kuntscher[4] nail was inserted into the medullary canal of the right femur for treatment of that fracture. Subsequently the left patellar fracture was sutured and the patient mobilized. Serial x-rays depicted the healing process from beginning to end in this instance. Final roentgen examination on August 29, 1951, showed complete healing of this fracture and the nail removed. The latter procedure was carried out because of bursa formation in the buttock. Multiple fractures in an epileptic were simplified by intramedullary fixation of the femoral fracture in this case.

Summary

The method of internal fixation of femoral fractures by open reduction and insertion of a large intramedullary nail is one which has proven safe, efficient, and productive of excellent end results. The advantage of fixation secure enough to allow immediate mobilization of an individual with a femoral shaft fracture is readily apparent. Dangers inherent to the method are resolved by careful preoperative evaluation, proper operative technique, and an appreciation by the surgeon of the manifest problems peculiar to the control of all fractures. Sixteen fractures in fifteen patients are presented with the known end result. The method has proven satisfactory in this group of individuals who collectively represent most of the special indications for which use of the intramedullary nail is of value.

Conclusions

On the basis of this study, the following predications are possible. Intramedullary fixation of femoral fractures should be considered of great value in:

1. Pathological fractures.
2. Segmental fractures.
3. Certain comminuted fractures.
4. Fractures in the upper third of the femoral shaft.
5. Individuals requiring treatment for multiple fractures.
6. Grand Mal epilepsy.
7. Selected cases with transverse or short oblique fractures above the lower third of the femur.

ALLERGIC REACTION TO PARA-AMINOSALICYLIC ACID

Report of Case

ROBERT P. KOENIG, M.D.
Paynesville, Minnesota

RELATIVELY few instances of marked systemic allergic reactions have been noted in the use of para-aminosalicylic acid, in spite of its widespread use in tuberculosis therapy.[3]

Since the introduction of PAS in treatment of tuberculosis, gastrointestinal irritation and varying forms of skin eruptions have been noted, but few serious allergic phenomena have been reported.[1,3,4] Indeed, some experimental evidence exists showing that PAS has an antagonistic effect on allergic reactions.[5]

The case presented here represents a more marked systemic response to PAS than is usually seen and illustrates the necessity of keeping allergic responses to drugs in mind in evaluating acute serious illness. A case reported by Hall[2] further illustrates this necessity, wherein a patient under penicillin therapy was subjected to an exploratory laparotomy—without revealing any surgical condition. Later review of this case convinced the author that the symptoms and findings were due to an acute allergic response to penicillin.

Case 1.—This case is that of a twenty-two-year-old single Mexican girl who was admitted to Ancker Hospital, Saint Paul, with bilateral apical tuberculosis on June 4, 1952. She was started on streptomycin, one gram bi-weekly and PAS, 12 gm. every day in divided doses of 4 gms. During the first month of therapy, the patient noted only occasional loose stools and vague, mild abdominal complaints.

However, on July 5, 1952, after one month of PAS and streptomycin therapy, she complained of generalized itch and skin rash, and later on of dizziness and nausea. Her temperature rose to 102° F., orally, and the complaints persisted, including frequent emesis, general malaise, severe headache and myalgia. Her blood picture revealed a rising eosinophilia of from 1 per cent on admission (prior to PAS and streptomycin) to 16 per cent on July 14, 1952.

On July 11, 1952, the patient complained of severe abdominal pain, especially in the right lower quadrant. Examination at this time showed rebound tenderness in the lower abdomen and marked tenderness on pelvic examination. A diagnosis of pelvic inflammatory disease was entertained at this time, but cervical smears and cultures were negative.

The patient was treated with penicillin and terramycin, and because she complained of "feeling sick" after taking PAS, this, as well as streptomycin, was discontinued. The patient recovered rapidly and was without complaint until August 2, 1952, when PAS, without streptomycin, was given through an error. Following one dose of PAS (3 gm.) the patient immediately developed her previous complaints again. Examination revealed rebound tenderness in the lower abdomen, active bowel sounds and a markedly tender cervix. Her temperature rose to 104°, pulse rate was 144 and her lungs were clear. A peripheral blood study revealed a white blood count of 16,200 with a differential of 86 per cent PMN, 3 per cent lymphocytes, 2 per cent monocytes, and 9 per cent eosinophiles. A repeat blood study the same day showed a rise in the eosinophiles to 19 per cent. A flat plate of the abdomen was interpreted as showing a possible ileus and free fluid in the peritoneal cavity.

The patient was again given antibiotics (terramycin), but PAS was discontinued after the one offending dose, and antihistamines were given. The patient improved during the next two days. A repeat blood study revealed an eosinophilia of 42 per cent at that time. Subsequent blood studies showed a gradual disappearance of the high eosinophilia.

There was no history of any previous allergic reactions, even to drugs related to PAS, such as aspirin. A patch test applied after recovery using powdered PAS produced a marked red, elevated, moist lesion while controls were negative.

The patient was subsequently treated with INH and successfully underwent surgical treatment for her tuberculosis.

History of Medicine In Minnesota

MEDICAL HISTORY OF THE COUNTY OF YELLOW MEDICINE

MILDRED B. LEE
Granite Falls, Minnesota

(Continued from the July issue)

In 1885 Canby had a population of 500, and Granite Falls was a city of 1,200. In that year Dr. Carlos Lord Chambers of Mantorville opened offices in Canby. Another doctor to locate there was Dr. Albert R. Torgersen, graduate of a Norwegian medical school.

Dr. Chambers was just beginning medical practice. He found time to sing on the programs of the Canby Literary Society, to head committees, to act on the school's Board of Examiners. For a time he was county physician for the west ten townships of the county. Dr. Torgersen had some difficulty convincing people that he was qualified to practice in Minnesota, according to the *Canby News,* but he was a determined man and soon built up a good practice. He was also a graduate pharmacist, and in 1888 bought out the Clarkfield drug store and removed to that village, the first doctor to settle there.

In 1885, Dr. Florado H. Wellcome gave up the practice of medicine at Granite Falls to go into banking. His real interest had always been in business, and for a number of years he had been interested in a loan agency. This was a lucrative business in the pioneer days, for times were hard, money scarce, and interest rates very high. It was common practice to demand of the borrower who wanted $100 that he execute a note for that amount, at ten or twelve percent interest, and pay $10 as a commission for making the loan. Eastern capital could be secured at a low rate of interest for investment or loans, and a search of the records would reveal some famous people as mortgagees in this remote region at that time. Dr. Wellcome also loved to travel. The Wellcomes were childless, for their daughter, Mamie, had died in infancy, and they traveled east and west, to Europe, Egypt, and the Holy Land. In 1900, the doctor removed to Minneapolis to continue his successful business career.

Two "lady doctors" were announced by the *Granite Falls Tribune* in the fall of 1886. They were Adelia M. Higley and Ella Webster, and they rented an office over the post office. However, they found that the State Board did not recognize the school from which they had graduated, and therefore they could not get licenses to practice.

The eighties were not prosperous years, but they were nevertheless years of progress. The sod and log houses had been replaced by houses of frame construction. Schools and churches had been built in every community. But farm prices were very low, in consequence of which every kind of business suffered. High freight rates and unfair discrimination on the part of railroad companies added to the farmers' troubles, for the railroad companies which had been largely financed and much pampered by government had grown powerful and greedy. They arbitrarily fixed freight rates and made discriminatory regulations which in some cases were almost confiscatory. The cost of getting grain to market was often in excess of the amount derived from the sale of it. For redress of such grievances farmers in Yellow Medicine County lent support to new third parties such as the Greenback Party and Farmers Alliance, and put their own candidates in the field.

The people of Granite Falls had visions of prosperity when traces of gold were found in the Minnesota river silt, and indications of the precious ore caused a mining company to sink a mine shaft near Minnesota Falls. The mine was called the Ben Harrison. The mine shaft reached a depth of eighty-five feet by the time the first ton of ore was ready for shipment. After this shipment activities ceased, probably because the gold was found in small quantity; many local citizens had invested heavily in the mine, and it may well be also that the man who years ago told the writer he had "salted" that mine had actually something to do with it.

Coal also was found, on the Finnis farm; but this too in quantities too small to be profitably developed. Still, the papers of 1886 continued to advertise coal from the local mines at Redwood, as well as brick from the old brick yards on the Yellow Medicine. Traces of silver and lead were also found in the county.

In the face of such disappointments the forward looking citizens of Granite Falls nevertheless approached the County Board with an offer to contribute a specified amount toward a new Court House, and posted a bond for payment. This project had been entertained by the county board for some time, and with this encouragement they issued bonds under a special act to raise $15,000 for a new building. In November, 1888, an architect, Frederick E. Hoover of Minneapolis, was commissioned to draw up the plans, and the building was complete and ready for occupancy in 1890.

The death records of the eighties show the usual causes of death: diphtheria took the largest toll of life; consumption, smallpox, "perished in the storm," "cyclone," pulmonary Phtisis" "Inflammation of the lungs," "bleeding of the lungs," "lung fever" "tiphus fever," "dropsy of the heart," "could not learn," "cholera morbus," "cholera infantum," and "inflammation of the bowels." And one death from leprosy.

Discovery of leprosy cases in the county was reported in the *Granite Falls Tribune* of August 15, 1884, as follows:

> "Two weeks ago we stated that there were several cases of leprosy in Yellow Medicine County. Thursday last Dr. Stoddard of Beaver Falls brought to Granite Falls a man who lives a half mile south of Sacred Heart, who has had the disease for four years, and a consultation of physicians was held to determine whether or not it was a case of leprosy. Dr. LaRue of Appleton, and Dr. Rogers of Montevideo being present. The physicians were satisfied that it was a case of leprosy. Photographs of the man were taken, and one, with a history of the case, was sent to Professor Phiffard of New York, a specialist. While here Dr. Stoddard visited a man living in the town of Sannes who has had the disease so long that his fingers have fallen off and he is reduced to a mere skeleton. There is another in Stony Run, making three in all within a radius of ten miles of Granite."

The "man in Sannes" died the day after the consultation at the age of forty-two years. He had come to Minnesota from Norway June 10, 1870.

During the eighties the amount required for poor relief increased greatly, due to the hard times. The county had acquired a poor house but many families were given aid to maintain them in their own homes, and some individuals were boarded out on contract for from $1.88 to $5.00 per week, depending upon the circumstances. In 1884, the total amount spent for the poor was about one-third of the amount spent for all purposes. In 1887, the Board decided that to "promote the health, happiness, and prosperity of the people of the county it would grant no liquor licenses during the year; it also acquired a tract of land for a poor farm, erected buildings upon it, stocked it with machinery, animals, and furniture. Thereafter the commissioners ruled that any person requiring more than $50 aid from the county in any year should be taken to the poor farm, and further specified that no dealer in liquor should sell liquor to any person receiving public aid.

The County Board sometimes extended aid to persons who as immigrants were not entitled to receive assistance, or when through hardship or misadventure common decency demanded such aid. But they were meticulous in requiring other counties to bear the burden for the poor and sick who had come from them to Yellow Medicine County. There is even an instance where the County Board billed Chippewa County for one-half of the cost of burying a stranger who drowned on "the Chippewa side of the Minnesota River." Families were sometimes removed to their former homes by the sheriff, and the Board's policy toward Indians was, no aid whatsoever.

The Indians were driven out of the county after the uprising, but Yellow Medicine was their ancient home, and in time numbers of them came drifting back to live in scattered groups along the Minnesota or Yellow Medicine rivers. By 1888 a community was formed which continues as the Pehijutazi Village now scattered along the Minnesota river three miles south of Granite Falls.

The Indians were desperately poor and many were sick, victims of the dread and incurable tuberculosis. Although some of them owned lands in South Dakota the income from them was small. Annuity payments, when forthcoming, were quickly spent, for the Indians were by nature improvident. No hospitalization for Indians was provided, nor was the contagious nature of tuberculosis fully recognized. The sick lived in the poor and unhealthful surroundings with the well, and it was not unusual for an entire family of children to be wiped out by the disease. Sometimes in a family of eight or nine only one child would survive, and it seemed that the tribe would soon die out.

The County Commissioners recognized the Indians as a potential drain upon county resources, and in 1889 instructed the county attorney to find out "who owned the Minnesota River woods" where they were camping. But if any effort was made to dislodge them it was unsuccessful. The board's policy of no assistance was strictly enforced, with the single exception, of appropriating $12.00 to buy a coffin. In January, 1891, when the Indians petitioned for aid the county attorney was directed to remind Washington that it was the business of the federal government to look after them.

In 1891, Dr. George W. Nichols, formerly of Rochester, Minn., settled with his family at Wood Lake. He also opened an office in Granite Falls. Dr. Nichols was fond of spirited horses and a smart turnout. *The Granite Falls Tribune* comments: "Dr. Nichols invited us to visit a patient with him, and we can vouch for the rapid transit to and from." He practiced in Wood Lake until 1895.

In the same year Dr. Albert W. Cummings, formerly of Sauk Center, located in Granite Falls. His office was in a small, one story building on Prentice Street which is now used as a shoe repair shop. He was of the homeopathic school and had a good practice.

In Canby Dr. Chambers was about to go into the drug business, although he was not a pharmacist; and his friend and chess partner, Adolph Gilberson, sold out his drug business to Dr. James McPeek of Gary, South Dakota, and his partner O. M. Eichinger.

Dr. James McPeek came to Canby in the spring of 1885 and at once opened offices "over Gilberson's old stand." He was not a pharmacist, but continued in the drug business as long as he lived in Canby. The doctor and his family moved into the house of Mrs. O. N. Lund, where a new barn was built for the accommodation of the doctor's fine team which had "carried off the laurel in a race with one Thompson at the Gary Fair."

Late in the year Dr. Chambers sold his drug business, announcing that he would accept "a lucrative position in New York with the Bellview Hospital." His departure left Dr. McPeek the only doctor in Canby, but this was soon remedied by the arrival of Dr. Charles A. Atherton. "He is from the city hospital and we understand he is a man of experience in the medical profession. His office and headquarters will be in the drug store of Dorr and Jenson." Dr. Atherton was immediately in demand socially, took part in programs of the Literary Society, was appointed county physician for the west ten townships; but after about six months he left Canby to practice in Toronto, South Dakota.

Dr. E. A. McPeek "from the eastern part of the state" spent a few months in Canby in 1892, assisting his brother during his absences in the long illness of Mrs. McPeek, who died in January, 1892. He also planned to locate permanently in the county but this plan was not carried out.

Several of the larger towns in the county were by this time looking forward to improvements such as the installation of electric light and sewer systems. The city of Granite Falls let the contract for this work in the winter of 1892 and work began the following spring. In Canby there had been agitation for the erection of a water tower and pumps to supply water for fire protection, but the $5,000 bond issue presented to the voters for approval was defeated by a vote of sixty-six to thirty-two. The irate editor of the *Canby News* attributed this defeat to the Council's purchase of four dozen pails. "Ye gods," he cried, "how we have tumbled!"

The City of Canby was located on the prairie nine miles from the Dakota line, and every year its citizens were reminded of the fire hazard when prairie fires flared in the distance. Each fall the city would be "burnt around" as a fire protection measure. But the fire which threatened its existence on September 5, 1893, originated in a store, and driven by rising winds the flames raged through the business district. It spared the new city hall and bank building but destroyed almost two blocks of frame business buildings, including the McPeek and Eichinger Drug store. Total loss was estimated at $150,000.

Yellow Medicine County felt repercussions of the panic of 1893. The local board of Granite Falls (quoted in the *Tribune*) chided President Cleveland for going snipe shooting "while we by charity are fed." That indefatigable traveller, Dr. Florado H. Wellcome, returned from one of his extensive trips through the west and reported widespread unemployment.

Farm prices continued low, but taxes and land values were steadily rising. The farmer, caught between two extremes, found it hard to make more than a bare living. Such protective tariff measures as had been advocated were designed to protect industry only. Pioneer settlers were leaving the farms for the small towns where, with a garden patch, a cow and a flock of chickens they could live at least as well and much more comfortably than on the farm. The younger generation were not so wedded to the land; they were not so sure they wanted to put in a lifetime of hard work for small returns, and they drifted in ever increasing numbers to the industrial areas which offered them a higher standard of living and better educational advantages. For the first time in history the population of the state was almost equally divided between the farm and urban areas. Alarmed at the drift toward the cities the state government for the first time looked into conditions of farm life, and offered aid to rural school systems as an inducement to keep young people on the farms.

Still, the spirit of the time was optimistic and buoyant, for people lived well on a little money, and it was a period of expansion and boundless hope for the future.

New doctors were attracted to the county. In the spring of 1894 Dr. Tord Nielson, a graduate of the Royal University of Norway, located in Canby. He had been licensed in Minnesota in 1883, in North Dakota in 1885, and practiced in Minneapolis prior to his arrival in Canby. This move proved not a happy one for Dr. Nielson and he left Canby after about two years.

In the next year a number of new arrivals are noted. Dr. J. Woodbury Donnell settled in Clarkfield, where Dr. Albert Torgersen was practicing and also conducting a drug business. Dr. Martin A. Nelson also settled in Clarkfield; he had just graduated from the Physio-Medical College of Indiana, and this was his first field of endeavor.

In the fall of 1895, the little village of Echo had positive proof of the benefits sometimes conferred by an ill wind. A blizzard brought that community its first resident doctor.

Dr. Thomas J. Gill was on his way to Appleton, Minnesota, when the storm blocked all rail traffic. Passengers of the Minneapolis and St. Louis were stranded in Echo, and Dr. Gill took a room at the Nicollet House. The community was in the midst of a diphtheria epidemic, with no doctor nearer than Granite Falls or Redwood Falls. Word that there was a doctor at the hotel flew through the town, and in a matter of hours a man was at his door to beg his services for two sick children. The doctor found the little girls ill with diphtheria. For Dr. Gill there could be no question of leaving the community while the need was so great, so he stayed on. By the time the epidemic was under control he had made up his mind to stay and practice in Echo.

Dr. M. N. Triplett located in Hanley Falls in 1895, for that little village had had no doctor since Dr. Sweet had left in 1891. Dr. Triplett had just graduated from the University of Louisville. After two years at Hanley Falls he removed to Dawson, but continued his professional card in the local papers and occasionally returned to care for his patients in the county.

In 1896, Dr. James A. Watson began his medical practice in Wood Lake, succeeding Dr. Nichols. He was a Canadian, born in Ireland, a graduate of the University of Manitoba, and he was one of three brothers to launch careers in Yellow Medicine County. Frederick G. Watson, a brother who was a druggist at Wood Lake and later became a doctor who located in Clarkfield, had preceded him. Another brother, Charles, took his medical training at Hamline University and began practice in Boyd, Minnesota, a small village not far from Clarkfield, from which point he frequently came to Yellow Medicine County to help his brothers or take over their practices during their absence.

Dr. James McPeek had been for a time the only doctor in Canby when Dr. William D. Calvin and his wife, who was also a doctor, settled in Canby. Dr. Calvin soon proved himself a skilled physician and was very well liked, but Mrs. Calvin was unhappy over the lack of opportunity for herself. It was principally for this reason that the Calvins left after about a year in Canby. Dr. McPeek left Canby for St. Charles in 1896.

Then Dr. William A. Angell opened offices in a building which housed an implement store. His wife was a nurse, and a very beautiful woman, and within a short time the Angells were well established. Dr. Angell was appointed County Physician for the ten west townships of the county, and served in this capacity for a number of years. His practice and his popularity grew year by year; he travelled as far west as Brookings, and all through the surrounding counties. He kept two teams and two drivers, and it was his habit to take what rest he could in sleeping while they drove.

Another doctor coming about the same time was Dr. Thomas McKey, who had spent ten years in practice at Clear Lake, South Dakota. He was to remain in Canby until after 1900.

Dr. Nicolay H. Schjelderup (later spelled Schelderup, Sheldrup) began his medical practice in June, 1897, directly after his graduation from Rush Medical College. Born and educated in Norway, he appended the words "Skandinavisk Laege" to his professional card which appeared in most of the county newspapers. The county was by that time so thoroughly a Norwegian community that English was almost a secondary language in parts of it. Church services in Norwegian were continued until comparatively recent times.

Dr. F. G. Sparling began to practice in Wood Lake about the same time. Since he and Dr. Scheldrup worked together and helped each other the impression was that they had long been friends. Dr. Sparling is remembered as a young man who helped the residents of Wood Lake through an epidemic of measles, but since that community has no newspapers of that period, and did not contribute items to any county newspaper, there are no records of him that are at all informative.

In the May 10 issue of the *Clarkfield Advocate,* 1897, Dr. Triplett's professional card gives his address as Dawson, and there is mention of a new doctor, John O. Dyrnes, at Hanley Falls.

Dr. John O. Dyrnes came to Hanley Falls without any intention of remaining there, for he was waiting for an appointment as medical missionary in some foreign field. He had been born in Norway in a poor family, and under most adverse circumstances won for himself an elementary education in the United States after he had attained manhood, then took his medical and theological training at the same time, while also supporting himself by working at various menial occupations. After about two years of practice at Hanley Falls and other places he received his appointment, went to Paris to study French and take additional medical training, then to Madagascar where he devoted the rest of his life to his work as a medical missionary.

The next doctor to locate in Hanley Falls was Dr. Walter M. Beck, who according to the *Clarkfield Advocate* of March, 1898, "has moved into the Wilson Building and is prepared to receive calls at any time." As a further introduction a later issue states: "We understand the doctor has had an extensive practice of twelve years, has diplomas from two leading eastern medical colleges and two hospitals, and for five years conducted a hospital of his own in Wisconsin, and we may judge that he is a physician of exceptional qualifications." But Dr. Beck barely had time to get settled in the county, for when the Spanish-American War began he immediately answered the call for volunteers. According to the *Clarkfield Advocate* the doctor went in as a private. He was assigned to the Thirteenth Minnesota Regiment, one of three raised in the state for service in that war and the only regiment actually to see active service. The Thirteenth left San Francisco on the ship *City of Para,* was transported first to Honolulu, where the troops were royally welcomed, and then to the Philippines. An interesting commentary upon the food of soldiers in that war was furnished by Private Bohannen of Clarkfield and reported in the *Advocate:*

> "We are fed worse than cattle, and our fare consists chiefly of hard tack, poor coffee, and "sow bellie" and a flavor of potatoes but on some occasions we get even worse than that. One night our supper consisted of a half a cup of soup (so-called) and a handful of hard tack. The officers do not appear to care as they get a good living themselves."

As a private Dr. Beck distinguished himself by his sharp-shooting, for he was an expert marksman and proud of his skill; and as a doctor, when he headed a military hospital on the island. On completing his military service he did not immediately return to Hanley Falls, but eventually he resumed his practice there and made a reputation for himself as a doctor and as one of the most colorful figures in the history of Hanley Falls.

During Dr. Beck's absence Dr. Alonzo T. Munro had settled in Hanley Falls, but in 1899, he removed to the larger village of Wood Lake. He became a candidate for coroner but was defeated by the incumbent, Dr. F. J. Cressy of Granite Falls.

In June, 1898, a new doctor was announced by the *Clarkfield Advocate.*

> "Dr. E. H. Kerkhoff came up from Minneapolis last Friday and is now permanently located in Clarkfield. The doctor comes very well recommended, is a very pleasant gentleman to meet, and we predict success for him in our midst. He can be found at the drug store or Commercial House for the present. For the benefit of those who do not speak English we will state that the doctor can converse in both Skandinavian and German."

The doctors then practicing in Clarkfield were Dr. Albert R. Torgersen and J. Woodbury Donnell.

Barely two weeks after his arrival Dr. Kerkhoff was asked to make a professional call upon Dr. J. Woodbury Donnell, who had been drinking rather heavily, in his quarters above the Lewis Drug Store. Dr. Kerkhoff found Dr. Donnell in convulsions and bleeding profusely from self-inflicted wounds in the throat. The doctor tried to close the wounds and stanch the bleeding, but Dr. Donnell did not want help; he apologized for not having done a better job. He had taken strychnine before cutting his throat, and died in great agony within a short time. He was a single man, forty-seven years of age.

In November Dr. Kerkhoff returned to Minneapolis for further hospital training in the city hospital, leaving "many fast friends all of whom will greatly miss him." The vacancy thus left was promptly filled by a new arrival.

> "Dr. William B. Torgerson, formerly of Cannon Falls, this state, has located at Clarkfield and has fitted up offices over the Clarkfield State Bank where he can be found day and night. The doctor is a graduate of the University of Minnesota and comes highly recommended."

Dr. John S. Kilbride settled in Canby in 1900, after some years of practice in the county, from his former headquarters in Dawson, Minnesota. He expected to make Canby his permanent home, and did in fact live there for many years, except for an interval of three years when he practiced at Watertown, South Dakota. He practiced as a general practitioner but was a specialist in diseases of the eye, ear, nose and throat. He attended clinics both at home and abroad, and was at one time President of the Camp Release Medical Society.

(To be continued in the September issue)

President's Letter

ROUND-UP SEASON

For much of Minnesota's population, summertime means a time of vacations, traveling, leisurely evenings and weekends and thorough enjoyment of the state's many marvelous resources.

But for children of a certain age group it means a time of looking forward, with either dread or extreme interest, to the fall, when they will be entering school for the first time.

The prospect of entering into the regular daily routine of school is a very serious business in most homes. And rightly so, too. Preparing a child for this important milestone is a vital part of his training and education.

Parents and teachers in Minnesota are aware that the health of the school-age youngster is of primary concern when he enters school. For many years now, the Minnesota Congress of Parents and Teachers, in active co-operation with the Minnesota Tuberculosis and Health Association, has developed a program of pre-school examinations for children. Called the Summer Round-Up Program, this project has done great good in bringing children in, either in groups or individually, for a thorough physical examination before entering school.

The program calls for active support and co-operation from the state's physicians. Without their willing help, fewer children would be examined, and consequently, many of them would continue in school with some minor defect or illness which could have been checked had a pre-school examination been given.

During the summer of 1952, about 22,000 children were examined in a group or individually as part of the Summer Round-Up Program of the PTA. This is out of a total of about 28,000 children entering classes in the fall of 1952.

It is interesting to note the extent to which physicians of Minnesota co-operated in this effort. Of that 22,000, nearly 19,000 children were examined in the office of their family doctor, the remaining portion being examined in a group.

As part of the routine physical examination, children needing vaccination and immunization are given this protection. Also, many of the children are given routine dental and eye examinations. Corrections are recommended, not only by the child's dentist and eye doctor, but by the family physician as well, and most corrections are made quickly to avoid any possible future complications.

The importance of excellent health for a child starting school cannot be overemphasized. Considering the many problems confronting a new young student, it is imperative that he not be handicapped from getting a good start, by some small health matter which could have been found and corrected in a pre-school check-up.

I would urge physicians to play their part willingly in this statewide program of the PTA. Not only can doctors co-operate fully when called upon to do so, but they can take the initiative in their own community, working with and through parents and teachers to help bring better health to children beginning their education.

Editorial

CARL B. DRAKE, M.D., *Editor;* GEORGE EARL, M.D., HENRY L. ULRICH, M.D., *Associate Editors*

NEW EDITOR AND BUSINESS MANAGER

WITH THE September issue of MINNESOTA MEDICINE, the present editor will turn over his responsibilities to the new editor, Dr. Arthur H. Wells of Duluth. Dr. Wells is a graduate of Harvard Medical School, class of 1930, and spent some five years at the Research Hospital in Kansas City before moving to Duluth in 1936. He is at present pathologist at St. Luke's Hospital in that city. He has been chairman of the Cancer Committee of the Minnesota State Medical Association since 1945 and was elected president of the Minnesota Division of the American Cancer Society in 1948 to succeed Dr. W. A. O'Brien. He has been a member of the Editing and Publishing Committee of MINNESOTA MEDICINE for several years. Dr. Wells is relinquishing his responsibilities with the Cancer Society in order to have more time for his new editorial duties.

Simultaneously with the change in editors, the office of business manager of the journal will be relinquished by Mr. J. R. Bruce, past president and present chairman of the Board of Directors of the Bruce Publishing Company of Saint Paul, who has been publishing the journal since its first appearance in January, 1918. Thus Mr. Bruce has been business manager of the journal nearly thirty-six years, a longer tenure than that of the retiring editor who assumed his duties officially on April 1, 1919. MINNESOTA MEDICINE was the first medical publication of the many medical and other journals and books to come off the presses of the Bruce Publishing Company. The high quality of all the Bruce Publishing Company publications is due to Mr. Bruce and his fine organization.

The title of business manager will be assumed by Mr. R. R. Rosell, executive secretary of the Minnesota State Medical Association, who has proven himself a most efficient executive during his long tenure of office as secretary of the State Medical Association. Communications to the business manager of MINNESOTA MEDICINE may continue to be mailed in care of MINNESOTA MEDICINE, 2642 University Avenue, Saint Paul 14, Minnesota. Likewise, letters to the new editor of the journal may continue to be sent to MINNESOTA MEDICINE at the same address.

C. B. DRAKE

MEDICAL LICENSURE STATISTICS FOR 1952

STATISTICS regarding the number of physicians dwelling and practicing in Minnesota and the United States possess a certain interest. According to the fifty-first annual medical licensure report of the Council on Medical Education and Hospitals of the AMA,* there were 214,667 physicians licensed in the United States at the close of the year 1952. Of these, 151,363 were in private practice, 6,677 were in full-time research and teaching, 28,366 were interns, residents and physicians engaged in hospital admintration, 8,166 were retired or not in practice, and 20,095 were in government services.

During the year 1952, 6,885 new licenses were issued and 3,829 physicians died, making a net gain of 3,056. In 1951, the net gain was 2,207.

The figures for Connecticut and Maryland include physicians licensed by the homeopathic medical examining boards of these two states. Those boards in Arkansas and Louisiana had no new licentiates in 1952.

In Minnesota, 351 new licenses were issued, 220 by examination and 131 by reciprocity endorsement. This compares with 1,581 issued in California, 1,292 in New York and more than 500 in Florida, Illinois, Ohio, Pennsylvania and Texas. Of the 132 graduates of the University of Minnesota Medical School, none failed to pass a state board or a national board examination.

Of the freshmen students who entered medical school for the 1951-1952 session, 5,249 (73.1

---

*Medical Licensure Statistics for 1952, Donald G. Anderson, M.D., Secretary, and Anne Tipner. J.A.M.A., 152:415 (May 30) 1953.

per cent) had baccalaureate degrees; 408 (5.7 per cent) had attended college four years but did not receive a degree; 1,437 (20.3 per cent) had had three years of college work and only 63 (0.9 per cent) had had only two years of college.

Minnesota is included among the nineteen other states, the District of Columbia and Alaska which require a Basic Science certificate before a candidate may take the state board examination. Certificates were granted to 5,730 candidates in 1952. Some 26.1 per cent of those who took the examination failed. Of the physicians, medical students and dentists examined, 12 per cent failed. Only 15.5 per cent of the osteopaths who took the Basic Science examination failed, whereas 65.1 per cent of the chiropractors and 55.2 per cent of the unclassified failed.

The certificate of the National Board is recognized by all medical licensing boards for registration by endorsement with the exception of Arkansas, Florida, Indiana, Nebraska and Texas.

The practice of medicine in any state is under the jurisdiction of the state board of medical examiners. These have been bending their efforts towards assisting foreign-trained physicians to locate in the United States. Forty-five boards now permit foreigners to take examinations, but under varying conditions. The Council of the Association of American Medical Colleges has prepared a list of fifty foreign medical schools whose graduates they recommend for consideration by the medical boards on the same basis as graduates of approved medical schools of this country. This list has proven of great value to the state licensing boards. Of the total number (1,208) of graduates of foreign medical schools 648 (53.7 per cent) passed the examination. The state boards are to be congratulated on the way they have been handling a difficult problem.

CANCER WARNINGS NOT OVERDONE

THE OTHER DAY a patient, whom I had seen off and on for a variety of complaints, consulted me about a lesion he had had behind the lobe of his ear for about two years. It was located where the tip of the ear-piece of his spectacles had been irritating him.

One glance at the rather extensive area of granulation-like tissue aroused my suspicions that here was skin cancer which had been allowed to progress for at least a couple of years.

The patient was a contractor and above average in intelligence and must have been exposed to the barrage of publicity which has been fired at the public in recent years about the signs and symptoms that should make one suspicious of cancer. A sore spot on the skin which fails to heal is on the list. How could one neglect an area like this man had for two years and allow it to reach a stage impossible to remove without producing extensive scarring and difficult to treat with x-ray—for it proved to be a squamous cell cancer.

Imagine my consternation when my patient told me he had consulted an aurist a year or so ago and had been assured the lesion was nothing that deserved any attention. That cast a different light on the picture. The aurist and not the patient was, therefore, the one most to blame for the neglect of this serious lesion. It seems unbelievable that any physician in this day and generation could fail to be suspicious of a skin lesion of this sort which had failed to heal after a matter of weeks. There is some excuse for failing to detect certain hidden cancers, but not skin cancers.

One can conclude, however, that the publicity campaign which is being conducted by the American Cancer Society and its subsidiaries and the life insurance companies and other agencies to draw attention to the signs of beginning cancer is not overdone, but that warnings to the public and also to the medical profession must continue to be offered again and again, if cancer is to be recognized in its early stages when it can be effectively treated.

In all the attention now being paid to chemotherapy, it should not be forgotten that bed rest is just as necessary as ever in the treatment of tuberculosis. All forms of collapse therapy are still useful in suitable cases. Whereas chemotherapy has not shortened the duration of hospital stay, it has helped the recovery of many patients who would otherwise have succumbed. The lives of many additional patients have been prolonged indefinitely, although the disease was not arrested.—WILLIAM S. SCHWARTZ, M.D., *The New England Journal of Medicine*, April 23, 1953.

* * *

BCG is harmless if prepared and used properly; it produces a certain degree of immunity, and it should be used to immunize the more vulnerable groups in the population. These groups are doctors, medical students and nurses; hospital and laboratory personnel; individuals unavoidably exposed to infection in the home; patients and employes in custodial institutions, and children and certain adults considered to have inferior resistance and living in communities where tuberculosis is unusually prevalent.—JAMES E. PERKINS, M.D., *Bulletin of the National Tuberculosis Association,* April, 1953.

UNIVERSITY HOSPITALS ADMISSION POLICY

The University Hospitals serve two distinct but inseparable functions, the provision of facilities for the instruction of medical students, interns, and fellows, the provision of medical care to a segment of the population of the state. Since many physicians, especially those who are graduates of medical schools other than the University of Minnesota Medical School, may not be entirely clear as to which patients are eligible for care at the University Hospitals, a brief discussion of our admission policies should be of interest and possibly of some help.

Patients referred to the University Hospitals or its Out-Patient Department are classified as follows:

1. *County.*—These are patients unable to pay for any portion of their medical care. Their expenses are shared equally by the county and the state. They must present county papers filled in by both their physician and their county commissioner (or his representative, i.e., the executive secretary of the welfare board).
2. *Per Diem.*—These are patients who cannot afford to pay for the services of both a private physician and a private hospital. When applying for either out-patient or hospital care, they must present a special form filled in by themselves and their family physicians. They are required to pay their clinic or hospital expenses only, no charge being made for the professional services of the staff. From the standpoint of money received by the hospitals, there is no difference between a county patient and a per diem patient.
3. *Private Patients.*—These patients, limited in number, are admitted as a convenience to the staff and as a service to physicians of the state. Each private patient is referred by letter from his physician to a specific member of the University Hospitals staff.

Our objective is to furnish the best possible medical care to all patients. Treatment, services, and privileges accorded to patients are identical whether they are admitted as county, per diem, or private patients. It should be emphasized that private patients of the members of our staff are seen by students, interns, and fellows and are considered to be "teaching cases" to the same extent that county and per diem cases are so considered.

In referring patients, you will be of great assistance to the patient and to the hospitals if you will consider his ability to take care of the expenses. Each new patient is interviewed with regard to his financial status and is placed accordingly into one of the above categories. Per diem and private patients should be prepared to make a substantial deposit on admission to the hospital. They are sent statements weekly and are expected to pay their bills in full on discharge.

The facilities of the hospital emergency room, W-212, are available on a twenty-four-hour basis for taking care of acutely ill patients. When such a patient is being sent in, an advance telephone call to the admitting physician in charge of the emergency room will often make it possible to handle the patient's problem most expeditiously.

Out-of-state patients should have a signed authorization from agencies if they are unable to manage the expense themselves. Definite arrangements should be made in advance for these patients since out-of-state cases are taken on the general services only if there are no Minnesota residents awaiting admission. However, at the present time there is no waiting list for admission to the hospital. Any patient who is eligible for care at the University Hospitals and who requires hospitalization can be promised early if not immediate admission.

Indigent patients living in Minneapolis and Saint Paul, as a rule, are eligible for care at Minneapolis General Hospital or Ancker Hospital. If there are special circumstances which make you wish to send a patient to the University Hospitals, certification should be sought in advance. Should you have any question concerning a patient's eligibility for admission or any aspect of his medical care, please feel free to communicate with the hospital administration or an individual member of the staff.

of the
Minnesota State Medical Association
George Earl, M.D., Chairman

INCREASE NOTED IN MEDICAL EDUCATION FUND

New impetus to individual giving toward alleviation of financial stress of the nation's medical schools is seen in a recent report on contributions to medical education.

More than one million dollars has been donated to medical education by physicians in the United States since January 1, 1953. This increase is shown in reports released by the American Medical Education Foundation, indicating that approximately 11,000 physicians have contributed $800,000 to the Foundation since the first of the year. Also, records from thirty-three of the country's seventy-nine accredited medical schools indicate that 8,217 doctors have contributed $301,426.42 directly to their alumni organizations.

Although this number of physicians may seem a large amount, percentage-wise, the record is not so impressive. This group of contributors represents only 9.9 per cent of the nation's doctors. But it must be remembered that this 9.9 per cent have given over one million dollars to medical education.

If such a small percentage of the nation's physicians can give so generously, how much more would the fund swell if the percentage were to rise to 100!

STATE MEDICINE HAS ECONOMIC APPEAL

A slightly different slant on the reasons why socialized medicine appeals to some people, is seen in a recent editorial in the *Long Prairie Leader*. The emphatic point made by the paper is that economic aspects, as contrasted to political and social ones, are the basic considerations when it comes to deciding what type of medical care system America should have. The paper says: "People living in towns like Long Prairie where good hospital service is available at reasonable cost, do not realize what city folks are up against when family illness comes and hospitalization is necessary. It is a common expression among city folks that 'one serious illness with surgery and hospitalization means ruin for the head of the family.' "

Specialist and G. P.

Another point stressed is the rise of the specialist and the disappearance of the old-time general practitioner in the city. The editorial states:

> "In cities now it is almost impossible to have a doctor come to the house. This is one of the by-products of the specialist system. . . . Much of this is of course necessary and undoubtedly saves lives but the public is becoming increasingly suspicious that much of it is unnecessary and is actually an excuse for doubling the fee."

Reiterating the problem of costs for city folks in obtaining medical care, the editorial affirms that "hospital charges, specialist's fees, nurses, operating room expenses, drugs and other service costs have climbed alarmingly in recent years." All this helps get supporters for government interference in financing medical care. "It is true that wonderful advances have been made in the successful treatment of surgical and medical cases," the editorial goes on, "but the evidence multiplies that when the bill comes in, it usually makes a new supporter for the demand that the government get into the hospital and medical business."

An Urban Problem

The editorial concludes that the problem is very much a city one, "as the rural citizen still has access to the general practitioner who comes on call, knows a little about everything and does not have to have a hospital staff to assist him with a case of bellyache. The movement for socialized medicine has its impetus in the cities, not the country."

AMA REAPPROVES MEDICAL EXPENSE DEDUCTIONS

The medical profession, together with insurance companies, underwriters and the noncommercial health insurance plans, has long realized the seriousness of the cost of the so-called "catastrophic illness." Changes in present insurance coverage are being worked out to help alleviate much of the financial hardship imposed by this type of illness.

Also, the medical profession is supporting related measures which will help ease this often heavy burden.

Official approval of the American Medical Association has been given once again to deduction of medical and dental expenses for income tax purposes.

Appearing before the House Ways and Means Committee, which is considering this measure, Dr. David B. Allman, member of the AMA Board of Trustees, reaffirmed the AMA's position of approval of such legislation. He said: "The principle involved in all of these measures (previous similar legislation) has been actively approved by the Committee on Legislation and by the Board of Trustees of the American Medical Association. Although no attempt has been made to work out the details of the formula to be applied, we are of the opinion that a greater measure of relief should be provided in this way for those individuals who have suffered from the financial burden resulting from the expense of a serious, long-term illness."

Notes Misconceptions

Dr. Allman pointed out that taken as a whole, medical costs are not out of line with other normal living expenses. He stated:

> "Statistics presented by the United States Department of Labor for the third quarter of 1952 reveal that living costs have increased 90.8 per cent since 1935-39, while medical costs have increased only 65.5 per cent in the same period.
>
> "In addition, it should be noted that recent surveys indicate that only 3 per cent of American families have medical bills over $200 and that 80 per cent have no medical debts of any kind. Despite this fact, it is realized that a serious long-term illness can be a financial catastrophe to almost any family."

Dr. Allman's testimony before the committee also emphasized that for some time several insurance companies have been experimenting in a relatively new form of insurance called, among other titles, "medical disaster" or "catastrophic" coverage. "A few of the agencies established by medical associations are also underwriting this newer version of protection," he added. "Its purpose is to provide sound protection in those instances requiring long-term or high-cost treatment. These ventures are being undertaken with the knowledge and full support of the medical profession."

After recounting the unparalleled growth of voluntary health insurance in America, and averring that both insurance agencies and physicians are attempting to improve that phenomenal growth in coverage, Dr. Allman concluded:

> "We believe that the enactment of legislation of this type will further encourage the improvement of existing plans, will extend coverage and help to eliminate or reduce the financial burdens which do exist as a result of illness. It will also encourage people to look after their own health rather than turn to the government for assistance. We are seriously convinced that our present non-governmental system of medicine not only provides the best care but that it is also the most economical. We are therefore in accord with any legislation designed to help preserve that system."

SOCIAL SECURITY SYSTEM HIT BY SENATOR BRICKER

Senator John Bricker of Ohio recently defined the proper role of the federal government in the social security field. Speaking at an insurance luncheon at the annual meeting of the Chamber of Commerce of the United States, Senator Bricker said, "The Federal Government has a definite part to play in meeting social problems, but this role should be clearly defined, kept within its proper limitations and safeguarded against those who would assign the Federal Government to a much larger role in this field."

Defining the fields wherein the federal government can properly work, Senator Bricker noted that social security "is an appropriate field for" and the primary responsibility of the federal government, but, he emphasized that unemployment compensation "should be made even more completely the responsibility of the several states," that elementary education should be left under the control of local governments, and that government should be kept out of the field of medical care.

Study Shows Promise

Senator Bricker further stated that the current study of the present system by a House Ways and Means subcommittee "will lead to a much improved system of social security." But he declared that "recognizing the government's role in this field does not imply blanket endorsement of the present Old-Age and Survivor's Insurance Program. Our present social security system is riddled with windfalls, arbitrary exclusions from coverage, inequities and financial madness."

HEALTH INSURANCE BOOK AVAILABLE FROM AMA

The American Medical Association's Council on Medical Service and the Committee on Prepayment Medical and Hospital Service have recently issued a late account of health insurance plans in America. The booklet is the seventh annual revision of the health insurance brochure which is called "Voluntary Prepayment Medical Benefit Plans."

The brochure carries a great deal of information about such insurance plans in the nation. Each plan is described by summary of benefits, enrollment at the end of 1952, and other information. There is a separate section listing plans by type of sponsorship, and also identified are those plans having been granted the Council's seal of acceptance. In addition, other types of programs are described to give examples of voluntary methods of insuring some of the costs incident to health care. Single copies are available without charge from the Council on Medical Service of the AMA.

INTERNATIONAL CERTIFICATES OF VACCINATION

A revised immunization form required for international travel is now available, according to the U. S. Public Health Service, Department of Health, Education, and Welfare. However, the old certificate will be acceptable in international travel until the expiration date of recorded vaccinations.

The new form, entitled International Certificates of Vaccination, provides travelers with a record of compliance with vaccination requirements acceptable to all nations governed by the International Sanitary Regulations now in effect. It is written in both English and French, but entries may be made in any language. The form contains vaccination certificates for smallpox, yellow fever and cholera, and space to record other immunizations.

After July 14, 1953, copies of the "Certificates" will be distributed with all passport applications issued by clerks of the court in any city and by the passport agencies of the State Department in Boston, New York City, San Francisco, New Orleans, Chicago, and Washington, D. C. The form may also be obtained from local or State health departments, or from facilities of the Public Health Service. The Superintendent of Documents, Government Printing Office, Washington, D. C., has the form on sale for 5c a copy or $2.50 a hundred. Persons traveling to countries where passports are not needed, but where immunization is required, may obtain the form from these same sources. Travel agencies, steamship lines, airlines, and other transportation companies will be given permission to reprint the form upon request to the Division of Foreign Quarantine, Public Health Service, Washington, D. C.

In accordance with the revised International Sanitary Regulations, the new "Certificates" require that the results of only the primary vaccination for smallpox be recorded. In the case of revaccination, the smallpox certificate becomes valid immediately, whereas previously a fourteen-day wait was required.

The cholera certificate becomes valid six days after the first injection. Previously, the entire series had to be completed before the certificate became valid. Travelers are cautioned that the type of vaccine used in this country provides maximum protection only after the second injection. Therefore, it is advisable to take the second inoculation.

The Public Health Service urges travelers to be sure that their smallpox and cholera certificates are properly stamped by the certifying health officer with an official stamp. The signature of the health officer, alone, does NOT make the certificate valid. If the local health officer is not equipped with an identifying stamp, undoubtedly the State Health Officer will be able to validate the certificate. Officers of the Public Health Service and Medical Officers in the Department of Defense may certify these certificates also.

As provided by the regulations, the new certificate for yellow fever vaccination is valid for six years instead of four years. As before, yellow fever vaccination certificates are valid only when the inoculation is obtained from a yellow fever vaccination center designated by the U. S. Public Health Service. The international regulations require a nation to designate specific vaccination centers for this purpose.

Agencies having a supply of the old form may continue to distribute it until their stock is exhausted. However, when the old certificate is used, it is necessary to follow the requirements of that form for smallpox vaccination. In the case of yellow fever and cholera vaccinations, the new regulations may be applied.

Under the International Sanitary Regulations, the Department of Defense will issue its own certificate to military personnel on active duty; however, military dependents must continue to use the international vaccination certificate.

AMERICAN MEDICAL ASSOCIATION

House of Delegates—Résumé of Proceedings

New York City—June 1-5, 1953

The aspirations and ideals of American medicine, its hopes and fears and its enormous accomplishments passed in review once more as delegates to the American Medical Association thrashed out their problems in their 102nd annual session, June 1 to 5, in New York City.

Implicit in all of the resolutions introduced, in the lively deliberations of committees, and in discussions on the floor of the House, was the staunch attachment of the American doctor to freedom for himself and for the institutions of education, research and patient care which he has built. Also, his reasoned fear of anything approaching government controls which might threaten the high standards of education and practice built up in the climate of freedom over the years.

Among the issues presented for discussion and final determination, the expansion of government medical care for veterans loomed large; also the problems involved in financing medical education, and the relationship of the whole government social security program to the private practice of medicine, now and in the future. The sharp necessity for defining relationships between physicians and the governing boards of hospitals where they practice was considered at length.

There were other acute day-to-day problems to be explored such as the nursing shortage, the allocation of interns and residents with an eye, on the one hand, to their further education and, on the other, to the needs and rights of the smaller non-teaching hospitals.

Ethics Discussed

There were ethical and disciplinary problems to be thrashed out, especially in relation to public criticism leveled at doctors by the governing board and the director of the American College of Surgeons. There was the need for re-evaluating and adjusting old relationships between medicine and its auxiliary professions and between medicine and dentistry. There was also a demand of surprising vigor on the part of a few to change the relationship between medicine and osteopathy in its modern form.

All these and many other matters came before the delegates, some of them with as many as ten or eleven resolutions from as many state associations on the same subject matter. Differences of opinion were not lacking. The end result in each case, however, was a tempered and considered decision reflecting sober judgment and steady statesmanship on the part of the delegates as well as the reference committees involved.

Several resolutions were submitted at this meeting calling for a complete definition of the responsibility of the government in the medical care of the citizen. They closely followed a resolution to the same effect which had been introduced at the Denver Clinical meeting and referred to the Board of Trustees. The importance of such a definition, not only to medicine but to the future of all Americans, had been underlined by President Eisenhower who forecast in his message to Congress, appointment of a President's Commission to study the "whole question of federal control of activities to which the federal government contributes." Also by the bill introduced as House Joint Resolution 123, in the Congress, for an amendment to the Constitution prohibiting the United States government from engaging in any business not specified in the Constitution.

With such congressional and executive studies pending, the Board of Trustees recommended, and the House approved, continued study of the whole problem by the Committee on Federal Medical Services and its subsidiary Committees on Indigent Medical Care and on Maternal and Child Care with a report to be delayed until findings of the President's Commission may be available.

Children's Services Reviewed

In this connection, the action taken with respect to the Crippled Children's Services, financed jointly by the states and the federal government, might well be explained, in view of the scathing editorial on the subject printed in a recent *Life* magazine. The resolution, introduced by Dr. Cleone A. Nafe of Indiana, called attention to the fact that diagnostic services, under the plan must be made available within the area served by each diagnostic center to "any child (a) without charge, (b) without restriction or requirement as to the economic status of such child's family or relatives or their legal residence, and (c) without any requirement for the referral of such child by any individual or agency." The resolution asked, and the House approved, that the Board of Trustees work through whatever channels might be necessary to eliminate this section of the regulation. It called attention to the fact that a state which might institute a means test would have no federal funds allotted to it for crippled children's services. The resolution did not ask for elimination of free services to children who need them, as the *Life* editorial declared with considerable venom.

Another resolution with comparable objectives was recommended and passed to the effect that people who are able to do so be asked to pay for gamma globulin which, according to present plans of the National Foundation for Infantile Paralysis, will be distributed free of charge in polio-threatened areas. *Life* magazine failed to pick up this action along the same lines whose object was, of course, to preserve the money for polio research and for aid of afflicted patients. The Board will urge this course upon the National Foundation, in accordance with the resolution.

Actually, of course, *Life* did not initiate the current ground swell of public criticism of physicians. No less than 11 resolutions, of which the resolution adopted by the Minnesota State Medical Association's House of Delegates was one, were introduced on this subject. They came from all parts of the United States and most of them, like the Minnesota resolution, adopted by our House of Delegates in May, called such public remarks as those of Dr. Paul R. Hawley, director of the American College of Surgeons, irresponsible and unjustified, condemned them in fact and in principle and urged the American Medical Association to do everything in its power to curb such actions in the future. Several resolutions also urged appropriate councils of the association to establish billing procedures for all physicians acting jointly in the care of a single patient so as to assist in the handling of fee-splitting, one of the major charges made by Dr. Hawley.

The Reference Committee on Legislation and Public Relations considered these resolutions, the ethical problems involved and the violations of ethical principles cited particularly by Dr. Hawley and the governing board of the College of Surgeons. The conclusion of the committee's report, in which the House of Delegates concurred, follows:

> "Your reference committee claims no originality in stating an opinion often expressed by official spokesmen for the American Medical Association that some doctors of medicine violate the Principles of Medical Ethics. The committee believes that this involves relatively few physicians and that the geographical distribution is spotty. Human nature being what it is, this will probably always be true. The method evolved for dealing with the problem of unethical conduct and practices by the American Medical Association, while far short of perfection is still the best and most practical means of correcting these abuses and safeguarding the best interests of the public. This method is being and will continue to be followed. Dr. McCormick in his inaugural address called on constituent associations to become increasingly vigilant and aggressive in the pursuit and correction of abuses. Many of his predecessors have emphasized this continued need which is and always will be present, since doctors are subject to the same weaknesses of flesh and spirit as are other persons.
>
> "The American Medical Association must now and in the future always continue to enunciate to its members and to the public its stand on matters pertaining to abuses and evils in the practice of medicine. A positive public relations program must be maintained pointing out the good things the members of the American Medical Association are doing to promote the public health and welfare of the citizens of this country."

The requests for development of approved methods of joint billing were referred to the Judicial Council for further study.

In connection with efforts now being made in local associations all over the country to maintain active committees to investigate, pass upon and, if necessary, discipline members for unethical practices, considerable attention was given to the name by which such committees should be known. The name "mediation committee" was suggested and approved by one reference committee and the delegates. But the Council on Medical Service reported, on the basis of a study, that the name "Grievance Committee" was the most frequent and the most popular name, even among the larger state and county societies. The Council therefore reported that, while it was in agreement with the House that the American Medical Association should not dictate in such matters, the name "Grievance Committee" would continue to be used by the Council in all its own dealings with such organizations.

VA Care Defined

Action was finally taken by the delegates at this meeting on the heated and controversial question of medical care for non-service-connected disabilities in veterans' hospitals. The action taken was the one proposed, after careful study, by the Committee on Federal Medical Services at the Denver Clinical meeting last December. It called upon Congress and the Veterans' Administration to limit medical care and hospitalization benefits in Veterans' Administration and other federal hospitals to the following categories:

> (a) Veterans with peacetime or wartime service whose disabilities or diseases are service-incurred or aggravated; and
>
> (b) Within limits of existing facilities to veterans with wartime service suffering from tuberculosis or psychiatric or neurological disorders of non-service-connected origin, who are unable to defray the expenses of necessary hospitalization.

It was recommended and approved, further, that provision of medical care and hospitalization in Veterans' Administration hospitals for the remaining groups of veterans with non-service-connected disabilities be discontinued and that the responsibility for the care of such veterans revert to the individual and the community where it rightfully belongs.

Postponement last December was agreed upon after heated discussion in order that representatives of the American Medical Association, the veterans' organizations, the American Dental and Hospital Associations, the Department of Defense and the Veterans' Administration might have a chance to meet and perhaps agree on the data to be considered, if not on a solution to the problem. The Board of Trustees accordingly appointed a liaison committee of which Dr. Edwin S. Hamilton was chairman, to meet with representatives of the other groups named. There were several hours of open hearings in which the committee reported that all interested groups had a fair and full hearing. It was the opinion of the committee that no substantial inaccuracies were developed in the original special committee report. Although representatives of other groups asked that the report be rejected and that further meetings be held, the action taken followed the recommendation both of the Committee on Federal Medical Services and the Liaison Committee appointed by the Board.

Remarks by Mr. Louis K. Gough, Commander of the American Legion, who addressed the delegates in the course of the session, clearly indicated the dissatisfaction of veterans' organizations and the other groups with the decision of the delegates. Mr. Gough declared that abuses of the current entitlement to medical and hospitalization are negligible. He expressed disappointment that the meetings between the organizations involved had not been organized on a more permanent basis so that they might meet regularly and so erase evident misconceptions in the facts. He also cited some Legion studies now under way which he hoped the doctors would examine.

The close vote on a bill introduced in Congress subsequently to limit medical and hospital service for non-service-connected disabilities might well be regarded as a reflection of the action taken by the delegates in New York. The fact that many Congressmen reversed themselves on a later vote showed no doubt of the soundness of such a limitation but rather the force of veteran opinion to which they are all acutely sensitive.

Clarify Intern Program Rules

The whole problem of intern distribution and the qualification of hospitals for intern training was the subject of a variety of resolutions reflecting the scarcity of interns in general and the difficulties encountered by small hospitals in maintaining standards and attracting interns. Careful and detailed reports on the requirements and working, to date, of the revised "Essentials of an Approved Internship," first submitted in 1952 and approved for use in December, 1953, showed to the satisfaction of the House of Delegates that many of the criticisms voiced at this meeting were not justified. On the other hand, it was decided because of the dissatisfaction shown in reference committee hearings, first, that the rule be abolished whereby approval may be withdrawn for an internship program which for two consecutive years fails to obtain at least two-thirds of its slated complement of interns and, second, that further study be continued by a committee appointed by the Speaker of the House of Delegates, at least half of whom are to be doctors in private practice not connected with medical schools or affiliated hospitals.

The so-called "Matching Plan" for apportioning interns came in for criticism, too. This plan functions through an independent agency made up of equitable representation from the American Medical Association and the various hospital associations. Its objective is to act as a clearing house for applications for internships. The resolution asking for its abolishment was rejected but another condemning the "interference of teaching institutions with the operation of the plan" was given serious consideration and it was decided to request a restudy of its function by the agency with a view to implementing improvement.

The report of the Commission for the Improvement of Care of the Patient incorporated an eight-point program for improvements in nurse accreditation which was adopted in toto by the House. This program was submitted to the delegates in December and referred to the Board of Trustees for submission to the above committee for further study and consultation with the director of the Accreditation Program of the National League of Nursing. It provides for a number of constructive changes in current practices, notably a reduction of the present three-year program for diploma training, to two years: also, a chance for advancement, in selected cases, from trained practical nurse status to hospital diploma courses, and from hospital diploma status to collegiate degree courses.

Essentials for training of Medical Record Technicians, as distinguished from Medical Record Librarians, with more flexible and less demanding standards, were provisionally approved so that schools may be established as outlined next September. Further consideration and final action on the program was postponed until next December, however, when members will presumably have had time to study the program.

The problem of the relationship of the dental surgeon to the surgical service of a hospital was left over for study, also, from the December session. The final recommendation adopted at this session was the result of considerable consultation with the American Board of Oral Surgery (dental), the American Dental Association and the American Hospital Association. It reads as follows:

"The position adopted by the representatives at the meeting on March 21 was to the effect that the oral (dental) surgeon be assigned to a surgical service of a hospital and to perform such professional duties as the chief of the surgical service directs. The members of the American Board of Oral (dental) Surgery stated that this plan was fully satisfactory." Of interest in connection with this action is the definition of a dental-oral surgeon which was incorporated in the report and adopted. According to this definition "dental-oral surgery is to be limited to diseases of the teeth and jaws and lesions of contiguous soft tissues related to diseases of the teeth and jaws but excluding malignancies."

Hospital Relations Integrated

The over-all problem of medical-hospital relationships was considered at length by a Joint Committee of the Board of Trustees of the American Medical Association and the American Hospital Association and its recommendations to the delegates were adopted. These recommendations provide, in general, for closer integration between the medical staff, the administrative staff and the governing board of the hospital to the end that hospitals and physicians may aid each other in the delivery of the best possible care to the patient. It is the belief of the committee that mutual understanding will eliminate criticism and irritation between members of the hospital governing board, the medical staff and the administrator. It will also eliminate interference of administration in purely medical problems.

Two other resolutions on relationships in and out of the hospitals were submitted to the Board of Trustees for further study. One dealt with relationships to nonprofessional workers in the health field, the other with relationships to auxiliary workers in the field of medicine.

Warm Debate on Osteopathy

Still another problem in relationships developed considerable discussion and some difference of opinion. This one involved the relationship between medicine and osteopathy and the committee appointed by the Board of Trustees after the December meeting to study the matter, submitted an extensive report, including the history of osteopathy, current educational standards and requirements all over the country for admission to practice. In view of its findings, the committee, of which Dr. John W. Cline is chairman, made some radical recommendations which were not accepted by the Reference Committee. At the request of the Board of Trustees the Reference Committee recommended that "because of the length of the report and the controversial nature of the subject, the Board feels that the House should have adequate time for study and that the state associations should have an opportunity to express their opinions. Therefore it is recommended that the committee be continued but that action on the report be deferred until the June, 1954, session." Meantime, it was suggested that the House be prepared to answer the following questions:

1. Should modern osteopathy be classified as "cultist" healing?
2. Should doctors of medicine teach in osteopathic schools?
3. Should the relationship of doctors of medicine to doctors of osteopathy be a matter for determination by the several state associations?

A minority report of the reference committee, stressed improvement of the health of the American people as a consideration and the need for realistic leadership from the American Medical Association. It proposed immediate action instead of postponement for study, asked that doctors of medicine assist in elevating educational standards in osteopathic schools and that relationships be left for determination of the states.

Education in the specialties came in for attention in several quarters. Principally, critics of current procedure desired more representation on the specialty boards for men in practice and not allied with teaching institutions. They also desired more training in general practice for candidates for certification in the specialties. These matters will be studied further. The special committee appointed in December at the instance of Past-President Louis H. Bauer to study the possibility of requiring a period in general practice for all candidates in the specialties, was authorized to continue its investigation of the matter with a view to reporting next year.

Medical Education Fostered

The problem of financing medical education was discussed at length by Dr. Elmer L. Henderson, director of the American Medical Education Foundation and by Dr. Frank H. Lahey, trustee of the National Fund for Medical Education and a past president of the association, who until his recent death, was chairman of a special committee to solicit businessmen and organizations for funds. Dr. Lahey reported with enthusiasm on the response of business and industrial leaders to the appeal to keep medical education free of federal controls and subsidies. He estimated that doctors and their friends had given more than three million dollars (including direct alumni donations) for that purpose in the last three years as against an estimated deficit of 10 million dollars incurred annually by the schools.

Dr. Henderson reported that $906,000 has been contributed to the Foundation in 1951 and 1952 and that the number of contributors increased from 1,876 in 1951 to 7,259 in 1952, an increase of 287 per cent. The Foundation has turned over in excess of $1,650,000 to the National Fund for Medical Education which in turn made grants to each of seventy-nine approved medical schools of more than $2,918,000. The total amount raised and transferred in thirty months was $2,650,000. The goal in 1953, he said, is more than $2,000,000 and for this purpose the American Medical Association has already voted one half million to seed the campaign.

Most states are campaigning actively for the fund, according to Dr. Henderson's report. Indiana has given the largest amount per member but Nebraska raised $49,146 in cash and pledges in one month, with a doctor population of only 1,300. On the other hand, Illinois has voted to assess each member $20 a year for the fund, the first state to institute such an assessment. Among outstanding individual gifts to the fund was the contribution of $10,000 from the Auxiliary to the American Medical Association; also the $21,500 raised by one state committee of the Auxiliary and turned over to the Foundation.

Changes in By-Laws Voted

Four changes in the By-Laws pertaining to membership were adopted virtually as proposed by the Council on Constitution and By-Laws of which Dr. Louis A. Buie of Rochester, Minnesota, is chairman. The first specifically limited members to one type of membership at a time. Two others made it explicit that requests for exemption from payment of AMA dues must be transmitted through the constituent association to the Secretary of the American Medical Association. The third provides that "members temporarily in the Armed Forces may be excused from payment of AMA dues regardless of local dues exemption, for the period beginning January 1 or July 1 following date of the member's entrance into service."

Other changes adopted had to do with clarifying rules governing minority reports from reference committees and routine procedure of the reference committees. Also, a resolution requiring the Board of Trustees to appropriate money to provide sufficient funds, within the means of the Association to implement any policies, programs or measures adopted by the House of Delegates. This resolution which was adopted at the December meeting and referred to the Council was resubmitted to the delegates with a significant change. The altered statement was adopted for incorporation in the Constitution and By-Laws as follows:

> "All resolutions and recommendations of the House of Delegates pertaining to the expenditure of funds shall be referred to the Board of Trustees which shall determine if the expenditure is advisable. If it is decided that the expenditure is inadvisable, the Board shall report, at its earliest convenience, to the House of Delegates, the reason for its action. This procedure conforms to the statutes of the State of Illinois under which the American Medical Association is incorporated."

Important among changes in the By-Laws govering membership proposed at this session was the Minnesota resolution asking that payment of dues for the current year be sufficient, without payment of any back dues, in the event that a constituent state association should make annual payment of American Medical Association dues a requirement for membership in its association. This resolution was introduced at the direction of the Council by Dr. George Earl, Minnesota delegate, and the recommendation of the Reference Committee on Amendments to the Constitution and By-Laws which follows, was adopted by the delegates.

> "Your committee approves this resolution in principle," the committee said. "It believes that when a state association makes it mandatory to belong to the American Medical Association in order to be a member of the state medical society, then this provision of the resolution is sound policy. We do, however, believe that the various state medical associations should have time to study this resolution. We have been advised that some legal problems may arise at the state level. Your committee therefore recommends that copies of this resolution, with a copy of the remarks of the committee, be sent to the individual state medical societies and that this resolution be considered at the December, 1953, interim session of the House of Delegates."

Another change referred to the Council on Constitution and By-Laws for implementation concerned disciplinary action for members over whom county and state societies have no original jurisdiction. This amendment would provide that the Judicial Council, after due notice, and hearing could censure, suspend or expel any Service, Affiliate or Honorary member of the Association for an infraction of the Constitution and By-Laws or for a violation of the Principles of Medical Ethics. This action would bring many of the more vitriolic critics of medicine under direct disciplinary action of the Judicial Council.

Revision of the Principles of Medical Ethics is under way, as ordered in June, 1952, the Council reported, and a new preamble and conclusion were approved as submitted at this session.

The doctor-draft law, which was in the process of enactment by Congress at the time of the meeting received remarkably little attention at the New York session. One resolution bearing upon its operation was referred to the Council on National Emergency Medical Service for further study. This resolution asked that the opinion of the state medical advisory committee on the essentiality of a doctor be made final, in case of a dispute between local draft boards and committees.

It is obviously impossible in this résumé to describe or even mention all of the other actions and reports—some of them of great importance—at this meeting. For example, an exhaustive report was submitted by the Committee on Blood, on blood collection and banking all over the country which should be read in its entirety in the printed proceedings published in the June 27 issue of *The Journal of the American Medical Association.* In that connection, it is interesting to note that the Board of Trustees has taken under advisement for special study a plan proposed by California for establishment of a coordinated national blood bank program to be operated by the American Medical Association, the American Red Cross and other qualified agencies.

Other notable events of the proceedings included election of Dr. Alfred Blalock of Baltimore for the Distinguished Service Award. Also the presentation in person of the 26 millionth subscriber to Blue Shield, Mr. William P. Markham of Louisville, Kentucky.

Approve Bricker Resolution

The delegates also went on record in unanimous support of S.J. No. 1, the so-called Bricker resolution, which calls for an amendment to the Constitution limiting the treaty-making power of the executive and requiring that no treaty or executive agreement be made which conflicts with any provision of the constitution or which operates to regulate any of the purely domestic affairs of the United States.

Addresses of the president, the past president and the Speaker, always highlights of the proceedings, should be read carefully as printed in the June 20 issue of *The Journal.* Nine points emphasized by the new president, Dr. Edward J. McCormick, who took office at this meeting, constitute a sound and well-considered program for medicine all over and undoubtedly rate a brief capitulation here. Dr. McCormick urged the following upon all societies: active measures to promote proper distribution of doctors; 24-hour emergency call services for physicians everywhere; strong, fearless mediation committees to hear patient complaints; clarification of physician-hospital relationships by county and state medical societies; active development of voluntary health insurance by every county society; participation by individual physicians in all community affairs; better public relations by every physician in his own office including the utmost care to avoid overcharging, rudeness, and excessive waiting in the doctor's office; a closer contact between county and state societies and writers for press, radio and television; greater unity within the profession which should work as a team at all times, even when, as now, part of the pressure involved in the immediate threat of compulsory health insurance is off.

Officers, Guests Speak

As most people are already aware, the new President-Elect, chosen at this meeting, is Dr. Walter B. Martin of Norfolk, Virginia. The Vice President is Dr. Carl H. Gellenthien, Valmora, New Mexico. Dr. George F. Lull of Chicago, continues as Secretary, Dr. J. J. Moore as Treasurer and Dr. James R. Reuling of Bayside, New York, as Speaker of the House of Delegates, a post which he filled, as before, with admirable wisdom and fairness. Dr. Edwin S. Hamilton of Kankakee, Illinois, and Dr. Gunnar Gundersen of La Crosse, Wisconsin, were re-elected to the Board of Trustees. Dr. Julian P. Price, Florence, South Carolina, was elected to fill the unexpired term of Dr. Walter B. Martin.

Among the distinguished guests who addressed the delegates were two women of note, Mrs. Oveta Culp Hobby, already confirmed as Secretary of the new Department of Health, Education and Welfare, and Mrs. Ivy Baker Priest, Treasurer of the United States.

Doctors present were particularly interested in Mrs. Hobby's outline of what constitute "indispensable social services which serve the public health of the nation without affecting the doctor-patient relationship in medical practice."

They are, briefly: prevention of disease; medical research, the increasing cost and scope of which make it a field in which government support is increasingly sought; rehabilitation and restoration of the disabled in which private agencies work closely with government agencies and medical education. Local governments, with the private assistance of medical organizations, must meet an overwhelming deficit in funds if medical education is to be kept on a high level, Mrs. Hobby said.

One other point which greatly interested the delegates, the name of the Special Assistant for Health and Medical Affairs who is to serve in her department, was not disclosed by Mrs. Hobby. (Dr. Chester-Keefer of Boston was recently confirmed for this post.)

St. Louis has been selected for the December Clinical session; the 1954 meeting will be in San Francisco and the 1955 session in Atlantic City. Invitations were received from both Chicago and New York for the session of 1956. Decision awaits the progress both cities hope for in building new convention halls with adequate facilities.

George Earl, M.D.
F. J. Elias, M.D.
J. A. Bargen, M.D.
O. J. Campbell, M.D.

However accurately we carry out the health examination of the community, we cannot expect to achieve complete victory over infection until the public itself has become better informed. It sometimes happens that an infectious form of primary pulmonary tuberculosis runs such a rapid course that others have been infected long before the next scheduled examination. A flare-up of an older tuberculous infection may also occur rapidly. Such cases are, however, not common and the patient is brought to bed very soon. In many cases the ignorance and asocial, sometimes antisocial, attitude of the sources of infection have contributed to the spread of infection.—Tobias Gedde-Dahl, M.D., *The American Journal of Hygiene,* September, 1952.

1. Not included in tabulations.
2. Included in "Relief of Symptoms" as "Poor" and in "Evidence of Healing" as "None."
3. Four had no symptoms when Banthine therapy was begun.
4. Of which seven were penetrative lesions and five partially obstructive.
5. No symptoms were present in four.
6. Two with symptoms only; no demonstrable ulcer.
7. Three were psychopathic patients and one had a ventricular ulcer of the lesser curvature.
8. Roentgen findings after treatment period of two weeks; forty-seven had duodenal deformity.
9. All returned to work within a week.
10. In these four, after relief of symptoms, Banthine was discontinued because of urinary retention.

During the past three years, more than 250 references to Banthine therapy in peptic ulcer and other parasympathotonic conditions have appeared in medical literature. Of these reports, 22 have presented specific facts and figures on the results of treatment in a total of 1,443 peptic ulcer patients, 67.8 per cent of whom were reported as chronic or resistant to other therapy. These results are tabulated above and show:

"Good" relief of symptoms was obtained in 81.3 per cent of the 1,405 patients on whom reports were available.

"Complete" evidence of healing was obtained in 70.5 per cent of the 783 patients on whom reports were available.

In all but 9.3 per cent, relief of pain was "good" or "fair." In all but 22.9 per cent, evidence of healing was "complete" or "moderate."

During treatment, 26 patients required surgery or developed complications other than ulcer which required discontinuance of the drug before results could be evaluated.

Of the remaining 1,417 patients, only 3.7 per cent experienced side effects sufficiently annoying to require discontinuance of the drug.

✦ Reports and Announcements ✦

NORTHERN MINNESOTA MEDICAL ASSOCIATION

The annual meeting of the Northern Minnesota Medical Association will be held in Fergus Falls, Friday and Saturday, August 28 and 29, 1953. The annual banquet will be held Friday evening, August 28. The program for the two days is as follows:

Friday, August 28, 1953

Morning Session—10:00 A.M.

"Management of the Neurogenic Bladder."
Harold Walder, M.D., Duluth, Minnesota
"Treatment of Poliomyelitis."
Joseph P. Engel, M.D., Minneapolis, Minnesota
"Antibiotics in the Management of Staphylococcal Sepsis."
Robert I. Wise, M.D., Minneapolis, Minnesota
"Present Status of Drug Therapy in the Treatment of Allergic States."
Frederick W. Wittich, M.D., Minneapolis, Minnesota

Luncheon and Business Meeting—12:30 P.M.
Hosts: Park Region District and County Medical Society

Afternoon Session—2:00 P.M.

"Fluid and Electrolyte Balance"
Arthur H. Wells, M.D., Duluth, Minnesota
"Diagnosis and Treatment of Tumors of the Skin and Oral Cavity."
Lyle J. Hay, M.D., Minneapolis, Minnesota
"Aids in Foreseeing Obstetric Difficulties."
Bruce Williams, Duluth, Minnesota

Annual Banquet—6:30 P.M.

G. J. Mouritsen, M.D., Fergus Falls, *Presiding*
President, Northern Minnesota Medical Association
Remarks—O. J. Campbell, M.D., Minneapolis
President of the Minnesota State Medical Association
"Some Historical Facts and a Tribute"
L. H. Rutledge, M.D., Detroit Lakes, Minnesota
Remarks—Justus Ohage, M.D., St. Paul
President-Elect Minnesota State Medical Association
Address—"European Travels—Some Observations"
Frederick W. Wittich, M.D., Minneapolis, Minnesota

Saturday, August 29, 1953

Morning Session—9:00 A.M.

Clinico-Roentgen-Pathological Conference
Led by Henry G. Moehring, M.D., Duluth, Minnesota, assisted by those presenting material and cases.

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

The annual meeting of the Southern Minnesota Medical Association will be held at St. John's Catholic School, Mankato, Minnesota, Monday, September 14, 1953. The program will be as follows:

Monday, September 14, 1953

St. John's Catholic School

Registration—8:00 to 9:00 a.m.

Morning Session—9:00 to 12:00 Noon

"A Survey of Small Intestinal Obstruction in a Small Group Practice."
John C. Mickelson, M.D., Mankato
"Regional Enteritis: Present Opinions Regarding its Treatment."
S. R. Maxeiner, M.D., Minneapolis
"Fluid Regulation in Nephritis and Nephrosis in Childhood."
E. C. Burke, M.D., Rochester
"The Intervertebral Disk Problem in the Teen Age Group."
D. R. Lannin, M.D., Saint Paul

Intermission

"Hazards of Arsenic in the Treatment of Asthma."
L. E. Prickman, M.D., Rochester
"Injection Therapy of Varicose Veins Using Sylnasol Foam, Complications, Indications, and Contraindications."
H. A. Alexander, M.D., Minneapolis
"Chemotherapy of Leukemia and Lymphosarcoma."
J. M. Stickney, M.D., Rochester

Luncheon Meeting—12:15 to 2:00 p.m.

Bethlehem Lutheran Church

Afternoon Session—2:00 to 5:00 p.m.

St. John's Catholic School

Case Report: "Acute Cervical Tumor in Mental Defective."
Heinz Bruhl, M.D., Faribault
Case Report: "Stromal Endometriosis."
R. F. Mears, M.D., Northfield
Case Report: "Gun Shot Wound of Kidney."
E. J. Richardson, M.D., Saint Paul
"Present Status of Surgery in the Treatment of Heart Disease."
Ivan D. Baronofsky, M.D., Minneapolis

Intermission

"Epidemiological Situation in Southern Minnesota 1953."
State Board of Health

"Conditions Confused with Leukemia in Children."
S. D. Mills, M.D., Rochester

"The Mankato Rehabilitation Center."
Wm. S. Chalgren, M.D., Mankato

"Current Trends in the Management of Infantile Hydrocephalus."
Henry S. Dodge, M.D., Rochester

Cocktail Hour—5:30 p.m.

Mankato Country Club
Courtesy of Mankato Pharmacists

Banquet—6:30 p.m.

Mankato Country Club

Remarks: O. J. Campbell, M.D., Minneapolis, President of the State Medical Association

Presidential Address: H. J. Nilson, M.D., Mankato

"Medical Tour of India."
Leo G. Rigler, M.D., Minneapolis

The Women's Auxiliary of the Blue Earth County Medical Society will entertain the visiting ladies.

Authors are requested to leave typewritten copies of their papers with the Secretary in order that they may be submitted to Minnesota Medicine for publication.

Application for membership may be made at the registration desk.

AMERICAN CONGRESS OF PHYSICAL MEDICINE AND REHABILITATION

The thirty-first annual scientific and clinical session of the American Congress of Physical Medicine and Rehabilitation will be held on August 31, September 1, 2, 3 and 4, 1953, at the Palmer House, Chicago.

Scientific and clinical sessions will be given on the first four days of the session. All are open to members of the medical profession in good standing with the American Medical Association.

Full information may be obtained by writing to the executive offices, American Congress of Physical Medicine and Rehabilitation, 30 North Michigan Avenue, Chicago 2, Illinois.

AMERICAN MEDICAL WRITERS' MEETING

The tenth annual meeting of the American Medical Writers' Association will be held at the Elk's Club, Springfield, Illinois, September 23, President Lewis J. Moorman, M.D., editor of the *Journal of the Oklahoma State Medical Association,* presiding. (The meeting will be held during the eighteenth annual meeting, Mississippi Valley Medical Society—September 23, 24, 25—at the same club.)

The morning session will feature a Symposium on Medical Writing by Julius Jensen, M.D., St. Louis, Steward G. Wolfe, Jr., M.D., Oklahoma City, Theodore R. Van Dellen, M.D., Chicago, Richard M. Hewitt, M.D., Rochester, Minnesota, and Lee D. von Antwerp, Chicago. Also papers on Medical Writing for Medical Students by Walter R. Bett, M.D., London, England, and Dean F. Smiley, M.D., Chicago. The afternoon session will feature a symposium on Medical Writing by a non-medical group of six from the *Southern Medical Journal,* Mayo Clinic, Illinois State Medical Society and the Universities of Oklahoma and Michigan. The evening session will feature a fellowship hour, dinner, presentation of awards and fellowships and an address by Walter R. Bett, M.D., of London, the distinguished British writer and libarian. With thirteen speakers on the program this is the most ambitious program the association has ever had. A detailed program may be secured from Harold Swanberg, M.D., Secretary, W.C.U. Building, Quincy, Illinois. All concerned with any phase of medical writing are cordially invited. There are NO registration fees.

AMERICAN UROLOGICAL ASSOCIATION AWARD

The American Urological Association offers an annual award of $1,000 (first prize, $500; second prize, $300, and third prize, $200), for essays on the result of some clinical or laboratory research in Urology. Competition shall be limited to urologists who have been in such specific practice for not more than ten years, and to men in training to become urologists.

The first prize essay will appear on the program of the forthcoming meeting of the American Urological Association, to be held at the Waldorf-Astoria, New York, New York, May 31 to June 3, 1954.

For full particulars, write to the Executive Secretary, William P. Didusch, 1120 North Charles Street, Baltimore, Maryland. Essays must be in his office before February 1, 1954.

EIGHTEENTH ANNUAL CONVENTION OF THE NATIONAL GASTROENTEROLOGICAL ASSOCIATION

The National Gastroenterological Association will hold its Eighteenth Annual Convention and Scientific Sessions at The Biltmore Hotel, Los Angeles, October 12, 13, 14, 1953.

The program will include a Symposium on Cirrhosis of the Liver; Panel Discussions on "Peptic Ulcer;" "Diseases of the Large Bowel" and "Latest Developments in Cancer Research," and additional papers on interesting subjects in gastroenterology and related fields.

Following the Convention, on October 15, 16, 17, 1953, the Association's Fifth Annual Course in Postgraduate Gastroenterology will be given at The Biltmore Hotel and the College of Medical Evangelists in Los Angeles. The Course will be under the personal direction of Drs. Owen H. Wangensteen of Minneapolis, Minnesota, and I. Snapper of Chicago, Illinois, who will be assisted by a faculty from the medical schools in and around Los Angeles.

THE SHELTERING ARMS
4330 River Road, Minneapolis 6, Minnesota
A HOSPITAL FOR TREATMENT OF POLIOMYELITIS
Acute and Convalescent
Fully Approved by American College of Surgeons
Modern treatment—Staff includes Kenny trained technicians

The Scientific Sessions on October 12, 13 and 14 are open to all physicians without charge. The Postgraduate Course will be open to only those who have matriculated in advance.

Further information concerning the program and details of the Postgraduate Course may be obtained by writing to the Executive Officer, National Gastroenterological Association, 1819 Broadway, New York 23, New York.

COURSE IN OCCUPATIONAL SKIN PROBLEMS

The Institute of Industrial Health, University of Cincinnati, will hold a course in Occupational Skin Problems, October 12-16, 1953. The general objective of the program is to fulfill the professional needs of the industrial physician. The program will be divided into three daily sessions, consisting of morning didactic lectures and clinical demonstration, afternoon field instruction in industrial plants, and evening panel discussions. The didactic presentations will include orientation in the anatomy, physiology and chemistry of the skin, consideration of the etiologic aspects, clinical types, diagnosis and treatment of occupational dermatoses, and discussion of specific measures of prevention and control. The evening sessions, in panel form, have been designed to present pertinent material on the subjects of cutaneous cancer, cutaneous allergy, and medico-legal problems. A clinic on industrial skin problems will be held.

There will be a registration fee of $50.00. Registration will be limited to fifty persons and application must be made before September 15, 1953.

For further information, write to the Secretary, Institute of Industrial Health, Kettering Laboratory, Eden and Bethesda Avenues, Cincinnati 19, Ohio.

1954 COLLEGE ESSAY AWARD

The Board of Regents of the American College of Chest Physicians offers three awards to be given annually for the best original contribution, prepared by any medical student studying for the degree of Doctor of Medicine, on any phase relating to the diagnosis and treatment of chest disease.

The first prize will consist of a cash award of $250 and a certificate. The second and third prizes will be certificates of merit. The Essay award is open to all medical students in accredited medical schools throughout the world.

The winning contributions will be selected by a board of impartial judges and will be announced at the Twentieth Annual Meeting of the American College of Chest Physicians to be held in San Francisco, California, June 17-20, 1954. All manuscripts become the property of the American College of Chest Physicians and will be referred to the Editorial Board of the College jour-

1 *to escape pollens*

2 alternatives for the hay fever patient

2 *to relieve symptoms*

Pyribenzamine®
hydrochloride
(tripelennamine hydrochloride Ciba)

Once atop Pike's Peak, your hay fever patient can enjoy freedom from pollens. But for patients who must remain in a high-pollen environment, you can institute this effective therapy: one or two Pyribenzamine tablets, 3 or 4 times daily.

Alone and as an adjunct to desensitization, Pyribenzamine has proved effective in relieving hay fever symptoms, as evidenced by thousands of published case reports. On the basis of this evidence, no other antihistamine combines greater clinical benefit with greater freedom from side effects.

For your prescription needs, Pyribenzamine 50 mg. tablets are available in bottles of 100 and 1000 at all pharmacies.

Ciba *Ciba Pharmaceutical Products, Inc., Summit, N. J.*

nal *Diseases of the Chest* for consideration. The College reserves the right to invite the winner of the first prize to present his contribution at the Annual Meeting.

Applicants are advised to study the format of *Diseases of the Chest* as to length, form, and arrangement of illustrations to guide them in the preparation of the manuscript. The following conditions must be observed:

1. Five copies of the manuscript typewritten in English (double spaced) should be submitted to the Executive Director, American College of Chest Physicians, 112 East Chestnut Street, Chicago 11, Illinois, not later than March 15, 1954.
2. The only means of identification of the author shall be a motto or other device on the title page and a sealed envelope bearing the same motto on the outside enclosing the name and address of the author.
3. A letter from the Dean or Chairman of the Department of Medicine of the medical school certifying that the author is a medical student studying for the degree of Doctor of Medicine and that the contents represent original work.

EIGHTH ANNUAL POSTGRADUATE COURSE ON DISEASES OF THE CHEST

The Council on Postgraduate Medical Education of the American College of Chest Physicians, in co-operation with the respective state chapters of the College as well as the staffs and faculties of the local hospitals and medical schools, will sponsor the Eighth Annual Postgraduate Course on Diseases of the Chest at the Hotel Knickerbocker, Chicago, Illinois, September 28-October 2, 1953, and the Sixth Annual Postgraduate Course on Diseases of the Chest to be held at the Hotel New Yorker, New York City, November 2-6, 1953.

These annual postgraduate courses endeavor to bring physicians up to date on recent advancements in the management and treatment of heart and lung disease. Tuition for each course is $75.

Further information may be secured by writing to the Executive Director, American College of Chest Physicians, 112 East Chestnut Street, Chicago 11, Illinois.

PAN AMERICAN MEDICAL WOMEN'S ALLIANCE, INC.

The Fourth Congress of the Pan American Medical Women's Alliance will be held at the Beekman Towers Hotel, First Avenue and 49th Street, New York, from September 24 through October 1, 1953. The morning hours will be given over to a scientific program of general interest. There will be round-table luncheon discussions with leaders speaking Spanish and English. Through the sponsorship of leading New York medical women those interested in a special field will have opportunities to attend clinics of their choice. The Medical Women's Association of New York is serving as hostess and planning a most delightful program, including tours of the New York Hospital-Cornell Medical Center and Columbia-Presbyterian Medical Center, a boat trip around Manhattan Island, tour and luncheon at the United Nations, visits to Radio City and the Empire State Building, and a drive to Hyde Park.

A. S. ALOE COMPANY OF MINNESOTA • 927 Portland Avenue • Minneapolis 4, Minnesota

Hotel reservations should be made direct to the hotel. For further information write: Registration Chairman, Ina A. Marsh, M.D., 140 Linwood Avenue, Buffalo 9, New York.

MINNESOTA PUBLIC HEALTH CONFERENCE

The Minnesota Public Health Conference will hold its seventh annual meeting Thursday and Friday, September 24 and 25, at the Nicollet Hotel in Minneapolis.

Dr. Lee Burney, Indiana State Health Officer, will be the principal speaker at a banquet meeting Thursday evening. Thursday afternoon session will be devoted to a discussion of local health services in Minnesota.

Group meetings of special interest to physicians will be held all day Friday.

Last year more than 600 public health workers from all parts of the state attended the Conference.

MISSISSIPPI VALLEY MEDICAL SOCIETY MEETING

The eighteenth Annual Meeting, Mississippi Valley Medical Society will be held at the Elk's Club, Springfield, Illinois, Sept. 23-25. (The tenth Annual Meeting, American Medical Writers Association will also be held at the Elk's Club on Sept. 23.)

The meeting will feature forty-one speakers and over forty scientific and technical exhibits in an intensive three-day session with the entire program geared to especially appeal to men in general practice. The program will include a Symposium on Diabetes, a Clinico-Pathologic Conference and a Panel on "What Is New in Medicine and Surgery." There will be clinical teachers from the Universities of Illinois, Iowa, Louisville, Oklahoma, Tennessee, and from Northwestern, St. Louis and Washington Universities. The September 24 evening program will feature a presentation of awards and fellowships with the principal address by Assistant Secretary of Defense (Health and Medical) Melvin A. Casberg, M.D., Washington, D. C., formerly Dean of St. Louis University. A detailed program may be secured from Harold Swanberg, M.D., Secretary, W.C.U. Building, Quincy, Illinois. All ethical physicians are cordially invited and urged to attend. There are NO registration fees.

SYMPOSIUM ON CARDIOVASCULAR PHYSIOLOGY AND SURGERY

Under the auspices of the Minnesota Heart Association, the University of Minnesota will present a Symposium on Cardiovascular Physiology and Surgery on September 14 to 16 in the Museum of Natural History Auditorium on the University campus.

Participants will include such internationally known experts as Drs. W. G. Bigelow, Toronto; Clarence Crafoord, Stockholm, Sweden; Lewis Dexter, Boston; Charles T. Dotter, Portland, Oregon; John H. Gibbon, Philadelphia; Robert P. Glover, Philadelphia; William F. Hamilton, Augusta, Georgia; Dwight E. Harken, Boston; W. F. H. M. Mommaerts, Durham, North

Carolina; Willis J. Potts, Chicago; John W. Remington, Augusta, Georgia; Robert Rushmer, Seattle; C. W. Sheppard, Oak Ridge, Tennessee; Torgny Sjostrand, Stockholm, Sweden; Olle Snellman, Stockholm, Sweden; H. J. C. Swan, Rochester, Minnesota; Henry Swan, Denver; Richard W. Stow, Rochester, Minnesota; and E. Wetterer, Munich, Germany.

The symposium will be open, without tuition fee, to all physicians and to qualified investigators in the field of cardiac physiology. Housing accommodations will be available on the campus for out-of-town registrants who wish them. Further information may be obtained from the Director, Department of Continuation Medical Education, University of Minnesota Hospitals, Minneapolis 14, Minnesota.

CONTINUATION COURSES

Dental Problems in Medicine for Physicians will be presented by the University of Minnesota on October 21, 1953, at the Center for Continuation Study. The physician is from time to time confronted with a problem which is principally a dental one but for which he is called upon to render emergency treatment. In other instances the patient may seek his physician's advice as to whether a given dental procedure should be carried out. This course will attempt to provide useful information which will help the physician meet such problems. Subject matter will include examination of the teeth, gums, and mouth; oral manifestations of systemic disease; management of injuries involving the mouth and jaws; afflictions of the tempero-mandibular joint; and the fluoride problem. Faculty for the course will be made up of members of the faculties of the University of Minnesota Dental and Medical Schools.

* * *

Radiation Therapy for Specialists will be held at the Center for Continuation Study on the University of Minnesota campus from October 26 to 31, 1953. Principles and clinical applications of all forms of irradiation therapy will be discussed. The guest faculty will include Dr. Robert McWhirter, Professor, Department of Radiotherapy, Royal Infirmary, Edinburgh; Dr. Raymond Zirkle, Institute of Radiobiology and Biophysics, University of Chicago; Dr. Edith Quimby, Department of Radiology, Columbia University, New York; and Dr. Lauren V. Ackerman, Professor of Surgical Pathology and Pathology, Washington University School of Medicine, St. Louis, Missouri. The course will be presented under the direction of Doctors Leo G. Rigler, Professor and Head, Department of Radiology, and K. W. Stenstrom, Director of Radiation Therapy. Members of the faculty of the University of Minnesota Medical School and the Mayo Foundation will complete the faculty for the course.

* * *

The University of Minnesota, in conjunction with the American College of Chest Physicians and the Minnesota Chapter of the American Trudeau Society, will present a continuation course on *Diseases of the Chest* October 15 to 17, 1953. Intended primarily for physicians engaged in general practice, the course will emphasize management of frequently-met chest problems. Three outstanding visiting speakers will participate in the program: Dr. Andrew Banyai, Associate Clinical Professor of Medicine, Marquette University Medical School, Milwaukee, Wisconsin; Dr. Donald S. King, Consultant, Tuberculosis Service Veterans Administration Area No. 1, Boston, Massachusetts; and Dr. Dan Morse, Medical Director and Superintendent, Peoria Municipal Tuberculosis Sanitarium, Peoria, Illinois. The remainder of the faculty will include members of the clinical and full-time faculty of the University of Minnesota Medical School and the Mayo Foundation.

* * *

The University of Minnesota will present a course in *Hematology for Medical Technologists* at the Center for Continuation Study on October 6 to 7, 1953. This year's course is designed to emphasize technical aspects of hematology of use to the medical technologists. The program will be presented under the direction of Dr. Gerald T. Evans, Director of Hospital Laboratories, and the faculty will include members of the staff of the University of Minnesota Medical School.

NEW COURSE FOR LABORATORY AIDS

A twelve-month course for laboratory aides—a pioneer venture by the general extension division and the college of medical sciences—will begin September 28 at the University of Minnesota.

Geared to prepare young men and women for work as laboratory assistants to medical technologists and physicians, the course will include six months of classes on the University campus and six months of practical training in Twin City hospital laboratories.

The course will be run in conformity with the requirements for certification of laboratory aide under the Registry of Medical Technologists of the American Society of Clinical Pathologists. After successfully completing this course and after a year's work under a qualified physician, students will be eligible to take the certification examination.

Those enrolled in the program will attend classes during the University's regular fall and winter quarters. Starting March 29, 1954, they will begin their clinical training. Comprehensive examinations, scheduled September 13-27, 1954, will round-out the course.

Students will take a curriculum consisting of courses in physiological chemistry, human anatomy, basic laboratory techniques, electrocardiography and basal metabolism, blood bank techniques, urinalysis and elementary hematology, bacteriology, and physiology.

The course is open to high school graduates with college aptitude ratings of 40 percentile or higher, who are in the top half of their high school class and who fulfill the necessary personal qualifications such as an ability to work with people, a liking for science, and integrity. Since enrollment will be limited, students will be selected on a basis of scholastic aptitude and vocational promise.

Applications for the course can be obtained from the Medical Technology Office, W225, University Hospitals, University of Minnesota, Minneapolis 14. The forms must be returned by August 21.

AMERICAN COLLEGE OF CHEST PHYSICIANS

The twentieth annual meeting of the American College of Chest Physicians will be held in San Francisco, California, June 17-20, 1954. Physicians interested in presenting scientific papers on any phase in the diagnosis and treatment of heart and lung disease should send a 100-word abstract, not later than January 1, 1954, to Dr. Edgar Mayer, Chairman of the Committee on Scientific Program, 850 Fifth Avenue, New York 21, New York.

Woman's Auxiliary

NORTHERN MINNESOTA AUXILIARY PLANS ANNUAL MEETING

Mrs. Robert D. Estrem

Doctors and their wives from the northern part of Minnesota will be attending the annual meeting of the Northern Minnesota Medical Association in Fergus Falls on August 28 and 29, 1953.

Auxiliary members will be entertained at a luncheon on Friday, August 28, and will meet for breakfast on Saturday, August 29. They are also invited to attend the Friday night banquet with their husbands.

In Memoriam

ALEXANDER AUBIN

Dr. Alexander Aubin, a physician of Minneapolis for thirty-six years, died June 26, 1953, at St. Cloud, Minnesota.

Dr. Aubin was born in Canada, September 10, 1872. He graduated magna cum laude from Laval University, Quebec, Canada, in 1902. He practiced medicine in Minneapolis from 1912 until his retirement in 1948.

Dr. Aubin is survived by his daughter, Mrs. Joseph B. Gaida of St. Cloud; a sister, Mrs. Z. Bonneville of Cornwall, Canada, and two brothers, Alfred of Saint Paul and Albert of Edmonton, Canada.

WALTER MEREDITH BOOTHBY

Dr. Walter M. Boothby, well known for his work in metabolism and aviation medicine, died of a heart condition in Albuquerque, New Mexico, July 3, 1953. Dr. Boothby had retired from the Mayo Clinic and Foundation in 1948 and, on invitation from the King of Sweden, spent two years at the University of Lund continuing his work in aviation medicine. Following his return to the United States, he was awarded the order of Commander of the North Star, one of the top Swedish honors. In 1950 Dr. Boothby joined the professional staff of the School of Aviation Medicine at Randolph Field, San Antonio, Texas, and later became associated with the Lovelace Clinic in Albuquerque. Dr. Boothby was one of the world's foremost scientists in aviation medicine and during World War II, with Dr. William Randolph Lovelace and Dr. A. H. Bulbulian, developed in Rochester the BLB oxygen mask for aviators.

Dr. Boothby was born July 28, 1880, in Boston. He received the degree of B.A. in 1902, of M.D. in 1906, and of M.A. in 1907 from Harvard University. He interned at the Boston City Hospital for eighteen months; practiced surgery in Boston for seven years; was in charge of the metabolism laboratory at the Peter Bent Brigham Hospital, Boston, from 1913 to 1916; was instructor in anatomy from 1910 to 1916, and lecturer on anesthesia in the Harvard Medical School from 1914 to 1916. He entered the Mayo Clinic as head of the Section on Metabolism in November, 1916, and also was associate professor of medicine, the Mayo Foundation. During World War I he was with the A.E.F. in France for twenty-two months as captain and major in the Medical Corps; he was assigned for the greater part of the time to the Gas Defense Service. He was also at the front as chief of the surgical team for the St. Mihiel and Argonne battles. He became head of the Section on Aviation Medicine and Research, Mayo Foundation, in January, 1942.

Dr. Boothby was certified by the American Board of Internal Medicine as a specialist in internal medicine. He was a fellow of the American College of Surgeons, of the American College of Physicians and of the Aero Medical Association of the United States, and associate fellow of the Institute of Aeronautical Sciences. He was a member of the Massachusetts Medical Society, the American Physiological Society, the American Society of Biological Chemists, the American Society for Clinical Investigations, the Society for Experimental Biology and Medicine, the American Medical Association, the American Institute of Nutrition, and American Society for Experimental Pathology, the American Society for Pharmacology and Experimental Therapeutics, the Association of American Physicians, the Alumni Association of the Mayo Foundation, and Sigma Xi.

On November 15, 1930, Dr. Boothby married Catherine Burns who with two daughters, Mrs. Louis A. Schulze of Rochester and Mrs. Robert Reinhardt of Detroit, survive him.

GERHART A. DAHL

Dr. Gerhart A. Dahl, of Mankato, died July 15, 1953. He was born June 23, 1872, in Dell, Faribault County, Minnesota. After graduation from Luther College, Decorah, Iowa, he attended Hahnemann Medical College in Chicago, where he graduated in 1893.

Dr. Dahl came to Mankato in 1897 and began practice with the late Dr. W. A. Beach. He was one of the founders of the Mankato Clinic and continued his association with the clinic until his retirement in 1946.

For eighteen years, Dr. Dahl was a medical officer of the Minnesota 205th Infantry regiment of the Minnesota National Guard and served as a major in the organization from June 22, 1918, until his sixty-fourth birthday, on June 23, 1936. He was one of the few guardsmen in the state to be decorated by the state government for meritorius service. For almost thirty years, Dr. Dahl was coroner for Blue Earth County.

On August 29, 1903, Dr. Dahl married Alma Hanson in Mankato. He is survived by his wife, a sister and two nieces.

EDWIN G. EKLUND, JR.

Word has been received of the death of Dr. Edwin G. Eklund, Jr., in North Korea on February 28, 1951.

Dr. Eklund is a graduate of the University of Minnesota and went to Korea as a battalion aid surgeon in August, 1950. He was captured at Kunu-ri, North Korea, on December 1, 1950. He died of pneumonia and malnutrition.

Dr. Eklund is survived by his wife who lives at 1727 LaSalle Avenue, Minneapolis, and his mother, Mrs. Edwin G. Eklund, of Spring Lake Park.

AUGUST F. HUNTE

Dr. August F. Hunte, formerly of Truman, Minnesota, died at Alhambra, California, July 5, 1953, at the age of eighty-two.

Dr. Hunte was born at Beecher, Illinois, August 5, 1870. He obtained his M.D. degree from Rush Medical College in 1899 and practiced at Truman from 1899 to

1930, when he moved to Bylas, Arizona. There he became a physician in the United States Indian Service at the San Carlos Indian Reservation. Following his wife's death, he and his daughter, Frances, moved to Alhambra, California. He is survived by his daughter.

During World War I Dr. Hunte served as an officer in the Medical Corps of the Army, being assigned to Base Hospital 114 of the A.E.F.

F. PAUL KORTSCH

Dr. F. Paul Kortsch, a physician of Prior Lake, Minnesota, since 1936, died July 15, 1953, aged forty-nine.

Dr. Kortsch was born in Saint Paul, Minnesota, July 2, 1904. He obtained his medical degree from the University of Colorado in 1935 and interned at St. Barnabas Hospital in Minneapolis and at St. Mary's Group of Hospitals at St. Louis, Missouri. He had done graduate work at Cook County Hospital, Chicago.

On June 15, 1929, he married Kathryn Niebergall, who with one daughter, Kathy, and two sons, Tommy and Jay, survive him.

Dr. Kortsch was a member of the Scott-Carver County Medical Society, the Minnesota State Medical Association, and the American Medical Association.

LINUS F. LEITSCHUH

Dr. Linus F. Leitschuh of Winsted, Minnesota, died on June 28, 1953, at the age of forty-one. He obtained his medical degree from the University of Minnesota in 1938 and interned at Minneapolis General Hospital from 1937-39. He practiced at Red Lake Falls and Foley before moving to Winsted. During World War

II, Dr. Leitschuh served as captain in the Army Medical Corps for five years.

He was a member of the McLeod County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Dr. Leitschuh is survived by his wife, two daughters, Carol and Jean, and two sons, Paul and Nicolas. His parents, Mr. and Mrs. Henry Leitschuh, reside in Sleepy Eye.

A. MASON RANDALL

Dr. A. Mason Randall of Ashby, Minnesota, died suddenly on June 20, 1953.

Dr. Randall was born at Sechlerville, Wisconsin, December 2, 1880. He graduated from the College of Medicine, Hamline University, in 1903 and opened an office at Underwood, Minnesota, the same year. In 1909, he moved to Ashby, where he practiced until his death.

On July 22, 1905, Dr. Randall was united in marriage to Anna Mortenson. His wife and one son, Carter, of Ashby, survive him.

Dr. Randall was a member of the Park Region District and County Medical Society, Minnesota State Medical Association and American Medical Association.

Between November, 1917, and June, 1919, Dr. Randall served as captain in the Medical Corps of the Army. He was interested in civic affairs and served thirty-one years on the school board. He was a member of the American Association of Railway Surgeons, Minnesota Association of Railway Surgeons, Ashby Community Club and staff of St. Luke's Hospital in Fergus Falls.

PATRICK J. GALLAGHER

Dr. Patrick J. Gallagher, formerly a resident of Graceville, Minnesota, died on July 12, 1953, in Seattle, Washington, at the age of seventy-four.

Dr. Gallagher was born in Westport, Ireland, and came with his parents to Graceville in early childhood. He was graduated from the University of Minnesota Medical School in 1904 and practiced medicine at Connel, Washington, for many years.

In 1918, Dr. Gallagher became medical director of the New World Life Insurance Company in Seattle, a post he held until his final illness forced him to resign.

He was a member of the King County Medical Society and the Washington State and American Medical Associations. A sister and brother, Mrs. P. H. Costello and A. E. Gallagher, both of Graceville, survive him.

Dr. A. D. Fetzek, recently graduated from the University of Minnesota Medical School, who interned at Minneapolis General Hospital, joined the St. Michael clinic staff early in July. Dr. Fetzek will practice with **Dr. R. D. Thielen.**

* * *

Dr. S. W. Giere, of Benson, chairman of the Swift County Heart Fund Campaign, was the recipient of a merit award from the Minnesota Heart Association, in June. The citation referred to Dr. Giere as a "public-spirited Minnesotan who places humanitarian ideals above self-interest" and as one "who has earned mankind's gratitude for the future reduction of the ravages of heart disease."

* * *

Dr. Frank Hammond Krusen, of Rochester, specialist in physical medicine for twenty-three years, was named Minnesota's nominee, June 26, for the President's award in 1953. The award is given annually to a physician who has made a significant contribution to the rehabilitation and employment of persons with physical impairments.

Dr. Krusen has been head of the Mayo Clinic's physical medicine section for eighteen years. He was chairman, in 1944, of Bernard Baruch's committee on war and postwar physical rehabilitation, is past president of the American Congress of Physical Medicine, has been councillor of the National Association for Crippled Children since 1947, serves on the board of the Minnesota Rehabilitation Association, and is the author of many widely circulated books and articles in the physical medicine field.

* * *

Dr. H. O. Hagen, of New Richland, was unable to attend a dinner at Chicago University given by the Alumni of the Rush Medical College honoring the graduates of 1903, held in June. Dr. Hagen has been ill for the past year.

* * *

Dr. Lyle A. Weed, of Rochester, received an honorary degree of Doctor of Science from his alma mater, Simpson College, of Indianola, Iowa, May 31.

* * *

Dr. and Mrs. Joseph Flynn, of Richfield, celebrated their fiftieth wedding anniversary in June. Dr. Flynn, now retired, was graduated from Rush Medical College in 1900 and practiced for many years in Minneapolis.

* * *

Dr. W. L. Patterson, of the Fergus Falls State Hospital, gave the address of welcome to the farmers attending the Grassland Field Day held at the State Hospital grounds, June 9. The field day program consisted of tours of farm tracts and various demonstrations of farm implements and equipment. There are 600 acres in cropland at the state hospital.

Dr. Jack Delmore, of Roseau, president of the Red River Valley Medical Society, welcomed the guest legislators and newspapermen of Northwestern Minnesota who attended the Red River Valley Medical Society's dinner reception, held at East Grand Forks, June 8. **Dr. L. E. Dale,** Red Lake Falls, presided as toastmaster, and local arrangements were made by **Dr. O. K. Behr,** of Crookston.

* * *

Dr. S. J. Raetz, of Maple Lake, attended the fifth annual convention of the International Academy of Proctology which was held in New York, New York, May 28 to 31, 1953. Dr. Raetz was recently elected to a Fellowship in the International Academy.

* * *

Dr. James K. Heid, of Browerville, who recently was graduated from the University of Minnesota Medical School, was married June 20, to Barbara Anne Hadley, also of Browerville. Classmates of the groom, **Drs. Lyle Haberland** and **Maland Hurr,** were ushers.

* * *

Roseau County physicians, meeting in Roseau, June 22, formed "The Roseau County Medical Society," with **Dr. D. O. Berge,** president, and **Dr. Robert J. Delmore,** secretary. Other doctors of the county are **J. L. Delmore, Jack Delmore,** and **Gilbert S. Wheeler,** all of Roseau; **Kenneth Nelson,** of Warroad, and **L. H. Klefstad,** of Greenbush.

* * *

Dr. Erick Cukors, who has been a member of the Fergus Falls State Hospital staff, left July 1 to accept a position at the Jamestown, North Dakota, State Hospital.

* * *

Dr. Robert Bormes, recently on the staff of the Veterans Hospital at Milwaukee, Wisconsin, joined the Olive Clinic at Graceville, in June.

* * *

Dr. Bela Gallo, of Czechoslovakia, began the practice of medicine in Lake Bronson in June. Dr. Gallo received his medical degree from the University of Prague in Czechoslovakia, but did some of his study at the University of Budapest, Hungary. The citizens of Lake Bronson sponsored Dr. Gallo's coming to the United States. Recently Dr. Gallo completed the two years of medical education in the United States necessary for becoming licensed in this country.

Dr. Jan Tillisch, of the Mayo Clinic, attended a

Why Should You Own Municipal Bonds?

BECAUSE—

Your money is invested in a class of security that has been proved to be second only to U. S. Government bonds in certainty of payment.

It has been authoritatively reported that less than 2% of all municipal issues defaulted during the depression and nearly all of these were cleared up without loss of principal.

BECAUSE—

Your money earns an income that is not subject to current federal income taxes —you are not adding to your tax burden from your investment income.

Income from state and municipal bonds has never been subject to the levy of federal income taxes.

BECAUSE—

Your money is securely invested and you need not be concerned with "Day-to-day market fluctuations."

Municipal bond investors buy bonds for interest income to maturity without market worries in the meantime.

BECAUSE—

Your money is invested at a known yield or rate of return.

The income from municipal bonds is not contingent upon the action of a board of directors—semi-annual interest coupons are attached to each bond to be deposited in your bank as they mature.

BECAUSE—

Your money would be invested in a class of security known to conservative investors for many years.

Municipal bonds have been issued in this country since prior to the Revolutionary War. They are actively traded in a market with a greater volume than all bonds traded on the stock exchange.

Dr. B. Melby, of Blooming Prairie, was honored June 17, by the community members paying tribute to his fifty years of medical practice. On "Dr. Melby night" everyone in the community was invited to join in the demonstration of civic appreciation of a good citizen.

Dr. Melby was presented with a gold clock-pen desk set and a framed, hand-lettered scroll commemorating his fiftieth anniversary of practicing medicine. He has been a member of the American Medical Association for over fifty years.

Practicing in Blooming Prairie since 1905, not only has Dr. Melby served the medical needs of the community but for thirty-nine years served as a member of the Board of Education. In February, 1951, he was honored in being awarded a scroll by the Minnesota Educational Association for his long and faithful interest and work in the public schools.

Dr. Stewart T. Ginsberg, formerly of Saint Paul, was named manager of the new 956-bed neuropsychiatric hospital at Pittsburgh, Pennsylvania, June 25. Dr. Ginsberg received his medical degree from the University of Minnesota in 1932.

* * *

Dr. Walter P. Gardner, of Saint Paul, was appointed by Gov. C. Elmer Anderson, to represent the medical profession on the new state advisory commission on the problem of alcoholism. The board, as appointed by Governor Anderson, began functioning July 1, as provided by recent legislation.

* * *

Dr. H. O. Mortenson, of Pequot Lakes, recently separated from the Army Medical Corps, began practice in Menahga, July 1. Dr. Mortenson was graduated from the University of Minnesota Medical School in 1951. He was awarded the bronze star for meritorious service in Korea.

* * *

Dr. Russell M. Wilder, former member of the Mayo Clinic staff, retired as director of the National Institute of Arthritis and Metabolic Diseases at Bethesda, Maryland, July 1. Dr. Wilder, internationally known as an authority on diabetes and nutrition and the first director of the NIAMD, retired because of ill health.

* * *

Dr. Catherine B. Friedrich, of Red Wing, became the bride of **Dr. Harlan David Root,** of Brainard, New York, June 26, at a ceremony held in the Christ Episcopal Church at Red Wing. Dr. Friedrich and Dr. Root both received their medical degrees from Cornell University, Ithaca, New York.

* * *

Dr. Bryson Roy McHardy, of Minneapolis, became a member of the permanent staff of the Karlstad Hospital, Karlstad, Minnesota, in July. Dr. McHardy was graduated from the University of Minnesota Medical School and served in the Air Force in World War II.

* * *

Dr. James W. Halvorson, who has been recalled to the Navy, was honored at a testimonial dinner given June 30 by the Goodhue community members. Dr. Halvorson has practiced in the Goodhue community for three years and will report to the Navy in August.

* * *

Dr. Owen C. Bolstad, formerly of the Duluth Clinic, began practice in Little Falls in July, in association with **Drs. D. L. Johnson, A. H. Benson,** and **W. F. Skaife.** Dr. Bolstad, a graduate of the

University of Minnesota Medical School, completed his internship at St Luke's Hospital at Duluth.

* * *

Dr. Robert D. Koenig, Ancker Hospital, Saint Paul, began practice in Paynesville in July. Dr. Koenig is replacing **Dr. Ray Lindeman,** who was recalled to service with the U. S. Air Force.

* * *

Dr. W. W. Rieke, of Wayzata, joined **Dr. Richard F. Kline** in his practice at Grand Rapids in July. Dr. Rieke is replacing **Dr. David Feigal,** who is serving with the Army Medical Corps.

* * *

Dr. and Mrs. J. S. Blumenthal, of Columbia Heights, Minneapolis, celebrated their twenty-fifth wedding anniversary, June 27. Dr. Blumenthal has practiced in Columbia Heights for thirty years.

* * *

Dr. James H. Reinhardt (Lt. MC), formerly in practice in Alexandria, was named chief of the department of obstetrics and gynecology at the James Connally Air Force Base Hospital at Waco, Texas.

* * *

Dr. Owen H. Wangensteen, chief of surgery at the University of Minnesota Medical School, was the recipient of a $15,000 grant from the Damon Runyon Memorial Fund for Cancer Research, in July. Dr. Wangensteen will use the funds to restudy operations on patients suffering with gastric, colon, and rectal cancer.

* * *

Four new physicians to receive appointments to the staff of the Mayo Clinic in July, were **Dr. Richard W. P. Achor, Dr. James C. Broadbent, Dr. Robert L. Faucett,** and **Dr. Richard E. Symmonds.**

Dr. Achor received his medical degree from the University of Oregon Medical School, Portland, in 1945, and served with the Navy for two years. He interned and was a medical resident at Ancker Hospital, Saint Paul. In January, 1950, Dr. Achor entered the Mayo Foundation as a fellow in Medicine and received the degree of master of science in Medicine from the University of Minnesota, in July.

Dr. Broadbent received his medical degree from the Stanford University School of Medicine in 1946, and interned at Los Angeles County General Hospital. He served with the Army Medical Corps from 1947 to 1949, and entered the Mayo Foundation as a fellow in Medicine in November, 1949. Dr. Broadbent received the degree of master of science in Medicine from the University of Minnesota in July.

Dr. Faucett received the degree of master of arts in Bacteriology from the Graduate School of the University of Kansas in 1940, and his medical degree from the University of Kansas Medical School, in 1944. He interned and was a pediatric resident at the University of Kansas Hospital. From 1946 to 1948, he was a resident in psychiatry with the United States Public Health Service. Lexington, Kentucky, and from 1948 to 1949, a resident in psychiatry at the University of Minnesota Hospitals. Since 1951, Dr. Faucett has been director of the United States Public Health Service Demonstration Mental Health Clinic, College Park, Maryland.

Dr. Symmonds received his medical degree from Duke University School of Medicine in 1946, and interned at the Los Angeles County Hospital. He served with the Navy for several years. Dr. Symmonds entered the Mayo Foundation as a fellow in Obstetrics and Gynecology in April, 1950, and received the degree of master of science in Obstetrics and Gynecology from the University of Minnesota in July.

* * *

Dr. Leighton W. Larson, originally from Canistota, South Dakota, joined **Dr. J. W. Bratholdt** in his practice in Watertown, in July. Dr. Larson is a graduate of the University of Minnesota Medical School and interned at St. Luke's Hospital in Chicago. He was recently released from military service with the Army Medical corps in the Far East.

* * *

Dr. James Blake, of Hopkins, was named to represent the Minnesota State Medical Association on the eleven-member advisory council on unemployment due to temporary sickness or disability. The committee, appointed by Gov. C. Elmer Anderson in July, was authorized by the recent Legislature to make a comprehensive study of the possible need for a program to provide unemployment benefits for persons temporarily idled by reason of sickness or disability who are not compensable under workman's compensation insurance.

* * *

Dr. L. H. Stahn, who has been on the staff at the Anoka State Hospital for three years, was recalled to service with the Army and left July 1, for San Antonio, Texas.

* * *

Dr. Robert Nelson, and **Dr. Warren Kilmer,** both recently completing their internships at Minneapolis General Hospital, began practice in International Falls in July. Dr. Nelson was graduated from the University of Minnesota Medical School, and Dr. Kilmer, from the University of Indiana Medical School.

Dr. Anthony H. Kelly, who recently completed a fellowship in surgery in the Mayo Foundation, left July 8 for an extended tour of Europe which will include clinical visits in many cities and attendance at a surgical congress in Lisbon, Portugal.

* * *

Four physicians to enter the Mayo Foundation as fellows during the summer quarter, which began July 5, are the sons of Mayo Clinic staff members, and one, the son of an emeritus Clinic physician.

Dr. John A. Higgins, a graduate of the University of Minnesota Medical School, is the son of **Dr. George M. Higgins,** of the Mayo Clinic.

Dr. Louis A. Brunsting, Jr., a graduate of the University of Michigan Medical School, is the son of **Dr. Louis A. Brunsting**, of the Mayo Clinic staff.

Dr. Louis A. Buie, Jr., a graduate of the University of Minnesota Medical School, is the son of **Dr. Louis A. Buie, Sr.,** of the Mayo Clinic staff.

Dr. Richard M. Moersch, a graduate of Harvard Medical School, is the son of **Dr. H. J. Moersch**, of the Mayo Clinic staff.

Dr. Henry W. Pemberton, a graduate of the George Washington University School of Medicine, is the son of **Dr. John deJarnette Pemberton,** an emeritus member of the Mayo Clinic staff.

* * *

Dr. Arthur T. Laird, who retired from the Moose Lake State Hospital staff July 15, was honored by the hospital employes and their families at a picnic held July 7.

Dr. Laird's four years at Moose Lake State Hospital are only the most recent of a career of over half a century of contributions to medicine. The first eleven years of his career, Dr. Laird spent in private practice in Albany, New York, and as a member of the medical staff at Trudeau Sanatorium, Saranac Lake, New York. Dr. Laird came to Nopeming Sanatorium as superintendent in 1911, and served in this capacity for thirty years. During World War I, he was chosen by the Rockefeller Foundation to work with the French government in demonstrating the most recent advances in the care of tuberculosis patients.

Following his retirement from Nopeming Sanatorium, Dr. Laird became associated with the Duluth Clinic until 1947, when he came to Moose Lake for several months to study conditions in Minnesota mental hospitals. In 1949, he returned as a permanent member of the staff.

* * *

Dr. Merrill D. Chesler, of Minneapolis, spoke to the members of the Stearns-Benton County Medical Society at their meeting held July 16, at the St. Michael's Hospital, Sauk Centre. His talk, illustrated with slides, was entitled "Skin Grafts, Flaps and Related Plastic Problems."

* * *

Dr. Edward Burleigh, a graduate of the University of Louisiana Medical School, and **Dr. Jack Bonner,** a graduate of the University of Minnesota Medical School, joined the East Range Clinic of Virginia, in July.

Major appointments in health and related fields made by the President recently include:

Dr. Melvin A. Casberg, former dean of St. Louis University Medical School who has been serving as a special assistant to the Secretary, was appointed to be Assistant Secretary of Defense for Health and Medical Affairs, a post whose establishment has been long advocated by the American Medical Association. Dr. Casberg will supervise the department's medical programs and advise the Secretary of Defense on health policies.

Harvey V. Higley, of Marinette, Wisconsin, chairman of the board, Ansul Chemical Company, was appointed to be head of the Veterans Administration. Mr. Higley has been active for many years in the American Legion, serving as state commander and member of the Legion's National Executive Committee and National Retirement Committee. He succeeds Carl R. Gray, Jr., who recently resigned.

Russell R. Larmon, professor of administration at Dartmouth College, was appointed to be an Assistant Secretary of Health, Education, and Welfare. Prof. Larmon is one of two Assistant Secretaries provided under Reorganization Plan 1 which elevated the Federal Security Agency to cabinet status. Prof. Larmon has served as consultant on many New Hampshire state commissions.

MINNESOTA BLUE CROSS-BLUE SHIELD PLANS

Analysis of Blue Shield claim rejections from October 1, 1952, to date for those rejections based on the grounds of pre-existing conditions discloses several interesting facts. First, it reveals an actually smaller number of such rejections; secondly, it shows a reduction in the percentage of claims disallowed for this reason; and finally, dissatisfaction and misunderstanding on the part of both subscribers and doctors regarding such claims is definitely decreasing.

On October 1, 1952, the revised Blue Shield contract went into effect thereby establishing a new standard for deciding claims involving pre-existing conditions. Prior to October 1, 1952, the Blue Shield contract required a ten-month waiting period before benefits could be paid for treatment of those conditions which, on the date of receipt of the application, were known to exist by the subscriber or any member of his family. The new contract now provides that benefits are not available for the treatment of any physical condition, ailment, or disease which, known or unknown to the participant subscriber, may be considered from a medical standpoint to have been in existence on the effective date of the contract unless the participating subscriber has been covered under the contract for at least ten consecutive months at the time the services are rendered. The most important change, then, is the elimination of the requirement that the subscriber know that he has had a particular condition, ailment, or disease. Now, under the new contract, if services are rendered to a subscriber who has been covered by the contract less than ten months, and the condition is one which, from a medical standpoint, could be said to have been in existence on the effective date of the contract, the claim cannot be approved.

The current review of operations from the time the new contract went into effect until the present shows a decided improvement in relationships between Blue Shield and the doctors, between Blue Shield and the subscribers, and between the doctors and the patients regarding this matter. The claims can now be explained on a much more factual basis and disagreements with subscribers are greatly reduced.

The Professional Relations Department reports that in discussions with the doctors in their offices, understanding of the clause and its purpose is much clearer, and the clause is approved in almost every instance. The same information comes from the Claims Department wherein contact is had with subscribers either by correspondence, telephone conversations, or personal calls. Both subscribers and doctors are apparently realizing that Blue Shield cannot afford to pay benefits to those who join the plan after they discover that they might need medical, surgical, or obstetrical services. It is being

PATTERSON SURGICAL SUPPLY COMPANY

130 W. Seventh Street, St. Paul 2, Minn.
HOSPITAL AND PHYSICIANS SUPPLIES AND EQUIPMENT
Cedar 1781-82-83

understood that waiting periods for pre-existing conditions and maternity care are necessary to avoid costly and dangerous over-utilization of Blue Shield benefits. Furthermore, the records under the new contract are showing that the change in this clause has had distinctly beneficial effect in producing this result. Because of safeguards such as this, the public, the medical profession, and Blue Shield can look forward to the attainment of their mutual goal—adequate medical care at the lowest possible cost.

On July 1, 1953, University Hospital became an affiliated hospital of the Blue Cross plan. All subscribers going to University Hospital will now receive full contract benefits while hospitalized there.

Blue Cross is now celebrating its twentieth anniversary. From a humble beginning in 1933 with only eight hospitals backing the plan, Blue Cross has grown by leaps and bounds. The concept of prepayment of hospital care has proven to be wise and farseeing, for today over 169 Minnesota hospitals sponsor the Blue Cross plan.

Blue Cross was designed to provide the best hospital care to people who needed care at the lowest possible cost. Evidence of the fact that Blue Cross is providing more people with the best care is that we now have nearly one million Minnesotans protected (one out of every three), a remarkable growth.

Since 1933, Blue Cross has paid over $83,000,000 in benefits to subscribers.

OPERATIVE SURGERY. 2 Vols. Sixth Edition. Guy W. Horsley, B.S., M.D., F.A.C.S., Associate Professor of Surgery, Medical College of Virginia; Attending Surgeon, St. Elizabeth's Hospital, Richmond, Virginia; and Isaac A. Bigger, M.D., F.A.C.S., Professor of Surgery, Medical College of Virginia, Surgeon-in-Chief, Medical College of Virginia Hospital, Richmond. Vol. 1, 714 pages; Vol. 2, 1579 pages. Illus. Price $30.00, cloth. St. Louis: C. V. Mosby Co., 1953.

ANNUAL REPORT ON THE RESULTS OF TREATMENT IN CARCINOMA OF THE UTERUS. Statement of Results Obtained in 1946 and previous years. 8th Volume. Sponsored by American Cancer Society, British Empire Cancer Campaign, Cancerföreningen, Stockholm, Damon Runyon Memorial Fund, New York, Landsföreningen mot Kreft, Oslo, and National Cancer Institute of Canada. 247 pages. Available on application. Stockholm 60: Editorial Office, Radiumhemmet, 1953.

STUDIES IN VISUAL OPTICS. By Joseph I. Pascal, B.S., M.A., O.D., M.D., Licentiate in Optometry and in Medicine by the University of the State of New York; Director of Eye Department, Stuyvesant Polyclinic; Attending Ophthalmologist, New York Polyclinic Medical School and Hospital, Outpatient Department; Lecturer in Ophthalmology, New York Polyclinic Medical School and Hospital. 800 pages. Illus. Price $12.50. St. Louis: C. V. Mosby Co., 1952.

In this book, Dr. Pascal presents the theoretical and practical aspects of many phases of visual optics and refraction techniques. His optometric as well as medical training and experience give him a unique orientation on these subjects.

Dr. Pascal's formula for ophthalmic calculations is simple and effective and well presented. His concept of the accommodative unit clarifies such things as the earlier onset of presbyopia in hyperopes.

This book is valuable and interesting additional reading, but would not replace the standard simpler textbooks for the novice.

J. A. McNeill, M.D.

PROGRESS IN FUNDAMENTAL MEDICINE. J. F. A. McManus, Editor. 316 pages. Illus. Price $9.00. Philadelphia: Lea & Febiger, 1952.

The editor of Progress in Fundamental Medicine has assembled a series of monographs, presenting the current information, primarily pathological, but including its application to clinical medicine. The subject matter includes parenteral nutrition with an exhaustive survey of the use of protein hydrolysates and amino acid mixtures; a chapter on the liver, histochemistry, viral hepatitis and other pertinent subjects; coronary disease considered not a pathological entity, but as a symptom complex.

Other topics, in a similar manner, include the histochemical approach to pathology, melanotic tumors of the skin, systemic lupus erythematosus, carcinoma *in situ* and non-silica pneumonoconioses.

This volume gives a complete summary of present-day knowledge of the various subjects including a very complete table of references. This will prove of great value to the student as well as the clinical practitioner, in keeping informed of the rapid advances in these various phases of modern medicine.

C. K. Williams, M.D.

The Medical Book Guild of America offers a large list of books by nationally famous editors at a substantial saving with special gift "bonus" books. (See page 808).

Effective Arthritic Therapy

DOCTOR... *This is Your Hospital and Your School of Neuropsychiatric Nursing*

(By that we mean that not only have these institutions undertaken to constitute a haven of help for patients, but they form, in your interest a *remarkable facility for you professionally.)*

View of hospital, school, buildings and environs, 7 minutes from downtown Minneapolis

A COMPLETE NEURO-PSYCHIATRIC HOSPITAL

Up-to-date in all respects, new, functional buildings, set in spacious grounds, rehabilitation center, electroencephalography, therapies, laboratory. One of the largest neuro-psychiatric staffs in the United States. A voluntary, non-profit, non-sectarian institution of which this region may be proud.

SCHOOL FOR NEURO-PSYCHIATRIC NURSING

To offset the existing universal shortage of nurses, Glenwood Hills conducts a one-year course in neuropsychiatric nursing. You have observed the skill and attitudes of our graduates and trainees. Recruit one or two in behalf of your profession as a "contribution" stipulating that we send them back to you when trained. We will. Meanwhile tuition, room and board are free.

THROMBIN TOPICAL acts directly on the blood fibrinogen to form a firm, adherent, *natural* clot, producing hemostasis in a matter of seconds. Whether you spray, flood or dust it onto affected surfaces, THROMBIN TOPICAL helps control capillary bleeding in abdominal surgery, brain and bone surgery, skin grafting, nose and throat operations, prostatic surgery, dental extraction, bleeding incident to drainage, excision or debridement, and many other operative procedures.

THROMBIN TOPICAL (bovine origin) is supplied in vials containing 5000 N.I.H. units each, with one 5-cc. vial of sterile isotonic saline diluent. Also available in a package containing three vials of THROMBIN TOPICAL (1000 N.I.H. units each) and one 6-cc. vial of diluent.

THROMBIN TOPICAL should never be injected. It is intended for topical use only.

Against STAPHylococci, STREPtococci and PNEUMOcocc

ALWAYS CONSIDER

RYTHROCIN*

a selective action antibiotic

ORALLY EFFECTIVE

against these coccal infections—especially indicated when patients are allergic to penicillin and other antibiotics or when the organism is resistant.

A DRUG OF CHOICE

against staphylococci—because of the high incidence of staphylococcal resistance to other antibiotics.

A DRUG OF CHOICE

because it does not materially alter normal intestinal flora; gastrointestinal disturbances rare; no serious side effects reported.

ADVANTAGEOUS

because the special acid-resistant coating developed by Abbott, and Abbott's built-in disintegrator, assure rapid dispersal and absorption in the upper intestinal tract.

USE ERYTHROCIN

in pharyngitis, tonsillitis, scarlet fever, pneumonia, erysipelas, osteomyelitis, pyoderma and other indicated conditions.

Abbott

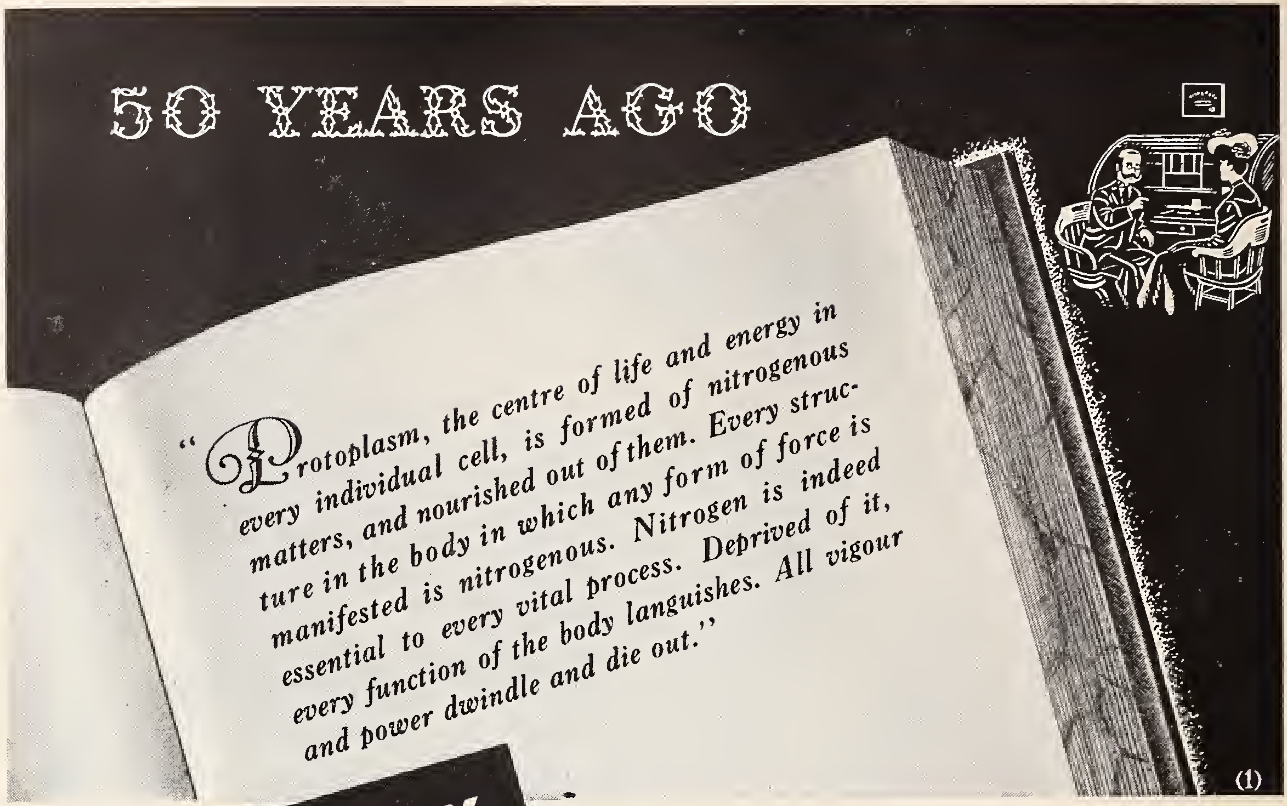
Erythromycin, Abbott
Crystalline

50 YEARS AGO



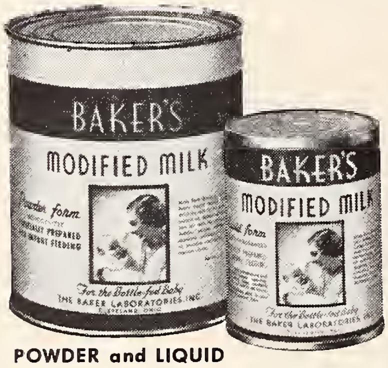
"Protoplasm, the centre of life and energy in every individual cell, is formed of nitrogenous matters, and nourished out of them. Every structure in the body in which any form of force is manifested is nitrogenous. Nitrogen is indeed essential to every vital process. Deprived of it, every function of the body languishes. All vigour and power dwindle and die out."

(1)

TODAY

Now as then, we know that proteins play a predominant role in nutrition . . . and Baker's Modified Milk provides an adequate protein intake (2) . . . 3.7 grams per kilogram of body weight per day.

Baker's also provides a replaced fat as well as adequate amounts of carbohydrates, vitamins (except C), calcium, phosphorus, iron and other minerals.



POWDER and LIQUID

Baker's Modified Milk is made from Grade A Milk (U. S. Public Health Service Milk Code), which has been modified by replacement of the milk fat with animal and vegetable oils and by the addition of carbohydrates, vitamins and iron.

BAKER'S MODIFIED MILK IS NUTRITIONALLY ADEQUATE FOR INFANTS

Meat...

and the Diet after 50

Although caloric needs in the later decades of life lessen with decreasing physical activity and diminishing metabolic rate, clinical observations[1] corroborated by experimental studies[2] show that protein needs of the aging organism continue at the levels of adequacy in earlier years.[3] For avoidance of protein deficiencies, which the aged are prone to develop,[4] the protein quota of the diet of persons over fifty should be more liberal than is often the practice.[5] In providing this quota, lean meat may well be one of the protein foods of the daily diet.

In the years beyond fifty, as well as before, continuous adequate protein nutrition remains an absolute necessity for maintenance of a normal concentration of plasma proteins and, in turn, a normal osmotic pressure of the plasma.[6] Even more pronounced in the aged than in younger persons are the ill consequences of hypoproteinemia—edema, decreased resistance to generalized infection, retarded bone healing, and poor wound healing.[7] Furthermore, dietary protein is essential for the continuous chemical regeneration of cell protein in the prevention of abnormal tissue wasting, one of the most characteristic and obvious changes in the geriatric patient.[8]

But meat is much more than an outstanding protective protein food in the dietary of persons over fifty. It also supplies generous amounts of the B group of vitamins and of iron, phosphorus, and other essential minerals. In the well-balanced diet of the later years of life, meat is just as important for the maintenance of nutritional and physiologic well-being as it is during the earlier years of life.

THE ORIGINATOR OF ERYTHROMYCIN

ILOTYCIN
ETHYL CARBONATE
(ERYTHROMYCIN ETHYL CARBONATE, LILLY)
PEDIATRIC

Formula:

Each 5 cc. (approximately one teaspoonful) contain 100 mg. 'Ilotycin' as the ethyl carbonate.

Dosage:

15 pounds—1/2 teaspoonful every six hours
30 pounds—1 teaspoonful every six hours
60 pounds—2 teaspoonfuls every six hours

How Supplied:

Each package consists of one bottle containing 1.2 Gm. 'Ilotycin' as the ethyl carbonate in a dry, pleasantly flavored mixture: 45 cc. of water are added at the time of dispensing to provide 60 cc. of an oral suspension. After mixing, the suspension is stable for two weeks at room temperature.

PROBLEMS IN THE ROENTGEN DIAGNOSIS OF BLEEDING LESIONS OF THE UPPER GASTROINTESTINAL TRACT

JOSEPH C. BELL, M.D.
Louisville, Kentucky

YOUR speaker is honored in being invited by the Minnesota State Medical Association to present the annual Russel D. Carman Memorial Lecture during this Centennial Meeting of the Association. Russel D. Carman contributed much to medical progress during his lifetime and in the field of Gastrointestinal Diagnostic Radiology no American has contributed more and few, if any, as much.

The first edition of a text entitled *The Roentgen Diagnosis of Diseases of the Alimentary Canal,* prepared jointly by Carman and Albert Miller was published by W. B. Saunders Company of Philadelphia in 1917. It was an immediate success and the second edition followed in 1920, Carman then being the sole author. This book sets a high standard for medical writing. It is filled with information, words of wisdom, is beautifully illustrated and even today, more than thirty years since publication, is still a modern text, one that all those doing roentgen examinations of the gastrointestinal tract should know intimately.

In the first chapter of the second edition appears this statement regarding essential apparatus.

> "It is true that in this, as in many other things, the man counts for more than the machine, and the bulk of roentgenologic knowledge has been gained by those who had to content themselves with crude appliances."

This truth is especially pertinent today for radiologic machines become progressively more complicated and in at least some institutions those in administrative positions at times fail to appreciate that a well-trained, experienced, conscientious physician is the key to accurate diagnosis and adequate therapy, the machine being only a necessary adjunct.

Since the method of roentgen examination of the gastrointestinal tract is of cardinal importance, Carman's views as set forth in the following quotations should be of interest. He writes:

> "I believed that the advantages of the screen in the examination of the digestive tract can hardly be too strongly emphasized. Only by its use can exact information be obtained as to mobility and flexibility, the phenomena of peristalsis and antiperistalsis, the nature and permanence of irregularities of contour, and the effects of palpation, respiratory movement and varying positions."

As to "plates" now replaced by films, this is said:

> "After the examiner has acquired some proficiency with the screen, he will occasionally be inclined to dispense with plates, especially in the apparently normal case in which the patient is thin, the screen image sharp, and the clinical history negligible. But it is never wholly safe to do this. . . . Plates show minute deformities which cannot always be detected on the screen, may be studied at leisure and may be filed for future reference."

Carman then makes the following very important statement:

> "In published discussions of gastric roentgenology it is occasionally intimated that the screen and plate are rivals. This is a misapprehension. Rather should they be considered as indispensable complements to each

---

The Russell D. Carman Memorial Lecture read in the Symposium on Gastrointestinal Disease at the Centennial Meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 18, 1953.

other in every complete examination. I have always used both methods, and would fear to discard either. Cases are frequently met with in which sometimes one, sometimes the other, alone elicits the information sought."

In the chapter entitled "Interpretation" the following appear:

"The roentgenologic examination of the digestive tract is not a mysterious art requiring extraordinary talents. Neither is it a simple diagnostic method which can be learned in a day. Its successful employment demands industry, experience, judgment and care, just as any other procedure in medicine—no more, but no less.

"The maintenance of a conservative attitude in this work is especially necessary, and, at the same time, especially difficult. The veteran roentgenologist, as well as the novice, is tempted to see too much rather than too little. Once the observer has acquired some familiarity with his work he will find that direct signs of lesions will be manifest quickly or not at all.

"Failure to discover a lesion by the roentgen-ray is often pardonable, but the subjection of a patient to needless operation on trivial roentgen evidence alone, is not readily forgiven by those concerned. Common sense has been defined as the ability to distinguish the important from the unimportant, and in this meaning every diagnostician has an abiding need of common sense.

"There are two very practical checks against error which the examiner may employ, namely, re-examination and the giving of antispasmodics in cases in which spasm is suspected. In all doubtful cases one or both of these tests should be applied."

He ends the chapter by the following:

"To sum up, the essentials for satisfactory roentgen diagnosis are faithfulness to an orderly routine, careful observation, the use of antispasmodics and re-examination in doubtful cases, cautious interpretation, and last, but not least, a willingness to admit whenever it is true, that the findings are inconclusive.

Concerning the "Normal Stomach" Carman writes:

"It is rather trite to say that a knowledge of normal conditions as revealed by the roentgen ray is essential to a proper understanding of abnormal conditions. Yet this general truth applies so accurately and specifically to roentgenology of the stomach that its reiteration is never amiss."

Knowing the normal is an essential and one of the most difficult requirements in accurate diagnosis, for if the normal is known, the abnormal will promptly be recognized even though the exact nature of the lesion may not readily be apparent.

Carman's discussion of Gastric Cancer is a masterpiece, containing detailed case histories and operative and microscopic findings in various forms of gastric cancer, some typical and some very atypical in their manifestations. The illustrations are seldom excelled even today although most of the films were made with crude equipment of low capacity using gas tubes and glass plates.

The above quotations were selected from the wealth of invaluable material in Carman's text for they have a direct bearing on the problem under consideration here this afternoon, "Problems in the Roentgen Diagnosis of Bleeding Lesions of the Upper Gastrointestinal Tract."

Methods of Roentgen Examination

Your speaker believes as did Carman that no one method of examination is the answer to accurate diagnosis. He considers that the wise radiologist should avail himself of all well-established means of investigation, which include a pertinent although brief history, palpation, detailed roentgenoscopy and indicated films, usually including so-called spot films and serial films. Likewise he will stimulate wider use of esophagoscopy and gastroscopy when these are indicated.

Gastroscopy is quite widely available today and is of decided value particularly in the diagnosis of gastritis, some ulcers, and certain gastric tumors.

Serial radiography, particularly of the stomach and duodenum advocated by Lewis Gregory Cole of New York, is mentioned by Carman in the second edition of his book. This method of examination, in one of the various modifications, is used by many radiologists. It has the virtue of recording intrinsic movements, irregularities in contour and density, and of showing certain structures particularly the duodenum both filled with contrast material and almost empty when the mucosal relief is demonstrated. In the hands of the writer the serial film is considered the single most valuable method of roentgenography although it is used only in conjunction with other essential films and is always preceded by painstaking and detailed roentgenoscopy.

Compression technique, commonly spoken of as "spot film" technique, early advocated by Berg and Akerlund in Europe and later introduced into this country by Geyman, is now widely employed and when varying degrees of compression are indicated for the demonstration of certain lesions, it may be invaluable. A part of the apparatus for the above type of examination is the so-called quick change over switch making possible the instantaneous change from the roentgenoscopic to the roentgenographic setting of the machine and the securing of any predetermined exposure. With this apparatus the examiner immediately can record on an x-ray film anything seen roentgenoscopically.

In 1937 Hampton[4] introduced what he considered to be a safe method for the examination of patients with actively bleeding duodenal ulcers. This method is now generally accepted. He employs a heavy mixture consisting of four ounces by volume of plain barium sulphate and one teaspoonful of plain petrolagar suspended in three ounces by volume of water. The entire examination is done with the patient horizontal without palpation or compression. It has proven to be of great value in demonstrating ulcer craters in the posterior wall of the middle and distal one-thirds of the first portion of the duodenum, ones where there may be little deformity of the cap but which frequently hemorrhage most severely.

In Hampton's method, after the heavy barium suspension has entered the stomach, the patient is gently rotated to the right almost into the true lateral. The duodenum is given time to fill and a film is then made centering over the first portion. Ulcers of the anterior and posterior walls are frequently well shown in profile in this way. The patient is next rotated to the left until the gas from the fundus of the stomach passes into the distal part of the stomach and the duodenum resulting in a double contrast visualization of the mucosa lining these structures. A film is then exposed after which Hampton secures any other indicated films employed in a conventional examination that can be made with the patient horizontal. Localized compression and palpation are avoided throughout the examination.

Your speaker has made use of this form of examination since it was first described by Hampton and the first two projections, those made in right and left posteroanterior oblique projections, are routinely employed in all examinations of the stomach and duodenum.

General Considerations

In 1933 Allen and Benedict[1] studied the duodenal ulcers seen in the Massachusetts General Hospital during the previous twenty years. In 20 per cent of the cases bleeding was severe and in almost all fatal cases the ulcers were in the posterior wall of the duodenum with erosion into the pancreas and into a large vessel. In the fatal cases the average age was 56.3 years, although in those that recovered the average was 41.8. They found death from hemorrhage rare under fifty years of age.

Stanley O. Hoer[5] of the Cleveland Clinic Foundation in discussing "Management of Bleeding from the Upper Gastrointestinal Tract," reported that the hemorrhage arose from a peptic ulcer in 75 per cent of their cases, the ulcers being duodenal in 63 per cent, gastric in 8 per cent and marginal in 4 per cent. Hemorrhage was secondary to gastritis in 9 per cent, to esophageal varices in 7 per cent, to gastric neoplasms in 3 per cent and in 6 per cent it was from other sources, among which unquestionably were a very few hiatus hernias. In a few the source was never demonstrated.

The incidence of bleeding from the upper gastrointestinal tract and the mortality from hemorrhage vary somewhat between hospital patients and all those suffering from this malady, for those severly affected are more likely to enter hospitals. In our experience with nonhospitalized patients, in a significant number who had no history of any previous upper gastrointestinal disorder, no cause for bleeding could be discovered even with repeated examinations.

Not too many years ago the surgical treatment of bleeding lesions of the upper gastrointestinal tract was not to be considered, and transfusion was rarely employed. Today, however, with the liberal use of blood, improved methods of anesthesia and more accurate diagnosis, especially in those past fifty with severe hemorrhage, and in those with a history of recurrent or continuing hemorrhage, surgery is becoming the treatment of choice.

All agree that a determination of the site and nature of the bleeding lesion, when at all possible, is essential and it is here that the roentgen examination is of great importance, the examiner assuming a major responsibility in determining the method of treatment indicated.

The history, as so often is true, may be of utmost importance often indicating the probable site and nature of the lesion. Now that ACTH and cortisone have come into such widespread use in the treatment of many diseases, the history of such medication becomes of significance for Gray and associates,[2] Halstead[3] and others have shown that these substances may cause acute peptic ulcers in individuals who previously have had no findings indicative of ulceration. Ulcers previously healed may become active and hemorrhage and/or perforate. Severe gastritis at times followed by bleeding may develop.

Using the method introduced by Hampton, the upper gastrointestinal tract, even during active hemorrhage, can be examined with safety. Esophageal varices, if present, and if at all well developed, usually will be diagnosed. Hiatus hernias, gastric ulcers, marginal ulcers, gastric neoplasms and duodenal ulcers will be detected in a high percentage of cases. All agree that ulcers of the duodenum that hemorrhage severely most frequently are in the posterior wall, may present few, if any, roentgen signs unless the actual crater is visualized and that they usually are distal to the more common sites of ulcers in which hemorrhage is not a major factor. It is essential, however, that the entire duodenum be examined, for ulcers of the second or descending portion are not uncommon and may hemorrhage, and new growths, although uncommon, may occur in any portion.

Bleeding lesions of the small bowel distal to the duodenum are uncommon but they do occur. Hemorrhage rarely is severe but may be protracted. When suspected, a small bowel study is indicated.

When hemorrhage is slow or at the earliest opportunity after it ceases, it is essential that every effort be made to discover the lesion causing the disability. If hemorrhage has stopped only a very short time before beginning the examination, great care must be exercised, and if palpation and compression are employed, they must be performed with the greatest gentleness.

If surgical intervention is under consideration, it is essential that bleeding from esophageal varices be ruled out, for a laparotomy in such instances would be useless and dangerous.

Comment

In bleeding from the upper gastrointestinal tract, the radiologist is an important member of the team charged with the safety of the patient. He assumes a major responsibility but with industry, painstaking care, and the exercise of a high degree of common sense, as defined by Carman, he will be equal to the task before him.

BONE MARROW CULTURE HELPFUL IN DIAGNOSIS OF HISTOPLASMOSIS

Routine bone marrow culture for Histoplasma capsulatum, believed to be of little value in adults, was reported to be of considerable diagnostic help in infants and children. This was concluded by Rohn and Bond† of the Indiana University Medical Center in a study of 76 patients admitted as hematologic diagnostic problems and subjected to bone marrow cultures.

Histoplasmosis was found in five cases, a positive yield of 6.5 per cent. In two of the five patients harboring H. capsulatum, the organism was observed on microscopic examination of the marrow, and cultures were of only confirmatory value. In the remaining three children, however, bone marrow culture was the single test which established the diagnosis.

In any infant or child suffering from unexplained fever, lymphadenopathy, splenomegaly, hepatomegaly or unexplained pulmonary findings with or without an abnormal peripheral blood picture, Rohn and Bond suggest the routine culture of the bone marrow for H. capsulatum.

MASSIVE UPPER GASTROINTESTINAL HEMORRHAGE

JOHN M. DORSEY, M.D.
Evanston, Illinois

WE ARE especially indebted to Welch[3] and Stewart[1] for their published reports on the results of treatment of patients with massive hemorrhage from the upper gastrointestinal tract. Analysis of the data presented by them provides definitions of their concept of what constitutes massive hemorrhage, through the employment of certain clinical measurements. According to Stewart they are: (1) that the patient has shown gross evidence of bleeding into the upper gastrointestinal tract within one week; (2) the total circulating red cell mass was reduced to less than 60 per cent of normal, and (3) there was reasonably good clinical evidence for the diagnosis of bleeding peptic ulcer. According to Welch they are: (1) the occurrence of acute hemorrhage accompanied by variable signs of shock; (2) the loss of approximately 50 per cent of the red cells, that is, the red cell count has fallen to 2.5 million or below; (3) the photohemoglobin determination has been below 7 grams, and (4) over 2,500 cc. of whole blood has been required to restore the hemoglobin level to normal.

Once defined it is interesting to note from their experience what has been the source of the bleeding.

It is apparent that there are three general approaches to the treatment of this most important symptom.

Conservative Medical Management Alone.—This no doubt evolved because in the earliest years surgery was not available and when later it was employed it was attended by a mortality much higher than that which accompanied the straight medical regime. Turnbull[2] and his associates have presented the results in patients so treated at the Evanston Hospital in the years between 1928-1937 and 1938-1947. Their mortality was 2.5 per cent. The excellence of this result has made the acceptance of indications for more active intervention reluctant, to say the least. If their success can be rationalized it must be pointed out that the economic status of their patients allowed for more rigid attention to ulcer management, and more careful follow-up medical care. Unwittingly too late surgical intervention in patients obviously not responding to medical management might have been considered as surgical mortality.

It is difficult to sustain the cause of unqualified conservative medical management in light of the obvious improvement in surgical results as reported by Stewart (Table II). He arbitrarily, according to definition, selected from the patients having upper gastrointestinal hemorrhage presumably due to ulcer those whose hemorrhage qualified as being massive. He per-

formed gastric resection with the outcome as indicated in Table III—a very impressive figure.

It is logical that approach No. 3 as reported by Welch, the results of which have been shown in Table IV, might combine the advantages of Nos. 1 and 2, and more adequately satisfy the contentions of the proponents of each of these methods.

Patients bleeding from the upper gastrointestinal tract were admitted to the surgical service for joint watching by both surgeon and internist. Those who continued to bleed or had recurrent hemorrhage, massive in character, were subjected to planned gastric resection under conditions conducive to optimum surgical technique. Those whose hemorrhage ceased were after a definitely established time returned to the medical service and advised to have interim gastric resection. It was felt that the mortality, not to mention morbidity or economic loss, was less under such a plan. Those not operated were known to have recurrent hemorrhage. The mortality in that group exceeded that in the group in which interim gastric resection was performed.

Upon what significant beliefs should the management of acute massive upper gastrointestinal hemorrhage be predicated?

1. Indiscriminate emergency surgery should be condemned.

2. Discriminate intervention carries the least risk during the first twenty-four to thirty-six hours.

3. Despite the impressive reduction in the medical mortality due to improved management, a certain percentage of patients will continue to die of uncontrollable hemorrhage:
   (a) Below the age of forty there has been a reported 2 per cent death rate but this has been achieved by an 8 per cent surgical intervention.
   (b) Over the age of fifty there has been a reported mortality of 23 per cent.

4. The reported mortality of massive hemorrhage from gastric ulcer (22 per cent) is higher than from duodenal ulcer (10 per cent):
   (a) A patient over fifty bleeding from a chronic gastric ulcer is the most likely to die of uncontrollable hemorrhage.

5. Continued or recurrent bleeding is of utmost importance as a *prognostic factor:*
   (a) Seventy per cent of hemorrhages even in older age groups cease spontaneously on hospitalization.
   (b) Since 2,500 cc. of blood is lost in a single massive hemorrhage, if five pints of blood replacement does not produce stabilization, then bleeding is continuing.
   (c) The majority of patients (85 per cent) who bleed again do so within a short time within the third hospital day.
   (d) The mortality of persistent or recurrent hemorrhage in the age group over fifty may be as high as 56 per cent.

6. Unrelievable pain differing from previous ulcer distress often with back radiation preceding hemorrhage or persisting after hemorrhage is a serious symptom for massive bleeding.

7. Pyloric stenosis predisposes to recurrent hemorrhage.

8. Massive hemorrhage in the presence of previous perforation is of significance.

9. Massive hemorrhage in relation to previous bleeding:
   (a) Sixty-four per cent of patients have not bled previously—mortality 12 per cent.
   (b) Twenty per cent have bled before—mortality 16 per cent.

(c) In the remaining 16 per cent—mortality 7 per cent.

10. Transfusion therapy is not without risk because:

(a) Despite vigilance the suddenness of hemorrhage may produce recurrent shock, hypoxia, and associated phenomena.

(b) There has been reported the occasional occurrence of a hemorrhagic tendency.

(c) Incompatibilities are evidenced at times because of the urgency of the need.

(d) Delayed effects such as hepatitis are almost inevitable, though infrequent.

(e) Transfusions in great numbers are more of an economic burden than surgical intervention.

What is the management of acute massive upper gastrointestinal bleeding?

Because the patient will no doubt exhibit evidence of shock, combative measures are instituted at once with but the most cursory physical examination. Nothing is allowed by mouth except moistening of the lips. Blood replacement is begun as soon as typing and cross matching can be performed. The blood count including smears searching for evidence of blood dyscrasias, hematocrit, blood volume, prothrombin, non-protein nitrogen, and chloride determinations are proceeded with. Blood tests for liver function are included. Half hourly blood pressure determinations help guide blood replacement endeavoring to sustain the pressure at 100 mm. of Hg and the pulse at 120 or less.

With restorative measures under way a more careful history and physical examination is recommended. Evidences of liver disease such as spider angiomas, hepatic and splenic enlargements, altered albumin-globulin ratio, depleted prothrombin or excessive dye retention are suggestive of the presence of bleeding esophageal varices. Their management would constitute a separate discussion. Laparotomy is to be avoided, however.

In the absence of a history suggestive of peptic ulcer in a patient with uncontrollable bleeding in whom surgical intervention is contemplated, x-ray examination of the esophagus, stomach and duodenum is advisable. With the patient in the recumbent position barium may be administered. Turning the patient from side to side without using pressure on the abdomen will lead to the establishment of evidence of ulcer in a high percentage of patients.

If no evidence of esophageal varices are found, a soft nasal tube is introduced into the stomach and gentle suction applied to remove clots and hydrochloric acid. Nausea is inhibited and digestion prevented.

Morphine should be used with caution as should barbiturates in the elderly. Demerol may be employed for restlessness.

Vitamin C, Vitamin K, and fluid requirements can be administered parenterally.

When surgery is indicated on a basis of the foregoing considerations, it should be done under conditions allowing for optimum performance—a rested surgical team, experienced nursing and anesthetic personnel, and with optimum blood replacement accomplished and additional blood available.

An upper mid-line abdominal incision immediately establishes the appearance of the liver as substantiating the absence of evidence of cirrhosis. The stomach may be full of blood clots. These should be evacuated by gastrotomy. If these are not present, immediate gastrotomy should be performed. The presence of blood once established, the stomach may be advantageously transected. Bleeding from the free edges is controlled by Allis forceps. First the lower segment is inspected, mobilizing the duodenum by dividing its lateral peritoneal attachment if necessary. The lower segment may be split anteriorly for adequate exposure if necessary. Similarly the upper segment may be inspected. All steps taken should be with the object of a 75 per cent or 80 per cent gastric resection in mind once it has been established that there is no evidence of liver disease and that the stomach contains gross blood. Even though no source is apparent the resection is advisable. Superficial ulceration or bleeding vessels covered by mucosal folds may be easily overlooked. Resection with ligation of the blood supply will control the hemorrhage from these sources.

With gross bleeding arrested—blood replacement will manifest its restorative effect. Shock, hypoxia and their attendant changes can be re-

(Continued on Page 943)

THE PEPTIC ULCER PROBLEM

OWEN H. WANGENSTEEN, M.D.
Minneapolis, Minnesota

The Centennial

It is a rare privilege to have the opportunity of participating in this Centennial Celebration of the Minnesota State Medical Association. At its meeting places over the past century, the physicians of the State of Minnesota have congregated annually since a point nearer in time, to the beginnings of Anesthesia (1846) than to the first publications by Lister (1867) upon the application of the antiseptic principle in surgery. Through the years, as now, members of the Society and distinguished visitors have tried to bring to these sessions of the Society an up-to-date critical appraisal of the practical aspects of current problems. And in these gatherings, through the bond of a common interest, acquaintanceships have been renewed, confidences have been exchanged and friendships cemented. The Association has also been the spokesman for the Profession in its contacts with the Public, whom it has been our pleasure to serve.

Within the space of two years, Minnesota has observed the Centenary of its Statehood and the Centennial marking the beginnings of our University. On an occasion such as this, when with filial piety we ponder the achievements of our forebears in a spirit of grateful thanksgiving, and look hopefully toward the future, let us not forget the interdependence of State, School and our Association. The hopes and aspirations of each are indelibly linked to the training and promise of our youth—an asset transcending in value all the natural resources of our great State. As we renew and pledge again today the faith of our Fathers, let us rededicate ourselves to their labors of making Minnesota truly American—the great land of unlimited opportunity for anyone, who like every good physician, serves his fellowmen, forgetful of self, in a spirit of humility with tender care and devotion.

Peptic Ulcer—Still an Important Problem

PEPTIC ULCER is still a challenging problem. We know that the origins of peptic ulcer are traceable primarily to an abundant secretion of gastric juice with a high digestive power, owing to its content of hydrochloric acid and pepsin. However, many persons who have very responsive stomachs, capable of secreting large amounts of acid gastric juice, do not have peptic ulcer. Moreover, a number of conditions, which fail to augment gastric secretion, nevertheless, abet the ulcer diathesis and lower the threshold to ulcer production. Anemia of the mucosa of those segments of the digestive tract which may come in contact with gastric juice increases the ease of ulcer production. Lillehei, Dixon, and the writer (1948) found that bleeding a dog with maintenance of the blood pressure below 70 mm. Hg for half an hour—the withdrawn citrated blood being then returned—is followed regularly by far greater ease of ulcer production.[6] In fact, any change which affects the normal homeostatic pattern of the mucosa of segments of the alimentary tract which may come in contact with the acid-peptic juice appears to lower the threshold to ulcer production. Fatigue, cold and anoxia appear to be strong abettors of the ulcer diathesis. Adrenergic stimuli, which give rise to vessel spasm, and consequently to anemia of the mucosae over which acid-peptic juice may ply, abet the ulcer diathesis.[11] Employment of histamine-in-beeswax has proved a very useful tool in these explorations.

A surprise finding in these studies has been the great sensitivity of the esophageal mucosa to injury by acid-peptic[4] juice. In fact, it would be quite safe to suggest that all squamous epithelium is far more susceptible to digestive injury by acid-peptic juice than is columnar epithelium protected in part by mucous secreting glands.

Location of Ulcer

The most frequent site for peptic ulcer appears to be the duodenum. The next most frequent

location is the stomach. Observations in this Clinic, relating to the reflux of gastric juice into the esophagus, suggest quite definitely that manifestations of acid-peptic disease in the esophagus are more common than is generally believed. In 1949, the relief of so-called "idiopathic stricture" of the esophagus was reported from this Clinic in patients, following a conventional three-quarter gastric resection.[19] Shortly thereafter, experiments in the laboratory on dogs and cats, in which the esophagus was perfused with gastric juice obtained from isolated canine gastric pouches, showed how very sensitive esophageal mucosa is to injury by acid-peptic juice. In fact, as a logical sequence of these clinical and experimental observations, this writer feels that so-called "idiopathic" stricture of the esophagus as well as "spontaneous perforation" of the esophagus in man are, in all likelihood, manifestations of acid-peptic digestion of the esophagus.[17]

The only other areas in which peptic ulcers are observed are in the jejunum following the establishment of gastro-jejunal stomas, or spontaneously in a Meckel's diverticulum.

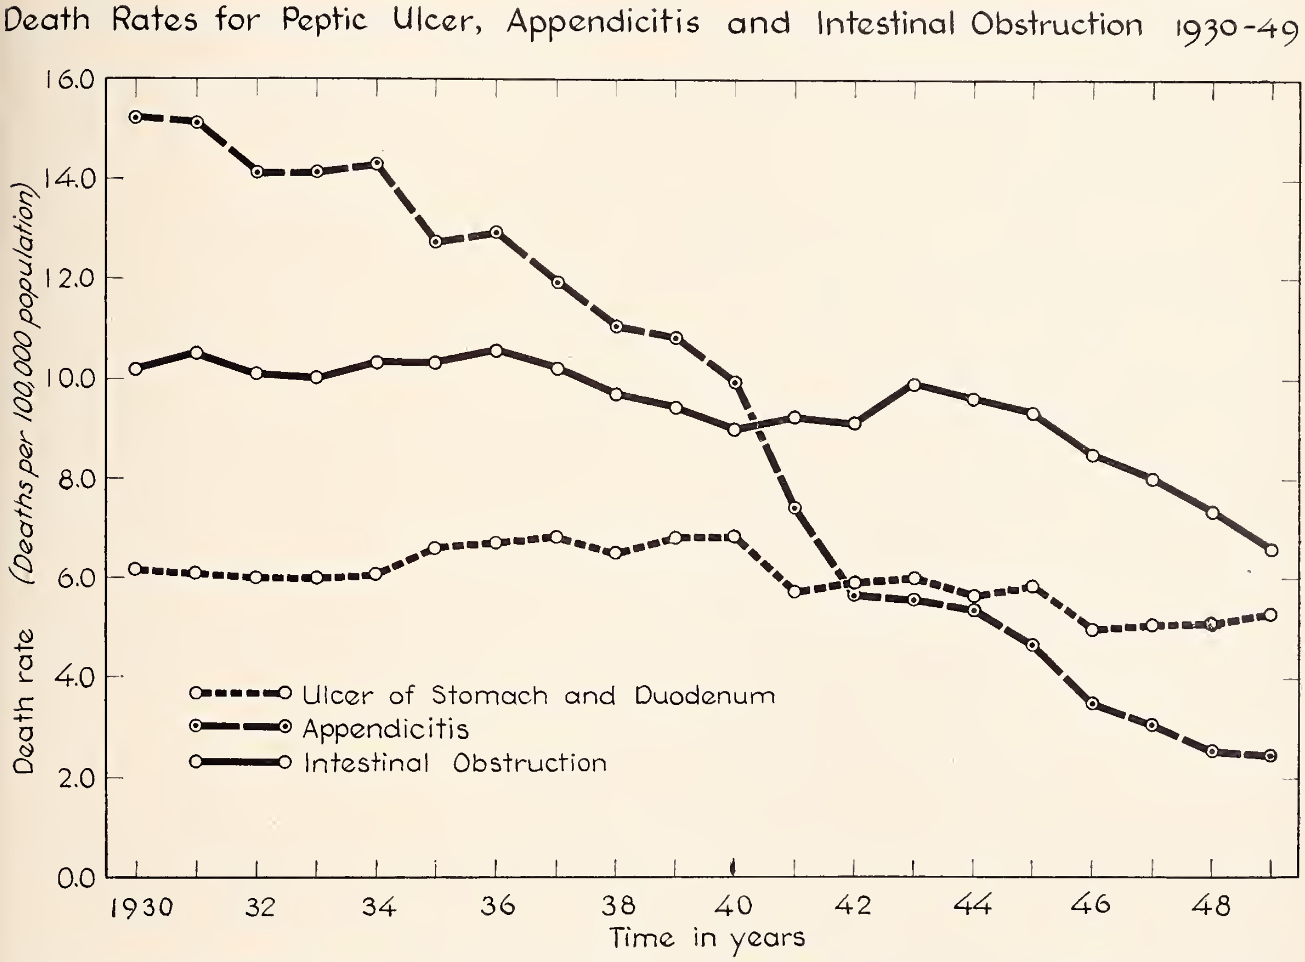

Fig. 1. There has been only a 10 per cent decrease in the mortality of peptic ulcer as shown by the Vital Statistics of the United States over a period of many decades.

Meanwhile, however, there has been a continuing reduction in the mortality of appendicitis. In fact, the present annual mortality of appendicitis is only 15 per cent of what it was twenty years ago.

During the past decade, the mortality of bowel obstruction has declined steadily, the present mortality being 65 per cent of what it was a decade ago.

Defense of the Designation "Peptic Ulcer"

Dragstedt[2] (1936) once made the suggestion that the correct designation for ulcers resulting from digestion by gastric juice should be "acid-ulcer." The great sensitivity of the esophageal mucosa to injury by acid-peptic juice consitiutes a good test of the validity of retaining the designation, peptic. Whereas the esophageal mucosa does show distinctive effects of injury when subjected to perfusion with hydrochloric acid of pH_1, by contrast, when gastric juice, obtained from an isolated dog's pouch of the same acidity, is used, unmistakable evidences of far greater digestive action upon the perfused esophagus are observed, owing to the presence of pepsin. Perforations of the esophagus were never observed when the

*Vital statistics, 1949.

It is apparent that Minnesota's accomplishment is slightly better than in the Nation and in our own area of States.

esophagus was perfused with hydrochloric acid. Employment of gastric juice of the same pH was followed by perforations quite readily.

The Resistance of Gastric Mucosa to Injury By Acid-Peptic Juice

Since the day of John Hunter, the question has frequently been asked: "Why does not the stomach digest itself?" It is still a good question. It is well known that the great secretory capacity of mucous secreting glands in the tubules of the stomach cannot be exhausted. In this function, undoubtedly, resides a good deal of the native resistance of the gastric mucosa against injury by acid-peptic juice. And, inasmuch as gastric ulcer is frequently observed in the absence of distinctly high values for gastric acid, it would appear that there are other abetting factors which lower the threshold of the gastric mucosa to injury by acid-peptic juice. Gastric ulcers should be studied with reference to the content of mucus in the gastric tubules adjacent to the ulcer. Possibly there may be some defect in the protective action with which the gastric mucosa ordinarily is so richly endowed, in patients who develop gastric ulcer.

It is known that in the presence of pyloric obstruction, ulcers may be observed in the stomach. Since Pavlov made this observation long years ago, anyone who has worked with isolated canine gastric pouches in the laboratory has had occasion to observe that obstruction to outflow of the gastric juice may be accompanied by the development of an ulcer within the pouch. Moreover, vagotomy which reduces gastric acidity may be followed by gastric ulcer in man and in experimental animals because of gastric retention attending the gastric atony of vagotomy. It should be said however, that of all the mucosae which come in contact with acid-peptic juice, the gastric mucosa appears to be the most resistant to injury by the gastric juice. If this were not so, presumably everyone would have a gastric ulcer.

Duodenal ulcers occur with predilection just beyond the pyloric outlet. The pH of the duodenal content beyond the common opening of the bile duct and the pancreatic duct of Wirsung is such that the pH of the ejected content from the stomach is raised quickly by the admixture with bile and pancreatic juice to a level at which it loses its peptic activity.

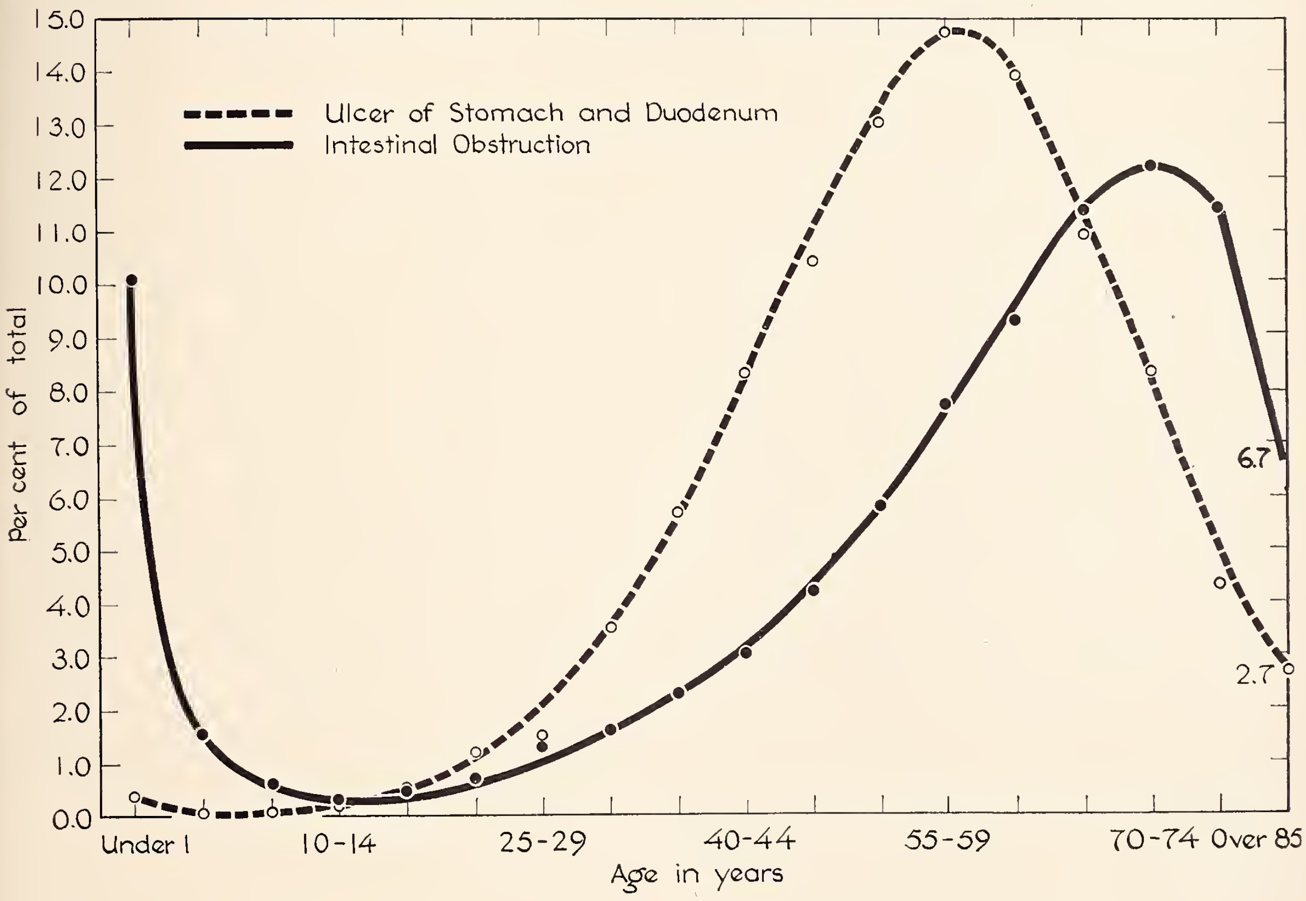
Special Considerations

Mortality.—Whereas there have been sharp declines in the mortality of acute appendicitis during the past twenty years, and a less striking decline in the mortality of acute intestinal obstruction during the past decade, there has been only an appreciable reduction (10 per cent) in the mortality of peptic ulcer as revealed by the Vital Statistics[11] of the United States over the past twenty years. It is gratifying to note that the accomplishment in Minnesota in all these acute disorders is slightly better than in our own geographic tier of states as well as in the country as a whole (Table I).

Perforation.—During the past ten years, throughout the country, a great reduction in the mortality due to perforation of an ulcer has taken place. A decade ago, hospital mortalities for perforated ulcer ran in the area of 20 to 25 per cent. Today, those mortalities are quite generally under 10 per cent. In fact, no mortality has been observed attending the closure of perforated peptic ulcers in this Clinic during the past five years.

There has been a renewal of interest in recent years in the conservative management of perforation with an indwelling duodenal tube, a method which this writer described[12] in 1935. That report mentioned four patients with acute perforation with pneumoperitoneum treated by suction. One of these patients, with a very large pneumoperitoneum and a perforation of twenty-eight hours, died. There were four additional patients with a "forme fruste" type of perforation without a demonstrable pneumoperitoneum, all of whom recovered. No antibiotics were then available, and following the death of the patient with the large pneumoperitoneum, the conservative management of acute perforation of peptic ulcer was abandoned. Despite the recent flurry of interest in the conservative management of perforated ulcer in England and in this country, operative closure continues to be the method of choice in this Clinic.

Mortality from Intestinal Obstruction *grand total 9,854;* Peptic Ulcer *grand total 7,809;* in the United States Census of 1949



Percent of total deaths in 5 year periods

Fig. 2. The mortality of duodenal ulcer and bowel obstruction, at various ages of life. It is to be noted that 75 per cent of the mortality of peptic ulcer occurs essentially between the ages of forty and seventy. Moreover, between the ages of fifty and seventy, the mortality of peptic ulcer is reminiscent of the large mortality from appendicitis of two decades ago.

On the contrary, the mortality of bowel obstruction is largest in the first few years of life, and again towards the end of life. This circumstance is readily apparent in that, during the first year of life particularly, such difficult and hazardous obstructions as meconium ileus, intestinal atresia, and volvulus neonatorum are encountered. Toward the end of life, the physcal infirmities of man and cancer of the colon are the important items in the large mortalities observed.

Obstruction.—Obstruction occurs usually as a sequel of a duodenal or a pyloric ulcer. Obstruction which fails to relent with the ingestion or intragastric dripping of skim milk suggests that an ulcer crater is present. Repeated episodes of obstruction lead to duodenual narrowing. Obstruction, like perforation, usually brings the patient to the surgeon.

Hemorrhage.—The large threat to life today for the patient who has a peptic ulcer is the hazard of hemorrhage. The continuing mortality of peptic ulcer is almost entirely owing to this circumstance. With very few exceptions, instances of massive hemorrhage from whatever cause has become the object of concern of surgeons. Peptic ulcer appears to be such an exception. This situation is in need of re-adjustment. Inasmuch as effective means of dealing with peptic ulcer are generally available, it would appear that patients who have had episodes of hemorrhage should not be held off from the protective influence of an operation indefinitely. The immediate risk to life can be reduced by earlier resort to operation, which will stop the bleeding. At the same time, protection will be afforded against recurrent hemorrhage in that a satisfactory operation thwarts the ulcer diathesis in an effective and lasting manner.

Reference to Figure 2 reveals that the large mortality from peptic ulcer occurs between the ages of forty and seventy. Between the ages of fifty and seventy the mortality of peptic ulcer today is as great as it was from appendicitis in this country twenty years ago. This situation obviously needs study and correction.

Patients coming to the hospital with active hemorrhage because of peptic ulcer should become the primary responsibility of the surgeon. He should decide whether operation is necessary. This decision should no longer be the responsibility of the internist. If hemorrhage has been brisk and bleeding to shock levels of blood pressure (80 mm. of Hg. or less) has occurred, immediate operation is in order. If there has been hemorrhage without bleeding to shock level, the dripping of skim milk through an inlying gastric tube, the milk being dripped over twenty-four-hour periods, may make operation unnecessary. Of all substrates with which this Clinic has had some experience in combating the hemorrhage of ulcer, it is my impression that the dripping of skim milk is easily the best agent. However, in patients who have had more than one hemorrhage, granted the patient is in satisfactory condition, no advantage would appear to be gained through the agency of delay. The unfortunate thing is that protracted, conservative treatment of active hemorrhage, provides a patient who is probably a far poorer risk for operation than he was when he first presented himself at the hospital for the relief of hemorrhage. It is not easy to correct the lag phases in the adjustment of vital processes attending any serious insult, such as hemorrhage. The harm occasioned by the delay is not undone by the simple expedient of blood replacement. The time-loss factor is an item of great importance and must come to be recognized as such. Lost opportunity cannot be retrieved readily.

Hematemesis Without Obvious Evidence of Peptic Ulcer at Operation

In 1945, in patients in whom hematemesis had been observed and bleeding was still active but no ulcer found at operation, the writer advised performing the conventional three-quarter gastric resection.[14] At the time of the report, four such cases were cited. In all save one, a small erosion was found high on the lesser curvature. In the remaining patient, diffuse ulceration of the mucosa was found microscopically. Recurrent hemorrhage has not been observed in any of these patients. In the meanwhile, many additional such patients have been subjected to gastric resections with gratifying results. Moreover, the suggestion of performing gastric resection in patients who have had hematemesis but in whom no ulcer can be found at operation, has been adopted by others.[1]

In such patients, it has become regular practice to measure the portal venous pressure at operation to make certain that one is not dealing with the item of portal hypertension. It has become evident too that, in the bleeding of portal hypertension, excision of the entire acid-secreting area of the stomach is mandatory, an anastomosis being made between the distal end of the esophagus and the antrum of the stomach.[15,17] It is becoming more generally accepted now that the bleeding from esophageal varices is essentially an acid-peptic linked phenomenon. Moreover, it is probably safe to suggest that *hematemesis* is almost invariably, if not always, an occurrence related to the erosive effect of acid-peptic juice. Inasmuch as the vagi nerves are divided in this maneuver, obviously, a concomitant Heineke-Mikulicz pyloroplasty also must be done.

The Problem of Gastric Ulcer

The garden-variety of benign gastric ulcer usually can be identified as such by a competent roentgenologist. Complete healing of the defect attending the ingestion of a Sippy milk diet for a period of two or three weeks, when well controlled roentgenographically, is a safe procedure in most acute gastric ulcers. However, failure of the defect to heal completely is an indication that operation is in order.

There are, however, peptic ulcers which cannot be differentiated from cancer. A more aggressive attitude by surgeons in the management of the gastric ulcer problem is therefore very much in order.[9] Moreover, the very circumstance that gastric ulcer is frequently recurrent at the very same site suggests that the gastric mucosa may not have regenerated completely over the defect.

Approximately five years ago, a number of my surgical colleagues in this Clinic followed thirteen patients with gastric ulcer to complete healing under carefully controlled medical management.[5] At that time, with the patients' consent, gastric resection was undertaken with a view to studying the situation microscopically. Interestingly enough, one of these ulcers which appeared to have healed completely under roentgen control was a cancer. Of the remaining twelve, only one showed perfect healing of the defect in the mucosa. In the remaining eleven, there were peninsulas of mucosa going out from the edges of a tiny residual defect, the center of which was not covered by gastric mucosa. Inasmuch as the mucosa was absent over a portion of the former ulcer, it is quite obvious that the nidus for a new ulcer still existed despite the apparent filling in of the ulcer.

Diet.—A smooth bland diet with milk as its base is undoubtedly the best dietetic regimen for the patient with peptic ulcer. It is to be remembered that it is the protein in the milk which decreases the acidity of the gastric juice. Patients who are above their optimal weight would do well to substitute skim milk for whole milk. Moreover, skim milk is a more effective agent in the control of acidity because the patient will ingest more of it than of whole milk.

Alcohol, coffee (and caffeine in any form) and tobacco are taboo for the peptic ulcer patient, who is trying to control his disorder by dietary methods. Whereas, antacids and depressants of gastric secretion, like Banthine, often afford fairly direct symptomatic relief, my experience has been that the relief in most instances wears out and the patients come seeking the more durable satisfaction of an adequate operation.

Operations for the Relief of Peptic Ulcer

Gastric Resection.—A number of operations appear to afford satisfactory protection against recurrent ulcer. During the past decade, standardization of the extent of excision of gastric tissue in Billroth I and II operations has come about. The incidence of recurrence after well-performed operations is approximately 1 per cent.[10] The majority of surgeons who have had a large experience in the surgical management of peptic ulcer have come to appreciate that it is not necessary to excise the ulcer to allay the peptic ulcer diathesis. The complaint of patients and surgeons, however, concerning these procedures has been that too frequently the operation, whether performed on the Billroth I or II plan, is accompanied by a group of symptoms commonly lumped together as the "dumping syndrome." Loss of weight is observed quite regularly; and attending the ingestion of food, sweating, palpitation and tachycardia, accompanied by the desire to lie down occur. Persistence of these symptoms, in some degree, is noted in approximately 20 per cent of patients undergoing the Billroth type of resection; in about 2 per cent of patients, these symptoms appear to be disabling.

Vagotomy.—Gastrojejunostomy and pyloroplasty have proved to be unsatisfactory operations in the relief of peptic ulcer.

During the past decade there has been considerable renewal of interest in vagotomy as an operative procedure for peptic ulcer. Dragstedt and his associates[3] (1951) who have made important contributions to our knowledge concerning gastric secretion in man, have insisted on the completeness of vagotomy as an essential feature of a successful operation. Today, however, very few surgeons perform vagotomy as an isolated primary operative procedure. Some add a drainage operation such as gastrojejunostomy; others remove the antrum as well. Some surgeons hold to the principle of gastric resection but feel that the protection afforded by a concomitant vagotomy is such that a lesser resection will suffice than if gastric resection alone is done. In other words, a 50 per cent gastric resection with an added vagotomy has been substituted for a 75 per cent gastric resection. Whether such a resection will ultimately afford the promise of the conventional three-quarter Billroth operation remains to be observed.

It needs to be said in this connection that surgeons, like myself, who affect a special interest in the peptic ulcer problem see each year a few patients who successively have had gastrojejunostomy, vagotomy, gastric resection, followed in turn by an additional gastric resection or two—the patient still continuing to have a persistent peptic ulcer. I have had several skirmishes with patients who have had such a succession of operations. The interesting finding at a fifth or a sixth operation is that invariably there is still a good deal of residual stomach. In the beginning, such patients have usually been hypersthenic—patients of the drayman type of constitution. The extrapleural sternal splitting inci-

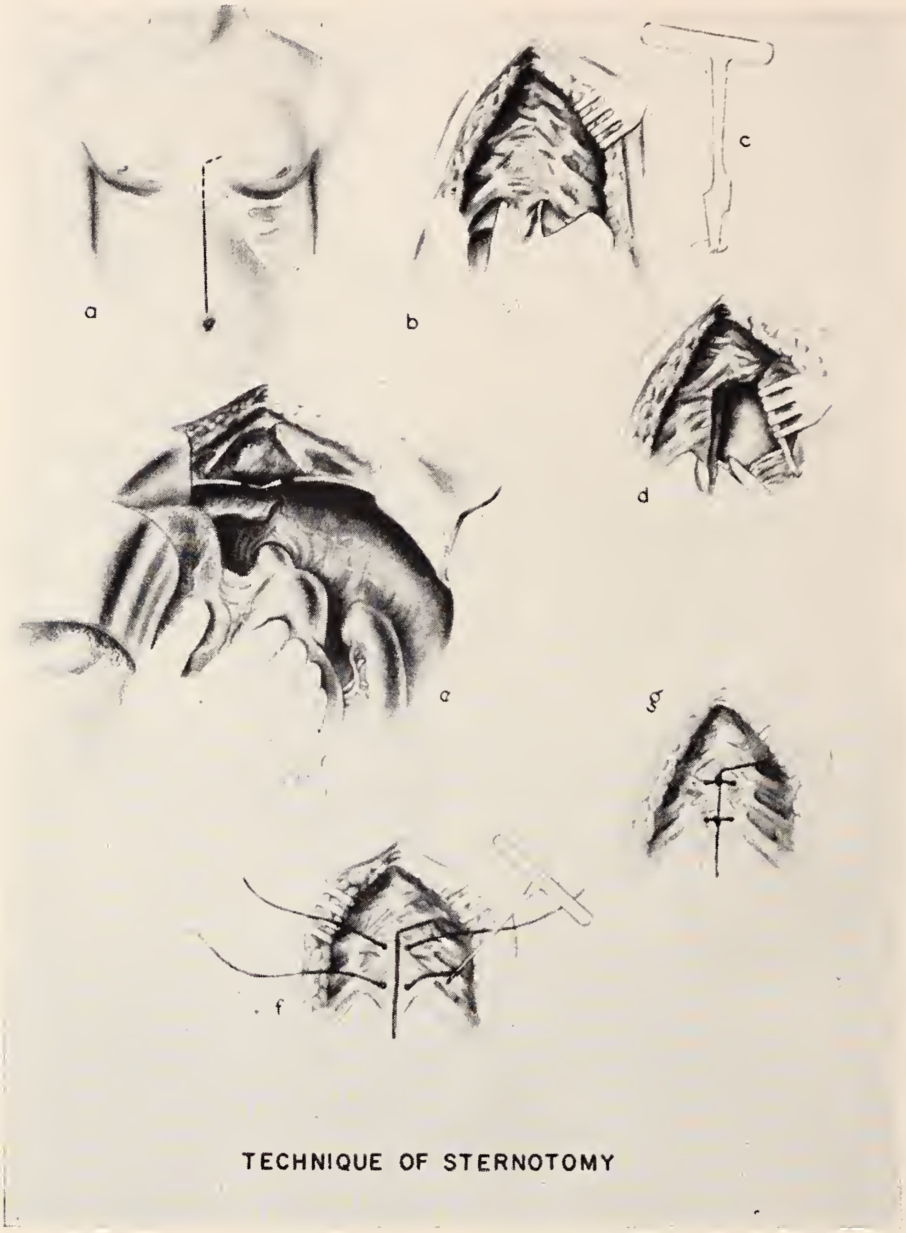


Fig. 3. The Extrapleural Sternotomy Incision: (a) The incision. (b) The finger is inserted beneath the ensiform, preparatory to the insertion of the Lebsche sternal knife. (c) The Lebsche sternal knife. The knife is driven with an ordinary orthopedic hammer. (d) The left margin of the divided sternum is retracted laterally. The knife is shown cutting the diaphragm downward. The incision in the diaphragm extends to the point at which the pericardium comes directly into view. It is obvious that a deliberate opening of the pericardium will permit even easier retraction of the rib margin on the left side. (e) The exposure obtained with the sternotomy incision. The whole attic of the upper left abdomen comes immediately into view. The avascular ligament of the left lobe of the liver has been divided and the liver has been retracted to the right. It is obvious that this incision affords excellent exposure for repair of paraesophageal hernia as well as for total gastrectomy, in which procedure excision of several centimeters of esophagus is to be performed. Moreover, sternotomy is very helpful in the conventional sub-total gastric resection and is employed routinely in this Clinic in that operation. (f) Rewiring of the sternum. Ordinarily, two No. 24 stainless steel wires suffice. The hand driven awl with a short side arm for engaging and pulling the wire through is shown. (g) The sternum is re-wired. The mid-line incision in the abdominal wall is closed in the conventional manner with two rows of interrupted silk.

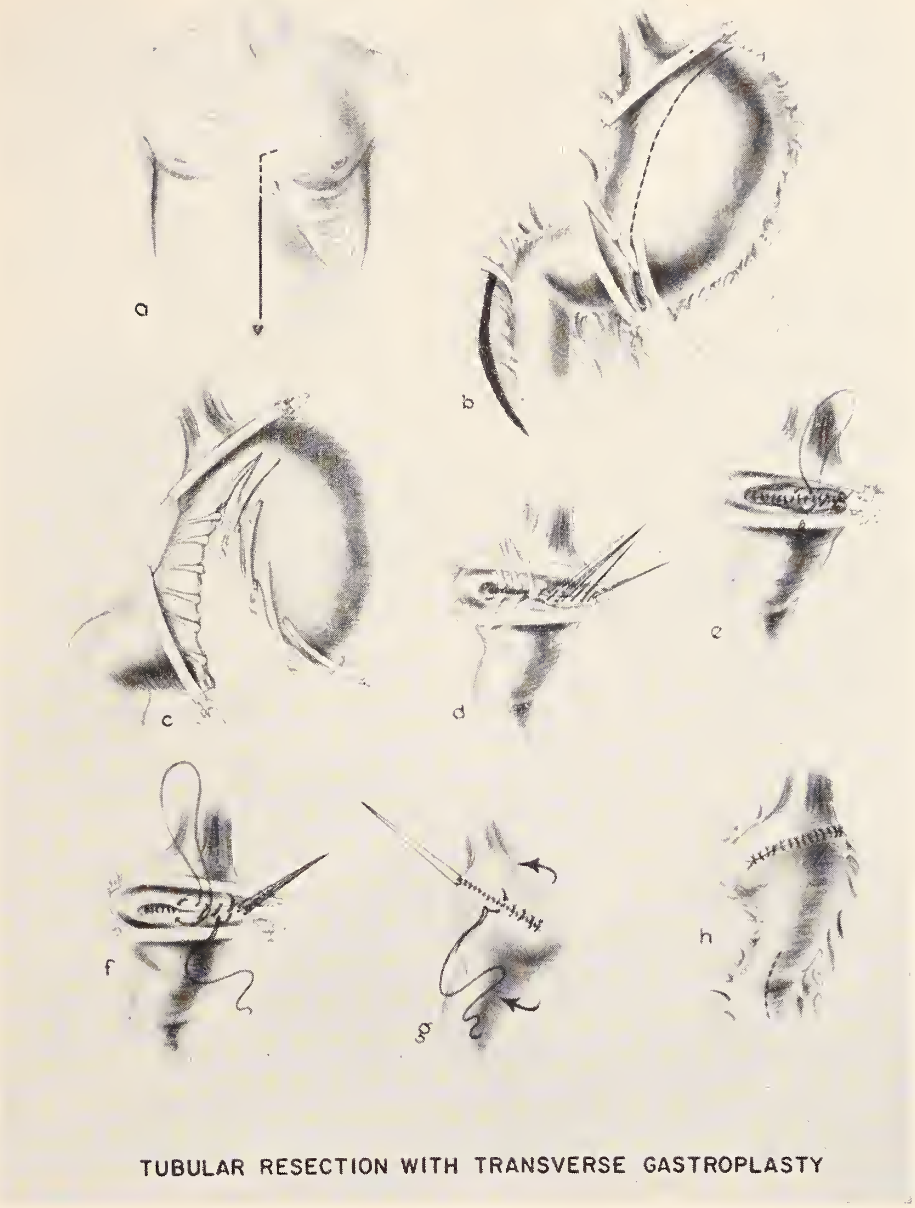

Fig. 4. Tubular Resection: This is the operation currently employed in this Clinic for duodenal ulcer. Obviously it is not applicable to gastric ulcer. The extent of the excision in the acid-secreting area is not quite as large as that in segmental resection. A comparison of illustrations (b) and (c) will suggest that, in tubular resection (c) a short segment of acid-secreting mucosa is left along the lesser curvature which is removed in segmental resection. The vagi are not divided in this procedure. Consequently a pylorotomy is necessary only in instances where there is narrowing of the duodenum or in the presence of massive hemorrhage from the duodenum.

Both segmental and tubular resection have been employed with satisfaction in the "idiopathic" strictures of acid-peptic ulcer. Inasmuch as free gastric drainage is so important in the relief of acid-peptic strictures of the esophagus, a Heineke-Mikulicz pyloroplasty is added, even though pyloric obstruction is not present.

Tubular resection has proved to be an eminently satisfactory operation in the management of duodenal ulcer. Tubular resection protects against the histamine-in-beeswax provoked ulcer in the dog.

sion (Fig. 3), which affords excellent approach to the attic of the abdomen, makes it possible to view with care the nature of the attachment of the fundic end of the stomach to adjacent viscera. Patients have come to me with the statement that they have been advised to have a total gastrectomy. I have not found it necessary to resort to this expedient. Ordinarily, 90 to 100 gm. of stomach are still available for excision in a fifth or sixth operation, leaving on completion of the anastomosis a residual gastric fragment constituting approximately 10 per cent of a normal sized stomach.*

In other words, whereas vagotomy and antral excision appear to be sound operations physiologically for the relief of peptic ulcer, the occurrence of situations like those just alluded to occasions one to be cautious in accepting as completely valid the belief that antral excision plus vagotomy is adequate to thwart the ulcer diathesis.

In the dog, vagotomy offers considerable protection against the ulcerogenic effect of the histamine-in-beeswax preparation. Yet, when a drainage operation, such as a concomitant gastrojejunostomy or antral excision is done, the vagotomy appears to have lost a great deal of its protective action.[7]

Segmental Gastric Resection.—This Clinic has had a satisfactory experience with the employment of segmental gastric resection in the management of duodenal ulcer.[16] The procedure also is adaptable to benign gastric ulcers not located in the antrum. Inasmuch as transverse division of the stomach vagotomizes the antrum, it is essential to perform routinely complemental pyloroplasty to insure satisfactory emptying.

No recurrences of ulcer have been observed in approximately 100 patients subjected to segmental gastric resection in this Clinic. However, the incidence of the "dumping syndrome" has been sufficiently great to suggest that this procedure is not an ideal operation for peptic ulcer, though probably superior to the Billroth operations. Achlorhydria is observed rather frequently following segmental resection.

Tubular Gastric Resection.—Enough experience has now been had with this operative procedure in the surgical relief of peptic ulcer to indicate that it appears to be an eminently satisfactory operation for duodenal ulcer.[14,17,18] Obviously, inasmuch as the entire lesser curvature of the stomach remains, this operation has no application in the management of gastric ulcer.

This operation has the advantage over segmental gastric resection in that inasmuch as the lesser curvature remains intact, no portion of the stomach is vagotomized. In consequence, it is not necessary to perform a complemental Heineke-Mikulicz pyloroplasty (Fig. 4), save in the presence of active bleeding, or in the presence of some degree of obstruction occasioned by an indurated duodenum.

The Heineke-Mikulicz pyloroplasty whether done in segmental resection or in tubular gastric resection circumvents the difficult problems of the large supraduodenal ulcer crater. In consequence, the surgeon can with relative equanimity make a long longitudinal opening, cutting across the anterior portion of the pyloric muscle. An excellent view of the lower antrum and the first portions of the duodenum is provided. Surgeons in our Clinic have learned a good deal concerning the appearance of ulcer through the simple expedient of opening the duodenum.

Tubular resection with a concomitant pyloroplasty has simplified the problem of dealing with brisk hemorrhage from an actively bleeding duodenal ulcer at operation. The technique of the operation of tubular gastric resection is shown in the accompanying diagrams (Fig. 4).

Symptoms of the "dumping syndrome" are observed less frequently after this operation than following any of the other resection techniques. Achlorhydria after histamine stimulation does not occur as frequently as after segmental resection. The volumes of gastric juice, however, are quite regularly small. MacLean[8] finds that patients having tubular resections absorb 95 per cent of the fats ingested. This observation indicates quite definitely that weight loss is owing essentially to diminished intake of food. It is to be remembered too that an ulcer regimen is a fattening diet, and that following operation, patients are inclined to veer away from the high caloric diet generally prescribed for patients with peptic ulcer.

---

*I have yet to see a recurrence following this type of operative correction—a procedure which has been carried out on a fairly large number of patients who have had multiple antecedent operations for peptic ulcer over the last fifteen years.

Summary

Peptic ulcer is still a challenging problem. Whereas there has been a very significant overall reduction in the mortality of acute appendicitis and bowel obstruction during the past two decades, no such reduction in the mortality of peptic ulcer has come about. This circumstance is owing largely to deaths occurring through the agency of hemorrhage. Inasmuch as satisfactory operations are now available which thwart the ulcer diathesis in an effective and lasting manner, there would appear to be no good reason to withhold operation from patients who have had more than one episode of hematemesis from peptic ulcer. When the medical profession learns to manage the threat of hemorrhage from peptic ulcer in a satisfactory manner, the mortality of the disorder largely will have disappeared.

During the past decade, the medical profession has learned how to control the serious threat of perforation. Through the agency of improved surgical care, including employment of antibiotics and a better toilet of the peritoneal cavity at the time of the closure of the perforation, the mortality of perforation is no longer as serious as it was a decade ago. In fact, a number of surgeons, in selected patients, are carrying out gastric resection at the time when the perforation is dealt with.

The gastric ulcer constitutes a special problem. The hazard of confusing a benign gastric ulcer with cancer is real. Inasmuch as gastric ulcers frequently recur at the very same site despite apparent satisfactory healing attending medical management, earlier and more frequent recourse to operation is in order.

Satisfactory operations which allay the ulcer diathesis are available. Moreover, in this area alone, a large number of patients who have been subjected to a satisfactory operation for ulcer have been taken on as standard risks by insurance companies after the lapse of five years following operation, no recurrence having been observed meanwhile. When it is recalled that patients with peptic ulcer are not insurable, this very circumstance speaks eloquently for the faith of actuarians in the protection of an acceptable operation against ulcer recurrence. When patients with recurrent gastric hemorrhage are urged to accept the protection of operation, the mortality of peptic ulcer, like that of appendicitis and bowel obstruction, will begin to exhibit definite evidence of betterment.

Tubular gastric resection appears to be an eminently satisfactory operation for peptic ulcer. It protects against the histamine-in-beeswax provoked ulcer in dogs. This operative procedure carried out through an extrapleural sternal splitting operation is essentially a simple operation. It is to be remembered that it is *antral exclusion* and *not retention* of the antrum which abets the ulcer diathesis. Were this not true, every man retaining his antrum would be a potential candidate for the occurrence of peptic ulcer. It is the writer's feeling that as long as the antrum is *in contact* with the residual gastric pouch, retention of the antrum does not abet the ulcer diathesis.

The etiology of peptic ulcer still remains in part an enigma. The corrosive effect of acid-peptic juice is the most important single agent. However, there are a large number of items such as fatigue, spasm of the blood vessels of the mucosae over which the acid-peptic juice may ply, blood loss, and other stress factors which abet the ulcer diathesis and yet fail to augment gastric secretion.

Of all the juxtagastric lying segments of the alimentary tract, the mucosa of the esophagus appears to be the most sensitive to injury by acid-peptic juice. In fact, it appears certain that esophageal peptic ulcer occurs far more commonly than has been generally believed. In fact, it may safely be said that every "idiopathic" stricture of the esophagus is acid-peptic ulcer of the esophagus. Similarly, it would appear too that "spontaneous perforation" of the esophagus is acid-peptic perforation of the esophagus.

Patients who get along well without any complication on medical management are not candidates for surgery. The patient to whom the monotony of the ulcer diet does not appeal, the patient who is never long wholly free from pain, the patient with recurrent gastric hemorrhage, as well as the patient with periodic episodes of obstruction—all these patients should be advised to have operation for the relief of peptic ulcer.

The key to reduction of the prohibitively large mortality from peptic ulcer which exists today in patients between the ages of forty and seventy, is more ready recourse to operation in patients who have persistent difficulty. And in patients who have suffered hemorrhage, such occurrences must come to be recognized as synonymous with failure of adequate control by conservative means. Only when hemorrhage comes to be viewed as an indication for operation—only then will the reproach of the present large mortality from peptic ulcer in the mature years of life become replaced by a record of objective accomplishment. The grave hazard of hemorrhage must come to be viewed with serious concern by every physician who affects an interest in peptic ulcer. Moreover, patients with ulcer as well as the public should come to know that hemorrhage is the most important single cause of death from peptic ulcer.

GREATER SELECTIVITY IS URGED IN USING ANTIBIOTIC THERAPY

A plea for greater selectivity in antibiotic therapy was made by Nelson of Temple University at a meeting of the New Orleans Graduate Medical Assembly held March 2-5, 1953†

In self-limiting diseases, severe infections not affected by available antibiotic agents, and noninfectious diseases simulating infectious ones, the speaker said, antibiotic therapy is unnecessary. Among the adverse effects of unnecessary treatment, Nelson held, are: possible carelessness in diagnosis, risk of untoward reactions of these agents, development of bacterial resistance, and the establishment of a new resistant bacterial flora.

The most widely active pathogens in the new-born seem to be Gram-negative bacilli and Staphylococcus aureus, the speaker stated, and these should be combatted with broad antibiotic coverage.

Patients with suspected osteomyelitis may be given aureomycin or terramycin alone. Penicillin alone was not advised. "Furthermore, treatment should be continued for at least two and one-half to three weeks in these cases."

"There is now an increased need for diagnostic acumen," Nelson said. "We are in an extremely dangerous position diagnostically—since the old familiar patterns do not appear when there has been early treatment."

MALE STERILITY

HAROLD J. WALDER, M.D.
Duluth, Minnesota

THE PROBLEM of management of the infertile and subfertile male is a challenge to many physicians. The urologist is especially interested in the correction of anomalies, such as hypospadias and cryptorchidism. However, public demand has prompted many urologists to become interested in sterility studies. Primarily, to collaborate with the gynecologists and obstetricians, these studies have been made.

Since January, 1948, 329 semen specimens have been examined from 271 patients. These examinations included previous examination of the wife by an obstetrician in most cases.

In the case of the male patients, a routine physical examination was done, including a sterility history and examination. An outline of the history and special examination followed in each case is given in Figure 1.

STERILITY HISTORY (MALE)

Fig. 1.

From the Department of Urology, Duluth Clinic, Duluth, Minnesota.

Read before the Centennial Meeting of the Minnesota State Medical Association, May 19, 1953.

The ages of the patients in this study ranged from eighteen years to forty-nine years. The average age was twenty-seven years. Eleven specimens were by withdrawal, the rest by masturbation.

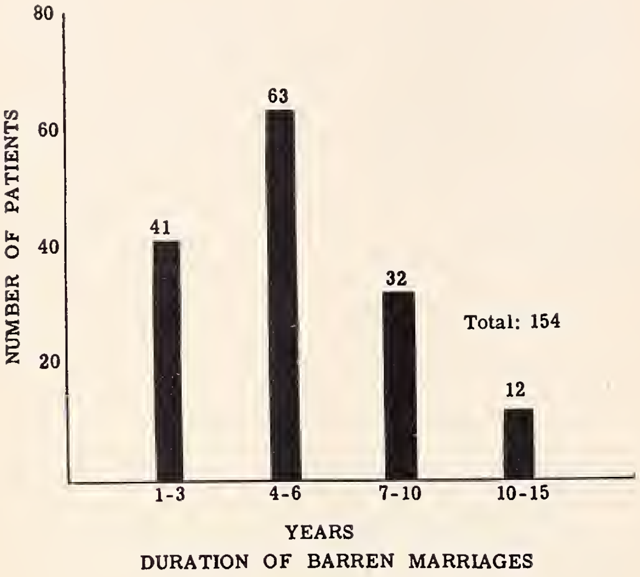

Fig. 2.

In each case the total specimen was measured, and all counts were made by the same individual. On several occasions the specimen was separated into two containers and sent to the laboratory. The proximity of the two counts was always surprisingly close. It is accepted that sperm counts can be remarkably consistent if one does enough of them to perfect the technique and minimize errors due to viscosity.

Morphology and motility of sperm were studied in each case, realizing that recognition of abnormal forms depends on personal and technical factors. To minimize this, the same individual carried out all of these examinations. Consistency of pattern for an individual on repeated specimens was interesting. In one case, a large irregular glob of mucus surrounding what appeared to be the normal head of each sperm was noted on repeated specimens. In another case it was noted, on repeated specimens, that each sperm had a neck piece much larger in diameter than the head.

The duration of barren marriages is shown in Figure 2. It is noted that most people seek consultation after four to six years of marriage.

The patients were then grouped according to the number of million sperm per cubic centimeter (Fig. 3.) Of the 271 cases, 34 per cent were sterile or considered subfertile. Twenty-five showed azoospermia. In this group, only four patients were noted with physical defects due to previous injury or mumps. In the group with 1 to 5 million sperm cells, six patients had physical defects. It can be noted that only one small hydrocele was noted among all of those cases with counts above 100 million per cubic centimeter.

A total of eighty-nine of the patients had received previous treatment, either by injection or oral medication. These were divided into groups according to their sperm counts and are shown at the top of chart (Fig. 3—Rx.) It was noteworthy that many were treated before a sperm specimen was examined. The number of patients previously treated are shown above the line, and the number having had a sperm specimen examined are shown below the line. Thus, of those twenty-five patients with azoospermia, eleven had been treated, and only two of the eleven patients had had a sperm specimen examination. Here, one can note the futility of any attempted treatment without a sperm specimen having been examined.

One other important consideration is the fact that often the wives of these patients may have had one or more examinations, at considerable expense, since the man is often reluctant to be examined early. This expense to the patient may be obviated by urging early examination of the husband in any barren marriage case study. On the basis of this study, this procedure is urgently stressed.

Eighteen patients with bilateral testicular biopsy were examined. Only one patient with oligospermia was examined—this on the basis of the patient's insistence on the procedure before adoption proceedings were initiated. Because of our inability to recognize specific deficiencies (endocrine, dietary, et cetera), biopsy has not been encouraged in cases of oligospermia. In the seventeen patients with azoospermia, all showed absence of spermatogenic cells. No individual with normal spermatogenesis and apparent obstruction of the tubular system was encountered. Transient oligospermia was encountered in several cases (Fig. 4.) *Case 1* showed some improvement on thyroid therapy when the basal metabolic rate was increased from -19 to +5. In this case there has been no conception after three years of observation and therapy. *Case 2* shows a wide variation with no treatment, as does *Case 3*. These tend to show the importance of repeated sperm examinations.

Fig. 4.

It is not the purpose of this discussion to consider various forms of therapy, but to relate the findings in a routine series of cases. In a few instances treatment of the man or woman has led to conception. The greatest success has been in selecting those cases in which conception is highly improbable. A detailed discussion of the findings with the family, and often helping them with adoption proceedings, has been most gratifying in eighteen instances. These have been our most satisfied and grateful patients. Experience has shown that adoption agencies seem to be

(Continued on Page 952)

EVALUATION OF FEMALE STERILITY

LOUIS L. FREIDMAN, M.D.

Saint Paul, Minnesota

THE PROBLEM of the childless couple is as old as the Bible. It has been estimated that 10-17 per cent of all marriages in the United States are barren. With few exceptions all young couples want children and it is of great importance to them to know whether they can, cannot, or are unlikely to achieve pregnancy. Most women who consult the doctor for the first time regarding their childlessness expect only a superficial inspection is necessary to solve the situation. The day is past when in the absence of gross pelvic pathology, the female seeking aid is given a pat on the back and told to go home and try for another year. The present-day concept of the infertile couple is a complex one and its solution extends far beyond mere conversation and encouragement but involves a thorough time consuming study of both husband and wife. It is of very little importance which one, the man or woman, is investigated first. Usually they are worked up simultaneously. The management of the sterile marriage may be divided into three phases: orientation, investigation and treatment.

When to Investigate

The old idea of waiting three years before considering a mating sterile is outmoded, for in large series of cases it has been shown that 80 per cent of couples will conceive in six months and 90 per cent within one year. We feel that one year of trial is a long enough time before the investigation is begun. The use of contraceptives has become an integral part of our society and may easily mask sterility. It would therefore seem wise to advise all young couples given contraceptive advice not to wait too long, certainly not more than a year, before proving their fertility.

Orientation

Before starting the investigation it has been our custom to orient each couple, spending thirty minutes or more covering the scope and complexities of the problem. In easily understood language, the basic physiology and the reasons for each procedure is explained. This orientation will inevitably be followed by better co-operation and more satisfied patients. It will lay the groundwork for the necessary patience in the often difficult study that lies ahead. The couple is told that the investigation will take eight to twelve weeks after which a second orientation is held. At this time all the disclosed factors, both male and female, are evaluated as a single biological unit, and an attempt to estimate the fertility potential is made. In the absence of absolute sterility they are told that approximately one year will be spent in treatment. They are advised to accept the whole plan "hook, line and sinker" or to delay the study.

Human beings are at best relatively fertile and there is no definite scale by which fertility can be measured accurately. The index of fertility is the sum total of all the factors both male and female. It is often forgotten that we are not dealing with normally fertile individuals. Highly fertile couples can produce babies under most any circumstances. However, an altogether different situation confronts the infertile couple. It can be said to these patients, "If you could have, you would have achieved pregnancy; so something must be wrong." Therefore, any and all factors no matter how small must be corrected. An adequate investigation will reveal etiological factors in 90 per cent of couples and these factors are usually multiple.

Statistical evaluation of etiological factors in sterility are of questionable value because so much depends on the particular investigator's interest, the material available to him, and the health of the general population in the area where he resides. Rabeau in the state of Israel found tuberculous endometritis in 10 per cent of 209 sterile couples. We have not found one in more than 300 endometrial biopsies. Overstreet in California finds the cervix at fault in 70 per cent of his cases. This is nearly three times the incidence in our cases. If you evaluate

Read before the Centennial Meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 19, 1953.

clinic patients you will find a larger proportion of infections with more occluded tubes than in private patients. All factors disclosed in the diagnostic survey are important and it is unwise to place greater significance on one because it is more frequent. Our studies show that the man is at fault in about one-third, the woman one-third and both are at fault in one-third of cases.

The investigation of the sterile female is usually divided into five factors:

1. *Constitutional factors* as anemias and chronic infections.

2. *Pelvic Conditions* which include congenital anomalies, infections, and tumors.

3. *The Cervix and Vaginal Factor* which is hostility or inadequacy of the cervical secretions and failure to deposit the semen properly.

4. *The Tubal Factor,* which is partial or complete occlusion and faulty motility of the fallopian tubes.

5. *Endocrine Factors,* which include hypothyroidism and disturbances in menstrual rhythm such as amenorrhea; dysfunctional bleeding; anovulatory bleeding and inadequate corpus luteum effect. Relatively few women of infertile couples have primary endocrine defects and even when these factors are at fault, therapeutic benefit is difficult to obtain. Aside from the use of thyroid we use very little hormonal therapy.

Minimal Diagnostic Survey of Wife

1. History and complete physical examination
2. General laboratory examination
    a. Blood Wassermann
    b. Complete blood count
    c. Sedimentation rate if there is a high white blood count
    d. Urinalysis
    e. Rh factor
3. Basal metabolism
4. Ovulation
    a. Basal body temperature
    b. Endometrial biopsy
5. Rubin test and if necessary uterosalpingography
6. Post coital tests
7. Miscellaneous tests if indicated
    a. Cervical culture and smear for infections
    b. Vaginal hanging drop for trichomonas vaginitis

History

The history should be complete, with particular attention to the onset, character and periodicity of the menstrual flow. The regular occurrence of menstrual cramps suggests ovulation. Special emphasis is given to a previous history of pelvic infection, abortion or abdominal operations. The types of medications and previous treatment should be recorded. Any excess in diet, alcohol, tobacco, sleep or coital habits may be important. Present and past occupations, previous marriage and period of present marriage, length and type of contraceptives used are also noted. To save time we use a prepared questionnaire which is gone over with a red pencil underlining the important points.

Physical Examination

The examination must be complete with special attention paid to general body architecture as regards to distribution of hair, fat, development of the breasts, external genitalia, and must include a thorough pelvic examination. Too much has been written about the hypoplastic uterus and far too many women are being told that their "womb is underdeveloped." In the presence of regular menstruation a small uterus is rarely the cause of sterility. There is variation from patient to patient and also a difference in size premenstrually and postmenstrually in the same female. Over the years we have encountered many obstetrical patients who volunteer that they were told that they would have trouble achieving pregnancy because their uteri were too small.

Value of Laboratory Tests

The role played by focus of infection in sterility has always been vague and different observers have associated varying degrees of importance with it. Disregarding these beliefs, no one will deny the absolute necessity of maintaining the best possible general health in a sterile couple as a unit. Even when one factor can be fairly well ascertained as the primary etiologic element, the so-called combined fertility index must be sustained at a peak. This assumes even greater significance in those enigmatic cases, in which no obvious factor in either partner can be discovered to explain the lack of fecundity. It therefore is of vital importance to determine the absence of anemia, chronic infection as reflected in the blood and the urinary systems.

Basal Metabolism

The relationship of thyroid activity to sex and its functions has long been recognized, but the nature of this relationship has been the subject of endless speculations and conflicting theories. The exact mechanism is far from clear. Litzenberg, in 1926, was the first of many to point out that hypometabolism is found with unusual frequency in women who cannot conceive and that the administration of thyroid to such women may enable them to become pregnant. Hypothyroidism on a clinical or subclinical basis has been described by many authors as a predominant factor in 10-25 per cent of females of barren couples.

The basal metabolism test is not an accurate method of determining thyroid activity, but it has enough statistical merit so that we recommend it for both the man and woman of every barren couple. Thyroid is given to all our sterility patients in whom the basal metabolic rate is plus 5 or below, for perhaps the best diagnostic test for subclinical hypothyroidism is the reaction of the patient to increasing doses of thyroid. The patient is started on small dosage of dessicated thyroid which gradually is increased to tolerance, which may take four to eight weeks. It has been our experience that thyroid therapy must be individualized because of the great variation in response of individuals, regardless of their initial basal metabolic rate. Tolerance is measured by a record of the pulse rate at regular intervals, and from the clinical signs of increased appetite, loss of fatigue and such. If palpitation, insomnia, tremor, or other symptoms of hyperthyroidism develop, the dosage is cut to the level below. Metabolism tests are repeated at infrequent intervals until the therapeutic level is reached. We do not share the concern of many internists over the wide use of thyroid in infertility patients with normal basal rates. If patients are oriented as to the signs and symptoms of overdosage and are checked at regular intervals, it is very unlikely that there will be any danger from this type of treatment.

Basal Body Temperatures

The simplest and perhaps the most popular method of determining ovulation is the basal body temperature record. Investigations on castrates have shown that progesterone causes a rise in basal temperature of a half a degree or more, and in these studies, this rise has been demonstrated to take place within twenty-four hours of the dosage used. In a normal ovulating woman the temperature graph is biphasic, and usually indicates ovulation 14 plus or minus 2 days before the onset of the next menstruation. The temperature should rise at least one half degree and remain elevated for ten days. Rectal and vaginal methods are not necessary; oral temperatures are satisfactory and are taken daily within one hour of the same time on awakening before getting out of bed. The thermometer is kept in the mouth five minutes. It must be remembered that this five-minute period is only one of the 1440 minutes of a whole day and it is futile to contend that ovulation takes place just before or just after the rise of the curve. Ovulation must be accepted as an unpredictable event and as yet there is no available test for precise timing. In timing intercourse to ovulation, because spermatozoa have been shown to survive forty-eight hours or more in the upper generative tract, it is best to be too early rather than too late with regard to the rise of the temperature curve. In some cases, the curves are far from satisfactory and do not mirror the corpus luteum effect as indicated by endometrial biopsies.

In spite of the shortcomings and occasional inaccuracies of the graphs, it does tell with few exceptions: (1) whether the patient ovulates; (2) roughly when the ovulation takes place; (3) and with less accuracy whether there is anything wrong with progestational activity of the cycle. Suitable symbols to indicate intercourse, intermenstrual bleeding, increased clear discharge, et cetera, recorded on the graph may give valuable information. When the temperature remains elevated beyond eighteen days, pregnancy is likely. This is called the "poor man's pregnancy test."

Endometrial Biopsy

The biopsy is best performed two to four days before the expected menstruation and the date of succeeding menstruation should be recorded. This, however, runs the remote risk of interrupting a pregnancy. If coitus is avoided during the cycle, this risk can be avoided. Proper histological interpretation of the tissue will reveal not only whether ovulation has occurred in that cycle (secretory endometrium), but may also determine whether the progestational effect has been adequately developed for the time taken in the cycle.

For religious or other reasons, a number of gynecologists prefer to do the biopsy within twelve hours after the onset of bleeding. The tissue taken at this time will usually reveal that ovulation has taken place. However, the quality and quantity of endometrial response to progesterone effect is very difficult to establish after the onset of bleeding.

Since 5 to 10 per cent of normal menstruating women have occasional anovulatory cycles it is wise to examine the temperature graph before performing the biopsy.

Post-Coital Test

The endocervical glands secrete mucus which is relatively impenetrable to sperm throughout the cycle except in the mid-month period. Then, under the influence of a high estrogen peak, the mucus secreted becomes profuse, crystal clear, watery, and is easily penetrated by spermatozoa. Instructions are given that intercourse should take place at the time in the month that ovulation might be expected, after three to five days of abstinence. The wife presents herself in the office within three to sixteen hours without having douched. The cervix is wiped with a dry sponge and a drop of mucus from within the endocervical canal is placed on a slide and examined immediately under a microscope. The finding of ten or more motile spermatozoa per high power field in a drop of this secretion may be considered a normal test, which can be taken as presumptive evidence that there is no mechanical or chemical barrier to spermatozoa. The finding of less than ten motile sperm per high power field suggests that either the husband is at fault or more likely that the wrong time in the cycle was selected for the test, or that some condition exists in the cervical mucus which prohibits the penetration and survival of the usual number of sperm. The post-coital test is worthless, unless done at ovulation. If the cervical mucus is of thick consistency, viscous, and cloudy, poor sperm survival will result. In these cases we find it helpful to perform cyclic post-coital tests, checking the cervical mucus every other day during the week preceding and following the expected ovulation. Not infrequently motile sperm will be found in cervical mucus forty-eight to seventy-two hours after the last copulation. This does not necessarily mean that these sperm are capable of fertilization of the ovum. If there is no spermatozoa in either the cervical secretions or the vaginal pool, the husband is azoospermic or ejaculation has taken place outside the vagina. The post-coital test is never a substitute for semen analysis.

Rubin Test

This test is best carried out three to seven days after the end of the period. This will avoid the chance of interrupting an early conceptus, and also during the luteal phase there is a greater risk of gas or oil infiltrating large blood sinusoids and causing emboli. Carbon dioxide gas is introduced through a closed system under a controlled pressure at a constant slow rate of less than 30 cc. per minute. Air should never be used. Usually no greater pressure than 200 mm. of mercury is used. By being very gentle and waiting a full minute after the apparatus is in place to allow for tubal spasm, a much more satisfactory test, as indicated by kymograph tracings, can be obtained. We have been able to omit using a tenaculum on the cervix in more than 75 per cent of our Rubin tests. A kymographic attachment can be obtained for any standard Rubin apparatus. It records pressure changes, the frequency and amplitude of tubal peristalsis, and in addition provides a permanent record. Any adnexal pathology that binds tubal segments down or interrupts the rhythmic flow of contractions, may interfere with normal tubal function. If gas has gone through one or both tubes, when the patient sits up, it will bubble up under the diaphragm and this irritation will cause shoulder pain. The Rubin test does not tell us which tube or whether both are patent, but if carefully performed it can tell us: (1) whether tubes are occluded; (2) whether there is stenosis; and (3) whether there is normal peristalsis and patency of at least one tube. Failure to produce patency may be due to spasm and an antispasmodic, as nitroglycerin, placed under the tongue may reduce the spasm.

When two separate Rubin tests reveal non-patency, one can perform uterosalpingography. Neither of these tests should be performed in the presence of infection of the vagina, cervix, uterus, tubes or pelvis. We prefer to do the Rubin test first and use the opaque media with x-ray for supplementary information. The technique with uterosalpingography is more complicated and hazardous. There is reasonable proof that in experienced hands more pregnancies result from repeated insufflations with increased pressures than from intraabdominal tubal plastic operations.

Treatment

Only a brief discussion of treatment which depends on the disclosed abnormalities will be undertaken. Usually several factors are found with impaired fertility in a woman and correction or improvement of each is important. Pregnancy may follow simple therapeutic measures as proper timing of intercourse with ovulation, or gentle cauterization of an eroded cervix. Endocervicitis itself must be rigorously attacked with antibiotics. A number of conceptions will follow routine tubal insufflations and instrumentation of the cervical canal as with endometrial biopsy. The cervical mucus may never show the thin watery non-viscous characteristics that should be present at ovulation, possibly due to previous infection or extensive cautery treatment of such infection. The mucus may also be deficient in amount because of lack of normal response of the mucous epithelium to estrogen. It is worth while to give these patients small doses such as 0.1 to 0.2 mg. of stilbesterol daily during the first half of their cycle. More than this amount might interfere with the pituitary ovarium relationship and inhibit ovulation. The use of pre-coital douches containing Ringer's solution fortified with glucose has been advocated by some as providing a favorable medium in which the semen will be deposited. We have not been impressed with the advantages of this procedure and have discarded its use.

If the evidence from basal temperatures and endometrial biopsies indicates that ovulation is not occurring, there is as yet no consistently effective treatment available. In certain cases of secondary amenorrhea associated with sterility, low voltage x-ray to the ovaries and pituitary has produced ovulation and also pregnancy in our hands. The various hormonal substances used in the treatment of ovarian failure are ineffectual. Gonadotrophic substances offer promise but as yet no commercial product will stimulate follicle growth or induce ovulation.

If tubal obstruction on both sides is apparent on x-ray examination and this is the only abnormal finding in both husband and wife, a course of diathermy and repeated tubal insufflations may effect patency. If this fails, then culdoscopy and plastic tubal surgery may be considered. The pregnancies from such procedures are rarely reported to be more than 10 per cent. These operations must be entered upon with full understanding by the patient of the possible hazards of abdominal surgery and the small chance of success. There is some promise that the use of polyethylene tubing may improve our present poor salvage rate in keeping diseased fallopian tubes open.

Much attention has been recently focused on the psychosomatic aspects of sterility; however, the objective measure of this factor is very difficult. There is no doubt that emotional conflicts can play a role in sterility. Typical examples are pregnancies that follow adoption or a good vacation away from home. It would seem that the most important psychotherapeutic role the attending physician can play is to induce a change of attitude whenever emotional tension is ascertained.

Discussion

The question is often raised "should the general practitioner be discouraged from handling the sterile couple." Many gynecologists feel the investigation is too detailed for ordinary workup. The great majority of infertile couples, at least in our state, consult the general doctor first and there is no reason why he cannot manage such couples if he has the interest and is willing to spend the time necessary for an adequate investigation. On the other hand, no matter whether he be surgeon, general practitioner, urologist, or gynecologist, if he has only a casual interest, it would be far better for him to refer the couple elsewhere for proper orientation, investigation and treatment. All too often the couple is treated with indifference and discouragement which leads to consulting doctor after doctor. Needless expense, effort and time will be spared if the first doctor orients them properly.

What can thorough study of the sterile couple do? It can provide a reliable opinion as to the prognosis of future conception with three possible answers:

1. The couple can be told there is nothing wrong and they should be able to achieve pregnancy.

2. When there is absolute sterility in the woman for which nothing can be done, treat-

ment is ended and the way is cleared for adoption. When there is irreparable sterility in the husband and the wife is relatively fertile, in suitable cases, donor insemination can be recommended.

3. The third answer may be that definite causative factors have been disclosed which may respond to treatment.

Twenty years ago only 15 to 18 per cent of sterile couples achieved pregnancy. Today with a better understanding of the physiology of reproduction and with the development of new diagnostic techniques a successful outcome is achieved in nearly twice as many barren couples.

Summary

An attempt has been made to present a systematic plan of management which is the culmination of a number of years of special interest in the childless couple. The problem is a common one, the solution of which requires a detailed study of both husband and wife. Such a study is rewarding in better prognostic evaluation and will produce a greater number of pregnancies. The over-all management is divided into orientation, investigation and treatment.

With few exceptions all young couples want children. It is important for them to know whether they can, cannot, or are unlikely to achieve pregnancy. The sooner the better. One year of trial before beginning the diagnostic survey is adequate. Both partners should be evaluated as a single biological unit and treatment directed at correcting all possible factors, large and small, in an effort to improve the combined fertility index of the marriage.

The infertile couple should not be told that the situation is hopeless, until everything has been exhausted. Indeed, an attitude of controlled optimism should be maintained. If after one year or more of treatment no pregnancy occurs, psychiatric help or adoption should be recommended.

MASSIVE UPPER GASTROINTESTINAL HEMORRHAGE

(Continued from Page 923)

versed. It is simpler to complete the operation by antecolic anastomosis.

Should the presence of duodenal ulcer and extensive inflammatory induration make invagination of the duodenal stump questionable, the Welch[4] maneuver is recommended. This is much safer than leaving or struggling with a questionable duodenal stump. Fatal bile peritonitis may readily result in a patient who has recently had a massive hemorrhage.

Drainage of the duodenal stump region, the line of anastomosis and meticulous wound closure and care are suggested. Evisceration may readily occur in a debilitated patient. In general, the improvement in the operative technique of gastric resection remains an avenue by which the mortality from acute massive bleeding from the upper gastrointestinal tract can be reduced.

In summary, acute massive upper gastrointestinal hemorrhage has been defined and the three general methods for its management indicated. The significant beliefs through which the optimum management may be selected have been recorded. These beliefs allow for the selection of patients for surgery. The surgery contemplated is 80 per cent gastrectomy with antecolic gastrojejunostomy. Such gastric surgery done under optimum conditions and with improved technique, salvages the patient and eliminates with satisfaction in a high percentage of patients, the threatening disease process. The restored patient is comfortable and productive, other factors permitting. The actual risk of the so-called conservative methods of treatment should not be underestimated.

THE MINNESOTA MEDICAL PROFESSION AND TUBERCULOSIS

J. ARTHUR MYERS, M.D.
Minneapolis, Minnesota

TUBERCULOSIS has been one of the most serious problems of the Minnesota medical profession throughout the past one hundred years and it remains so today. When this Association was organized in 1853 tuberculosis was already rampant among the American Indians to whom it had probably been transmitted from 1659 on by explorers, fur traders, soldiers, et cetera.

Scarcely was Minnesota declared a territory when its citizens began to offer inducements to persons residing in eastern states and in Europe to join them. One of the outstanding enticements was the "salubrious climate" thought to have preventive and curative effects on consumption. Tremendous numbers of pamphlets recommending the climate of Minnesota for consumptives were printed in various languages and distributed widely in the eastern states, particularly New England, in Germany, Denmark, Norway, Sweden, Ireland and England. Soon consumptives and their families were arriving by way of the Mississippi river by boatloads, and later by trainloads. Among the large number of immigrants seeking cure from consumption in Minnesota were persons destined to become great, such as Henry David Thoreau and Edward Livingston Trudeau.

The blizzard of January 7, 1873, caused the Committee on Epidemics of the State Medical Association to announce briefly: "1. Minnesota air lost its vaunted prophylactic properties last winter and spring due to a very severe winter. 2. North and east winds from the Great Lakes were bad for consumptives."

Migration of consumptives to Minnesota began to decrease and by 1880, it was nearly over. Health seekers turned to the Southwest and Minnesota was almost forgotten in the rush to Arizona, Colorado, California and New Mexico. However, there were still thousands of consumptives and their families who had become permanent Minnesota residents and it seems probable that no one had escaped tubercle bacilli.

State Board of Health

With the influx of consumptives in addition to other diseases, Minnesota physicians were overwhelmed. Nevertheless they were alert and promptly developed everything of known value to aid in solving their problems. They felt the need of an official organization to control contagious diseases and therefore presented a bill to establish a State Board of Health in 1872—the third in the nation.

Since 1872 Minnesota has had a most efficient State Board of Health with particular interest in tuberculosis. It established a bacteriological laboratory in 1890. In 1892 it directed the first tuberculin testing in herds supplying milk to cities. In 1893 it offered tuberculin free of charge to local boards of health to be used by physicians and veterinarians in testing people and animals. In 1895 it began to make examinations of sputum for tubercle bacilli for physicians. In 1906 it required reporting of all cases of tuberculosis by attending physicians. In 1907 it required burial permits obtainable only on filing death certificates bearing the cause of death. Keeping a list of all reported cases of tuberculosis was begun in 1910. In 1918 a division of tuberculosis was established but was soon abandoned. However, in 1937, a new division of tuberculosis was created which is still in operation. The same year the State Board began to offer tuberculin ready for administration, to all physicians of the state. In 1945 it began to make photofluorographic surveys in various parts of the state.

Since 1872, Minnesota has had only four executive secretaries of its State Board of Health. Dr. C. M. Hewitt served from the beginning until 1897; Dr. H. M. Bracken, from 1897 until 1919; Dr. C. E. Smith from October, 1919, until October, 1920, and Dr. Albert A. Chesley for the past third of a century. Each of these four executive officers manifested great interest and became experts in tuberculosis control. Dr.

Read before the Centennial Meeting of the Minnesota State Medical Association as part of a Symposium arranged by the Minnesota Chapter, American College of Chest Physicians, Saint Paul, Minnesota, May 20, 1953.

Chesley's work in tuberculosis control is well known to all of us and we are agreed that no health officer anywhere or at any time has contributed more to the tuberculosis eradication program.

Dissemination of Information

Members of the medical profession early recognized that a well-informed public is essential for control and ultimate eradication of tuberculosis, therefore they recognized the need of organizations composed largely of nonmedical citizens to disseminate information about tuberculosis everywhere. The first organization of this kind was under the name, Anti-Tuberculosis Association of Willmar, in 1890. In 1903 the Associated Charities of Minneapolis established a Department of Tuberculosis. In 1906 a state organization was effected under the name, Minnesota Association for the Prevention and Relief of Tuberculosis. This is now known as the Minnesota Tuberculosis and Health Association. Each of the eighty-seven counties of Minnesota now has such an organization, most of which are components of the State Tuberculosis and Health Association. In the entire history of the state there has been no public health education program that has remotely approached in effectiveness that of these tuberculosis associations. These county organizations work in close co-operation with their local medical societies, and the State Tuberculosis and Health Association works in harmony with the Committee on Tuberculosis of the State Medical Association.

The funds for the operation of these various county associations are derived largely from the sale of tuberculosis Christmas Seals. This method of raising funds was introduced in Minnesota in 1908. It has increased in popularity so the total gross income to the eighty-seven counties was $712,476.86 in 1952. The percentage retained by each county depended upon the amount of effort required by local workers to raise the fund. In the three large counties where paid full-time staffs were employed, a much larger percentage was retained than in areas where the State Association did the bulk of the fund-raising work. In the state as a whole, 64 per cent was retained in the counties, 30 per cent was allocated to the operation of the state work, and 6 per cent was sent to the National Tuberculosis Association.

To one who has not analyzed the cost of tuberculosis in Minnesota, $712,476.86 seems like a large sum. However, it is a mere pittance when compared to over $8,000,000 expended in the operation of our sanatoriums alone in 1952. Thus the gross receipts from the sale of Christmas Seals in 1952 would be adequate to operate our sanatoriums slightly more than one month. When one includes the other costs of tuberculosis to the state, the amount of money raised and expended by the tuberculosis associations becomes a relatively small part of the total.

The Christmas Seal Sale fund has always been intended to promote educational work and was in no small way responsible for the building of sanatoriums, establishment of county public health nursing services and all of the other activities that have resulted in Minnesota's accomplishments. Its educational value is also indicated by the fact that per capita Minnesotans buy more Christmas Seals than any state except Delaware. As executive secretary for almost thirty years, Dr. E. A. Meyerding has developed this organization so it is recognized as the most outstanding Tuberculosis and Health Association in America.

Building and Operation of Sanatoriums

Through the leadership of H. Longstreet Taylor, Saint Paul, a campaign for construction and operation of sanatoriums was initiated in the early 1890's. This resulted in a few private, one state, and fourteen county sanatoriums. In addition, there has been a Veterans Administration Tuberculosis Division since 1927. In the tax-supported sanatoriums there have been approximately 2,500 beds available for tuberculous persons during the past quarter century. For a long time these beds were occupied for the most part by persons with contagious tuberculosis. Their isolation protected members of their families and communities against contagion. Thus the sanatorium has played a tremendous role in the control of tuberculosis in Minnesota. Physicians throughout the state deserve much credit for having so completely supported the sanatoriums.

Tuberculosis in Animals

Large numbers of tubercle bacilli were carried into Minnesota in the bodies of animals, particularly cattle, and therefore serious economic and public health problems were created. In 1885 the control of tuberculosis among cattle became a responsibility of the State Board of Health. This state was fortunate in having as one of its citizens, Dr. Charles E. Cotton, a young veterinarian, who had participated in the first tuberculin testing of cattle in the United States in the vicinity of Philadelphia in 1892. Early in the 1890's a tuberculin testing program was in operation in the vicinity of the Twin Cities and Duluth. In 1903 a State Livestock Sanitary Board was created and the responsibility for control of diseases among animals, including tuberculosis, was transferred to this Board. A memorable event occurred in 1903, when the herd of C. R. Brackett near Minneapolis, was accredited as modified tuberculosis free. This was the first herd to be so accredited in the United States.

In 1920 Dr. A. J. Chesley stated that there were 100,000 tuberculous cattle in Minnesota.

Although a large volume of tuberculin testing of cattle was done in the first two decades of the twentieth century, it was not until 1923 that the State Livestock Sanitary Board in co-operation with the United States Bureau of Animal Industry adopted a statewide tuberculosis eradication program with the county as the unit. Those counties in which tuberculin testing of all cattle revealed 0.5 of 1 per cent or less reactors and those which reduced the incidence of reactors to this level were designated modified accredited tuberculosis-free areas. The first counties were so accredited in 1925. All counties of the state had been accredited by December 1, 1934, and thus the entire state was designated a modified accredited tuberculosis-free area. Although this important goal had been reached, veterinarians were cognizant of the fact that a large volume of work remained before the eradication goal could be attained. Therefore they have continued periodic tuberculin testing of cattle and slaughter of reactors.

In 1898 the Minnesota State Medical Association invited Dr. M. H. Reynolds, Chief of the Division of Veterinary Medicine, University of Minnesota, to read a paper on bovine tuberculosis. He called attention to the importance of the tuberculin test in locating all animals which had this disease. In 1902 Dr. Reynolds said: "I would like to see the medical men of Minnesota take a very active interest in bovine tuberculosis." As the years passed this desire was fulfilled, as a number of physicians supported the veterinarians' tuberculosis eradication program wholeheartedly. In fact, William H. Feldman has represented the veterinary profession as *ex officio* member of the Committee on Tuberculosis of the State Medical Association since 1940. This is an exceedingly important relationship, since the bovine type of tubercle bacillus is highly pathogenic and causes great destruction in human tissues. This form of disease is contagious from animals to people, who in turn may pass it back to animals.

Committees on Tuberculosis

Although the reports of the State Medical Association and the State Board of Health abounded with reference to tuberculosis and its control, apparently it was not until 1894, that the president of the State Medical Association appointed a committee on tuberculosis. The next year this committee made an elaborate report and recommendations, many of which are good to this moment.

No record has been found of the existence of a committee on tuberculosis during the first two decades of the twentieth century. Probably this was because the officials of the organization were under the impression that adequate tuberculosis work was being provided by the State Board of Health and newly formed organizations, including the State Tuberculosis Sanatorium Advisory Commission, the State Board of Control and the Association for the Study and Prevention of Tuberculosis, since all of these organizations were working in close co-operation with the medical profession.

In 1924 a public health committee was appointed by the State Medical Association, one of whose members was responsible for tuberculosis activities. This member served in a liaison capacity between the State Medical Association and the Minnesota Public Health Association. In 1934 the Public Health Committee organized subcommittees, of which one was tuberculosis. This subcommittee was made a regular scientific committee of the State Association in 1941 and has since held numerous meetings each year and presented an annual report to the House of Delegates. The presidents of the State Medical Association have appointed the membership of

the Committee in such a way that every organization in Minnesota having to do with tuberculosis as well as various groups in private practice were represented. This has made it possible for the Committee to study numerous tuberculosis problems and projects and to make recommendations to the Council only after the most careful consideration of all tuberculosis groups concerned.

On recommendation of the State Committee, a committee on tuberculosis was appointed in each of the thirty-four county and district medical societies in Minnesota. This was the first state to have tuberculosis committees in all of its societies. These committees consider various proposed projects for their respective counties and make recommendations to their societies. In this manner the local medical society keeps in close touch with and participates in the tuberculosis eradication movement.

Statewide Control Program

One of the first recommendations in 1940 was that the Medical Association develop a Minnesota statewide tuberculosis control program. It was recommended that physicians throughout the state employ standard fundamental procedures in diagnosis, treatment and prevention. The tuberculin test was recommended as the first step in diagnosis with x-ray inspection of the chest of all reactors, most detailed studies of those who presented shadow-casting lesions to determine etiology and treatment as indicated. It was also advised that all reactors without shadow-casting chest lesions be completely examined since 10 to 15 per cent of clinical lesions are extrathoracically located. It was recommended that every possible support be given the sanatoriums so that contagious cases might be isolated promptly and retained as long as their disease remained contagious.

It was felt that all surveys and other tuberculosis work should be in co-operation with local medical societies and that insofar as its members are willing, as much of the work as possible be done by them. The famous Meeker County survey initiated in 1941 was an excellent example. No physician or equipment was introduced from outside the county.

It was requested that every physician make a tuberculosis center of his office and search carefully for tuberculosis in each patient examined.

Accreditation of Counties

In 1940 the Committee on Tuberculosis developed qualifications whereby counties might be accredited with reference to tuberculosis control. This was in co-operation with the State Board of Health and the State Executive office. To qualify for accreditation a county must have an average five-year mortality rate of ten or less per 100,000 population. At least 90 per cent of all seniors in high schools must be tested with tuberculin with not more than 10 per cent reactors. Lincoln was the first county to qualify and received its certificate on December 11, 1941. On April 20, 1953, Lyon was the twenty-fifth county to be accredited.

The average mortality rate over the past five years ending in 1952, revealed that there were sixty-four counties in Minnesota with tuberculosis mortality rates of 10 or less per 100,000. This low rate gives each of these counties the first qualification for accreditation. For those not already accredited, it only remains to administer the tuberculin test to at least 90 per cent of the seniors in high school and to find that not more than 10 per cent react. These counties are listed alphabetically in Table I.

Over the years the Minnesota Tuberculosis and Health Association has done the lion's share in publicizing the program throughout the state and aiding medical societies in their work of qualifying for accreditation. If the physicians in the forty-two counties not yet accredited (Table I) but with mortality rates of 10 or less per 100,000 population will work closely and promptly with this Association in testing the seniors in high schools we could soon have sixty-four accredited counties.

In twenty-three counties there is a mortality rate of more than 10 per 100,000, as listed in Table II. Several of these counties should have rates of 10 or less per 100,000 within two years.

It now appears that within five years every county may have qualified for accreditation.

Certification of Schools

Minnesota physicians have supported the American School Health Association in its certification of schools program with reference to tuberculosis control work in progress. In fact, the first schools in the world to be so certified were in this state. The Minnesota Subcommittee on Tuberculosis (composed of three members of the State Medical Association) of the American School Health Association established qualifications by which schools could be certified. These qualifications include tuberculin testing of children and personnel as well as x-ray film inspection of the chests of all adults, including high school students and personnel who react. Those who are found to have shadow-casting lesions are immediately examined to determine etiology. This is rapidly spelling the doom of the tuberculous teacher, bus driver, janitor and other personnel members who in the past have so frequently spread tubercle bacilli to the children as well as fellow personnel. Our State Association can take great pride in the fact that already more than 1,500 schools have been granted certificates which are displayed on their walls. Many more schools are about ready to qualify and it now appears that within five years practically every school in the state will be certified with reference to tuberculosis work in progress.

Tuberculous Mentally Ill and Prisoners

Institutions for the mentally ill and the prisons were long infested with tuberculosis. Others contracted the disease there. Many persons entered these institutions with tuberculosis already established and contagious. The State Medical Association has offered every possible support to this problem with the result that nearly all mentally ill tuberculous persons are now housed in the H. A. Burns Memorial Unit at the Anoka State Hospital where they are receiving the most modern treatment, including chemotherapy and surgery. Excellent work is being done to control contagion.

Incorrigible and recalcitrant tuberculous persons still constitute a serious problem. They cause sanatorium management and the patient body a great deal of trouble. They leave institutions against advice and disseminate turbercle bacilli wherever they go. For many years the Committee on Tuberculosis of the State Association has strongly recommended that provision be made for incarceration of such individuals. Though sincere efforts have been made, the problem has not been adequately solved. There is now the possibility of satisfactory facilities being provided at the Anoka State Hospital in conjunction with the H. A. Burns Memorial tuberculosis unit.

General Hospitals and Tuberculosis

Until recently many tuberculous persons were admitted to our general hospitals, both private and public, for various well diagnosed conditions who also had unsuspected contagious tuberculosis. They disseminated tubercle bacilli to fellow patients and personnel, including students of nursing and medicine. Since 1940, the Committee on Tuberculosis of the State Medical Association has strongly recommended that each hospital in Minnesota require a careful examination for contagious tuberculosis of every admission, and that pre-employment examinations be required of personnel, and persons be examined periodically while in the employ of an institution. This had already been in effect with remarkable success in a few hospitals, including that of the University of Minnesota since 1936. St. Joseph's hospital, Saint Paul, was the first private institution to establish such routine examinations on a permanent basis. This was done in 1951. At this moment a sizable number of hospitals have adopted such a program and it now appears that within a year or so it will be routine in every hospital in Minnesota.

Since tuberculosis has become compensable, no hospital can afford to neglect routine examinations of entering patients and members of personnel. The State Association has long contemplated and probably soon will issue certificates of recognition of accomplishment of this activity which can be displayed by the institution.

Every institution that has adopted this routine procedure has found it profitable in bringing to light not only unsuspected cases of tuberculosis, but other previously unknown diseases such as malignancy. It now appears that Minnesota may be the first state to have this routine procedure adopted by all of its hospitals.

Since the tuberculin reaction is a more delicate criterion of the presence of tuberculosis than the x-ray film, every person entering a hospital should have the tuberculin test administered. It is important that every patient as well as his physician knows whether his body harbors tubercle bacilli as manifested by the tuberculin reaction. If so, he is a potential case of clinical tuberculosis despite the clarity of his chest by x-ray film at the moment. He should be warned of this potentiality and advised to be examined periodically in order that any lesion destined to evolve to gross proportions may be found while in the "silent stage."

It is also important that the tuberculin reacting status of all employes be known. Therefore the test should be administered as a part of the pre-employment examination and periodically thereafter for those who do not react. All reactors should have x-ray film inspection of the chest and complete examination each six months. This is the only satisfactory method of determining whether employes become initially infected with tubercle bacilli during their period of employment. Knowledge of the reaction to tuberculin determined on pre-employment or thereafter is of great value in determining liability in event of litigation. It is also important from the standpoint of the patient who may claim the hospital is liable for having transmitted infection.

Phenomenal Accomplishment

In no place or time in the history of the world has the result of efforts against tuberculosis been as phenomenal as in Minnesota. The rapidity with which this accomplishment has been achieved is almost unbelievable. Veterinarians and their allies have almost eradicated tuberculosis from the cattle herds. They have reduced the incidence of infected cattle to 0.02 per cent. Thus only one in 5,000 cattle reacts to the tuberculin test. The search for the infected bovine is almost like that for the proverbial needle in a haystack. As the disease was practically driven from cattle, there was a corresponding decrease in mortality, morbidity and tuberculous infection among people.

When the Gillette Hospital for Crippled Children was constructed and for some time thereafter, it is said that approximately one-half of all the crippling among children and young adults of this state was due to tuberculosis. Now it is estimated that only about 3 per cent of such crippling in these age periods is due to this disease. Tuberculosis of the cervical lymph nodes once so prevalent has now become relatively rare. There is good reason to believe that the practical elimination of the bovine type of tubercle bacillus from the environment of children and young adults has played an important role in the rapid and marked decrease of these forms of tuberculosis. In parts of the world where tuberculosis has not been well controlled among animals, 50 per cent or more of the cases of tuberculosis of the skin and cervical lymph nodes are due to the bovine type of bacillus. This is also true of 20 per cent of the cases of bone and joint disease as well as organs of the genitourinary system and 25 per cent of acute fatal forms, including meningitis and miliary disease. In Minnesota it has become rare for persons to become infected through association with or by consuming the products of cattle. There is much greater likelihood of cattle becoming infected from people. A considerable number of such cases have already been reported. Thus by almost eradicating tuberculosis from the cattle of this state veterinarians have nearly solved a large economic problem and tremendously reduced the incidence of tuberculosis in people.

Control of tuberculosis among people in Minnesota has far exceeded the most pleasant dreams and the fondest hopes of the pioneers of the '90's and the early 1900's. Tuberculosis mortality in Minnesota reached its height in this century in 1911 with 2,522 deaths, a rate of 119.7 per 100,000 persons. With the educational campaigns, completion of the sanatorium programs, active and extensive participation of physicians in their offices, the veterinarians' eradication campaign and other projects the mortality rate began to tumble. For the first time it reached less than 100 per 100,000 in 1919, less than 50 in 1930, less than 25 in 1946, and precipitously declined to 6.6 with only 205 deaths in 1952.

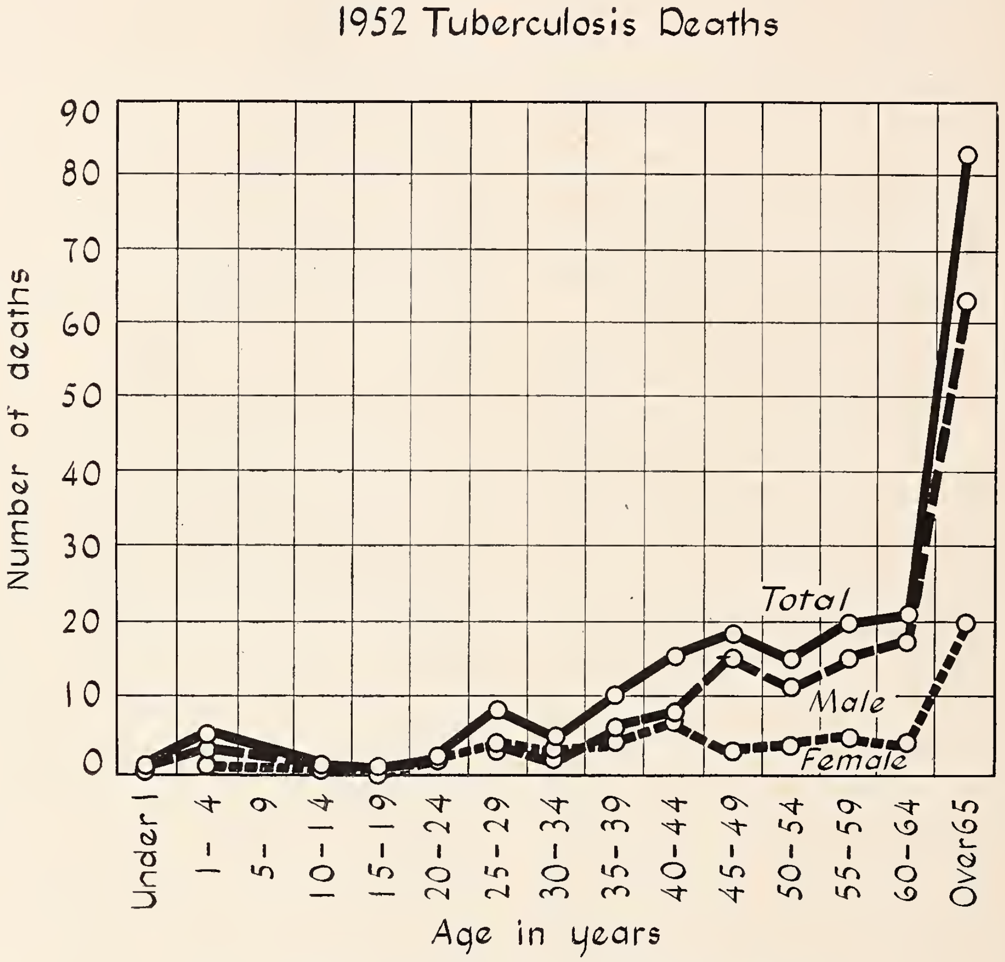

Fig. 1. Deaths from tuberculosis in Minnesota in 1952.

In this entire state of approximately 3,000,000 people, only one baby died from tuberculosis in 1952. This is in contrast to sixty-eight deaths among babies in 1916. From birth to fifteen years only six children died in this state in 1952 in contrast to 275 in 1916. (Fig. 1) In the teen-age period (ten to nineteen years) only two died in the whole state in 1952, whereas 268 in this age period died in 1916. In the age group twenty to forty-nine years, only fifty-nine persons died in 1952. Of the 205 deaths in Minnesota in 1952, 139 (67.8 per cent) were fifty years or older, and eighty-three of these were sixty-five or older.

The majority of deaths from tuberculosis in Minnesota are occurring among persons in the later decades of life. These are the persons born in the '70s, '80s and '90s, when tuberculosis was rife both among people and animals, and when few escaped invasions of tubercle bacilli. This generation has paid a terrible price. They filled the sanatoriums to capacity and provided a long waiting list for sanatorium beds. They died in large numbers. The survivors who are now fifty or more years old are still paying the price in illness and death. (Fig. 1) For the most part, they are falling ill and dying from the progeny of tubercle bacilli which entered their bodies prior to 1900 and which have since lurked there in residual, necrotic and caseous lesions. Those under fifty have benefited by the protection afforded them from tubercle bacilli. This protection has been continuously improved over the past fifty years so that it has approached the absolute for the children and young adults of this state. Hence death has become a rarity in this age period.

Among the 139 persons who died from tuberculosis in 1952 at the age of fifty or older, 106 (76.3 per cent) were men. (Fig. 1) A similar preponderance of deaths among men has been observed throughout this country. The cause is not known.

Over the five-year period ending in 1940, 15,510 cases of tuberculosis among residents of Minnesota were reported to the Health Department. This was a case rate of 105.7 per 100,000 population. During the five years ending in 1952, 12,431 cases were reported, a case rate of 83.4 per 100,000. Thus it appears that the number of cases has not decreased in proportion to the number of deaths. These figures are misleading since they are not entirely comparable for the two five-year periods. From 1936 to 1940 most persons reported as tuberculous had sought examinations in the offices of their physicians and in clinics because of symptoms. During the 1940's, intensive statewide case-finding programs were in operation and have been continued, with the result that between 1948 and 1952 a large number of cases of tuberculosis were reported whose lesions were found in the presymptom stage. Obviously if the same case-finding effort had been in vogue between 1936 and 1940, numerous presymptom cases would have been found, which would have brought the total far beyond 15,510. Likewise if between 1948 and 1952 only persons had been reported who had symptoms, the total number would have been far less than 12,431. Therefore there is good reason to believe that there has been a much more marked decrease in the case rate than the reported cases indicate.

In this discussion factors which have been introduced since 1940 must be considered. One pertains to displaced persons who have developed clinical tuberculosis in considerable number; another to war veterans of World War II and the Korean War. A third factor is the precipitous decline in mortality since 1947, at least partially due to suppressive effects of streptomycin, para-aminosalicylic acid and isonicotinic acid hydrazid. These drugs have caused mortality rates to decrease faster since 1947 than morbidity rates. The permanence of the effectiveness of these drugs has not yet been determined.

A Gigantic Problem Lies Ahead

Despite the phenomenal accomplishment in controlling tuberculosis, the most difficult part of the course to the eradication goal lies ahead. Tuberculosis is a contagious disease. Most of our work among people in the past has been devoted to gross lesions, relatively easily diagnosed but treated with limited success. The time has arrived when we must give more thought to the cause of tuberculosis and concentrate our efforts on the tubercle bacillus long before it has produced gross lesions detectable by x-ray shadows.

Veterinarians have long known that tuberculosis unmolested in cattle doubles itself every fifteen years. They have also long been aware of the fact that every animal that reacts characteristically to tuberculin regardless of apparent good health has tubercle bacilli-containing lesions and therefore is a potential disseminator of these organisms. Long ago they stopped seeking just the animals with evidence of clinical disease but sought diligently for all with tubercle bacilli in their bodies as manifested by the tuberculin test.

Although the incidence of tuberculin reactors among cattle in Minnesota is now only one in 5,000, veterinarians recognize that a tuberculosis problem still exists. Therefore they test the entire cattle population (about 3 million) with tuberculin every six years. They will not consider their job finished as long as they find a single reactor. Concerning this, A. G. Karlson, D.V.M., recently said: "An animal that reacts positively to the tuberculin test is properly considered as a dangerous individual . . . In spite of the great advances in control there is a constant potential hazard as long as only a few infected animals exist."

Mortality and morbidity rates are not the best criteria of the tuberculosis problem. The only dependable criterion is the incidence of individuals who harbor tubercle bacilli since each such person is a potential case of clinical contagious tuberculosis. The physicians of Lincoln and Lyons counties with the co-operation and support of the Minnesota Tuberculosis and Health Association and the State Board of Health have recently conducted countywide demonstration surveys to determine the incidence of persons who harbor tubercle bacilli as manifested by the tuberculin reaction. In each county it was found that approximately 30 per cent of those tested were tuberculin reactors. The percentage was exceedingly low among the children and young adults, but reached its height among the older persons who were not protected against tubercle bacilli of either the bovine or human type during their infancy and childhood. These individuals still carry residual tubercle bacilli-containing lesions. To keep these reactors examined with sufficient frequency so that those who develop clinical lesions will be found before they are ill or contagious constitutes a considerable task for the physicians of those counties. However, it is the only known method of eradicating the disease. This must be done in the remaining eighty-five counties in the state if we are to proceed as rapidly as possible toward the eradication goal. Tuberculosis will not be eradicated from Minnesota as long as a single tuberculin reactor remains.

In addition to keeping the present tuberculin reactors under close surveillance all nonreactors should be tested with tuberculin periodically. We are in the dawn of the day when chemotherapy may actually sterilize the body of tubercle bacilli if administered sufficiently early after the initial invasion. When an individual converts to a reactor and for some time thereafter the lesions are usually small and vascular. A germicidal drug administered at that time might be expected to destroy all tubercle bacilli, whereas if one waits for lesions to become large and dense enough to cast x-ray shadows their vascularity has been so decreased that it may be difficult, if not impossible, for a drug in the blood stream to reach the tubercle bacilli in caseous and necrotic masses.

Present-day diagnostic armamentarium makes it easy to find every person whose body contains tubercle bacilli. Moreover, present-day therapeutic armamentarium enables the physician to treat gross lesions about as soon as they become detectable by x-ray film inspection so successfully that they do not become contagious.

The greatest danger of the Minnesota medical profession failing to attain the tuberculosis eradication goal is a sense of false security due to the marked decrease in mortality and morbidity. We have nearly reached the halfway mark. The remainder of the way to the eradication goal is long, tedious, and difficult, but I have full confidence that it will be reached by the Minnesota medical profession and its allies.

MALE STERILITY

(Continued from Page 937)

showing more and more interest in the results of such studies when selecting families for homeless children.

For the busy practitioner, plagued with male sterility problems, it is recommended that at least one carefully executed sperm count be done, and delay specific classification of a patient until repeated counts are done. Since reliable spermatogenic drugs are not available, medication given for psychic or tonic value should not be continued too long, for if one partner is sterile, and adoption could be considered, the earlier the better for the couple concerned. Avoid prognosis, inasmuch as extreme oligospermia may be capable of causing pregnancy. Psychosomatic factors are also assuming ever greater importance, and should be mentioned when discussing the problem with a childless couple.

EXTRAPULMONARY INTRATHORACIC TUMORS

Clinical Manifestations and Surgical Treatment

STUART W. HARRINGTON, M.D.
Rochester, Minnesota

I AM PLEASED to discuss with you some of the clinical and surgical considerations of intrathoracic tumors as I have been interested in the surgical treatment of these lesions for more than twenty-five years. In this paper I will discuss primarily extrapulmonary tumors. The first tumor of this type which I removed surgically was in 1925. In this paper I am reporting on the series of 212 patients on whom I have operated for this type of tumor to the present time. During the period covered, knowledge of the different histologic types of tumor that occur within the thorax, methods of establishing a diagnosis and methods of treatment have improved markedly. However, even though all of the present methods of diagnosis are utilized, these tumors still present many problems in regard to the establishment of a definite clinical diagnosis and the determination of the type of treatment to be instituted.

Early recognition of these growths before they have made serious inroads on the patient's general condition has been of inestimable aid to their surgical removal and to the final result. Study of proved cases of intrathoracic extrapulmonary tumors has given a different conception of the type of lesion found in the thorax and of the prognosis than was held formerly. The older belief was that most intrathoracic growths were malignant and that only conservative treatment was justified because surgical treatment was a hazardous procedure. The lack of response of many of these tumors to conservative treatment encouraged surgical intervention with a view to complete removal of the growth, and the marked advancement in surgical technique has made operative removal a relatively safe procedure. Microscopic study of the lesions removed has shown that a large percentage of intrathoracic tumors are benign.

The incidence of these growths is probably no greater now than it has ever been. However, interest in the diagnosis and treatment of these tumors has increased in recent years because their presence is being recognized more frequently. One of the principal reasons for this more frequent recognition is the present use of routine roentgenographic examinations of the thorax, regardless of whether or not the patients present symptoms which are referable to the thorax.

For many years the medical profession has carried out roentgenographic examinations on patients who seek medical attention for some definite complaint but only in recent years has it been done as a routine diagnostic procedure on mass groups of people who have no definite complaint. When an abnormal condition which is indicative of the presence of a tumor is shown in a routine roentgenogram, it is important that complete roentgenologic and physical examinations be made to determine the type of lesion.

All intrathoracic tumors should be considered potentially malignant. The increased number of benign tumors seen in recent years is due to early recognition and their removal before they have undergone malignant change. Tumors that remain benign often attain great size and may cause death from mechanical pressure on the important structures in the thoracic cavity which are adjacent to the tumor. Because of the potential malignant character of these tumors and their close proximity to the important structures contained within the thorax, it is of paramount importance that tumors in this region be recognized early and that treatment be instituted immediately before the growth has become malignant and metastasized or has caused serious and permanent injury from pressure to the vital structures within the thorax.

Anatomic Situations

From a study of the types of tumor in which the diagnosis has been proved by histologic examination of surgically removed tissue, it has been found that the position of the tumor in the thoracic cavity is of great value in suggesting

Read at the Centennial Meeting of the Minnesota State Medical Association, as part of a Symposium arranged by the Minnesota Chapter, American College of Chest Physicians, Saint Paul, Minnesota, May 18 to 20, 1953.

the type of tumor present, for certain types of lesions are more likely to occur in certain locations than in other locations.

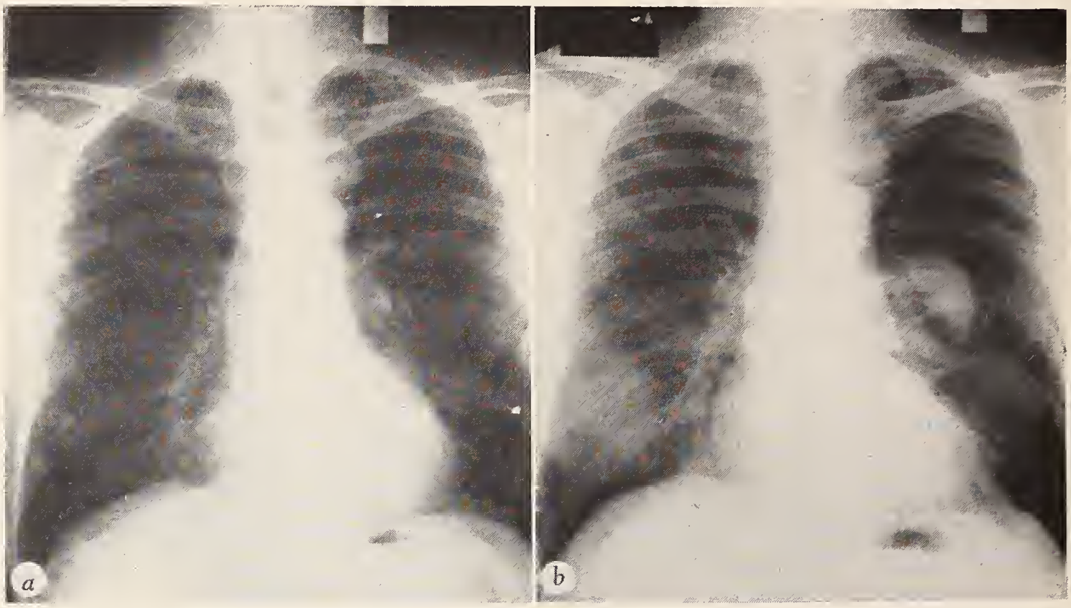

Fig. 1. Neurofibroma of left vagus nerve and left recurrent laryngeal nerve in a man aged forty-five years. Chief and only symptom was husky voice of four years' duration. Examination of vocal cords showed paralysis of left cord. *a.* On admission: rounded tumor at anterior mediastinum extending above arch of aorta. *b.* After artificial pneumothorax with collapse of left lung for better visualization of the tumor on, and extending above the arch of the aorta (roentgenoscopic examination revealed transmitted pulsation).

Anterior Portion of the Thorax.—In a general way, it may be stated that the types of tumors most frequently encountered in the anterior part of the thorax are the various types of teratoid neoplasms, mesodermal, entodermal and ectodermal (dermoid cysts), but these tumors also occasionally occur in the posterior mediastinum. Other lesions most frequently found in the anterior part of the thorax are thymic tumors, cystic tumors, lipomas, fibromas, intrathoracic adenomatous thyroids and various types of connective tissue tumors.

Posterior Portion of the Thorax.—The tumors most commonly located in the posterior portion of the thorax are perineural fibroblastomas, such as neurofibromas from the thoracic spinal root nerves. These tumors may extend through intervertebral foramina into the spinal cord and are often called "dumbell" or "hourglass" tumors. Perineural fibroblastomas also may occur along the course of the intercostal nerves in the lateral portion of the thoracic wall. The posterior mediastinum also contains the sympathiconeurofibromas and gangliomas. Other lesions found in this region are granulomatous lesions of the mediastinal lymph nodes or hilum of the lung, tumors of the esophagus, mediastinal cysts and occasionally bronchogenic cysts.

Middle of the Thorax.—The lesions most commonly seen in the middle of the thorax are the lesions of the great vessels, cardiac lesions, aneurysms and lymphoblastomas. Distinction of lesions in this location require the greatest care from a surgical standpoint, because many of them are not amenable to surgical treatment although some can be treated surgically.

Superior Portion of the Thorax.—Distinction of tumors of the superior part of the thorax often is difficult (Figs. 1 and 2) because they frequently fill the entire space, so that it is difficult to determine the relationship to the surrounding viscera. The tumors most commonly located in this region are thymomas, intrathoracic goiters, neuroblastomas, aneurysms, cystic lymphangiomas, cystic azygos lobes as well as tumors of the upper lobe of the lung (sulcus tumors).

Lower Portion of the Thorax.—The lesions most commonly found in the lower part of the thorax above the diaphragm are cystic or solid tumors associated with the pericardium, tumors or diverticula of the lower part of the esophagus and lesions of the diaphragm which may simulate intrathoracic tumors. These consist of tumors of the diaphragm, subcostosternal hernias (foramen of Morgagni) containing omentum only, or hernias of the liver through the dome of the right side of the diaphragm.

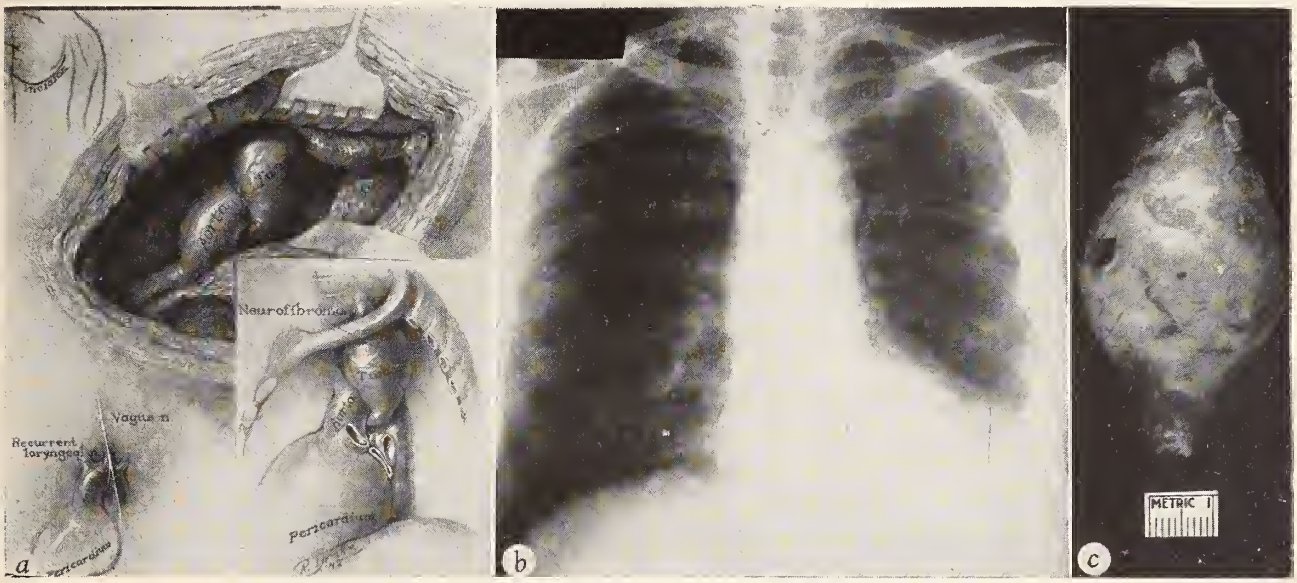

Fig. 2. Same case as in Figure 1. *a.* At operation: left transpleural complete removal of the tumor of left vagus and left recurrent laryngeal nerves. *b.* Three weeks after operation. *c.* Neurofibroma measuring 6.5 by 3.5 by 3 cm. Small portion of the normal vagus nerve in upper pole of tumor.

Roentgenologic Factors

When an abnormal condition which is indicative of the presence of a tumor is shown in a routine roentgenogram, it is important that complete roentgenologic and physical examinations be made to determine the type of lesion. This should be done regardless of whether or not the condition has caused any symptoms because early diagnosis and immediate institution of treatment are of the utmost importance in the treatment of these tumors.

From a roentgenologic standpoint, it must be kept in mind that many different types of tumor in various locations in the thorax and mediastinum have similar roentgenologic manifestations, and a definite diagnosis often cannot be established even after utilization of all the different roentgenologic means, such as roentgenoscopy, angiocardiography and examination of the esophagus and stomach after the patient has ingested barium, to rule out the possibility of a lesion of, or impingement on, these structures. In many instances after utilization of all methods of thoracic diagnosis, such as bronchoscopy, esophagoscopy, examination of sputum for malignant cells or organisms and so on, a definite preoperative diagnosis cannot be established.

Symptoms

One of the important features of extrapulmonary intrathoracic growths is that they may cause no symptoms. The absence of symptoms is rather common for benign lesions and also for early malignant lesions. However, many of these lesions do present some clinical manifestations and the symptoms, when present, vary depending on the type of intrathoracic tumor as well as on the duration and location of the tumor in the thorax.

Tumors situated in the anterior mediastinum as a rule cause more symptoms than those situated in the posterior mediastinum, because of the small space in which they are confined and their proximity to the lung. This is true whether the lesion is benign or malignant. Pain is one of the most important symptoms of these growths. Anterior mediastinal tumors usually are accompanied by pain, whether they are benign or malignant, but the pain of benign tumors is of a different character and is never so severe as that associated with malignant lesions.

When the lesions are benign, the patients have a sense of pressure beneath the sternum, usually associated with dyspnea and cough on physical effort. These symptoms are progressive and are

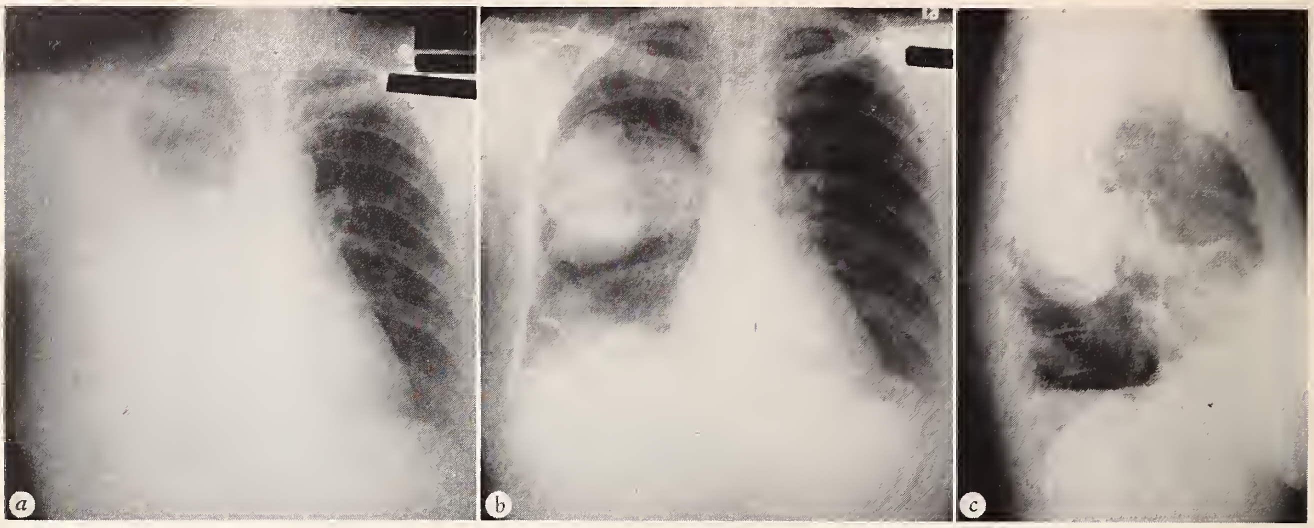

Fig. 3. Fibrous mesothelioma from parietal pleura of right posterior part of chest wall in a woman fifty-three years of age. Chief complaint was dyspnea of nine months' duration. Two years previously mobile x-ray unit reported tumor in right lung. *a.* On admission: extensive right pleural effusion. *b.* and *c.* After pleuracentesis; 1,800 cc. of clear fluid removed; large posterior tumor in right mid lung field.

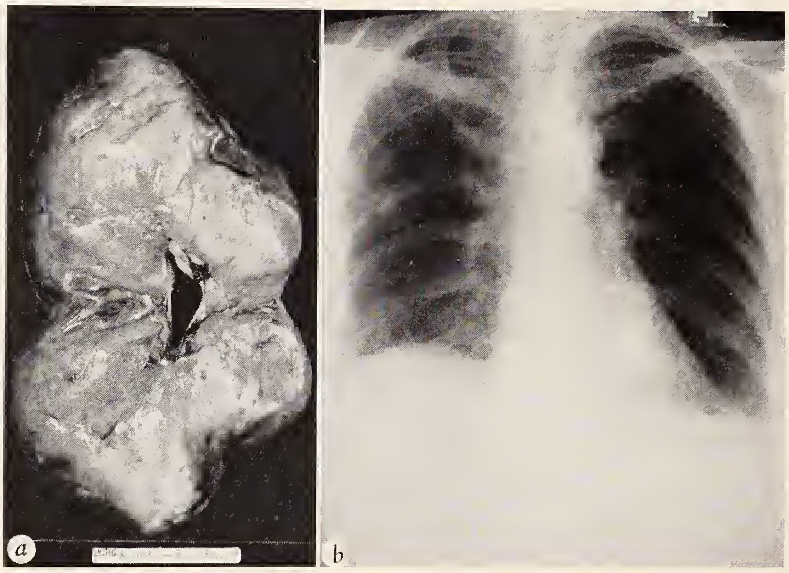

Fig. 4. Same case as Figure 3. *a.* Fibrous mesothelioma measuring 10.5 by 9 by 6 cm. from the parietal pleura of the right side of the thorax. *b.* Following complete transpleural removal of tumor. Right lung fully expanded. No pleural effusion.

associated with, and augmented by, inflammatory lesions of the respiratory tract. These tumors are commonly diagnosed at first as pulmonary or pleural lesions, such as pleurisy, pneumonia or influenza. When anterior mediastinal tumors are malignant, the pain is usually more severe; at first it occurs periodically and is noted mostly at night. It gradually becomes more or less constant until sedatives are required for relief.

Posterior mediastinal tumors may be benign or malignant. Benign tumors in this location are the most silent tumors that occur within the thorax. The outstanding clinical features are relatively few, and only mild symptoms may be associated with large growths, for these tumors may fill practically the entire hemithorax without producing any marked symptoms other than dyspnea on exertion (Figs. 3 and 4). In some instances neurologic symptoms consisting of varying degrees of paralysis are associated with tumors in this region particularly when tumors are neurogenic, such as dumbbell tumors which extend into, and cause pressure on the spinal cord, or gangliomas which are common in the superior mediastinum and may cause Horner's syndrome or anhidrosis. When tumors situated in this region are malignant, or have undergone malignant change, relatively small growths are associated with severe pain; the patient's chief complaint then is of the pain.

Dyspnea and other clinical manifestations are usually more marked when the tumor is situated in the superior mediastinum, because in this region the growth not only produces pressure on the lung itself, but in many instances it causes direct pressure on the large bronchi and on the hilus of the lung; at times, also, it exerts pressure on the trachea and thus causes marked interference with respiration, particularly on exertion. These tumors also may compress the esophagus causing difficulty in swallowing.

The clinical manifestations of intrathoracic tumors are often meager and rarely pathognomonic, although when present, they are of value when correlated with the roentgenologic findings in the establishment of a final diagnosis and in the selection of the type of treatment. Even after correlation of the results obtained by application of all the modern diagnostic methods for thoracic lesions, it is often impossible to determine clinically the type of lesion that is present or whether the tumor is benign or malignant.

Surgical Indications and Procedures

Extrapulmonary intrathoracic lesions for which surgical treatment is advisable may be divided into two groups from a clinical standpoint: (1) those that are causing symptoms, and (2) those that are not causing symptoms and are found on routine roentgenologic examination. For the first group, surgical treatment is a generally accepted tenet and when indicated should be carried out without delay. Concerning the second group, there may be some difference of opinion as to whether surgical treatment is indicated immediately or whether the patient should be kept under observation. This latter group presents one of the more important problems associated with intrathoracic lesions at the present time because of the relatively frequent finding of symptomless lesions on routine roentgenographic examinations. Each lesion must be dealt with individually; the manner depends on the findings.

Every effort should be made to establish a definite clinical diagnosis but in many instances this cannot be accomplished. When the roentgenographic findings are those of an indeterminate lesion which cannot be differentiated from a malignant lesion, I believe that exploratory thoracotomy should be performed and tissue should be removed for histologic diagnosis. The risk of exploratory thoracotomy is very small owing to the marked improvement in technical surgical methods and preoperative and postoperative measures, and, in my opinion, is much less than would be associated with delaying treatment for a malignant lesion. In those cases in which exploratory operation is required to establish a diagnosis, if the lesion is found to be a surgical condition, the complete operation indicated should be carried out at that time.

The methods of approach to, and the types of operative procedures for, extrapulmonary intrathoracic growths depend on the site of the tumor, its extension within the thoracic cage and the presence of complications which may have been produced by the growth. In each case the surgical procedure must be selected individually on the basis of the indications. A few general principles apply in all cases. Some of the more important are the selection of the location and method of approach through the thoracic wall which will give the greatest exposure of the tumor with the minimal amount of trauma and removal of normal structures of the thoracic wall. These are necessary so that at the completion of the operation, the thoracic wall can be reconstructed completely in order to restore the normal relations of the thoracic viscera and give the minimal amount of deformity of the wall.

The more important factors related to removal of the tumor are early operation, complete removal of the tumor at the time of operation and repair of any damage to surrounding structures which may have been caused by the presence of the tumor or its removal from these structures.

As said before, the approach to intrathoracic tumors varies according to their location. Tumors located anteriorly may be approached through the anterior or posterior wall of the thorax. I prefer the posterior approach, particularly when the tumor projects into either pleural cavity. The posterior approach gives much greater exposure than the anterior approach, and it permits dissection under direct vision of the tumor from the important structures to which it may be adherent. These usually are the heart, the great vessels and the lungs. Furthermore, any injury to these structures caused by the tumor or operative procedure can be detected and repaired immediately.

If the tumor is small and is confined to the anterior or superior mediastinum, or if it has ruptured into the lung anteriorly, the growth may be more accessible if approached anteriorly. This may be achieved by splitting the sternum or removing the cartilage and turning back the wall of the thorax. In some instances such tumors can be removed extrapleurally through an anterior type of incision, whereas the operation is transpleural when the posterior approach is used.

For tumors situated in the posterior portion of the thorax, a posterolateral incision is made around the vertebral border of the scapula. The entrance into the thoracic cavity is made by partial resection of one rib, over the most central portion of the tumor and when greater exposure is required, resection of 2 cm. of the ribs above and below is usually adequate to permit removal of even very large tumors.

Tumors situated in both the posterior mediastinum and spinal cord are removed after posterior mediastinotomy and laminectomy. This operation may be done in one or two stages. If the tumor is removed in two stages, the intraspinal portion of the tumor should be removed first after laminectomy to minimize the danger of permanent damage to the spinal cord from pressure caused by edema of the tumor or hemorrhage into the spinal canal. The mediastinal portion of the tumor usually can be removed by posterior mediastinotomy and excision ten to fourteen days later. The two-stage procedure is usually indicated when the mediastinal portion of the tumor is large because collapse of a large amount of lung and other intrapleural complications may greatly increase the operative risk.

When the mediastinal portion of the tumor is small, the two procedures may be done at one time through two separate incisions. The laminectomy is done first to expose the intraspinal portion of the tumor and then posterior mediastinotomy is done with complete removal of both portions of the tumor through the mediastinum. This one-stage procedure is preferable in selected cases because any possibility of leaving a portion of the tumor is avoided, hemostasis can be more accurate, and in some cases the mediastinal portion of the tumor can be removed extrapleurally.

The most inaccessible intrathoracic tumors are those located in the upper portion of the thoracic cavity between the first and the sixth ribs posteriorly, because these ribs are covered by the scapula. Tumors located posteriorly and some located anteriorly can be satisfactorily removed after elevation of the scapula and posterior removal of the fourth rib (Figs. 5 and 6).

After the tumor has been removed completely, any injury to surrounding structures should be repaired and all bleeding points should be ligated carefully. Any raw surface produced by removal of the tumor should be covered as much as possible with pleura. The pleural cavity is then irrigated with physiologic saline solution to remove any particles of tissue or blood clots, the lung is fully inflated by increasing the positive pressure, and 240,000 units of penicillin is placed in the pleural cavity. Then the incision is closed. The pleural cavity is drained by airtight or closed type of drainage with a 22 French catheter and application of gentle suction to the catheter. Institution of closed drainage is usually through the posterior portion of the periosteum of the rib which has been resected or if this is not an adequate position for drainage of the pleural cavity, a closed type of intercostal drainage is instituted posteriorly through the eighth interspace. In this way the bloody serum, which may collect after removal of intrathoracic lesions, is drained. The immediate drainage of this bloody serum permits rapid and complete re-expansion of the lung. Drainage rarely continues for more than forty-eight or seventy-two hours at which time the drainage tube may be removed.

Respiratory difficulty is the most serious immediate complication after operation and should be relieved entirely before the patient is taken from the operating room. The trachea and bronchi should be aspirated through the intratracheal tube before it is removed. If excessive mucus is present, bronchoscopic aspiration should be performed before the patient is removed from the operating room. Roentgenograms of the thorax and upper part of the abdomen should be made while the patient is still on the operating table; exposed films should be developed immediately and read before the patient is removed from the operating room. If roentgenograms of the thorax show evidence of pulmonary congestion or collapse of the lung, immediate measures should be taken to correct the condition, and further roentgenograms should be taken and read before the patient is returned to his hospital room.

Fig. 5. Intrathoracic adenomatous thyroid in a man, aged sixty-four years. No subjective symptoms. Tumor found on routine roentgenographic examination. No enlargement of the thyroid in the cervical region. No previous thyroidectomy. *a.* and *b.* On admission: rounded tumor in right upper part of midthorax (roentgenoscopic examination revealed tumor in right upper part of midthorax which moved with swallowing).

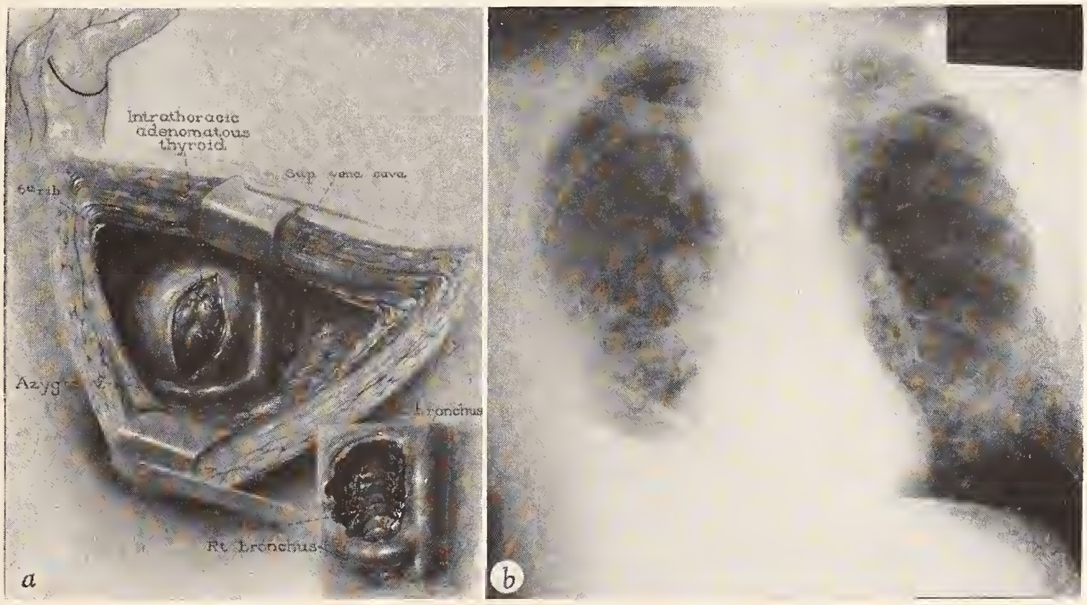

Fig. 6. Same case as Figure 5. *a.* At operation showing large intrathoracic adenomatous thyroid in the upper part of the posterior mediastinum above the azygos vein and lateral to the superior vena cava and extending posteriorly under both vessels. The tumor was attached to trachea and right upper lobe bronchus. Complete transpleural removal of tumor. *b.* Ten days after operation. Thickened pleura at site of tumor in upper posterior mediastinum and at the right base. Lungs fully inflated.

It is most essential not to remove the patient from the operating room until the bronchi are entirely clear of mucus, and on some occasions it may be advisable to keep the patient in the operating room until he has fully recovered from the anesthesia and the cough reflex is established. This is rarely necessary but in some cases in which the lung has been more or less collapsed by the tumor for a long time, it does not re-expand readily after removal of the growth. In many cases the pulmonary congestion can be minimized greatly if the lung is not permitted to remain collapsed for more than ten to fifteen minutes at one time during removal of the tumor. After being collapsed for this period, the lung should be fully re-expanded for three or four minutes to re-establish aeration and circulation of the blood before it is permitted to collapse again and removal of the tumor is continued.

If the roentgenograms of the upper part of the abdomen show dilatation of the stomach with gas, which not infrequently occurs when positive pressure is employed for the anesthesia, this should be relieved immediately by insertion of an indwelling stomach tube and application of suction to it. This tube may be removed after the accumulated gas has been removed or it may be left for a few days during the patient's immediate convalescence to remove any gastric secretions and to prevent vomiting. If this gas is permitted to remain in the stomach, it may cause acute dilatation.

Series Studied

In the series of 212 intrathoracic extrapulmonary lesions which I have operated on from 1925 to 1953, the classification of the tumors based on a histopathologic study of the lesions as is shown in Table I, is as follows: Fifty-eight were neuroblastomas. Forty-nine of these were located in the posterior mediastinum. Six of these forty-nine were both posterior mediastinal and intraspinal tumors, so-called dumbbell or hourglass type of neurofibromas. Five of the fifty-eight neuroblastomas were in the posterosuperior mediastinum, three were in the anterior mediastinum and one was situated in the lateral wall of the thorax. Three of the fifty-eight neuroblastomas were malignant.

Twelve of the tumors in the entire series were various types of fibromas of which seven were malignant and were designated as "sarcomatous." Roentgenologic findings and location of these tumors in the posterior mediastinum suggested a clinical diagnosis of probable neurofibroma.

Forty-three of the entire series were teratoid tumors. Thirteen were of the dermoid type of teratoma in which the predominant tissue was ectoderm. In these cases the epidermis lined the tumor, and the teratoma in one was of such high degree of organization that it was termed a "fetal parasite." This tumor was covered with epidermis. Forty-one of these teratoid tumors were situated in the anterior part and two in the posterolateral portion of the thorax. Six of the teratoid tumors had undergone malignant change.

TABLE I. INTRATHORACIC TUMORS

	Extrapulmonary Tumors
Neuroblastomas: (50 neurofibromas; 6 dumbbell; 3 or 5.1 per cent malignant. 5 ganglioneuromas; 3 sympathiconeurofibromas)	58
Cellular fibromas: (7 or 58 per cent malignant)	12
Teratomas: (6 or 14 per cent malignant; 13 dermoids)	43
Cysts:	
Mediastinal (12 celomic; 20 endothelial; 4 lymphangioma)	36
Bronchogenic	5
Thymomas: (5 or 25 per cent malignant)	20
Thoracic adenomatous thyroids	16
Hemangio-endotheliomas	8
Granulomas	5
Hamartomas	1
Lipomas	4
Mesotheliomas	2
Calcareous hematomas	2
Total	212

Thirty-six of the extrapulmonary tumors were cysts of the mediastinum. Of these, twelve were celomic or pericardial cysts; twenty were endothelial cysts; four were cystic lymphangiomas. There also were five bronchogenic cysts. None of these cysts were malignant. Cystic tumors of the esophagus and leiomyomas of the esophagus which may simulate posterior mediastinal tumors are not included in this series.

Twenty tumors of the series were thymomas and were situated in the anterior and superior mediastinum.

Sixteen of the tumors were intrathoracic adenomatous thyroids; all were below the third rib anteriorly and one extended to the diaphragm.

There were eight hemangio-endotheliomas; five various types of granulomas in the middle and posterior mediastinum; one hamartoma, entirely extrapulmonary in the anterior mediastinum; four lipomas in the anterior mediastinum; two mesotheliomas in the lower part of the thoracic cavity, one from the parietal pleura and one from the mediastinal pleura and two organized calcareous hematomas in the anterior mediastinum.

In all of the 212 cases of extrapulmonary tumors, the lesions were removed by transcostal intrapleural or extrapleural operation and in the six cases of posterior mediastinal and intraspinal neuroblastomas of the dumbbell type, laminectomy and mediastinotomy were performed.

There were seven operative deaths in the total series. Three of the patients who died had

ASPIRATION BIOPSY OF BONE MARROW

Its Diagnostic Value

GERTRUDE L. PEASE, M.D.
Rochester, Minnesota

ASPIRATION biopsy of the bone marrow has become a relatively simple and safe procedure. Study of the morphologic changes in this organ may offer valuable information to the clinician. The aspiration and preparation of the material for examination should be done according to an acceptable technique and the interpretation of findings should be done by physicians trained in hematology.

Laboratory tests done on peripheral blood in diseases affecting the hemopoietic system either primarily or secondarily may reveal one or more of the following conditions: anemia, leukopenia, lymphocytosis, monocytosis, thrombocytopenia, immature cells, normoblasts, rouleaux and elevation of the erythrocytic sedimentation rate. When such clinical findings as indeterminate fever, adenopathy, hepatomegaly, splenomegaly, purpura, indeterminate thoracic lesions and bony lesions exist with one or more of the previously mentioned laboratory findings and when a diagnosis cannot be established, morphologic alterations of the bone marrow may offer valuable information. With this information, the clinician may be able to establish a definite diagnosis, rule out certain diseases or obtain confirmation of a diagnosis that is fairly well established. Examination of the marrow may reveal changes or lesions not diagnostic in themselves but of such nature that other lines of investigation are indicated.

Among the findings in bone marrow that aid in the establishment of a definite diagnosis are the following: myeloma cells, lipid-storage cells characteristic of Gaucher's or Niemann-Pick disease, metastatic carcinoma, L. E. cells (lupus erythematosus) and granulomatous lesions. The latter, as will be mentioned presently, may be found in a number of conditions but if cultures of the marrow, animal inoculation, and special stains for organisms are done, evidence of histoplasmosis, brucellosis or tuberculosis may be found. Bone marrow may be the only tissue easily available for study in such cases.

Whenever splenectomy is being considered in the treatment of thrombocytopenic purpura or hemolytic anemia, studies of the bone marrow help in the exclusion of some underlying disease that may produce secondary thrombocytopenia or hemolysis. The presence of a leukemic process should be ruled out before splenectomy is considered.

Although the diagnosis of pernicious anemia may be fairly well established on the basis of clinical and peripheral blood findings, examination of the bone marrow offers further confirmation. The typical textbook picture is not present in the peripheral blood in every case of pernicious anemia nor are all macrocytic anemias classified as pernicious anemia. Megaloblasts and hypersegmented cells of the granulocytic series found in bone marrow confirm the diagnosis of pernicious anemia.

By common usage, the term "aplastic anemia" has come to mean a condition associated with anemia, leukopenia and thrombocytopenia. Certain drugs and toxic agents have played an important role in the production of this anemia but bone marrow should be studied to rule out leukemia or other malignant processes before such a diagnosis is made.

The diagnosis of leukemia can be made in most instances from the clinical and laboratory findings, together with the morphologic changes in the peripheral blood. Initial examination in some sub-

---

From the Section of Clinical Pathology, Mayo Clinic, Rochester, Minnesota.

acute and acute leukemias may reveal leukopenia and relatively normal values for erythrocytes and platelets. Only an occasional immature cell may be noted in smears of the peripheral blood. Atypical and immature cells occur in the peripheral blood of infants and children in a wide variety of disorders, and it is most important to rule out the possibility of leukemia in patients of this age group. Examination of bone marrow may be the only solution.

Among lesions not always diagnostic in themselves but of such a nature that other lines of investigation will be indicated are the granulomas. A report of the presence of a granuloma often comes as a complete surprise to the clinician because disorders characterized by granulomatous inflammation may simulate a number of diseases. Granulomatous lesions may be found in tuberculosis, brucellosis, histoplasmosis, sarcoidosis and occasionally in malignant lymphoma.

Lesions compatible with the diagnosis of malignant lymphoma have been found in bone marrow but usually biopsy of lymph nodes gives more adequate material for examination and diagnosis. Lesions typical of Hodgkin's disease have been found occasionally in bone marrow when no other tissue was available for biopsy.

Not all hematologic problems can be solved by study of aspirated bone marrow. If, however, a single aspiration gives negative results when the presence of a disorder of the hemopoietic system known to have a characteristic bone-marrow pattern is suspected, multiple sites should be used to obtain more material. It is occasionally impossible to obtain marrow by aspiration; in such cases, trephination is necessary to obtain a button of bone with the contents of the marrow cavity. Examination of such material may reveal replacement of marrow by fibrotic tissue or tumor cells.

In summary, studies of the bone marrow are of value in the diagnosis of diseases affecting the hemopoietic system either primarily or secondarily. The results may be of diagnostic significance, of confirmatory importance or of value in the exclusion of blood dyscrasias.

This is the eighth in a series of editorial reports sponsored by the Minnesota Society of Clinical Pathologists and designed to foster closer relationships between the practicing physician and his pathologist.

During the past decade, the study of bone marrow has become much commoner as part of a complete hematologic examination than it was formerly. This has come about in part because of a great increase in the application of all phases of hematology. Also of importance in this more frequent use of examination of bone marrow is the fact that many pathologists have become adept in the aspiration and study of such material.

Removal of bone marrow in most cases is an easy procedure. Proper use of local anesthetic agents insures the fact that about the only pain felt by the patient is momentary discomfort when suction is made for the actual aspiration. Many patients willingly have undergone multiple aspirations without complaint. Use of proper precautions, including a guard on the aspirating needle, renders the procedure free of practically all complications.

Thorough study of the material obtained, including quantitative, morphologic and bacteriologic examinations as indicated, often solves puzzling problems in hematologic disorders as well as in other diseases.

The editorial committee of the Minnesota Society of Clinical Pathologists, which includes Dr. Arthur H. Wells, of Duluth, and Drs. Arthur H. Sanford and George G. Stilwell, of Rochester, solicits suggestions and ideas regarding this series of editorial reports. Reprints of this presentation can be obtained from the author or the chairman of the committee.

ACHIEVEMENTS IN TUBERCULOSIS CONTROL

The past fifty years have been momentous in the fight against tuberculosis. At the outset, it was found that the control of the disease was the problem both of the physician and the layman. . . . The achievements have been substantial. Our horizon has been raised to new and challenging vistas beyond. Despite our gains, we still are dealing with a serious killing disease that has sacrificed countless lives that should have been preserved for productive effort.

So far as we can see at this time, tuberculosis will be with us for many decades to come. But we are drawing nearer to a complete understanding of its cause and control, which is beyond the tubercle bacillus alone. When we learn how to maintain our factors of resistance at a level that will keep the infection dormant, we may achieve as practical a result as complete eradication of the tubercle bacillus and the clinical manifestations of the germs in our bodies.—H. R. Edwards, M.D., American Review of Tuberculosis, March, 1952.

MEDICAL HISTORY OF THE COUNTY OF YELLOW MEDICINE

MILDRED B. LEE
Granite Falls, Minnesota

(Continued from August issue)

In the last years of the century the prosperity of the country at large was reflected in Yellow Medicine County. New schools were built, electric light and waterworks systems were installed in Canby, Granite Falls, Echo, and to a certain extent in Wood Lake. Telephones were coming into general use, better roads were being built with state aid, and the population of the county had increased from hundreds to thousands.

The oxen which had furnished motive power for the covered wagons, the breaking plow, and the long trips to market had long since gone the way of other frontier conveniences and were replaced by the fine matched teams of horses with nickel-studded harness, the high stepping family horse hitched to the polished buggy or "surrey with the fringe on top." By 1895 the horseless carriage was more than an inventor's dream: for there was actually a 1894 model Orient automobile in use on a mail route out of Canby which was capable of the phenomenal speed of fifteen miles per hour when at its best. Not so many years in the future a skilled mechanic and blacksmith in Granite Falls by the name of Olaus Lende would be building serviceable automobiles of his own design (with many features later adapted by more modern cars), which would be proudly driven by the town's leading citizens. In 1900, the local papers commented that an automobile would go through town almost every day, sometimes even two together. Probably the first doctor in the territory to own an automobile was Dr. Rogers of Montevideo, who had an Oldsmobile about 1900 or shortly thereafter.

Farm prices continued to be low, by modern standards, but a little money went a long way. One dollar would buy ten pounds of coffee, or twenty pounds of sugar, or thirty-two bars of soap. With raisins at five cents a pound, prunes five cents, rice six cents, and staples correspondingly low, farm prices were not greatly out of proportion. Although an agricultural county, Yellow Medicine was having a period of economic security and expansion.

Health problems had received their share of attention from government. A pure food and drug act provided the stimulus for better methods of care and production of food. Children were required to be vaccinated for smallpox before entering school, and doctors were not afraid to invoke the power of the law to enforce quarantine regulations, as Dr. Triplett did at Dawson, when he caused some protesting persons to be jailed and fined for interference. The germ theory had been generally accepted, by the public as well as by the medical profession, and greater consideration was given to possible sources of disease such as contaminated water. Canby with its deep wells had no problem. Wood Lake also had sunk deep wells to furnish the village with good water, but Granite Falls still took its city water, untreated, from the river, and depended upon local wells for its drinking water; although a representative of the State Board of Health urged the abandoment of all such wells, on the theory that they were filled with surface water which sank into a basin underlying the town.

With four railroads serving the county, transportation of the sick to medical centers was now merely a matter of a few hours when local facilities were insufficient; and surgery of a serious nature was performed in the city hospitals, except in emergencies. In 1898, Dr. N. H. Scheldrup established the first hospital in the county. It was at first located in East Granite Falls, near the site of the present municipal light plant, in the old Henry Hill homestead; but in 1900 more space was needed, so a large two-story frame house on Ninth Avenue was purchased for the purpose.

Medical Practice in Yellow Medicine County

Pioneer doctors faced great hardships in this new and sparsely settled region. Both youth and a hardy, adventurous spirit were required to brave the vicissitudes of Minnesota's inclement climate and the trackless wastes of its prairies, lacking all the comforts and advantages offered by more settled areas.

The first doctor's offices at Minnesota Falls were probably as good and as well equipped as any that could have been found at any time in the county in the next twenty years. Heated by wood stoves, lighted by oil lamps, furnished only with the bare necessities, it was necessary for the doctor to see to his own supply of wood and water and often to do his own janitor work. His mail was brought in by stage from the nearest railhead at New Ulm, Marshall, and later Willmar, and the doctor had to keep substantial amounts of drugs and medicines on hand because of the slowness of communication with the outside world.

The pioneer doctor made calls on horseback, on snowshoes, or on foot if the distance was not too great. It was necessary for him to have a horse or two and some sort of conveyance, although where there was a livery stable he could hire a rig to make his country calls. Doctors were probably the first to use the light buckboards and spring wagons which preceded the buggy; the settlers themselves preferred the more utilitarian wagons and ox teams which had brought them into the territory. As roads were laid out and built and the country became more settled horses replaced the oxteams and the wagons were superseded by surreys and buggies for transportation of the family to church or to town.

When the doctor had a conveyance of his own a driver was also needed, for in winter roads were often blocked by snow and in spring and fall were ankle deep in mud. It required the combined efforts of both doctor and driver to negotiate the snow banks and mudholes, and as there were few landmarks upon the prairie after a heavy snowfall there was security in having a companion. Also, the doctor who was trying to cover a large territory could rest while on the road between calls.

Since the germ theory was not advanced until long after some of the pioneer doctors had completed their medical training they were not unduly troubled by the lack of conveniences for medical practice. A little carbolic acid poured into cold water was sufficient for cleansing of instruments; they were simply swished around in this solution, and often left to gather dust when not in use. "Blood poisoning" was not uncommon, and often it resulted in death. Perhaps the large number of amputations performed in the early days was made necessary by fear of this complication which doctors then did not know how to prevent. Every accident seemed to necessitate amputation of some member of the injured person's body, and so frequent were they that a large per cent of the population must have been maimed in this way at one time or another. A rider who was thrown into barbed wire fence by a fractious horse; a man who carelessly shot himself through the arm, or one who was injured in the use of dynamite, or in the operation of horse-drawn vehicles, would after such injuries usually undergo amputation of torn or mangled limbs, and be considered fortunate if he did not die from loss of blood.

In fixing the county physician's salary the Board sometimes provided that the amount must include all amputations. One of the few items concerning Dr. Falk of Minnesota Falls was a bill presented to the Board for an amputation performed by him, with the assistance of Dr. Stratton, in the amount of $50.00. It was rare indeed for the Board to allow bills for medical services at the full amount, and this one was "layed over for investigation" till the next meeting. While the Board seemed to acknowledge the laborer as worthy of his hire, they reserved the right to fix the value. Thus Dr. Farnsworth's bill for $232.00 for the amputation of the arms, legs, and fingers of one of the hands of Michael J. Dowling was allowed at $155.10.

From 1873 to 1877, Doctors Falk, Stratton, and N. M. Smith were the only doctors known to be in the county. Of these Dr. Stratton was probably the best known. With Dr. Flynn of Redwood Falls he served the territory embraced in the original boundaries of Redwood County, as far west as Ortonville and the South Dakota line.

In every community there were women who were especially skilled in the care of the sick and experienced as midwives, and these valued members of the community relieved the doctors of the necessity of attending cases of childbirth and minor ills. Pioneer doctors held to the belief that birth was a natural process with which the midwife was competent to deal. Dr. Stratton often recommended a midwife when his services were requested. In Granite Falls Mrs. Margaret Hazelberg and Mrs. Maris Flaten served in this capacity, and at Echo Mrs. Jenny Giffen and Mrs. L. Moses might be called upon. Pioneer women also helped each other through these crises; Mrs. George E. Olds, an early resident and mother of five children, who reached the age of ninety-four still in splendid health, proudly boasted that she had never had a doctor in her house.

Mrs. Margaret Hazelberg came to the county on July 31, 1878, with her husband and five young children. They came to Marshall by train and from there to Granite Falls by ox team, which required two days' travel. Her older son, Knute, and daughter, Emma, were already established in Granite Falls. When a year later Mrs. Hazelberg was left a widow and responsible for the support of the family, she sought work as a practical nurse and midwife, which had formerly been her calling. Dr. Fuller and Dr. Stratton relied upon her help, and for many years she took care of the sick and attended women in childbirth throughout the area. It was said that she delivered more babies during her long service than all the doctors combined. Although she cared for people afflicted with diphtheria, consumption, typhoid and smallpox and still ordered her household of young children, she never communicated any of these diseases to her own family.

During her long life Mrs. Hazelberg won the esteem and affection of the community. Five prominent businessmen of Granite Falls presented her with a valuable gift and had her portrait hung in the city hall as a token of public esteem. This remarkable woman lived in Granite Falls until she reached the age of ninety-two years, then moved with her daughters to Minneapolis where she died at the age of 101 years.

The doctors who came to Yellow Medicine County were for the most part educated in the eastern medical schools, and may be considered to be representative of the profession. Almost without exception they were devoted to their patients and spared no effort in their desire to heal and cure, to cope with epidemics and to bring to this hinterland all of the benefits of medical care. The rewards for such service were small; yet at that time land could be bought for a few dollars an acre, and many doctors were wise enough to invest their small savings and profit by the steady increase in price. Others did much of their work on credit, and as usually happens in such cases were but poorly rewarded.

Dentists and Dentistry

Pioneer doctors expected to extract teeth for their patients, and instruments for this purpose were included in their medical equipment. Inventories in the estates of Dr. Fuller and Dr. Farnesworth include "dental tools, value $15.00" along with other items. Dr. Sweet might extract a tooth for a little girl for fifty cents; and give her back the half dollar for being a good child. The May 3, 1877, issue of the *Granite Falls Journal* ("Devoted to News & Making Money") states that Dr. Fuller had that day pulled eight teeth for one Peter Hanson who insisted that eight teeth were not too many to be pulled at one time; and in spite of the fact that part of his jawbone came away with one of the teeth Hanson insisted that it didn't hurt much, and started out on the fourteen-mile trip home as if nothing had happened. A display, the paper stated, "of pioneer grit and sand."

In 1877, Dr. A. Marden of New Ulm made regular trips through the county. There was also Dr. Kraft who did his work at the Commercial House in Granite Falls. In 1886, Dr. Woodmas of Montevideo began making regular calls at Granite Falls with his stand at the drug store of Hazelberg and Nare the first five days of each month, "teeth extracted without pain by the use of vitalized air." Dr. M. P. Salisbury was also a taxidermist; he had an office over the Post Office where he could be found the first half of each month. Dentists from St. Paul, Drs. Newel and Sandburg, Sandburg and Ellis, made periodical visits to the county. Dr. C. M. Leffingwell of Redwood Falls ("He is no common dentist, but one who has spent years in the business and commands the best knowledge of dentistry to be had") advertised in all the county papers. Dr. G. D. Moyer of Montevideo also made regular trips through the county. Dr. G. Ridgway shared an office with Dr. Cressy when he was in town.

The first dentists to reside in the county seem to have been Dr. W. J. Brady who had an office over Nare's Drug Store in Granite Falls, beginning in May, 1891, and Dr. F. Seeley who settled in Canby in August, 1889, but soon removed to Toronto, South Dakota.

The newspapers obligingly notified the public of the arrival of dentists: "the dentists are here, ready to jerk out grinders." "Dr. Fischer is doing a railroad business at Hanley Falls."

The best known of the early dentists was Dr. S. Wintner who established offices in Granite Falls early in the year 1898. He was very aggressive and advertised in most of the county papers. "Best set of teeth (with large illustration), $10. Filling and Cleaning Teeth $1.00. Teeth extracted without pain by the use of Odontunder." He spent the first two weeks of the month at Granite Falls, where he had at one time an office with Dr. N. H. Scheldrup. Later he had an office more conveniently located over a drug store.

But Dr. Wintner is remembered not for his dentistry, but as the principal in the county's most notable murder trial. The local legend is that Dr. Wintner gathered a number of local citizens together for poker at his office in the evenings, and in these sessions he was a consistent and heavy winner. After a time these victims of his skill decided to call in some outside help. Within a few days a young stranger was introduced into the group, and in the play that followed he proved to be more than a match for Dr. Wintner. But Dr. Wintner was a poor loser. In his anger over his losses he accused the young man of cheating and then, getting a revolver from a drawer, shot and fatally wounded him.

While the handsome young dentist languished in jail many of the young ladies of the community waited upon him with expressions of sympathy and offerings of food. The family of the accused provided the best counsel available, and the murder trial attracted large crowds. The Hon. A. J. Volstead was the county attorney. The sober citizens of the community fully expected a conviction, and were greatly shocked when the jury brought in a verdict of acquittal.

This closed Dr. Wintner's career in Granite Falls. Dr. E. C. Hawkins, who had worked with him for a time, then took a course in dentistry, took over his office, and practiced in Granite Falls until his death.

About the turn of the century Dr. Douglas of Minneapolis served the towns on the Minneapolis and St. Louis Railroad. He had a railroad car equipped as a dental office, and this was hauled from town to town according to a fixed schedule.

Druggists and Opticians

The first drug business in Yellow Medicine County was established by Drs. Falk and Stratton at Minnesota Falls, about 1874. The few newspapers of the time which are available for research do not mention this drug store, and it is probable that it was carried on by the doctors for convenience in their medical practice. Like most drug stores of the early days it sold liquor; the minutes of the County Board of March, 1876, specify that William Stratton shall be notified to apply for a license to sell liquor or "suffer the penalty."

"The Reliable Drug Store" of Marion Gould was the first drug store in Granite Falls. Gould secured a license to sell liquor in 1876, and continued to apply annually for a license as long as he remained in Granite Falls. The Gould stock was sold to Dr. Cressy in 1880 or 1881, and two years later Dr. Cressy took in a partner, J. C. G. Johnson, who was also an optician. Mr. Johnson not only fitted glasses for Granite Falls people but regularly went to Clarkfield and other towns in the county for that purpose.

A druggist who was a doctor but did not practice was Dr. C. H. Nare, who for many years operated a drug store in Granite Falls, with a stock of "patent medicines, chemicals, paints, brushes and varnish, window glass, putty and alabastine; toilet articles, drugs and medicines, and perfumerie."

In 1887, there were three drug stores in Granite Falls: Ireland and Powers, Nare's Drug Store, and Nelson and Johnson's Drug. Ben E. Nelson of Nelson and Johnson's Drug Store was also an optician, and remained in this business until long after the turn of the century. He had begun his apprenticeship in the Cressy Drug Store as a boy of eight or nine, sweeping out and running errands for the proprietor. When he finished elementary school he took a course at Carleton College and became a registered pharmacist, and also an optician. At the age of eighty he still carries on this work at Buffalo, Minnesota.

Canby's first drug stores were established about 1880, one by Lewis Gerald and another called the City Drug Store operated and owned by Adolph Gilberson. Dr. Billington is said to have been interested in a drug store in the early days and may have had a drug business prior to 1880 in Canby. Two doctors to go into the drug business in Canby were Drs. Chambers and McPeek, neither of whom were registered pharmacists.

The drug business was the first step toward the medical profession for some of the doctors who practiced in Yellow Medicine County. Dr. Fuller was a druggist before he took medical training, and this was also the case with Dr. Sweet and Dr. Frederick G. Watson, who was one of the first druggists in Wood Lake.

Pioneer druggists were not subject to the many restrictions and liabilities placed upon druggists of modern times. They were permitted to sell liquor upon doctors' prescriptions, and could sell any amount: by the pint, the gallon, or the keg. They could sell many kinds of sedatives; the druggist was supposed to be the judge as to whether or not it should be sold in each individual case.

Coroners of Yellow Medicine County
1872-1900

The County Board of Yellow Medicine County met for the first time on January 1, 1872, in a small brick building in Yellow Medicine City, and appointed John D. Otis to the office of coroner. Mr. Otis, who was later Judge of Probate of Yellow Medicine County, was a prominent pioneer settler, and the part of Stony Run Township which is the site of the city of Granite Falls was originally called Otis Township, in his honor. Mr. Otis did not qualify, and the Commissioners then appointed W. A. Monroe. When the first county election was held in November, 1872, Monroe was elected to the office, and re-elected in 1874. In 1876 J. A. Lewis succeeded to the office, and in 1878 it was taken over for the first time by a doctor—Dr. M. G. McLean of Canby.

In 1880, Dr. Florado H. Wellcome of Granite Falls was elected coroner, and held the office for two years. In 1882, Nels Erickson was elected but did not qualify, so again J. A. Lewis became the county coroner. In 1884, another layman, W. W. Pinney, owner of the Pinney Mill at Granite Falls, was elected, and in 1886, Ole J. Foss, a merchant of Granite Falls, succeeded him in the office.

The office again fell to a doctor when Dr. Albert R. Torgersen of Clarkfield was elected in 1888. He held the office until 1894, and was very conscientious in the performance of his duties, as shown by the case of Peter Strand, reported in the *Canby News* of 1889. Here was a death under suspicious circumstances. The *News* reports:

> "Dr. Torgersen, we believe, thinks a murder was committed and is inclined to think he was hindered somewhat in his investigation of the case."

According to the *News,* the body of Peter Strand was found in a meadow by a man named Luders. In view of the fact that Luders had been mowing in the meadow for several days prior to reporting the discovery, and the place where the body lay was in full view, the question arose as to why it had not been discovered earlier. Examination showed a quantity of blood about and wounds in the head and throat. The man was reported to have been a stranger in rather poor health, but reputed to have money inasmuch as he had remarked that he did not have to work for a living although he had taken employment as a farm hand. No money or valuables were found upon the body and it was buried at county expense.

After burial a further investigation was made. The body was exhumed. The County Attorney, A. J. Volstead, conducted the inquiry and a verdict of death by natural causes was entered. Evidently Dr. Torgersen as coroner did not sanction this verdict, and did not hesitate to make his disagreement known.

(To be continued in the October issue)

President's Letter

MEDICAL ALLIES

A large group of people who are closely allied to the medical profession add great strength to the medical team in its constant battle against the perils of disease and illness.

These people—members of those professions which so ably aid practicing physicians—have not always been given the esteem and importance they deserve. Many of us take these people for granted, for often their work is so normal a part of our lives that we overlook its importance to our own practices.

I am referring to medical technicians, medical technologists, nurses, physical and occupational therapists, x-ray technicians, dietitians, medical record librarians, medical social workers and anesthetists.

Most of us realize that these professions are composed of highly trained, efficient persons, who feel that they can serve humanity as readily and well as those who become doctors.

Recently, the Minnesota State Medical Association co-operated in a renewed effort to encourage junior and senior boys and girls to enter this field. Together with other interested organizations, the Association aided in the publication of a brochure which was sent to all high school seniors in Minnesota and in neighboring states.

The brochure presented the advantages of professional training in the allied medical fields, explaining where such training may be taken and outlining requirements and courses. Attractively printed and well written, the booklet gives a composite view of the entire field of allied medical careers and should be of considerable weight in convincing our young people that such training is worth while and that such a career would serve humanity.

Physicians of the state have been sent a copy of this brochure. It will serve as a ready reference when young men and women question the doctor about these careers, and information about these careers can be furnished quickly and easily through this pamphlet.

Not only can the doctor aid young people in choosing this type of career, but he can become an active force in the community to show that these careers are important, interesting and vitally necessary. Because he is an important and respected person in his place of practice, the physician can help young people to see that they are urgently needed in this profession, and that they will be welcomed into it by those already established.

Conrad J Campbell

President, Minnesota State Medical Association

THE NEW EDITOR SPEAKS

IT IS with mixed emotions of inadequacy, determination and enthusiasm that I have accepted the responsibility of the editorship of MINNESOTA MEDICINE. I can only hope that the journal will not deteriorate from the high standards which Dr. Carl Drake has maintained for so many years. The fact that Miss Olive Seibert is remaining as the publisher's editor is a great consolation. The many others who have taken an active part in the publication of the journal also should continue to assist in maintaining the standards already set.

A brief panoramic view of the present status of MINNESOTA MEDICINE as seen by one newly come upon the scene appears to be in order. Just as each physiologic function of the body has a good reserve in health, so the journal must receive adequate numbers of manuscripts to maintain its standing. There is a considerable gap between a minimum number which barely sustains life, and sufficient numbers of articles to permit some degree of discrimination, timely alterations, and delays for additional illustrations, et cetera, plus no less than four months of edited manuscripts in reserve for publication in their turn. Why should a journal representing some three thousand physicians seek manuscripts elsewhere, when its owners probably publish more scientific articles in other journals than any other comparable group of physicians in the United States? Why should a fertile source of Minnesota's scientific information be seriously drained into other journals, thus dividing our resources into rather thin streams? These and other related questions should be analyzed and their solution resolved in favor of MINNESOTA MEDICINE.

It appears to be the official reaction of our organization that any cost of the journal to the members is a deficit. If this be the case, possibly we should reconsider the matter. MINNESOTA MEDICINE represents the principal contribution to the advancement in medical science made by the organized physicians of the state. For years I have considered the various state medical journals as mirrors of the standard of medical practice in the area. Some are quite poor, and again there is the *New England Journal of Medicine.* All of this leads to a pet theory that those willing to write for our journal should be subsidized by those who can't find the time. Should our Association decide to share in the cost of reprints, then I am sure many physicians would feel a stronger inclination to publish in MINNESOTA MEDICINE. At the same time, all of our members would have the opportunity of more directly contributing to our torch of knowledge, and industry would be rewarded.

The present members of the Editing and Publishing Committee are appointed by the president for a five-year term. The editor, and not the president, is responsible for the publication of the journal. Why shouldn't he select his own assistants, so that they will be responsible to him? If they do not function in this work of love, why can't he drop them at the end of the year? This should not be a one-man journal. The editing committee should meet at least bimonthly to combine their efforts to build a better publication. The membership of this committee should have representation from the University of Minnesota and the Mayo Clinic, as well as throughout the state. Surely, most of us must agree that all groups should help in the construction of this scientific endeavor by which others will judge us.

Yes, indeed, it looks like an interesting voyage ahead. It is my earnest hope that the good ship MINNESOTA MEDICINE may keep a steady course under the guidance of her new navigator.

A. H. WELLS

PHYSICIANS' ASSISTANCE FUND

THE NEED for a substantial state fund for the relief of our needy colleagues has been clear to all of us for years.

We were late in our first tentative effort to do something about it, three years ago, and later still in our final determination, arrived at by the House of Delegates at the Saint Paul meeting this year, to levy a formal and compulsory assessment for the purpose.

Since 1951, when the Physicians' Assistance Committee was first created by the House of Delegates with Dr. W. R. Humphrey of Stillwater as chairman, some eight or nine appeals for help have been received, and the fund raised by repeated requests for voluntary contributions was pitifully inadequate to meet them. Here, if ever, was a cause to touch the heart of any physician and it was high time that we assessed ourselves to respond to it.

It should be noted that physicians are not asking the federal government to cover them under the Social Security program. But the fact remains that aging doctors who have not been able to set aside money for their last years are not cushioned, as their poorest patients are, against disaster. The number who need help at any one time is never very great. Often the need is only for funds to cover final hospital bills. But their necessities are as urgent as any man's. And it should be no great task for an Association like ours to provide for them.

The truth is, men and women—and doctors—being what they are, something more imperative than an impersonal appeal is generally necessary to get a general response. That is why the voluntary appeal failed and why the House of Delegates levied the special assessment in May.

This assessment is, indeed, compulsory, but only on active members who have not already contributed at least $10, and only for one year. Future assessments will wait upon the experience of the next few years.

Furthermore, this assessment should not be confused with the one levied last year to augment the general funds of the Association. This one is being collected separately from the dues and will be set apart in a separate fund to be used for assistance of needy colleagues only. The response, to date, has shown how heartily most of our members approve of the undertaking.

AMERICAN GERIATRICS SOCIETY

THE American Geriatrics Society was organized on June 11, 1942, at Atlantic City through the efforts of Dr. Malford W. Thewlis, of Wakefield, Rhode Island. The society was organized to study factors in the prevention and cure of diseases incident to advancing years. Membership has been open not only to physicians but to physiotherapists, hospital superintendents, registered occupational therapists, directors of homes for the aged, social and welfare workers and, in fact, all those who are interested in the welfare of the aged.

The increasing percentage of the population in the latter decades of life, emphasizes the importance of geriatrics in general. While industry may consider sixty-five the beginning of old age, the field of geriatrics concerns itself largely with those forty years of age and over.

It is becoming more and more recognized that aging is an individual matter and not a matter of years. To retire an individual at a certain age is an extravagant procedure, for many an individual has many years of usefulness ahead of him at sixty-five, just as many in this day and generation are burned out in the forties and even in the thirties. To retire every employe at sixty-five, to obviate the necessity of picking and choosing those too old to work beyond that age, seems unfortunate.

It has been said with some truth that a man is as old as his arteries. Certainly, a number of diseases incident to old age are due to degeneration in the arteries. To determine the cause of atheromatous changes in the arteries, as well as other changes incident to advancing years, is a worthwhile objective. We are shocked when we hear of a coronary thrombosis occurring in an individual in his thirties. Geriatrics must therefore concern itself with living before the age of forty, if it is to improve the state of health of those over forty.

Several journals devoted to geriatrics have appeared in recent years. *Geriatrics*, edited by Dr. Walter C. Alvarez, with Dr. Maurice B. Visscher, of Minneapolis, and Dr. Edward J. Stieglitz, of Washington, as consulting editors, is now in its eighth year. Included on its Board of Associate Editors are: Drs. Reuben F. Erickson, J. Arthur Myers, and S. Marx White, of Minneapolis, and E. L. Tuohy, of Duluth. A quarterly, entitled *The Journal of Gerontology*, published at Ann Arbor, Michigan, began publication in 1946. It is the property of the Gerontological Society of St. Louis, Missouri, and was incorporated in 1945.

In January of this year, the first number of *The Journal of The American Geriatrics Society* made its appearance. Dr. Willard O. Thompson, of Chicago, president of the society, is also editor of *The Journal.* Upon inquiry, we have been informed that the society started its own journal in order to control editorial and advertising policies.

BLOOD DONATION STILL NEEDED

WITH the cessation of hostilities in Korea, the need for blood derivatives has naturally lessened. On the recommendation of the Health Resources Advisory Committee, the Office of Defense Mobilization, on July 31, announced that the American Red Cross is closing on August 3, 1953, fifteen of its defense blood collection centers and is terminating its contract with seventeen co-operating community blood banks which have served as collection centers for the National Blood Program.

There is still great need for blood and its derivatives for civilian hospitals, for providing adequate reserves of blood derivatives to meet any emergency such as a national disaster or atomic attack and for the production of gamma globulin, the need for which in the poliomyelitis immunization program is almost unlimited. The forty-five regional blood collection centers of the American Red Cross will continue to operate at full capacity and it is urged that there be no letdown on the part of the public in blood donation.

According to the American Medical Association's *Washington Letter* of July 24, about a third of this year's supply of gamma globulin was sent, in June and July, to eleven counties in eight states for mass injections. Such widespread use should shed further light on the value of gamma globulin in preventing polio infection and paralysis.

DOCTOR KEEFER APPOINTED SPECIAL ASSISTANT TO OVETA CULP HOBBY

THE medical profession has every reason to feel happy at the appointment of Dr. Chester Scott Keefer as Special Assistant on Health and Medical Affairs to Mrs. Oveta Culp Hobby, Secretary of Health, Education and Welfare. The medical profession has insisted for years that the health activities of the federal government should be supervised by a medical doctor, trained in medical administration. Dr. Keefer apparently fills the requirement.

Dr. Keefer received his medical degree from Johns Hopkins University in 1922 and has been Professor of Medicine at Boston University School of Medicine. He is an expert on antibiotics and he supervised penicillin and streptomycin distribution for the United States and our allies during World War II. He was also chairman of the National Research Council's committee on chemotherapeutics which advised on civil defense medical stockpiling. Dr. Keefer has been physician-in-chief at Massachusetts Memorial Hospital since 1940. He is also a fellow of the American College of Physicians, a member of the American Society of Clinical Investigation, and has served on the American Medical Association's Council on Pharmacy and Chemistry. Under terms of Reorganization Plan No. 1, creating the department, in which the American Medical Association House of Delegates concurred at their meeting in Washington, D. C., earlier this year, it was agreed that the Special Assistant be charged with advising the Secretary in reviewing all health and medical programs of the department as well as health and medical legislation.

ELMER L. HENDERSON

The death in July of Dr. Elmer L. Henderson of Louisville deprived the medical profession and the country of an outstanding personality. A surgeon who took a lively interest in medical organization, he was recognized as a dynamic leader by his election simultaneously to the presidency of the American Medical Association and the World Medical Association. Not content to rest after serving as president of both of these organizations, a strenuous assignment, he organized and became president of the American Medical Education Foundation to provide assistance for the medical schools and maintain their independence. So important, in his opinion, was the need of a change in administration in Washington that he gave up his official connections with organized medicine to form a unit of doctors for Eisenhower for president.

By a strange coincidence, Dr. Henderson died within the same twenty-four hours of the same disease as Robert A. Taft, his good friend and also a crusader for private enterprise as opposed to socialism. The following excerpt from Dr. Henderson's inaugural AMA address in San Francisco, June 27, 1950, illustrates his militant stand against Socalized Medicine.

> "American medicine has become the blazing focal point in a fundamental struggle which may determine whether America remains free, or whether we are to become a Socialist State, under the yoke of a Government bureaucracy, dominated by selfish, cynical men who believe the American people are no longer competent to care for themselves. . . .

George Earl, M.D., Chairman

COMMISSION REPORTS ON MILITARY DEPENDENTS' CARE

New coals have been heaped on the fire concerning the responsibility of the federal government for medical care of dependents of servicemen.

Equal medical and dental care for all eligible dependents of military personnel was recommended by the Citizens Advisory Commission on Medical Care for Dependents of Military Personnel—in view of, and in spite of the American Medical Association's opposition to military physicians being used to care for what is actually the civilian population.

The advisory commission was set up by Secretary of Defense Wilson to make a comprehensive study of the program of medical and dental care of dependents of servicemen. The commission probably is a result of a recommendation of the controversial Commission on the Health Needs of the Nation, which said of this matter:

> "However, the drafting of physicians and dentists for military service, with the result that the services of some of them are utilized to a great extent for the care of civilians, has disturbed the health professions. This whole matter needs a complete and definitive review: First, to determine what the Government's responsibility shall be to military dependents; and secondly, to decide in what way this responsibility shall be discharged."

Members Well Known

Chairman of the new commission is Harold G. Moulton, former president of Brookings Institution. Other members are: Dr. George W. Bachman, senior staff member of Brookings Institution assigned to health matters; Lewis W. Jones, president of Rutgers University; Mrs. Eugene Meyer, of the *Washington Post;* and Thomas I. Parkinson, president of the Equitable Life Insurance Company.

Coverage Inclusive

One of the surprising and alarming recommendations made by the Citizens Advisory Commission on Medical Care for Dependents of Military Personnel is the amount and type of medical care coverage to be extended to eligible personnel. According to the report, care should be *limited* to the following: (1) diagnosis, (2) acute medical and surgical conditions, (3) contagious diseases, (4) immunization, (5) maternity and infant care, and (6) emergency dental care —except in overseas or remote areas where civilian dental facilities are not available.

In glancing over this list, one wonders if "limited" is the correct terminology, and whether the term "be extended to include" would not serve better.

However, the Commission does provide a list of exclusions:

> "(1) Domiciliary care and chronic diseases requiring hospitalization; (2) Nervous and mental disorders; (3) Elective medical and surgical treatment, and (4) Prosthetic devices, hearing aids, orthopedic footwear, and spectacles (except overseas and at remote stations), ambulance service, except in acute emergency; and home calls, except in cases where it is medically advisable to confine the patients at home."

How to Finance?

The whole suggested program brings about the interesting question of how the Commission proposes to finance this program. And, of course, that old familiar worrisome phrase raises its head again, "Let the Government do it." Of great interest to all taxpayers is the Commission's method of proposed financing, as reported in a recent issue of "Social Legislation Information Service": The Commission noted in its report that if we furnish free medical care at military hospitals the care provided for those who must depend upon civilian facilities should also be at Government expense. The Commission considered the question whether the *supplementary* program, through private facilities, might best be handled on an insurance basis, but concluded that no insurance plan is desirable. The Commission recommended the following:

> "1. Care whenever practicable should be provided by military medical facilities, and the dependent who lives within 25 miles of military facilities should, except in emergencies, be required first to seek aid at the military establishment.
>
> "2. If military medical facilities are not available, he should be given a certificate to present to a civilian doctor or agency of his own choosing.
>
> "3. The patient would be required to pay the first $10, plus 10 per cent of the remainder of the bill, for any one illness treated by civilian doctors. (This is exclusive of maternity cases.)
>
> "4. For those living more than 25 miles from military medical facilities, since they must depend almost entirely upon civilian facilities, they would also be furnished with certificates which can be presented to a civilian hospital or doctor."

Thus it can be seen that if the Commission has its way, no eligible military dependent would be excluded from virtually free government medical care. However, the proposed program awaits favorable implementary legislation from Congress.

Defines "Eligible"

The Commission also took upon itself the task of defining just who is an eligible military dependent. As the "Social Legislation Information Service" states, this group has grown more through custom than by any clear-cut policy. Rather than definitive legislation, Congress has, throughout the years, defined to some extent, who is eligible, by approval of the various Service departments' annual budgets, thus giving authority for medical care to military dependents.

Noting that "there are numerous discrepancies with respect to definitions of dependents in the various Services," the Commission recommended that dependency status for medical care be restricted to:

1. Spouse and unmarried children under twenty-one.
2. Widows and dependent children of servicemen who lose their lives while on active duty or while retired with pay.
3. Parents and parents-in-law if in fact dependent and when residing in the home of the serviceman.
4. Dependent sons and daughters over twenty-one who are incapacitated.

PUBLIC DEBT NEAR LEGAL LIMIT

The federal debt of the United States has now reached the staggering total of $267 billion, just $8 billion under the congressional-imposed ceiling of $275 billion. According to a recent issue of "Insurance Economics Surveys," which quotes directly from the *Christian Science Monitor,* this debt will probably not change much between now and the end of the fiscal year, June 30, 1954.

A sizable deficit is in the making for the next year, the publication says, and the treasury has already estimated that its borrowings until the end of 1953 will reach around $8 billion.

However, the survey states that this does not mean the debt will reach the statutory limit this year: "But it wouldn't be necessary to go out in the market for all of this. The Treasury could avoid putting the debt dangerously close to the limit by taking money out of the general fund, which contains several billions of tax money awaiting disposal. Moreover, spending might be reduced under an administration pledged to economy. Nevertheless, the public debt is uncomfortably close to the statutory limit."

Marked Increase Shown

Over the history of the United States, the federal debt has taken tremendous jumps upward. And because of this, the survey feels, "it would be foolhardy to set some particular figure for the national debt beyond which disaster could be seen imminent." It traces the history of debt increases:

> "After the Civil War the debt was $2.2 billion, held to be too high. After World War I it had risen to $25.2 billion, regarded by then-prevailing sentiment as an incubus on the economy. Then years later in 1939 it was just under $40 billion, but fear of rising debt appeared to have vanished against the greater fear of unpreparedness.
>
> "When World War II exploded, the debt zoomed to heights undreamed of. Now there are those who say we need not fear this debt; instead, we can make it a tool for economic progress if properly managed."

Controversy Noted

Of course, the article states, there is considerable argument on how this huge indebtedness is to be handled. There are two schools of thought on the matter: the "soft" money people, who are unafraid of continuing inflation, who favor a controlled market as opposed to a free one, and who do not worry about large deficits as long as the country has full employment and prosperity; and there are the "hard" money people who stand for balanced budgets, reduction of the debt during high employment, an end to artificially low money rates, curtailment of centralized federal power with more emphasis on private enterprise.

Naturally, this whole question raises a vital issue for every thinking American. Depending on how the problem is handled, it could mean continued higher taxes and a further spiraling of the national debt; or it could mean lower taxes and a definite effort to reduce the national debt. In view of the medical profession's expressed view favoring less power for the central government, more spreading of business to private enterprise, and strict economy measures, it is well for doctors to keep a watchful eye on what happens to this all-important problem of a close-to-the-limit national debt.

CONSTRUCTION CONTINUES ON HILL-BURTON HOSPITALS

In view of the extension of the Hill-Burton Hospital Construction Act until June 30, 1957, the following résumé of construction figures for Minnesota is presented:

Projects which have been completed and are now in operation in Minnesota total thirty-three, with a cost of $24,560,931. Of this, the federal government contributed $8,013,995. These projects have supplied 1,361 additional hospital beds to the state.

At present there are seven projects under construction at a total cost of $16,916,752, which includes a federal contribution of $3,917,286. These projects are expected to supply about 371 additional beds.

Also, there is one project which has been approved, but which is not under construction as yet. This will cost $942,703, of which the federal government will contribute $419,717, and will be designed to supply 64 additional hospital beds in the state.

REPORT TOTALS FEDERAL RESEARCH AID

The National Science Foundation recently released a report showing the total of funds expended by the federal government to aid scientific research and development.

The four big departments of government which spent the most money for aid to research in the year ending June 30, 1952, were the Department of Defense, the Atomic Energy Commission, the Department of Health, Education and Welfare and the Department of Agriculture.

During the above quoted year, a total of $2.2 billion funds was spent, one-seventh of which went to nonprofit institutions. Eighty teaching and research hospitals received financial aid totaling $4,590,000.

The report notes that only 1 per cent of the country's hospitals received Federal research help in 1951-1952 and adds:

> "When compared with the total number performing a training function, the number receiving funds is still relatively small. This is especially noteworthy in the case of the teaching hospitals with major affiliations, i.e., those hospitals which have been designated by one or more medical schools as a major unit in the teaching program of the school . . . In 1951-52, twenty out of 154 such hospitals, or 13 per cent, received funds."

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

230 Lowry Medical Arts Building

Saint Paul, Minnesota

E. M. Jones, M.D., Secretary

LICENSE OF MINNEAPOLIS PHYSICIAN SUSPENDED FOR EIGHTEEN MONTHS

In re George F. Schmidt, M.D.

On July 18, 1953, the Minnesota State Board of Medical Examiners suspended for eighteen months, the medical license of Dr. George F. Schmidt, seventy-two years of age. Dr. Schmidt was arrested by Minneapolis police officers on April 21, 1953, charged with the crime of abortion. At the time of his arrest, Dr. Schmidt had his office at 2707 Nicollet Avenue, Minneapolis. Dr. Schmidt was also a deputy coroner of Hennepin County at that time. On April 28, 1953, Dr. Schmidt entered a plea of guilty to the charge of abortion. On May 29, 1953, Dr. Schmidt was sentenced to a term of not to exceed four years in the state prison. The Court suspended the sentence and placed Dr. Schmidt on probation for three years.

Dr. Schmidt also admitted his guilt when he appeared before the Medical Board on May 22, 1953. Dr. Schmidt admitted performing a number of other abortions in the past five years.

Dr. Schmidt was born in Minnesota in 1881. He graduated from Hamline Medical School in 1908, and was licensed that year by examination.

The Dean's Page

POLICIES RELATING TO ADMISSION OF MEDICAL STUDENTS

The responsibility for selection of each year's medical class is delegated by the Dean and the faculty of the Medical School of the University of Minnesota to five of its fellow members, who comprise the Admissions Committee.

Present facilities, staff, and budget of the Medical School are adequate, according to accepted standards, for about 100 students per class. However, because of the pressure for more positions, in recent years between 125 and 130 students have been accepted for the freshman class. The number of applicants varies somewhat from year to year, but is always several times the number of places available.

The minimum requirements for admission to the Medical School are three academic years of college work, totalling 135 quarter credits. Only in the case of superior students, at the discretion of the Admissions Committee, may this total number of credits be reduced under the quality credit rule of the College of Science, Literature, and the Arts. Required courses are rarely, if ever, waived; and then only at the discretion of the Admissions Committee. The minimum scholastic average which may be considered is "C." In view of the large number of well-qualified applicants each year, an average well above "C" is usually necessary in order to achieve admission.

The required courses include a varying number of credits in English, mathematics, chemistry, physics, zoology, psychology, social sciences, and humanities. Although a reading knowledge of a modern foreign language is no longer a requirement for admission, it is recommended that students devote some of their elective credits to German, French, or another appropriate modern foreign language.

Required courses make up approximately two-thirds of the credits needed for admission. In choosing electives, the premedical student is advised to avoid random sampling of elementary courses. The Admissions Committee shows preference for the applicant who has displayed a well-developed interest in and aptitude for a special field of knowledge.

Though the total number of necessary credits can be earned in three years of college work at normal pace, most students benefit from a fourth year of general or specialized education before they enter upon the medical course. This period of preparation is encouraged by the Admissions Committee. The Medical College Admission Test, which is a medical aptitude test sponsored by the Association of American Medical Colleges, and the Minnesota Medical Aptitude Test must be taken by the applicant before he can be accepted.

Acceptance for admission to the Medical School is based primarily upon ability and scholarship, as indicated by aptitude tests and scholastic records, and upon personal qualifications as evidenced by personal interviews and by recommendations of persons who know the applicant well. First choice is given to residents of Minnesota, second choice to residents of adjoining states which do not have medical schools, and third choice to residents of other states or countries who have acceptable reasons for desiring to attend this Medical School. Non-residents are accepted only if their scholarship has been outstanding and other qualifications indicate that they have unusual promise for the study of medicine or a career in science. The number of non-residents admitted averages about 8 to 10 per cent of each class. Some preference is given to applicants from rural areas of the state, since our studies have indicated that young men from rural communities are most likely to return to a rural area to practice.

The choice of students in no way depends on race, nationality, religion, or sex. In other words, no "quota" for any such group exists. The application blank to the Medical School requests no information as to the applicant's race or religion. The percentage of women in past classes has averaged less than five per cent, simply because of the sparsity of female applicants.

It is considered desirable that the medical student be free of financial worry during his course. Hours spent outside class in employment for support restrict appreciably the student's ability to gain optimum knowledge from the already crowded curriculum. A limited number of long-term loans are available through the University Bureau of Student Loans and Scholarships, and through the Minnesota Medical Foundation. A small though constantly increasing number of scholarships has been made available through the Minnesota Medical Foundation, the Minnesota State Medical Society, and private foundations. These total less than twenty in each class. It is hoped that some day contributions to the Minnesota Medical Foundation will be large enough to allow a majority of the medical students to have scholarship support.

The Admissions Committee is constantly and acutely aware of the difficulty in judging a person's ability to succeed in medical school. The scholastic average in the required natural sciences correlates the most highly of any of the various premedical experiences with actual success in the Medical School. However, other tests of ability and aptitude and personal recommendations are taken into account, as well as such factors as work outside of school and participation in school and community affairs. The Admissions Committee is constantly seeking new testing methods which have additional predictive value.

HAROLD S. DIEHL
Dean of Medical Sciences

Minnesota State Medical Association

HOUSE OF DELEGATES—SUMMARY OF PROCEEDINGS*

Saint Paul Session—May 18, 19 and 20, 1953

First Meeting, Sunday, May 17, 1953

Continental Room, Hotel Saint Paul
Saint Paul, Minnesota

The 100th Annual Session of the House of Delegates of the Minnesota State Medical Association opened in the Continental Room of the Hotel Saint Paul, Saint Paul, Minnesota, at 1:45 P.M., Sunday, May 17, 1953, Dr. C. G. Sheppard presiding.

After an invocation by Reverend Ira B. Allen of Saint Paul who thus initiated a precedent at this centennial meeting of the Association, minutes of the 1952 meeting were accepted, a quorum being present, and President O. J. Campbell of Minneapolis welcomed the delegates.

Dr. Leonard W. Larson of Bismarck, North Dakota, trustee of the American Medical Association for this area, was introduced. He spoke briefly on the work of the Board of Trustees and current national undertakings of organized medicine. Dr. Larson's remarks were followed by an extended discussion, conducted by Mr. Thomas A. Hendricks of Chicago, secretary of the Council on Medical Service of the American Medical Association, on the functions of the American Medical Association, its Councils and committees and its financial structure. An illuminated exhibit called "You and Your American Medical Association" (later moved from the hotel to the exhibit hall at the St. Paul Auditorium), was used to illustrate his remarks by Mr. Hendricks.

After introducing Mr. C. H. Crownhart of Madison, secretary of the State Medical Society of Wisconsin, and Mr. E. R. Thayer, Executive Director of Public Information of the Wisconsin Society, Dr. Sheppard called on Dr. A. O. Swenson of Duluth, chairman of the Council, to present the report of its first meeting.

Report of the Council

DR. SWENSON: The first meeting of the Council in connection with the 100th Annual Meeting of the Minnesota State Medical Association was held Saturday, May 16, 1953, at 2 p.m. in the Hotel Saint Paul.

Following the report of Dr. J. M. Waugh, chairman of the Finance Committee, on Association finances, Council considered and approved upon recommendation of Dr. John F. Briggs, chairman of the Association's Committee on Tuberculosis, the Governor's Interim Committee Report on Codification of Tuberculosis Laws for the sanitoria of the state, embodying possible use of some smaller sanitoria for geriatrics and chronic illness rather than for tuberculosis treatment. Also substitution of buffered for unbuffered tuberculin by the State Board of Health and the program of routine admission chest x-rays to be instituted in all hospitals in the state, with the stipulation that methods of initiation be decided by the roentgenologist, the staff, and the administrator of the hospital. The recommendation that sensitivity tests to the tubercle bacillus be done by the Minnesota Department of Health was likewise approved; also the proposal to send an official letter of commendation to Drs. L. S. and Kathleen Jordan of Granite Falls for their excellent and public-spirited service in the field of tuberculosis.

The following applications for *Life Membership* were accepted: Albert E. Ahrens, M.D., Saint Paul; Harry R. Baker, M.D., Hayfield; Frank T. Benoit, M.D., Winona; William Aaron Bessesen, M.D., Minneapolis; Albert E. Booth, M.D., Minneapolis; Frederick H. Buck, M.D., Shakopee; Edward Q. Ertel, M.D., Ellendale; Carl O. Estrem, M.D., Fergus Falls; Henry William Goehrs, M.D., St. Cloud; G. D. Haggard, M.D., Minneapolis; John V. Kelly, M.D., Saint Paul; Rae T. LaVake, M.D., Minneapolis; Frank J. Lexa, M.D., Lonsdale; Orianna McDaniel, M.D., Minneapolis; Benedik Melby, M.D., Blooming Prairie: Ette L. Mever, M.D., Minneapolis; Frank Naegeli, M.D., Fergus Falls: Daniel C. O'Connor, M.D., Eden Valley; Theodore S. Paulson, M.D., Fergus Falls; Fred J. Pratt, Sr., M.D., Minneapolis; A. Mason Randall, M.D., Ashby; Theodore Satersmoen, M.D., Pelican Rapids; Homer R. Smith, M.D., Minneapolis.

The following applications for *Residency Memberships* were approved: Kenneth G. Berge, M.D., Rochester; Robert C. Bolin, M.D., Saint Paul; Donald E. Bowes, M.D., Rochester; Wayne A. Chadbourn, M.D., Minneapolis; Peter C. Dykstra, M.D., Rochester· E. Wayne Gilley, M.D., Rochester; John H. Glaeser, M.D., Minneapolis; John L. Juergens, M.D., Belle Plaine; Bradley W. Kusske, M.D., St. Louis Park; Richard O. Leavenworth, Jr., M.D., Saint Paul: John B. O'Leary, M.D., Saint Paul; George R. Wilkinson, M.D., Rochester; Fred Eugene Wise, Jr., M.D., Rochester: Donald S. Swenson, M.D., Saint Paul.

The following applications for *Junior Associate Membership* were approved: Linus F. Leitschuh, M.D., Winsted, and Archibald W. Graham, M.D., Chisholm.

For *Associate Membership*, the following were approved: Clarence S. Bossert, M.D., Mora: Rudolph C. O. Logefeil, M.D., Minneapolis; John deJ. Pemberton, M.D., Rochester; Ellery De. W. Simpson, M.D., Minneapolis.

For *Service Membership* the following were approved: Alex Barno, M.D., Minneapolis; James A. Bastron, M.D., Rochester; James Bellomo, M.D., St. Paul; Hector M. Brown, M.D., Walker; John Paul Dahlstet, M.D., Mankato; Neal B. Davis, M.D., Rochester; Elmer M. Doherty, M.D., New Prague; John A. Evert, Jr., M.D., Saint Paul: Clarence R. Ferrell, M.D., Grand Rapids; Gerald I. Freeman, M.D., Saint Paul; Benjamin F. Fuller, M.D., Saint Paul; Grant L. Garlock, M.D., Bemidji: Neill F. Goltz, M.D., Saint Paul; Melvin L. Grais, M.D., Minneapolis; Glenn Gullickson, M.D., Minneapolis; Warren W. Haesly, M.D., Winona; George W. Haugen, M.D., Minneapolis; Robert J. Havel, M.D., Minneapolis; George W. Heine, M.D., Little Falls; John J. Heisler, M.D., Minneapolis; Donald E. Hogan-

---

**In accordance with action by the Council of the Minnesota State Medical Association in 1944, publication of the proceedings of the House of Delegates is limited to summary.*

son, M.D., Bemidji; Robert T. Hood, Jr., M.D., Rochester; Howard L. Horns, M.D., Minneapolis; Rollin J. Houle, M.D., New Brighton; Curtis M. Johnson, M.D., Dawson; Harold C. Johnson, M.D., San Diego, California; Peter J. Kitzberger, M.D., New Ulm; Malcolm J. Lester, Jr., M.D., Truman; Henry R. Lyons, M.D., Rochester; Sam M. Mackoff, M.D., Saint Paul; Rensselaer W. McClure, Jr., M.D., Rochester; Norman B. Metcalf, M.D., Princeton; Donald W. Mulder, M.D., Rochester; Valentine O'Malley, M.D., Saint Paul; Calvin R. Openshaw, M.D., Rochester; William B. Parsons, Jr., M.D., Rochester; Charles R. Peluso, M.D., Minneapolis; David R. Philip, M.D., Windom; Edward J. Richardson, M.D., Saint Paul; Richard J. Salk, M.D., Herman; Arnold G. Schwyzer, M.D., Ah-Gwah-Ching; S. C. Siegel, M.D., Saint Paul; George Randall Smith, M.D., Hutchinson; Robert A. Stoy, M.D., Little Falls; Lawrence J. Swanson, M.D., Saint Paul; David C. Utz, M.D., Rochester; John Edward Verby, M.D., Litchfield; D. E. Westover, M.D., Saint Paul; Louis James Wilson, M.D., Winona; Charles M. Zeigler, M.D., Pine River.

The Council appointed a temporary committee of five to study the possibility of establishing a uniform and central malpractice insurance program, with a view to making a financial saving in rates. This committee was instructed to report findings to the Council at the September meeting.

On the basis of a survey of publication costs and possible revenues, of Minnesota Medicine, the Council recommended that actual publication responsibilities for the journal remain in the hands of Bruce Publishing Company since it was clear, on the basis of the findings, that no saving would be effected by transfer of these responsibilities to the State Office. Also, that advertising rates be raised for the year 1954 to equal the rates charged by other medical journals of comparable circulation, for national advertising. That an effort be made, also, to increase the amount of local advertising in the journal. An effort is to be made, likewise, to increase the number of pages available for advertising so as to increase revenue and avoid the annual deficit. Mr. R. R. Rosell, Executive Secretary, was requested to take over business management of the journal in place of Mr. J. R. Bruce of the Bruce Publishing Company, who resigned.

The Council also deferred action on a request for development of a standardized medical report form for use in reporting health and accident cases, pending action by the American Medical Association's Council on Medical Service. It directed the Committee on Chronic Illness to develop an exhibit for the annual meeting of the American Association of Nursing Homes to be held in Minneapolis and referred a proposed educational program developed by a committee of the American Academy of Orthopaedic Surgeons on the public care of the crippled child to the Association's Committees on Child Health, Fractures and General Practice, for study and recommendations. It also approved affiliation of University of Minnesota Hospitals with the Minnesota Hospital Service for a year's trial period, on recommendation of the Association's Committee on University Relations, with the understanding that the Dean of the Medical School be requested to submit an annual report to the Council on the number of Blue Cross patients, the number of other patients admitted each year and the county and referring physician.

Following the dinner recess, the Council discussed two proposed changes in the By-Laws. The first, providing that payment of AMA dues be made a requirement for membership in the State Association, was tabled pending submission to the House of Delegates of the American Medical Association in New York of a resolution calling for the American Medical Association to make payment of current AMA dues, only, sufficient for membership in good standing, in the event that the State Association should make such payment a prerequisite to membership.

The second change read as follows (new matter in capital letters):

"Section 7. MEMBERS SHALL BE SUBJECT TO CENSORSHIP, SUSPENSION OR EXPULSION FOR GOOD CAUSE AND AFTER DUE NOTICE AND HEARING FROM THE COMPONENT MEDICAL SOCIETY AND FROM THE STATE ASSOCIATION. REGULATION OF PROFESSIONAL ANNOUNCEMENTS AND OTHER INFORMATION ABOUT MEMBERS MADE PUBLIC BY MAIL, PRESS, RADIO AND OTHER SUCH MEANS SHALL BE THE CONCERN OF THE COUNTY OR DISTRICT MEDICAL SOCIETY INVOLVED (AND THE DECISION OF THESE SOCIETIES ON SUCH MATTERS SHALL BE FINAL). Any physician who may feel aggrieved by the action of the society of his county or district in refusing him membership, or in suspending, censoring or expelling him shall have the right to appeal to the Council, and if he desires, to the Judicial Council of the American Medical Association. SUCH APPEAL TO THE COUNCIL SHALL BE PREFECTED WITHIN SIX MONTHS FOLLOWING THE DATE OF DECISION BY THE CONSTITUTED AUTHORITY OF THE COMPONENT MEDICAL SOCIETY. Only on the basis of QUESTIONS OF law and procedure should final determination rest with either the Council of the Minnesota State Medical Association or the Judicial Council of the American Medical Association."

This change was approved for submission to the House of Delegates.

Other actions included recommendation for passage by the House of a resolution on the subject of public criticism by physicians or physicians' organizations, prepared by the Minnesota Academy of General Practice; nomination of Dr. Frank H. Krusen of Rochester for the President's "Physician's Award of 1953," as Minnesota's candidate, for facilitating employment of physically handicapped persons; decision to send Dr. G. B. Logan, chairman of the Committee on Child Health, or a member of his committee, as delegate to the Fourth Annual Conference on Physicians and Schools; reference of the group insurance program of the Charles O. Finley Company to the Committee on Medical Economics for study and report; appointment of Dr. C. G. Sheppard, Speaker of the House of Delegates, as alternate advisor in Minnesota to the Student American Medical Association with instruction that either he or Dr. R. H. Creighton, advisor, attend the 1953 convention of the group; reference of the proposals made by the Northern and Southern Medical Associations for extension of nurse training programs to rural hospitals, to the Committee on Hospitals and Medical Education. A resolution of thanks for assistance during the 1953 session of the Legislature from the Minnesota Pharmaceutical Association was accepted.

Possible changes in Blue Shield contracts were outlined and discussed by Dr. E. J. Simons, Dr. O. I. Sohlberg and Mr. F. Manley Brist, and the Council adjourned until the next day, after instructing that the Blue Shield matter be presented to the House of Delegates at the Monday meeting.

The report of the Council was accepted as a whole with the understanding that the change proposed in the By-Laws was to be read and voted on, separately and finally, at the next day's session.

Report of the Finance Committee

Speaker Sheppard then called on Dr. J. M. Waugh, chairman of the Finance Committee of the Council, who outlined the financial condition of the Association and reported that the deficit of 1951 has been erased with the aid of the special assessment and that the year 1952 ended with a balanced budget. He strongly recommended, however, that the $10 assessment be made a permanent part of the dues which would then be $40 instead of $30 a year for the state association. The recommendation was based upon increased operating expenses of the association, plus the need for larger cash reserve for operation.

The permanent Investment Fund of the Association now has a market value of approximately $116,000, he reported, and is still somewhat short of the goal which has been set at an amount approximating the annual budget of the association. It was designed by the founders as a reserve to be used only in case of a catastrophic situation.

Dr. Waugh asked that the report be adopted and that, with its adoption, the dues be raised, as suggested.

It was moved, seconded and unanimously voted that the report be accepted and the dues raised for the state association from $30 to $40 a year.

Further Changes in the By-Laws

At the request of Speaker Sheppard, Dr. P. J. Pankratz of Mountain Lake, chairman of the Interim Committee on Changes in the By-Laws, appointed last year by the House of Delegates, proposed four changes having to do with appointment of the nominating committee, with selection of the First Vice President and his duties, and with the caucuses directed to be held in each councilor district from which a councilor is to be elected.

These changes were submitted in accordance with the provision of the constitution on changing the By-Laws, to be voted on at the next meeting of the House of Delegates.

Speaker Sheppard then read, as follows, the changes in the Constitution and By-Laws presented last year (altered passages indicated in capital letters), for final vote of the delegates at this meeting:

Constitution

Article I—THE NAME OF THIS ORGANIZATION IS THE MINNESOTA STATE MEDICAL ASSOCIATION, WHICH MAY HEREINAFTER BE REFERRED TO AS THE ASSOCIATION.

Article III—Location. THE HEADQUARTERS OF THE MINNESOTA STATE MEDICAL ASSOCIATION, INCORPORATED UNDER THE LAWS OF MINNESOTA, IS LOCATED IN THE CITY OF SAINT PAUL, COUNTY OF RAMSEY AND STATE OF MINNESOTA.

Article V—MEMBERSHIP CLASSIFICATIONS. THIS ASSOCIATION SHALL CONSIST OF ACTIVE, LIFE, SERVICE, AFFILIATE, RESIDENCY, HONORARY AND ASSOCIATE MEMBERS, AS SPECIFIED IN THE BY-LAWS.

Article VII—Annual Sessions and Meetings, Section 2. THE GENERAL TIME AND PLACE FOR HOLDING EACH ANNUAL SESSION SHALL BE FIXED BY THE HOUSE OF DELEGATES, EXCEPT THAT THE EXACT DATE OF THE SESSION MAY BE FIXED BY THE COUNCIL.

Article IX—Officers, Section 6. IN CASE OF VACANCY IN AN OFFICE, UNLESS OTHERWISE PROVIDED FOR IN THIS CONSTITUTION OR BY-LAWS, THE COUNCIL SHALL HAVE THE POWER TO APPOINT TEMPORARILY A SUCCESSOR, UNTIL THE HOUSE OF DELEGATES SHALL MEET AND ELECT ONE, OR UNTIL THE NEXT ANNUAL SESSION.

Article X—Funds and Expenses. THE ANNUAL DUES SHALL BE DETERMINED BY A TWO-THIRDS VOTE OF THE DELEGATES PRESENT. FUNDS MAY ALSO BE RAISED FROM THE ASSOCIATION'S PUBLICATIONS, BY VOLUNTARY CONTRIBUTIONS, AND IN OTHER MANNER APPROVED BY THE HOUSE OF DELEGATES. FUNDS MAY BE APPROPRIATED BY THE HOUSE OF DELEGATES TO DEFRAY EXPENSES OF THE ASSOCIATION, FOR SCIENTIFIC AND EDUCATIONAL PUBLICATIONS, AND FOR SUCH OTHER PURPOSES AS WILL PROMOTE THE ADVANCEMENT OF MEDICINE. ALL RESOLUTIONS APPROPRIATING FUNDS MUST BE APPROVED BY THE COUNCIL BEFORE ACTION IS TAKEN THEREON.

It was moved, seconded and carried that each of the above changes be adopted and that they become a part of the Constitution and By-Laws of the Association.

Dr. Leo Nash of Saint Paul, Chairman, reported for the committee appointed by the chair last year to evaluate the program of the University Cancer Detection Center, that complaints about the program of the Center have not been shown, after extensive study of the committee, to be justified. The committee, therefore, endorsed the current program of the Center, especially as a teaching center for cancer detection for doctors of the state and as a research center for evaluation of established methods of cancer detection, as well as a means of educating people to demand periodic examinations of the type done at the Center, and recommended that the Minnesota State Medical Association approve the extension of the program for one more year, the Minnesota Division of the American Cancer Society having agreed to finance the Center for that period. The report was accepted unanimously by the delegates.

Speaker Sheppard then called for reports of the reference committees. Dr. P. J. Pankratz of Mountain Lake gave the report of the Reference Committee on Medical Education Reports.

Medical Education Reports

Dr. Pankratz: The Reference Committee on Medical Education Reports met this morning at the Hotel Saint Paul. The following reports were considered:

Committee on Cancer—A. H. Wells, M.D., Duluth, Chairman
Committee on Conservation of Hearing—L. R. Boies, M.D., Minneapolis, Chairman
Committee on First Aid and Red Cross and Committee on Blood and Blood Banks—John S. Lundy, M.D., Rochester, Chairman
Heart Committee—F. J. Hirschboeck, M.D., Duluth, Chairman
Committee on Hospitals and Medical Education—H. S. Diehl, M.D., Minneapolis, Chairman
Committee on Public Health Nursing—Mario Fischer, M.D., Duluth, Chairman
Committee on Syphilis and Social Diseases—H. G. Irvine, M.D., Minneapolis, Chairman
Committee on Tuberculosis—J. A. Myers, M.D., Minneapolis, Chairman
Committee on Vaccination and Immunization—R. N. Barr, M.D., Minneapolis, Chairman

The Committee accepted the reports with the following special comments and recommendations: That a new term, "audiology," defined as the science of evaluating hearing, has been accepted by the Committee on Conservation of Hearing and information should be made available as suggested about the Audiological Clinic at the University; that delegates should make a point of reading carefully the excellent report of the Committee on First Aid and Red Cross; that the increase in incidence of infectious hepatitis reported by the Committee on Vaccination and Immunization be noted, also its possible transmission by contaminated syringes and needles; and that the Committee be asked to request from the State Board of Health a definition and outline of an accepted technique for mass immunization programs and that the information be distributed to county medical societies and public health nurses; that the Minnesota Department of Health be commended for its cancer program and that the report of the Cancer Detection Center Committee (heard earlier), be commended and approved; that efforts to increase the number of medical students and nurses accepted for training and graduation be especially commended as reported by the Committee on Hospitals and Medical Education and that the large number of new hospitals and hospital additions built in Minnesota without Federal aid be noted; that special commendation be bestowed upon the Committee on Syphilis and Social Diseases for its work in lowering incidence of these diseases, but that the need of constant vigilance should be stressed; and that special note should be made of the fact that the number of blood samples marked "pregnancy," submitted for analysis, is roughly only one-half the number of daily births; that the State Board of Health should be strongly supported by the Association in every phase of its tuberculosis control program.

The House of Delegates approved the report of the Reference Committee on Medical Education Reports as a whole. Speaker Sheppard then called for the report of the Reference Committee on Miscellaneous Scientific Reports, Dr. Claude J. Ehrenberg, Minneapolis, Chairman.

Miscellaneous Scientific Reports

Dr. Ehrenberg: The Reference Committee for Miscellaneous Scientific Reports met this morning and considered the following reports:

Committee on Anesthesiology—R. C. Adams, M.D., Rochester, Chairman
Committee on Brucellosis—W. W. Spink, M.D., Minneapolis, Chairman
Committee on Child Health—G. B. Logan, M.D., Rochester, Chairman
Committee on Chronic Illness—E. L. Tuohy, M.D., Duluth, Chairman
Editorial Committee—Carl B. Drake, M.D., Saint Paul, Chairman
Committee on Diabetes—J. R. Meade, M.D., Saint Paul, Chairman
Committee on Fractures—E. T. Evans, M.D., Minneapolis, Chairman
Committee on General Practice—R. H. Creighton, M.D., Minneapolis, Chairman
Historical Committee—Robert Rosenthal, M.D., Saint Paul, Chairman
Committee on Industrial Health—L. S. Arling, M.D., Minneapolis, Chairman
Committee on Maternal Health—J. J. Swendson, M.D., Saint Paul, Chairman
Committee on Medical Testimony—E. M. Hammes, Sr., M.D., Saint Paul, Chairman
Committee on Military Affairs—J. H. Tillisch, M.D., Rochester, Chairman
Committee on Nervous and Mental Diseases—W. P. Gardner, M.D., Saint Paul, Chairman
Committee on Ophthalmology—T. R. Fritsche, M.D., New Ulm, Chairman
Committee on Public Health Education—F. J. Elias, M.D., Duluth, Chairman
Radio Committee—R. M. Burns, M.D., Saint Paul, Chairman
Speakers' Bureau—H. M. Carryer, M.D., Rochester, Chairman

The Committee approved these reports with the following comments: That the Minnesota Society of Anesthesiologists be regularly given one session at the annual meeting, or part of a session, for a program on anesthesiology and in view of the fact that, though the number of maternal deaths in Minnesota in 1952 was very low, four were due to anesthesia, speakers on the subject be invited to address county and district medical societies; that the Committee on Brucellosis be discontinued as recommended; that particular attention be paid to the rehabilitation program of the State Board of Health as noted by the Committee on Chronic Illness; that the campaign to find hidden diabetes sponsored by the Committee on Diabetes and county medical societies all over the state has reached many people in Minnesota, with the Hennepin county society reaching some 36,000 and of these well over one hundred were found with sugar in the urine; that the recommendation of the Committee on Fractures for establishment of first aid training in the seventh and eighth grades (a proposal to be acted upon by the Committee on First Aid and Red Cross, also, in the course of this meeting) and the endorsement of employment by the Minnesota Department of Health of a Health Educator in Child Accident Prevention (also recommended by the Committee on Child Health) be noted and approved; that the recommendation by the Committee on General Practice that the president of the Minnesota Academy of General Practice become chairman of the committee, upon his retirement from office, appears agreeable to all and should be considered; that employment of Mrs. Nora Guthrey of Rochester as special writer and investigator for the Historical Committee is desirable; that the Committee on Maternal Health should be commended for doing one of the ablest jobs in the country in determining causes of maternal deaths; in that connection attention was called to the fact that the maternal death rate in Minnesota includes maternal, as well as obstetrical deaths, as opposed to many other states where obstetrical deaths alone are included; that physicians are apparently not reporting instances of unethical medical testimony to the Committee on Medical Testimony; that the work of the Committee on Military Affairs should be considered in co-operation with the Committee on Industrial Health to avoid confusion in plans made by each of them for disaster aid in Civil Defense; that mental health matters are probably in very good hands in the state, in spite of the fact that the office of Commissioner of Mental Health has been abolished; that attention should be called to the Eye Pathology Laboratory which the Greater University Fund will support at the University, in connection with the report of the Committee on Ophthalmology, and donations can be earmarked for this purpose: that the delegates be urged to review the report of the Committee on Public Health Education, including reports of the Radio Committee and the Speakers' Bureau, in detail.

The delegates voted to accept the report of the Reference Committee on Miscellaneous Scientific Reports and Speaker Sheppard called on Dr. E. C. Bayley of Lake City, Chairman of the Reference Committee on Medical Economics Reports.

Medical Economics Reports

Dr. Bayley: The Reference Committee on Medical Economics Reports met this morning and considered the following reports:

Editing and Publishing Committee—E. M. Hammes, Sr., M.D., Saint Paul, Chairman
Committee on Hospitals and Professional Relations—J. Minott Stickney, M.D., Rochester, Chairman
Committee on Interprofessional Relations—W. P. Gardner, M.D., St. Paul, Chairman
Medical Advisory Committee—W. H. Hengstler, M.D., Saint Paul, Chairman
Committee on Medical Economics—George Earl, M.D., Saint Paul, Chairman
Committee on Medical Ethics—Louis A. Buie, M.D., Rochester, Chairman
Committee on University Relations—F. J. Elias, M.D., Duluth, Chairman

The Committee moved acceptance of these reports with the following comments and suggestions: That the Editing and Publishing Committee be commended for showing a profit of more than $4,000; that the Principles of Medical Ethics of the American Medical Association should be adopted by the Minnesota State Medical Association; that the Committee on Medical Economics be commended for its vigilant stand against the threat of socialized medicine and that it be urged to continue its study of improvements in the state's coroner system; that parents of students all over the state who participate in athletic contests under the Minnesota State High School League and in the current athletic benefit plan be informed that medical benefits under the plan are only partial payments for services rendered; that every county and district society should have a Grievance Committee to consider and evaluate complaints; that the Medical Advisory Committee be commended for its report and that an effort to ascertain the amount of actual losses by insurance companies in the state be suggested to the committee, as distinct from reserves set up by the companies to cover pending cases, also that the membership be told again that accurate data on the incidence and disposition of all claims would be available without reliance upon insurance companies, if 100 per cent co-operation could be obtained by the state office from all members threatened with suit.

Following discussion by Dr. L. A. Buie of Rochester, Chairman of the American Medical Association's Judicial Council, on the advisability of making the Principles of Medical Ethics the official standard of all state associations, the delegates voted to accept the report as a whole and the Speaker called for the report of the Reference Committee on Miscellaneous Medical Economics Reports, Dr. A. E. Brown of Rochester, Chairman.

Miscellaneous Medical Economics Reports

Dr. Brown: The Reference Committee on Miscellaneous Medical Economics Reports met this morning and considered the following reports:

Insurance Liaison Committee—Clarence Jacobson, M.D., Chisholm, Chairman
Committee on Medical Service—J. A. Bargen, M.D., Rochester, Chairman
Committee on Rural Medical Service—Paul C. Leck, M.D., Austin, Chairman
Committee on State Health Relations—C. E. Proshek, M.D., Minneapolis, Chairman
Committee on Veterans Medical Service—R. H. Creighton, M.D., Minneapolis, Chairman

Reports of these committees were all accepted for approval by the delegates with the following comments: That the Committee on Rural Medical Service be commended for an excellent job in promoting rural health education and that the Woman's Auxiliary be given special thanks for its part in this work; that the Committee on State Health Relations also be commended for its continuing effort to improve the coroner system in the State; that the Athletic Benefit Plan of the Minnesota High School League (touched on by the Reference Committee on Medical Economics Reports) be more fully considered by the delegates and that some insurance plan be worked out that would more adequately carry athletes through serious injuries and that some method of making sure that parents have a better understanding of the scope of this insurance be worked out, also. Extensive discussion of possibilities for insurance, to be financed either by the school board, or athletic funds, or by the parents, followed, and Dr. Bargen was instructed to see that a letter explaining the present status and purpose of the plan to all parents be sent out as proposed by the League this fall.

The delegates accepted the report of the Reference Committee on Miscellaneous Medical Economics Reports, and Speaker Sheppard called for the report of the Reference Committee on Officers and Councilors Reports, Dr. L. E. Steiner, Albert Lea, Chairman.

Officers and Councilors Reports

Dr. Steiner: The Reference Committee on Officers and Councilors Reports met this morning and the following reports were discussed: Secretary and Executive Secretary, Treasurer, Chairman of the Council and Councilors of districts one through nine.

The reports of all officers and councilors were considered and approved by the reference committee with the following comments: That the work of the Secretary and Executive Secretary has continued on a high level and that they should be commended for their fine work of the past year; that the Council and delegates be requested to give the matter of the Physicians' Assistance Fund further consideration.

The delegates accepted the report and adjourned at 4:40 p.m.

Second Meeting, Sunday, May 17, 1953

The second meeting of the House of Delegates convened in the Continental Room of the Hotel Saint Paul, Saint Paul, at 8:15 p.m., Sunday, May 17, 1953.

Speaker Sheppard called on Dr. A. J. Chesley and Dr. R. N. Barr of Minneapolis for a report from the Minnesota Department of Health.

Dr. Chesley outlined major actions by the Legislature at its last session which affect the work of his department and the medical profession, notably the continuation of the Commission on Alcoholism for which $7,500 was appropriated to cover salary of a state consultant, expenses of an advisory board of nine and of a secretary stenographer, all to be developed under direction of the State Board of Health; also continuation of the study of requirements for care of the aged and chronically ill. He noted that grants-in-aid from the federal government have been drastically curtailed and that the program of mass tuberculosis case finding by means of mobile x-ray units will have to be discontinued except where surveys are already under way or have been promised; also that registrations and reports for the Division of Vital Statistics have now been organized on a county rather than a local community basis, except where cities have definitely specified a local city basis by ordinance; that it is hoped to set aside a laboratory room in the department headquarters for virus work, especially in view of new developments in influenza research; but that no funds will be available for the evaluation study of new tuberculosis drugs suggested by the medical association's Committee on Tuberculosis.

Dr. Barr pointed out that the care and rehabilitation of chronic diseases is the biggest problem facing the department, as well as the medical profession; that many new beds for the care of the chronically ill have been built during the past year; but that hospital beds are only one aspect of the problem which requires also medical care, nursing homes easily become overcrowded and under-problem of all right now is maintenance of standards in all these services and in this work doctors are the biggest factor and must take the lead. He also noted that nursing homes easily become over-crowded and understaffed; but that where facilities are provided for rehabilitation and where activity is systematically encouraged it is possible, as in Oak Ridge home in Minneapolis, for 66 per cent of the patients to walk out of the hospital and save the state untold amounts of money. With respect to the cut in aid for the tuberculosis program, Dr. Barr pointed out that routine hospital admission x-rays, sponsored by the association's committee and the Council, will find twice as many unsuspected cases as the mass x-ray surveys and that services performed by these mobile units can and should be taken up by doctors and medical services of local communities. He drew attention to the effectiveness of the maternal mortality program of the doctors in terms of lowered death rates in Minnesota.

Speaker Sheppard called on Dr. R. H. Wilson of Winona, Chairman of the Medical Advisory Committee of the State Division of Social Welfare, who reported that his committee has had fine co-operation from the Division of Social Welfare. No policy affecting medicine, no fee schedule or drug program is ever put into effect without clearing with the Medical Advisory Committee. He pointed to the difference between the budget for medical care when he first went on the committee, which was $500,000, and the $13,000,000 appropriated for the next biennium and emphasized that, although the entire program is labelled "medical care," physicians receive only about 15 per cent of the appropriation. The rest goes for hospital and other services. One reason for the large amount appropriated is that no limit is placed on medical services and more people are taking advantage of the program partly because it is free and partly because many families no longer take care of the ill and aged at home. To help cut down medical expenses he urged all doctors to discharge patient-clients from general hospitals as soon as possible. He also urged that every county society appoint an active medical advisory committee of its own to assist the state committee and iron out as many problems as possible at home. He also suggested that physicians consider establishment of a uniform fee schedule for the state, based upon the Blue Shield schedule. No uniform schedule will be forced upon the doctors by the state department; and no such schedule has been in use since the early days of the SERA when a schedule was adopted providing roughly for 33⅓ per cent of average fees. Many difficulties arise because of the discrepancy between fees in smaller towns and the cities.

Dr. F. F. Callahan, Saint Paul, Director of Medical Service for the Division of Social Welfare, emphasized the advantage of active local medical advisory committees, declaring that very little trouble over fees ever arises where such committees function.

After a report from Dr. L. L. Sogge of Windom, Chairman of the Public Policy Committee, and Mr. F. Manley Brist, attorney for the Association, Speaker Sheppard called for the Necrology report from Dr. F. J. Hirschboeck of Duluth. A moment of silence was observed.

After calling attention of the delegates to the special section devoted to "100 Years of Medicine in Minnesota" published that morning by the *Saint Paul Pioneer Press and Dispatch* in honor of the centennial meeting of the Association, Speaker Sheppard adjourned the meeting at 9:30 p.m.

Third Meeting, Monday, May 18, 1953

The House of Delegates reconvened at 1:20 p.m. at the Continental Room, Hotel Saint Paul, Saint Paul, Minnesota, with Speaker Sheppard presiding.

Dr. E. M. Hammes, Sr., Saint Paul, Chairman of the Editing and Publishing Committee, announced that Dr. Carl B. Drake had resigned after thirty-four years as editor of the Association's journal, MINNESOTA MEDICINE, and that the committee had not yet selected an editor to take his place. He also suggested that a vote of thanks and appreciation be given by the delegates to Dr. Drake for his long and distinguished service.

It was unanimously voted to send to Dr. Drake a resolution embodying the thanks and appreciation of the delegates, and Speaker Sheppard called for final action on proposed changes in the By-Laws.

Changes in the By-Laws

It was unanimously voted to make the following changes (read for the first time, at the first meeting, Sunday, May 17):

Chapter I, Section 6, having to do with associate members.
Chapter I, Section 9, having to do with residency members.
Chapter II, Section 9, having to do with duties of the Nominating Committee of the House of Delegates.
Chapter III, Section 4, having to do with selection of nominees for the office of councilor.
Chapter IV, Section 3, having to do with duties of the Vice President.
Chapter IV, Section 4, having to do with duties of the Speaker of the House of Delegates with respect to submitting names of nominees for the office of councilor.
Chapter VII, Section 7, having to do with county and district societies.

Speaker Sheppard then called for a special report from the Committee on First Aid and Red Cross, Dr. John S. Lundy of Rochester, chairman, which met earlier the same day to consider the program of first aid education proposed by the Committee on Fractures for seventh and eighth grade students.

Dr. Lundy recommended for this committee that a plan be set up to increase emphasis on first aid training in the schools of Minnesota, including disaster training and planning; That this program include all grades of the junior and senior high schools; That the plan be drawn up by competent groups and presented to the Commissioner of Education for this approval.

The report was unanimously approved, and Speaker Sheppard called on Dr. W. R. Humphrey of Stillwater to outline the status and needs of the Physicians' Assistance Fund.

Dr. Humphrey reported that out of a paid membership in the Association of 2,876 last year, only 321 members had contributed to the fund. The amount of money realized was only $3,936 which was obviously not enough to enable the committee to put any program in operation. The committee felt from the beginning, Dr. Humphrey said, that fund raising should not be left to voluntary contributions. Some men could be depended upon to give more than the suggested $10 apiece and others would fail to give any at all. Actually, one society, the Park Region Medical Society with fifty-six members, made fifty-nine contributions and realized $640, while some other bigger societies gave hardly anything at all. Many of the men who need help are not 100 per cent needy, Dr. Humphrey said. Some have inadequate fixed incomes, or they may need help with hospital bills, or they are disabled by illness or have encountered other misfortunes. It is the opinion of the committee that the volunteer method having been tried and having failed, every active member of the association who has not already invested at least $10 in this fund should be assessed $10.

In the discussion which followed it was revealed that eight or nine physicians in the state are in need of help at the present time; but that there has not been sufficient experience with the problem to be certain how large a fund would be needed, or how often the assessment would have to be made.

It was accordingly moved, seconded and carried that all active dues-paying members who have not already contributed at least $10 to the Physicians' Assistance Fund be assessed $10 for the year 1953, with all details as to the date when the assessment is due and when a member may be declared delinquet for nonpayment, and also as to methods of collection and disbursement be left to the decision of the Council.

Speaker Sheppard then called for the report of the Resolutions Committee, Dr. R. H. Wilson of Winona, Chairman.

Resolutions of thanks and appreciation to the Ramsey County Medical Society as host for the centennial meeting, to the *Minneapolis Tribune* and the *Minneapolis Star* for their excellent reporting of the meeting, to the *Saint Paul Pioneer Press and Dispatch* for the special centennial supplement on "100 Years of Medicine in Minnesota," to the Hotel Lowry and Hotel Saint Paul, the Saint Paul Auditorium and the Saint Paul Association for their contributions to the comfort of guests and success of the meeting were read by Dr. Wilson and passed unanimously by the delegates.

A resolution of appreciation to Mr. F. Manley Brist of Saint Paul, attorney for the Association, for his contribution to medicine through the work of the Committee on Public Policy, the Minnesota State Board of Medical Examiners and Minnesota Medical Service was submitted by the Upper Mississippi and the Stearns-Benton Medical Societies and presented by Dr. Wilson. Also a resolution of thanks to Dr. L. L. Sogge for his long service as President, as Councilor and as Chairman of the Committee on Public Policy was submitted by the same societies. Both resolutions were passed unanimously with a rising vote of applause by the entire assembly.

A resolution placing the Minnesota State Medical Association whole-heartedly behind the study now being made by the Legislative Research Committee, at the direction of the 1953 Legislature, on improvements which should be made in the state's coronor system was passed for submission to the Research Committee. A resolution from the Renville County Medical Society on the subject of the Veterans Administration was referred for study to the Committee on Veterans Medical Service.

The following resolution from the Minnesota Academy of General Practice was unanimously passed. It paralleled several other resolutions from the Renville, Ramsey, Stearns-Benton and Park Region societies.

WHEREAS it is agreed that public criticism of one physician by another is a violation of the principles of medical ethics of the American Medical Association and

WHEREAS in recent months nation-wide publicity has been given to intra-professional criticism and

WHEREAS such statements have tended to extol one branch of medical practice and disparage another, and

WHEREAS these statements are considered inimical and unbecoming to the dignity of the profession

THEREFORE BE IT RESOLVED that the House of Delegates of the Minnesota State Medical Association condemn such statements and direct that its delegates to the American Medical Association convening in New York in June, 1953, and

BE IT FURTHER RESOLVED that the delegates of the Minnesota State Medical Association to the American Medical Association further any effort made in the American Medical Association to curb such irresponsible action in the future, and

BE IT FURTHER RESOLVED that a copy of this resolution be forwarded to the Council on Medical Practice of the American Medical Association.

The following resolution, incorporating resolutions from the Upper Mississippi, Todd County, and Stearns-Benton Societies, was passed by the delegates:

WHEREAS there has been a marked lack of uniformity in the fee schedules as regards old age recipients, aid to dependent children and the blind in our state social welfare program, and

WHEREAS it would facilitate matters very much on the state level if we had a uniform fee schedule system throughout the State of Minnesota for these welfare cases.

THEREFORE BE IT RESOLVED that we recommend that the component medical societies of the State of Minnesota negotiate with their local welfare boards regarding the adoption of the Blue Shield fee schedule, with necessary supplements, as a standard fee schedule for these welfare cases throughout the state.

The final resolution was introduced by Dr. Wilson as submitted last year by Leo Nash of Saint Paul. The resolution specifically condemned consultation with cultists, in conformity with the Principles of Medical Ethics of the American Medical Association, and directed that offenders be reminded of this violation of the principles of medical ethics by proper judiciary authorities of the state or constituent society, on complaint of members. It was unanimously passed by the delegates.

Speaker Sheppard called for the final report of the Chairman of the Council, Dr. A. O. Swenson of Duluth.

Report of the Chairman of the Council

Dr. Swenson: The second meeting of the council in connection with the 100th Annual Meeting was called to order at 8:30 a.m. Sunday, May 17, 1953.

The Council recommended approval by the House of Delegates of a three-year continuation of the Cancer Detection Center at the University of Minnesota. Plans outlined provided for continuing the present patient load at the ratio of one-third new patient examinations to two-thirds re-check examinations with the reduction after March 1, 1954, to one-sixth new patient examinations and an increase to five-sixths re-check examinations, so as to keep the average load at about 5,000.

The Council also recommended approval of a plan to set up a one-year Laboratory Aid Training program at the University, including six months of hospital training for each trainee.

The following nominations for *Delegates and Alternates to the American Medical Association* were submittee to be voted on by the delegates: Drs. George Earl, Saint Paul; O. J. Campbell, Minneapolis; F. J. Elias, Duluth, as delegates: Drs. E. M. Hammes, Sr., Saint Paul; W. W. Will, Bertha; and A. O. Swenson, Duluth, as alternates, respectively.

To clarify the period which must be covered by annual reports from Association committees, the Council directed that the committee year should coincide with the calendar year and that all annual reports should cover that period, with supplemental reports to be made when needed after consultation with new committee chairman, officers and councilors.

It was decided, also, that a quorum for conducting committee business should consist of a majority of the members; but that business might be transacted by a minority of members with the right reserved by the Council to reject their report and ask for further consideration.

The Chairman reported that the National Health Council which he attended in New York, as representative of the Council, took no action on the report of the President's Commission on the Health Needs of the Nation after two days' discussion. He reported, also, that multiple Blue Shield contracts of varying costs and benefits would best serve the needs of the public in the opinion of the Health Council.

Transfer of Freeborn County Medical Society membership from Council District 1 to District 2 was reported and approved.

The Council re-convened Monday at 8:30 a.m. listened to plans for future developments of the Blue Shield (outlined below for the delegates), concurred in expression of appreciation made at Sunday's meeting by the delegates for the work of Dr. Carl B. Drake, retiring editor of Minnesota Medicine, and authorized the Editing and Publishing Committee to obtain the services of a new editor with arrangements for his salary to be reviewed by the Council.

Speaker Sheppard then called on Dr. E. J. Simons, Medical Director of Blue Shield, for a report of changes contemplated both in subscriber benefits and in fees, including, also, an increase in income level for subscribers below which benefits represent complete fees for services. Consideration is also being given, according to Dr. Simons, to a so-called $5,000 contract providing for considerable increase in benefits and in fees to doctors at a larger cost to subscribers, with the income level considerably higher than the level of the standard contract. Increases are contemplated in maternity benefits, in anesthesia benefits and in some surgical operations. Also, extension of benefits to treatment of sprains and strains with associated x-ray is contemplated.

Dr. Swenson's report and the plans for development of Blue Shield were both unanimously accepted by the delegates.

Speaker Sheppard then called for the reports of the Nominating Committee, Dr. O. M. Heiberg of Worthington, Chairman, and two recommendations, as follows, were proposed by the committee and unanimously accepted:

1. That councilors, in accordance with the change in the By-Laws adopted at this session, submit short biographical sketches with the names of candidates from their respective districts for the office of First Vice President, in advance of the meeting, so that the Nominating Committee may be informed of their qualifications.
2. That one member of the Nominating Committee of the previous year be appointed each year to help maintain continuity.

Nominations were then made as follows. After further nominations were asked for from the floor by the Chair, all were unanimously elected.

President-Elect—Justus Ohage, M.D., St. Paul
First Vice President—Paul C. Leck, M.D., Austin
Second Vice President—Vernon D. E. Smith, M.D., Saint Paul
Secretary—B. B. Souster, M.D., Saint Paul
Treasurer—W. H. Condit, M.D., Minneapolis
Speaker of the House of Delegates—C. G. Sheppard, M.D., Hutchinson
Vice Speaker of the House of Delegates—H. M. Carryer, M.D., Rochester
Councilor—First District—J. Minott Stickney, Jr., M.D., Rochester
Councilor—Second District—R. C. Hunt, M.D., Fairmont
Councilor—Ninth District—A. O. Swenson, M.D., Duluth

George A. Earl, M.D., Saint Paul, was elected delegate to the American Medical Association, as nominated by the Council; also O. J. Campbell, M.D., Minneapolis and F. J. Elias, M.D., Duluth. E. M. Hammes, Sr., M.D., Saint Paul, W. W. Will, MD., Bertha and A. O. Swenson, M.D., Duluth, were elected alternates, respectively, to the delegates as named.

The House of Delegates accepted the invitation of the St. Louis County Medical Society to hold the 1954 annual meeting of the Association in Duluth and, in response to a special request submitted by delegates from the Hennepin County Medical Society, voted to hold its 1955 annual meeting in Minneapolis in recognition of the 100th anniversary of the founding of the Hennepin County Medical Society.

At the request of Dr. A. O. Swenson of Duluth, the House unanimously voted to send a resolution of thanks to Dr. J. M. Waugh of Rochester, retiring councilor of the First District, for valuable and untiring work as Chairman of the Finance Committee of the Council.

The House of Delegates of the 100th Annual session adjourned at 3:20 p.m., May 16, 1953.

✦ Reports and Announcements ✦

AMERICAN COLLEGE OF SURGEONS

The Thirty-ninth Annual Clinical Congress of the American College of Surgeons will be held in Chicago, October 5 to 9, 1953. Headquarters will be at the Conrad Hilton Hotel.

It is estimated that more than 11,000 surgeons, physicians, and others will attend the meeting which will consist of postgraduate courses, forums, symposia, color television programs, and exhibits. Symposia on cancer, trauma, graduate training in surgery, and the surgical specialties will be featured during the week.

Dr. Harold L. Foss, president of The American College of Surgeons, and Sir James Paterson Ross, Vice President of The Royal College of Surgeons, of England, will address the Monday evening meeting. Dr. Fred W. Rankin, Lexington, Kentucky, will be installed as president for the year 1954.

FELLOWSHIPS FOR BASIC RESEARCH IN ARTHRITIS

The Arthritis and Rheumatism Foundation is offering the following research fellowships in the basic sciences related to arthritis:

1. Predoctoral fellowships ranging from $1,500 to $3,000 per annum, depending on the family responsibilities of the fellow, tenable for one year with prospect of renewal.
2. Postdoctoral fellowships ranging from $3,000 to $6,000 per annum, depending on family responsibilities, tenable for one year with prospect of renewal.
3. Senior fellowships for experienced investigation will carry an award of $6,000 to $7,500 per annum and are tenable for five years.

The deadline for applications is November 1, 1953. Applications will be reviewed and awards made by February 15, 1954. For information and application forms, address the Medical Director, The Arthritis and Rheumatism Foundation, 23 West 45th Street, New York 36, New York.

MISSISSIPPI VALLEY TUBERCULOSIS MEETING

Leading authorities on tuberculosis from this country and abroad will appear on the program of the Mississippi Valley Trudeau Society and the Mississippi Valley Conference which will meet October 15, 16, and 17 at the Nicollet Hotel, Minneapolis.

The American Trudeau Society is the medical section of the National Tuberculosis Association. Philip H. Becker, M.D., medical director of the James O. Parramore Hospital, Crown Point, Indiana, is president of the Mississippi Valley branch. Head of the Conference is J. H. Skavlem, M.D., medical director of Dunham Hospital, Cincinnati.

D. G. Madigan, M.D., Kent, England, who founded the unit for chemotherapeutic research in tuberculosis at Farnborough Hospital, is among the outstanding speakers.

Dr. Madigan, a consultant on chest diseases at Farnborough Hospital, will discuss "Old Tuberculin and Bacillary Emulsions Under Chemotherapeutics Cover in Treatment of Tuberculosis." His chemotherapeutic unit began the first clinical trials of streptomycin in Great Britain nine months before the British Medical Research Council's controlled trial was organized. Other chemotherapeutic substances which have been studied by the unit are Sulphetrone, Para-Aminosalicylic acid, Thiosemicarbazones, Viomycin and Isoniazid. He will speak at the Friday afternoon joint session.

Also speaking on this program will be: J. Arthur Myers, M.D., professor of medicine, preventive medicine and public health, University of Minnesota, on "Accomplishments and Future Needs to Eradicate Tuberculosis," and T. A. Duckworth, director of personnel, Employees Mutual Liability Insurance Company of Wisconsin, Wausau, Wisconsin, on "How to Establish an Industrial Health Program."

The program for the medical meeting includes the following: "The Nodular Lesion," by Donald S. King, M.D., president of the American Trudeau Society, Brookline, Massachusetts; "Experiences in the Management of Meningeal and Miliary Tuberculosis," by J. Park Biehl, M.D., and Morton Hamburger, M.D., University of Cincinnati College of Medicine; "Genito-Urinary Tuberculosis," by John Lattimer, M.D., Department of Urology, Columbia University College of Physicians and Surgeons, New York, and "Report of Isoniazid Study by U. S. Public Health Co-operative Group," by Harold G. Curtis, M.D., Sunnny Acres Sanatorium and Western Reserve University, Cleveland.

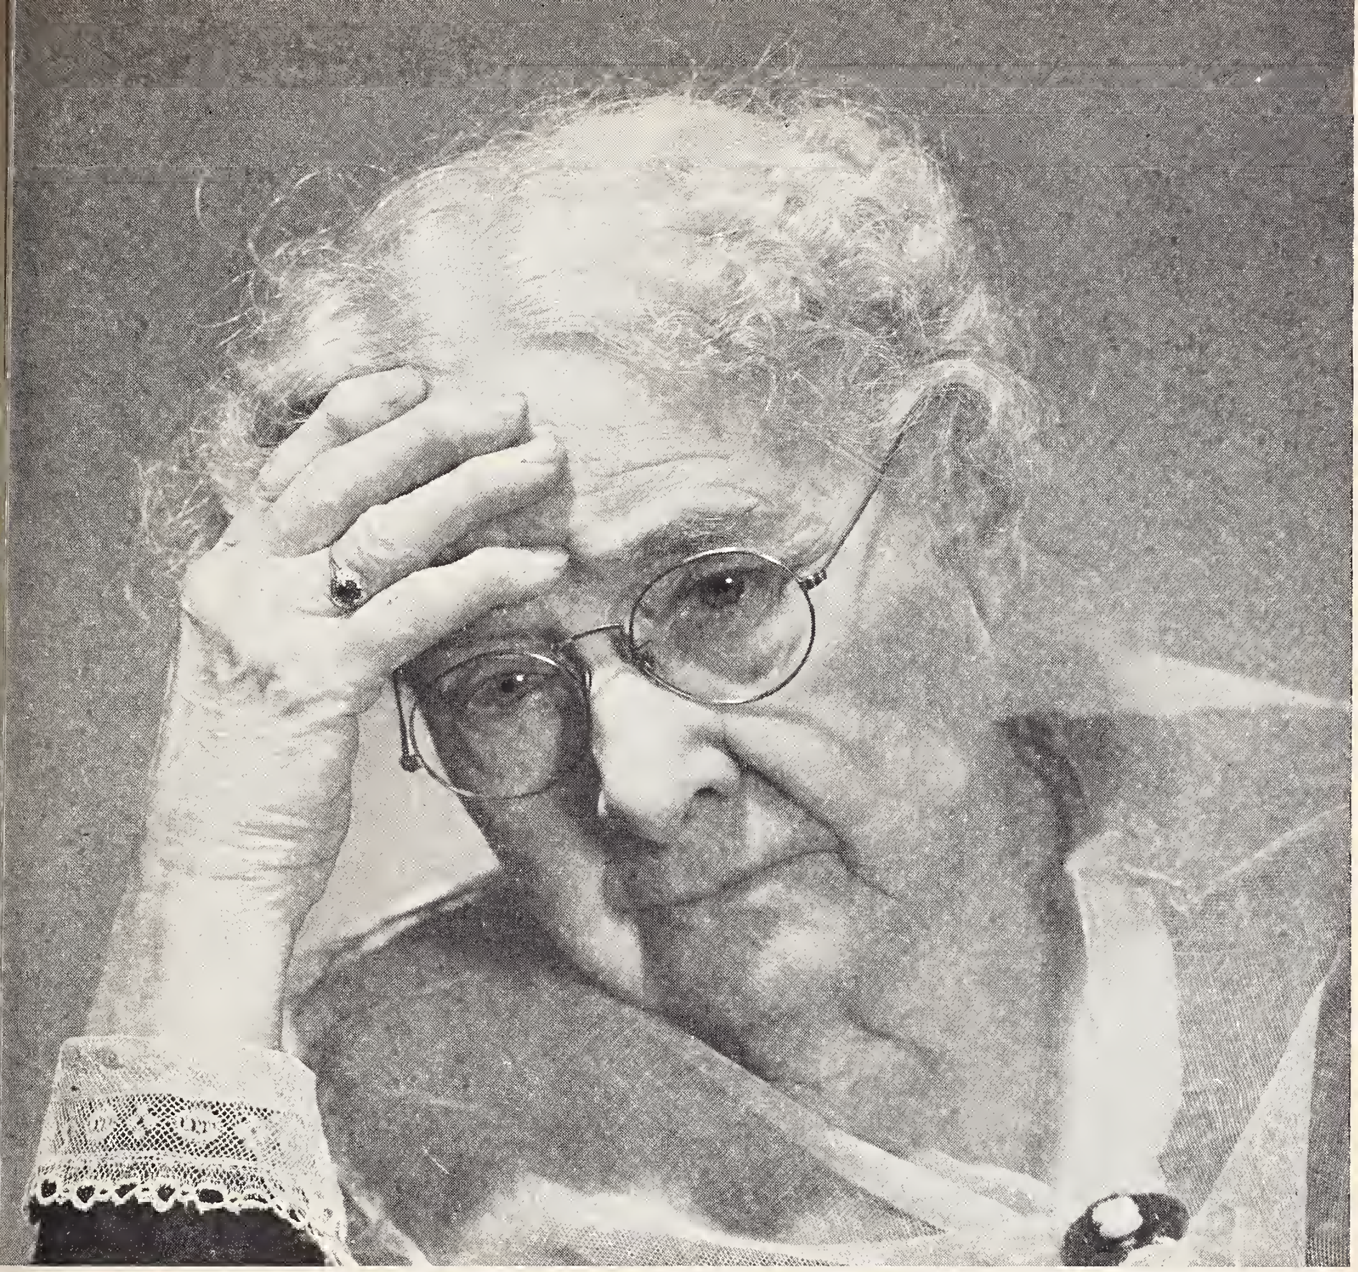
"Tuberculosis Control in Industry," by Dan Morse, M.D., medical director and superintendent, Peoria Municipal Tuberculosis Sanatorium; Harold Vonachen, M.D., medical director, and M. H. Kronenberg, M.D., assistant medical director, Caterpillar Tractor Company, Peoria.

"Bacterial Resistance to Modern Chemotherapeutic Agents," by Alfred G. Karlson, D.V.M., Mayo Clinic, Rochester, and "Esophageal Surgery," by Saul A. Mackler, M.D., Mt. Sinai, Michael Reese and Cook County Hospitals, Chicago.

"Pulmonary Circulation in Mitral Stenosis and Alterations Following Valvulotomy," by J. Gerard Mudd, M.D., St. Louis University, St. Louis; "Surgery of the Mitral Valve," by C. Rollins Hanlon, M.D., professor of surgery, also of St. Louis University, and "Respiratory Acidosis," by William W. Stead, M.D., Fitzsimons Army Hospital, Denver; "Presentation of Cases, Diagnosis and Management of Pulmonary Infiltrates," by William B. Tucker, M.D., and associates, Veterans Administration Hospital, Minneapolis.

All in attendance are invited to attend the Minnesota

(Continued on Page 988)



The inevitable restrictions of advancing years, the reduced activity and a lowered intake of bulk-producing foods all contribute to the high incidence of constipation in older persons.

CONSTIPATION IN THE AGED

Constipation is almost a universal complaint of geriatric patients

Frequently, too, the protracted use of cathartics has left the colon in an atonic state and it is no longer capable of effecting a normal evacuation.

Metamucil has long been recommended for the treatment of constipation in the elderly. A highly refined vegetable product which is free from irritants, Metamucil effects a natural mechanical stimulus in the colon which helps the dysfunctioning muscles to regain and maintain their normal tone.

Metamucil may be safely prescribed for prolonged use without fear of dependence, intestinal irritations or allergic reactions.

Metamucil® is the highly refined mucilloid of Plantago ovata (50%), a seed of the psyllium group, combined with dextrose (50%) as a dispersing agent. It is accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

SEARLE *Research in the Service of Medicine*

Tuberculosis and Health Association's annual dinner, October 15, Coffman Memorial Union, University of Minnesota. A special feature of the program will be a presentation of the popular Minnesota TV program, "The Doctors' Round Table." David T. Carr, M.D., consultant in medicine, Mayo Clinic, Rochester, will be the guest participant and the regular panel members are: Ezra V. Bridge, M.D., superintendent Mineral Springs Sanatorium, Cannon Falls; John F. Briggs, M.D., Saint Paul; J. A. Myers, M.D., professor of medicine, preventive medicine and public health, University of Minnesota, and T. F. Mulrooney of the Minnesota Tuberculosis and Health Association, moderator.

VAN METER PRIZE AWARD

The American Goiter Association again offers the Van Meter Prize Award of Three Hundred Dollars and two honorable mentions for the best essays submitted concerning original work on problems related to the thyroid gland. The award will be made at the annual meeting of the Association which will be held in Boston, Massachusetts, April 29, 30 and May 1, 1954, providing essays of sufficient merit are presented in competition.

The competing essays may cover either clinical or research investigations; should not exceed three thousand words in length; must be presented in English, and a typewritten double-spaced copy in duplicate sent to the Corresponding Secretary, Dr. John C. McClintock, 149½ Washington Avenue, Albany 10, New York, not later than January 15, 1954. The committee, who will review the manuscripts, is composed of men well qualified to judge the merits of the competing essays.

A place will be reserved on the program of the annual meeting for the presentation of the Prize Award Essay by the author, if it is possible for him to attend. The essay will be published in the annual proceedings of the Association.

Cook County Graduate School of Medicine

POSTGRADUATE COURSES—1953

SURGERY—Intensive Course in Surgical Technic, two weeks, starting September 14, September 28, October 12
  Surgical Technic, Surgical Anatomy and Clinical Surgery, four weeks, starting October 26
  Surgical Anatomy and Clinical Surgery, two weeks, starting November 9
  Gallbladder Surgery, ten hours, starting October 26
  General Surgery, one week, starting October 5
  Surgery of Colon and Rectum, one week, starting September 21
  Basic Principles in General Surgery, two weeks, starting September 21

TEACHING FACULTY—ATTENDING STAFF OF COOK COUNTY HOSPITAL

ADDRESS: REGISTRAR, 707 South Wood Street, Chicago 12, Illinois

CONTINUATION COURSES

The University of Minnesota, in conjunction with the Minnesota Tuberculosis and Health Association, will present a continuation course in *Tuberculosis for Lay Persons* particularly interested in this field. The course will be held at the Center for Continuation Study on the University of Minnesota Campus from October 12 to 14, 1953, and emphasis will be placed on the public health aspect of tuberculosis.

* * *

The University of Minnesota will present a continuation course in *Rehabilitation for General Physicians* at the Center for Continuation Study, October 22-24, 1953. Attention is being focused increasingly on the development of public and private programs in rehabilitation; therefore, this course is particularly timely. The course will deal with the physician's role in the rehabilitation of various types of patients and will provide information concerning agencies which may provide additional help for his patient. The faculty will be headed by Dr. Donald L. Rose, Professor and Head, Department of Physical Medicine and Rehabilitation, University of Kansas School of Medicine, and the program will be presented under the direction of Dr. Frederic J. Kottke, Professor and Head, Department of Physical Medicine and Rehabilitation. The remainder of the faculty will include members of the clinical and full-time staff of the University of Minnesota Medical School and the Mayo Foundation.

* * *

A continuation course in *Medical Jurisprudence for Physicians* will be presented by the University of Minnesota, November 5 and 6, at the Center for Continuation Study. This program has been designed to meet the needs of the physician who wishes to improve his understanding of certain legal aspects of medical practice. Guest speaker for the course will be Dr. Francis J. Gerty, Professor and Head, Department of Psychiatry, University of Illinois College of Medicine, Chicago, and the remainder of the faculty will include members of the faculty of the University of Minnesota. This course will be presented as one of a series of Homecoming Week events which will be of interest to all physicians.

* * *

A continuation course in *Fractures* will be presented by the University of Minnesota at the Center for Continuation Study, November 16 to 18, 1953. The program, which is intended primarily for physicians engaged in general practice, will emphasize management of the common types of fractures and some of the complications most frequently encountered. Two outstanding

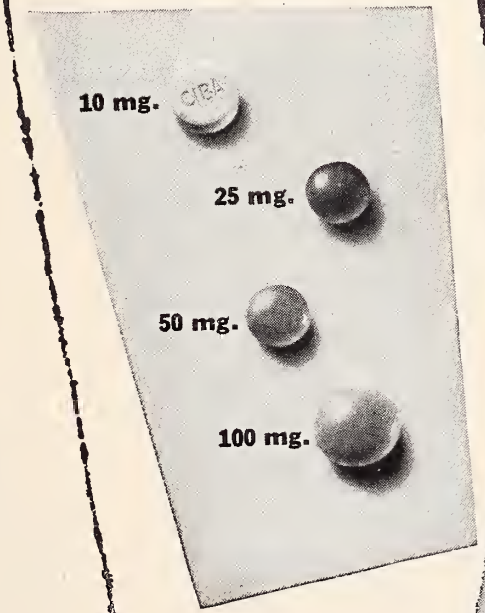
20% PRICE REDUCTION* ON 50-MG. TABLET

20% ADDITIONAL SAVING* WITH NEW 100-MG. TABLET

Now supplied as tablets in 4 different potencies



Ciba

maintenance therapy with

Apresoline®
hydrochloride
(HYDRALAZINE HYDROCHLORIDE CIBA)

now costs less

Advantage may be taken of the economy and convenience of the new high potency 100-mg. tablet for maintenance therapy—provided the patient's particular dosage requirements have first been meticulously determined.

An antihypertensive agent of choice, Apresoline hydrochloride has oral efficacy, relative safety and freedom from toxicity. Even while lowering blood pressure gradually, as it does in the majority of patients, it increases renal blood flow and tends to reduce cerebral vascular tone so that cerebral circulation is not diminished. It constitutes a major advance in the treatment of hypertension.

EAT AND
REDUCE
PLAN

Wide Medical Interest in New Knox Gelatine "Eat and Reduce" Plan

Developed and supervised by competent clinical authority, the new Knox "Eat and Reduce" Plan is intended especially for your overweight patients in otherwise normal health.

The plan has been tested on overweight patients with fine results. In addition, many physicians (and their families) have written us about their gratifying personal results with this plan.

The Knox "Eat and Reduce" Plan is a simple, sensible regimen that places no burden of exercise or hunger on the patient. Quite the contrary, it permits three tempting, solid meals daily, plus between-meal feedings. The menus have been carefully selected so as to provide an abundance of vitamins, minerals and protein. Many of the dishes utilize Knox Gelatine, which is, of course, all protein and no sugar — thus being an effective aid in weight reduction.

guest speakers will participate in the program: Dr. Edwin F. Cave, Chief of Fracture Service, Massachusetts General Hospital, and Associate in Orthopedic Surgery, Harvard University Medical School; and Dr. Walter P. Blount, Consultant in Orthopedics, Milwaukee County Hospital, Milwaukee, Wisconsin. The course will be presented under the direction of Dr. Wallace H. Cole, Professor and Director, Division of Orthopedic Surgery, and the remainder of the faculty will include members of the staff of the University of Minnesota Medical School.

REFRESHER COURSES FOR X-RAY TECHNICIANS

Regional refresher courses in x-ray technique to be held this fall at Crookston, Mankato, Virginia, St. Cloud and Worthington have been announced by the Minnesota Society of X-Ray Technicians which has planned the courses and whose members will serve as instructors. Joining with the Society of X-Ray Technicians as sponsors are the Minnesota Hospital Association, the Minnesota State Medical Association, the Minnesota Radiological Society and the Minnesota Department of Health. The course outline has been developed in cooperation with people in the various regions of the State and every effort has been made to meet the local needs.

All the courses have been planned for week ends to minimize the time spent away from work and will begin on Friday afternoon and end on Sunday afternoon. The schedule of courses is as follows:

Courses will begin Friday afternoon and end Sunday afternoon on the dates indicated.

Crookston, September 4-6, St. Francis Hospital.
Mankato, September 18-20, St. Joseph's Hospital.
Virginia, September 18-20, Virginia Municipal Hospital.
St. Cloud, September 25-27, St. Cloud Hospital.
Worthington, October 2-4, Worthington Municipal Hospital.

Objectives

These refresher courses are being offered to provide an opportunity for those presently engaged in x-ray work to review their techniques and to keep abreast of progress in the field. The courses are not intended to prepare an individual for a career in x-ray technique.

Subject Matter

The subject matter offered has been designed to improve routine techniques. It will be of value to technicians with formal training and/or practical experience whether registered or not. Each person attending will be given an opportunity to discuss his individual technical problems. Registered technicians, experienced in x-ray training programs, will serve as instructors.

Registration

Registration is open to those doing x-ray work in hospitals, clinics and physicians' offices. Tuition fee—$25.00. Send application and fee to Mr. Glen Taylor, Students' Health Service, University of Minnesota, Minneapolis 14. *Make checks payable to the Minnesota Hospital Association.*

Woman's Auxiliary

PRESIDENT SETS DATE FOR SCHOOL OF INSTRUCTION

Mrs. Henry W. Quist, Sr., president of the Woman's Auxiliary to the Minnesota State Medical Association, has announced the date for the fall Board meeting and School of Instruction.

The meeting will be held in the Curtis Hotel in Minneapolis on October 30. Mrs. Quist, in announcing the meeting, urges all Auxiliary members, and especially board members, to make a special effort to attend this important fall planning session. Projects and plans for the coming Auxiliary year will be thoroughly discussed.

Mr. Aubrey D. Gates, Field Director for the Council on Rural Health of the American Medical Association, will be one of the principal speakers at the morning session.

A special treat will be in store for those attending, with the appearance of the President-Elect of the Woman's Auxiliary to the American Medical Association, Mrs. Leo J. Schaefer of Salina, Kansas. Mrs. Schaefer will be one of several distinguished luncheon speakers, and she has expressed a deep appreciation of this invitation to return to Minnesota on this occasion.

Other informed speakers and discussants promise to make the program an interesting and informative one. All Auxiliary members should mark the date, October 30, on their special events calendar, and plan now to attend.

AUXILIARY GIVES EDUCATION MEMORIAL

The Woman's Auxiliary to the Minnesota State Medical Association has recently given a memorial gift to the American Medical Education Foundation in the memory of the late Dr. and Mrs. J. A. Thabes, Sr., of Brainerd. Mrs. Thabes was a former president of the Auxiliary, holding office during 1947-48. Dr. and Mrs. Thabes passed away on June 29, 1953.

Auxiliary members will remember the fine work Mrs. Thabes did during her term of office, as well as throughout her years as a member. It is hoped that the contribution will serve as a reminder of this service to the medical profession performed by Dr. and Mrs. Thabes.

AUXILIARY ROSTER BEING PRINTED

Work is progressing on the preparation of the new roster of board members for the Woman's Auxiliary to the Minnesota State Medical Association. Mrs. F. A. Zinter, roster chairman, reports that the county auxiliaries have responded quite well to her requests for lists of officers. The roster will include all state officers, past presidents and committee chairmen and county presidents and treasurers.

As in the past, the roster will be distributed to board members at the fall school of instruction meeting. If there are any last-minute changes in names or addresses, Auxiliary members are urged to contact Mrs. F. A. Zinter, 2815 N. E. Arthur, Minneapolis, immediately.

In Memoriam

ALFRED E. BORGEN

Dr. Alfred E. Borgen, staff member of the Northern Pacific Hospital in Saint Paul, was drowned in Lake Schelin near Duluth, Saturday, August 8, 1953.

Dr. Borgen was thirty-two years old. He was the son of Walter H. Borgen, St. Louis County auditor, and a graduate of the University of Minnesota medical school.

He met his death when the motor boat in which he and three companions were riding was overturned while towing an aquaplane. He was vacationing, at the time, at the home of his parents.

In addition to his parents, Dr. Borgen is survived by two sisters, Mrs. Ruth Rolf of Alborn and Mrs. Harold Cullen of Lynchburg, Virginia.

CARL OLAF ESTREM

Dr. Carl Olaf Estrem died at his home in Fergus Falls after thirty-nine years in the practice of medicine and many years' illness, on June 5, 1953. He was seventy-three years of age.

Dr. Estrem was born at Willmar and was graduated in medicine from the University of Minnesota in 1907.

He was a member of the Park Region Medical Society, the Minnesota State Medical Association and the American Medical Association and a leader for many years in organized medicine in his section of the state.

He is survived by his widow and five children, of whom two, Drs. Robert D. and Ralph E. Estrem, are both physicians practicing in Fergus Falls.

JOEL C. HULTKRANS

Dr. Joel C. Hultkrans of Minneapolis died at St. Barnabas Hospital, Minneapolis, on Monday, July 27, 1953, after an extended illness.

Dr. Hultkrans was fifty-eight years old. He was born in Saint Paul and was graduated from the University of Minnesota medical school in 1921. He specialized in psychiatry and practiced in Saint Paul until 1934 when he moved to Minneapolis. He continued to practice there until his illness and death.

He served in the Army Medical Corps in World War I and was a member of the Central Neuropsychiatric Association, the American Psychiatric Association, the Minnesota Society of Neurology and Psychiatry, the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association. He was also a member of the Rotary club and the Athletic Club of Minneapolis.

Dr. Hultkrans is survived by his wife, Opal; two daughters, Mrs. John O'Connor, Saint Paul, and Mrs. Clyde F. Anderson, Minneapolis; four sisters, Hildur Hultkrans, Evelyn Hultkrans, Mrs. Beda Olson and Mrs. Ebba Hedenstrom, all of Minneapolis; three brothers, Paul, Phil and Dr. R. E. Hultkrans, all of Minneapolis, and six grandchildren.

JOHN A. THABES

Dr. John A. Thabes, for many years identified with the Northern Pacific Beneficial Association Hospital at Brainerd, died on June 29, 1953. By a strange act of fate, his wife followed him a half hour later.

Dr. Thabes was born in Minneiska, Minnesota, December 5, 1872. He obtained his medical education from the University of Minnesota, graduating in 1896. In 1898 he took postgraduate work in the New York Post-graduate Hospital. He began practice in Brainerd in 1882 and carried on an active practice in addition to being largely engaged in the administration of the Northern Pacific Beneficial Association Hospital located in his home city.

Dr. Thabes was married November 12, 1900, to Daisy A. Badeaux. Two children, Dr. J. A. Thabes, Jr., of Brainerd, a son, and Mrs. Lois Adelaide Hensley of St. Louis, Missouri, a daughter, survive Dr. and Mrs. Thabes. On November 12, 1950, the occasion of their fiftieth wedding anniversary, open house was held at their home for some 250 friends who came from near and far.

Dr. Thabes was a member of the Upper Mississippi Medical Society, the Minnesota State Medical Association and the American Medical Association.

ELMER L. HENDERSON

(Continued from Page 972)

cal advances, and which has helped to make this the healthiest, strongest nation on the face of the globe, has been made the first major objective of those ambitious men in Washington who would make the American people walk in lockstep under a rigidly-controlled, government-dominated economy.

"The American medical system has been made a target for the barbs and criticism of a comparatively small group of little men—little men whose lust for power is far out of proportion to their intellectual capacity, their spiritual understanding, their economic realism or their political honesty.

"These men of little faith in the American people propose to place all our people—doctors and patients alike—under a shabby, government-dictated medical system which they call 'Compulsory Health Insurance.' And, this, factually, is Socialized Medicine, regardless of how hard they try to disclaim it.

"I call upon every doctor in the United States, no matter how heavy the burdens of his practice may be, to dedicate himself, not only to the protection of the people's physical health, but also to the protection of our American way of life, which is the foundation of our economic health and our political freedom."

The American Hearing Society which has had offices in Washington, D. C., since 1922, is moving to Columbus, Ohio, in the immediate future, according to an announcement made by Dr. Thomas L. Tolan, a Milwaukee otologist, president of the agency. Affiliated with the society are 115 local chapters in thirty-four states, the District of Columbia, and Canada. The organization is supported by membership dues from individuals and chapters and contributions of individuals and Community Chests. The Society serves as a clearing house for information relating to hearing and sponsors periodic audiometer tests for school children.

The Trustees of one of America's oldest medical essay competitions, the **Caleb Fiske Prize** of the Rhode Island Medical Society, announce as the subject for this year's prize dissertation, "Recent Advances in Cardiac Surgery." The dissertation must be typewritten, double spaced, and should not exceed 10,000 words. A cash prize of $250 is offered.

For complete information regarding the regulations, write to the secretary, Caleb Fiske Fund, Rhode Island Medical Society, 106 Francis Street, Providence 3, Rhode Island.

* * *

Dr. Daniel H. Bessesen, of Buffalo Lake, opened offices in Danube, in July. Dr. Bessesen will continue his office hours in Buffalo Lake and Olivia as before.

* * *

Dr. George Martin, a graduate of the University of Illinois Medical School, and **Dr. John F. Kane,** a graduate of Marquette University School of Medicine and a diplomate of the American Board of surgery, became associated with **Dr. H. A. Hartfiel** in the Hartfiel Medical Center in Montevideo, in July.

* * *

Dr. Franklin Sidell, of Minneapolis, began practice in the Belgrade Community, July 15. Dr. Sidell has been practicing in Minneapolis for the past six months.

* * *

Dr. Asher A. White, of Minneapolis, was re-elected president of the Hennepin County Tuberculosis Association, and **Dr. Robert N. Barr,** of the Minnesota Department of Health, vice president, at the annual meeting held July 31, in Minneapolis.

* * *

Dr. A. J. Houglum, recently separated from the army, began practice with his brother-in-law, **Dr. A. S. Midthune,** in Lake Park, in July. Dr. Houglum, a graduate of the University of Minnesota Medical School, served in World War II as a pilot in the South Pacific; during the Korean conflict, Dr. Houglum served as a flight surgeon in Japan and Korea.

* * *

Dr. Roy H. Good, recently completed his internship at Minneapolis General Hospital and joined the Caledonia Clinic, Caledonia, in July. Dr. Good is associated in practice with **Dr. J. J. Ahlfs.**

* * *

Dr. Jack Guy, of New London, left in July to enter the United States Public Health Service. Dr. Guy is stationed at the White Earth Hospital at Detroit Lakes.

* * *

Dr. William C. Woyda, a 1952 graduate of the University of Minnesota Medical School, who recently completed his internship at Minneapolis General Hospital, joined the medical partnership of **Drs. A. J. Roehlke** and **G. H. Tesch** at Elk River, in July.

* * *

Dr. Edward G. Burleigh, a graduate of the University of Louisiana Medical School, and **Dr. Jack Bonner,** a graduate of the University of Minnesota Medical School, joined the More Hospital staff at Eveleth, in July. Dr. Burleigh was married September 19, to Florence Marilyn Benassi, of Duluth.

* * *

Dr. Thomas J. Dry, chief of the cardiology section of the Mayo Clinic, and **Dr. Charles F. Code,** chief of physiology at the Mayo Clinic, were featured speakers at the dinner for new fellows of the Mayo Foundation held in the Mayo Foundation House, July 23. More than 100 physicians, including new fellows of the Mayo Foundation and fellows who have recently returned from military service, attended the dinner. **Dr. Clay Klakeg,** vice president of the Fellows' Association, was master of ceremonies.

* * *

Dr. George C. Doxsee, of Monticello, Iowa, who recently completed his internship at St. Luke's Hospital, in Duluth, joined the Mesaba Clinic at Chisholm, July 6.

* * *

Dr. Richard F. Kline has given up his practice of medicine in Grand Rapids to become associated with **Dr. W. W. Rieke,** of Wayzata. Dr. Kline is filling a vacancy which occurred when Dr. Rieke's associate, **Dr. David W. Feigal,** entered the Armed Forces the end of June.

* * *

Physicians, hospitals, and universities of Israel are very desirous of obtaining medical books of all kinds, provided they have been published since 1940 and are in good condition. Besides books on internal medicine and surgery, those on anatomy, bacteriology, biochemistry, biology, chemistry, endocrinology, gynecology, hospitals, industrial medicine, pathology, pharmacology, nursing, and dentistry are desired.

The Stability . . .

OF INCOME

One characteristic usually associated with a bond is that it has an established rate of interest; the investor therefore can compute the annual income he may expect from the date of purchase to the date of final maturity. A bond, like a note or mortgage, is a promise to pay a stipulated amount at a designated future date with interest to accrue in the meantime. This provides STABILITY OF INCOME—once a sound investment is made the annual income is fixed and is not altered by changing economic conditions or market fluctuations.

During the past several years, however, this STABILITY OF INCOME has been impaired by increasing Federal income taxes. The income that invested savings earn, when subject to such taxes, does not enjoy complete STABILITY OF INCOME since a change in the tax rate requires an adjustment in actual "spendable" income received—if taxes rise the effective income is reduced.

Because the income from Municipal Bonds is exempt from present Federal income taxes, Municipal Bonds enjoy a STABILITY OF INCOME not available to investments having taxable income.

We invite you to investigate the advisability of placing your savings in Municipal Bonds, one of the oldest and most widely employed means of investment, and we suggest you write for information and an example of Municipal Bonds currently available for your investment funds.

BROWN & DAY, INC.

St. Paul 1, Minnesota

Dr. C. L. Sherman, of Luverne, was re-elected for the thirty-ninth time as president of the Southwestern Minnesota Sanatorium Commission, in July. Dr. Sherman was first elected when the Commission was organized in July, 1915.

* * *

Dr. A. A. Brink, of Baudette, accepted the chairmanship of the Lake-of-the-Woods County Heart Association, the purpose of which is to raise funds for research and equipment that will aid in the treatment of various heart ailments.

* * *

Dr. Charles W. Mayo, of Rochester, was nominated July 27, by President Eisenhower, to be an alternate delegate to the eight session of the United Nations General Assembly.

* * *

Eight patients who were still under care at the **Ramsey County Children's Preventorium** at Lake Owasso, were moved to Ancker Hospital, Saint Paul, in July, and the Preventorium closed.

* * *

Dr. A. L. Vadheim, of Tyler, was honored August 10 by the community members holding "Vadheim Appreciation Day." The celebration marked the forty-third anniversary of Dr. Vadheim's arrival in Tyler. Besides working as a physician, Dr. Vadheim has been active in community affairs—he served as mayor, as a member of the school board, has been active in the Boy Scout work and assisted in establishing the library. As Red Cross director for Lincoln County, he brought the county national honor in 1941 when it became the first in the world to become accredited for the control of tuberculosis.

* * *

Dr. Joe R. Brown, of Rochester, left in July for Europe, where he will present a paper at the Sixth International Congress of Neurology at Lisbon, Portugal, in September. Dr. Brown will also visit and observe in neurologic centers in other European countries and attend a meeting in Munich of German neurologists.

* * *

Dr. J. S. Blumenthal, of Columbia Heights, professor of Medicine, University of Minnesota Medical School, was interviewed over WDGY radio station, July 23, on the program "Let's Talk It Over." Dr. Blumenthal spoke on allergies.

* * *

Dr. Walter S. Neff, a member of the board of directors of the Minnesota Heart Association, was presented with a merit award by the Heart Association, July 8. The personal presentation of the award was made by G. Ray Higgins, Saint Paul, executive secretary of the Association.

* * *

Attendance at medical short courses at the University of Minnesota's Center for Continuation Study increased 19 per cent during the 1952-1953 academic year, **Dr. Robert B. Howard,** director of the continuation medical study at the University, announced in his annual report which was released in July.

- Medically staffed by every neurologist and psychiatrist in Saint Paul.
- Especially trained nursing staff.

Send for photo booklet and rates.

APPROVED by the Minnesota State Medical Association and the Ramsey County Medical Society.

MEMBER of the American Hospital Association.

MEMBER of the Minnesota Hospital Association.

CRESTVIEW HOSPITAL, 145 W. College Ave., Garfield 5841, St. Paul

A non-profit organization.

Dr. Albert E. Krieser, for the past three and a half years associated with the State of Minnesota, Department of Public Welfare, in offices at Anoka, began practice in Minneapolis with **Dr. H. D. Good** and **Dr. L. J. Roberts,** July 1.

* * *

Dr. Robert H. Nelson and **Dr. Warren Kilmer** opened offices in the International State Bank Building in Littlefork, in July. Dr. Nelson served four years in the Navy and was graduated from the University of Minnesota Medical School in 1952. Recently, he completed his internship at St. Luke's Hospital in Duluth. Dr. Kilmer spent four years in the Army and was graduated from the University of Indiana Medical School in 1952. He recently completed his internship at the Indianapolis General Hospital, Indianapolis, Indiana.

* * *

Dr. M. C. Petersen, of the Rochester State Hospital staff, gave the welcome address and **Dr. Conrad Baars,** also of the State Hospital, acted as the master of ceremonies at the exercise honoring fifty-three psychiatric aids who have completed a year of classes and training at the Rochester State Hospital. This is the third group of psychiatric aids to receive certificates and pins.

* * *

Dr. Helen L. Knudsen, hospital services director of the Minnesota State Health Department, was among those named to a national study group which will survey design and construction of hospital facilities for chronically ill patients. The committee will prepare a report for the National Commission on Chronic Illness which is to meet in Chicago, March 18 to 20, 1954.

* * *

Dr. Martin Enderling, a fellow in the Mayo Foundation who is also an internationally known ice skater from Zurich, Switzerland, was the featured skater at the Rochester "Winter Wonderland" ice carnival held August 5.

* * *

The Koffee Klub of Sandstone served coffee and birthday cake at the Colonial Hotel, August 3, honoring **Dr. H. P. Dredge,** of Sandstone, on his eighty-third birthday.

* * *

Dr. L. H. Klefstad, of Greenbush, and **Dr. David O. Berge,** of Roseau, were named to the medical advisory committee of the Roseau County Chapter of the National Foundation for Infantile Paralysis, at the meeting held in July.

* * *

Dr. John J. Stransky, recently separated from the U. S. Air Force, became associated in practice with **Dr. H. A. Wenter** and **Dr. James R. Doyle,** of Rochester, in August.

* * *

Dr. Robert Dornbach, of Minneapolis, joined **Dr. M. H. Seifert** and **Dr. J. A. DuPont,** in their practice in Excelsior, in August.

The Birches Sanitarium, Inc.

2391 Woodland Avenue
Duluth 3, Minnesota

A hospital for the care and treatment of Nervous and Mental disorders. Quiet, cheerful environment. Specially trained personnel. Recreational and occupational therapy.

Dr. L. R. Gowan, M.D., M.S., Medical Director

Dr. Kenneth G. Henry, who recently completed his internship at Ancker Hospital, Saint Paul, became associated in practice with **Dr. D. H. Dewey**, of Owatonna, in August.

* * *

Dr. L. E. Karges, after two years of service with the army medical corps, returned to his practice in Grand Rapids in August.

* * *

Dr. Oliver M. Porter, of Willmar, left in August to return to Sisseton, South Dakota, where he practiced before coming to Willmar six years ago.

* * *

Dr. G. B. Stickler, a fellow in pediatrics at the Mayo Foundation, formerly of Germany, was the guest speaker at the weekly meeting of the Rochester Lions Club, held August 5. Dr. Stickler spoke on "Pre-War and Post-War Germany."

* * *

Dr. John C. Wohlrabe, who recently completed his internship at Memorial Hospital, Phoenix, Arizona, opened an office for the practice of medicine in St. Clair, Minnesota, July 15. Mrs. Wohlrabe, the former Lillian A. Haar, a graduate of Minneapolis General Hospital School of Nursing, is assisting her husband in his office.

Dr. Wohlrabe is the son of **Dr. and Mrs. Clarence F. Wohlrabe**, of Mankato. He was graduated from the University of Minnesota Medical School and is a veteran of World War II.

MINNESOTA BLUE CROSS-BLUE SHIELD

During the past thirty days, the Blue Shield claims rejections have been closely examined to determine the number disallowed for each specific reason. The results disclose that non-hospitalized medical care and the x-rays related to such care were the reasons for the majority of the rejections during the period. This was also brought out in a similar study several months ago. Further, the correspondence and telephone calls with doctors' offices also indicate some lack of understanding of this feature of the contract.

The Blue Shield contract provides benefits for the three general basic services rendered by doctors of medicine. These are surgical, in-hospital medical, and obstetrical services. On the other hand, the contract does not provide benefits for medical treatment in the home or office. Thus, home and office calls where medical care is administered cannot be the basis for an eligible Blue Shield claim. Medical care in the office or home includes not only care for the common medically treated conditions such as colds and virus infections, but it also embraces many injuries received accidentally. Such injuries might be, for example, contusions, hematomas, and abrasions in which no actual surgical procedure is necessary. It will be seen, then, that the controlling factor in determining the eligibility of services rendered in the office is not the fact that the treatment was necessitated by an accident, but rather that a surgical procedure was actually

HOMEWOOD HOSPITAL is one of the Northwest's outstanding hospitals for the treatment of Nervous Disorders—equipped with all the essentials for rendering high-grade service to patient and physician.

Operated in Connection with
Glenwood Hills Hospitals

rendered. While it is true that the surgical office treatment of many accidental injuries is covered by the Blue Shield contract, the fact that the injuries were received by accidental means does not alone control the validity of the claim.

In many instances where accidental injuries are treated in the offices, an x-ray examination is made prior to the treatment to determine whether there is a fracture or other undisclosed condition. X-rays taken in a doctor's office for diagnostic purposes are rated as Blue Shield benefits when, as stated in the contract, those x-rays are directly related to one of the basic services paid for by Blue Shield. In other words, the x-ray must be a part of an over-all claim which is itself eligible for payment under the contract before the x-ray can be considered a valid claim. Thus, when a condition is treated medically in the home or the office and it has been preceded by diagnostic x-rays, it is obvious that those x-rays are not directly related to a compensable Blue Shield service and, therefore, are not eligible for benefits. Under these circumstances, the most important single factor in determining the validity of a claim for x-rays is to determine whether it is a part of a claim wherein surgical, in-hospital medical, or obstetrical care has been rendered. If the x-rays precede or follow such care within a period of approximately thirty days and are directly related to it, then the x-rays taken in the doctor's office are eligible for benefits as a part of a compensable basic-service claim.

It is recognized that most of the care provided in the home or the office is relatively inexpensive in an individual case when compared to in-hospital medical, surgical, or obstetrical care. By the same token, it is established that home and office calls for examinations and medical advice occur with great frequency so that when they are considered on a collective basis, the cost of providing such services for a large group of people is very high. Consequently, it is obvious that the small monthly premium charged Blue Shield subscribers does not provide enough money to pay for the services now included under the contract plus home and office calls for medical care. As a result, it has seemed best to allow the subscriber to pay such small items and to devote most of the premium income to the more expensive items such as surgery, fractures, obstetrics, and medical care in the hospital. Carrying out such a program on this principle should avoid the pitfalls which have plagued some government-controlled plans which provide full coverage.

Television Show Proves Perfect Sales Medium

The response to the television program, "News at Noon" over WCCO-TV, from Minnesota physicians, hospitals, and the public is very gratifying, both from an institutional and inquiry point of view.

Almost everyone is interested in a news program and the delightful, sincere delivery of Charles McCuen, the News Director of WCCO-TV, has proven without a doubt that he is one of the leading news personalities of the day.

The fact that the news program is in the middle of the day when the listening audience is mostly women, serves to attract the housewife's attention in the belief that even though she may not be the breadwinner of the family, she is very interested in the health of her family. All cases reported are actual testimonials received from Minnesota subscribers.

Each hospitalization is different in respect to services required, and through the wide range of illnesses the program points out how necessary Blue Cross and Blue Shield are to a family.

Because of the response noted through our daily inquiry count on our television broadcasts, Blue Cross and Blue Shield are now sponsoring the "News at Noon" with Charles McCuen over Channel Four, WCCO-TV, 12:00 noon to 12:15, five days a week, Monday through Friday.

HOSPITAL NEWS

The new thirty-two bed hospital at *Madison* was officially opened in August, with dedication ceremonies and conducted tours of the new building beginning at 1 p.m., Sunday, August 16. The cost of the structure and equipment was more than $560,000, 45 per cent paid by federal funds and 55 per cent by the Madison Hospital Association.

* * *

Dedication ceremonies for the new *St. Francis Hospital* at Shakopee were held Sunday, August 23, with Archbishop John Gregory Murray of Saint Paul, giving the dedicatory address. Following the dedication ceremony, open house and conducted tours of the fifty-bed hospital were held for community members. The Sisters of St. Francis will administrate and partially staff the hospital.

Listed on the active medical staff are Dr. M. B. Hebeisen, chief of staff, Chaska; Dr. F. H. Buck, Dr. Ivy Heinz, Dr. L. H. Heinz, Dr. B. F. Pearson, and Dr. J. E. Ponterio, all of Shakopee; Dr. C. J. Olson, Belle Plaine; Dr. G. Schimpelfenig, and Dr. B. H. Simons, of Chaska, and Dr. P. Stahler, of Jordon.

EXTRAPULMONARY INTRATHORACIC TUMORS

(Continued from Page 960)

neuroblastomas; one of the three patients had a tumor of the dumbbell type for which laminectomy and mediastinotomy were required. Two of the seven patients had teratoid tumors, of which one was benign and one had undergone malignant change. One patient had a thymoma, and one a hemangio-endothelioma. Two hundred and five patients recovered from operation.

The series of 212 cases does not include the cases in which operations were performed for intrathoracic lesions of the esophagus, such as leiomyoma or reduplication of the esophagus, diaphragmatic hernia of congenital type in which the omentum is the only structure involved in the hernia, or hernias through the dome of the right side of the diaphragm which have placed a portion of the liver in the right side of the thoracic cavity.

In closing, I should like to emphasize that many different types of lesions occur within the thoracic cavity and that all of these lesions demand careful consideration regardless of whether or not they are producing symptoms. Some of these lesions require surgical treatment and some lesions require other types of treatment. The many problems associated with the establishment of a definite diagnosis and in the selection of the type of treatment to be instituted are best solved by close co-operation between the clinician, bronchoscopist, roentgenologist and the surgeon. The most important consideration of intrathoracic extrapulmonary tumors is that malignant lesions often cannot be differentiated from benign lesions and that all of these growths are potentially malignant. Their early recognition with complete surgical removal is their most effectual treatment.

ENTURY LATER—STILL UNEXCELLED

Pitocin®

oxytocic of choice

The isolation of PITOCIN by Parke, Davis & Company in 1927 and its introduction to the medical profession in 1928, marked a new era in hormone therapy. To the obstetrician this was an epochal event; he could now secure the desired uterine effect without the elevation of blood pressure caused by unfractionated posterior pituitary extracts.

Today, PITOCIN is still the oxytocic of choice, widely used in treatment for primary and for secondary uterine inertia, for postpartum hemorrhage due to uterine atony, for the third stage of labor, for induction of labor, and during cesarean section to facilitate suturing the uterine wall.

PITOCIN (oxytocin injection, Parke-Davis) is supplied in 0.5-cc. (5-unit) ampoules, and in 1-cc. (10-unit) ampoules, in boxes of 6, 25, and 100. Each cc. contains 10 international oxytocic units (U.S.P. units).

Looking Toward New Horizons

The day of adventure and experimentation is by no means past. But current accomplishments are often overlooked in the zeal to scan the horizon for something better. It's sage advice that suggests that we take advantage of and nail down the present maximum accomplishments. It is also sage advice that suggests that you turn to your Society's investigated and tested plan of Accident and Sickness Insurance. The horizon holds no greater value.

Income protection should have priority over all other forms of insurance, for you are not able to maintain anything that you own nor reach that Utopia without income. Please call us today.

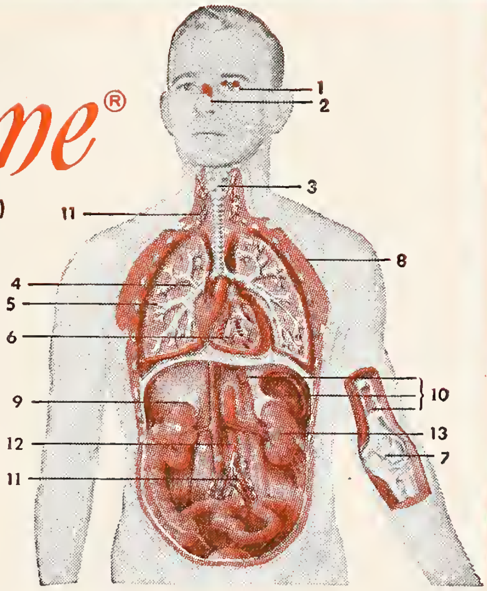
HydroCortone®

(HYDROCORTISONE, MERCK)

offers definite therapeutic advantages



1

HYDROCORTONE is a natural and principal anti-inflammatory adrenocortical steroid.

2

HYDROCORTONE Tablets produce the same therapeutic results as cortisone, and *in smaller dosage.*

3

HYDROCORTONE Tablets generally may be administered in a dosage two-thirds that of cortisone.

4

HYDROCORTONE Tablets recently were drastically reduced in price. Cost of therapy now is substantially the same as with cortisone.

Literature on request

Primary Sites of Pathology and Indications

1. EYE—Inflammatory eye disease. **2. NOSE**—Intractable hay fever. **3. LARYNX**—Laryngeal edema (allergic). **4. BRONCHI**—Intractable bronchial asthma. **5. LUNG**—Sarcoidosis. **6. HEART**—Acute rheumatic fever with carditis. **7. BONES, JOINTS, AND BURSAE**—Osteoarthritis; Rheumatoid arthritis; Rheumatoid spondylitis; Acute gouty arthritis; Still's disease; Psoriatic arthritis; Bursitis. **8. SKIN AND CONNECTIVE TISSUE**—Pemphigus; Disseminated lupus erythematosus; Scleroderma (early); Dermatomyositis; Atopic dermatitis; Exfoliative dermatitis; Dermatitis venenata (*e.g.*, poison ivy); Dermatitis medicamentosa. **9. ADRENAL GLAND**—Congenital adrenal hyperplasia; Addison's disease; Following adrenalectomy for hypertension, Cushing's syndrome, and neoplastic diseases. **10. BLOOD, BONE, AND MARROW**—Allergic purpura; Acute leukemia* (lymphocytic or granulocytic); Chronic lymphatic leukemia.* **11. LYMPH NODES**—Lymphosarcoma;* Hodgkin's disease.* **12. ARTERIES AND CONNECTIVE TISSUE**—Periarteritis nodosa (early). **13. KIDNEY**—Nephrotic syndrome, without uremia (to induce withdrawal diuresis). **14. VARIOUS TISSUES**—Angioneurotic edema; Serum sickness; Sarcoidosis; Drug sensitization; Waterhouse-Friderichsen syndrome.

---

*Transient beneficial effects.

HYDROCORTONE *is the registered trade-mark of Merck & Co., Inc. for its brand of hydrocortisone.*

Combination for diagnostic attack

A single chess piece can be a beautiful thing, but its ultimate efficiency comes only when it is arrayed with others in a combination. Just so with diagnostic instruments. Maximum accuracy, thoroughness and speed of diagnosis are attained with instruments, each having its own function, but designed to work together as a team.

All the Welch Allyn illuminated instruments shown above, for example, are superbly designed for their particular job, yet all are instantly interchangeable on a single battery handle. This feature alone can save many minutes of the physician's time each day and reduces instrument investment by obviating the need to purchase a different handle for each instrument.

We will be glad to send you a complete Welch Allyn catalog or to demonstrate any Welch Allyn diagnostic instrument which interests you.

A Wise Choice Against Resistant Cocc

ERYTHROCIN

a selective antibiotic

A DRUG OF CHOICE

gainst the majority of coccic infections—especially when atients are sensitive to other antibiotics or the cocci are esistant.

ADVANTAGEOUS

because the special acid-resistant coating, developed by Abbott, and Abbott's built-in disintegrator, assure rapid dispersal and absorption in the upper intestinal tract.

DRUG OF CHOICE

gainst staphylococci—because of the high incidence of taphylococcic resistance to other antibiotics.

A DRUG OF CHOICE

because it is less likely to alter normal intestinal flora than other oral antibiotics, except penicillin; gastrointestinal disturbances are rare; no serious side effects reported.

Prescribe ERYTHROCIN

in pharyngitis, tonsillitis, otitis media, sinusitis, bronchitis, pneumonia, scarlet fever, erysipelas, pyoderma, certain cases of osteomyelitis, and other indicated conditions.

NOTES: TREATMENT OF ANAL PRURITUS

New! SOOTHING, READY-TO-USE PADS REPLACE HARSH TOILET TISSUE

What are they?

Tucks are pure, soft outing flannel pads moistened and mildly medicated with a special solution containing witch hazel and glycerin.

Gentle, thorough

Being moist, Tucks clean the pruritic area completely, removing all vestiges of contaminating fecal material. Being soft, they cannot irritate sensitive anal tissue and cause further aggravation.

Majority improve

Numerous clinical reports indicate that a majority of cases of anal pruritus will show appreciable improvements when Tucks are prescribed to replace toilet tissue. Tucks have been recommended further as a prophylactic measure against all forms of anorectal disease which may be caused or aggravated by improper anal hygiene. We suggest you try Tucks for your next case of anal pruritus.

How supplied

Tucks are provided in jars of 100. A supply for trial will be sent you upon written request. Address Dept. M-3, Fuller Pharmaceutical Co., 715 So. 10th St., Minneapolis 4, Minn.

R

Tolserol Tabs. 0.5 Gm.

Disp. #100

Sig: Two tablets 3 to 5 times
a day. Take after meals
or with 1/3 glass of milk.

The clinical effectiveness of different brands of mephenesin tablets depends on their rate of absorption. A mephenesin tablet that disintegrates slowly is absorbed slowly. The resulting low blood levels may never produce a maximum therapeutic effect. Results with such a tablet are usually poor.

Tolserol Tablets are a result of extensive study and are formulated to disintegrate rapidly for fast absorption, thus maintaining optimum blood levels.

Tolserol
(Squibb Mephenesin)

Complete information on the use of Tolserol in muscle spasm of rheumatic disorders, in neurologic disorders and in acute alcoholism is available from the Professional Service Department, Squibb, 745 Fifth Avenue, New York 22, N. Y.

all the patients who represent
the 44 uses for short-acting NEMBUTAL®

44 PATIENTS? Just look in the picture above. You'll find them all. And with every NEMBUTAL patient, with every NEMBUTAL use, these are the facts that you'll find the same:

1. *Short-acting* NEMBUTAL (*Pentobarbital, Abbott*) *can produce any desired degree of cerebral depression—from mild sedation to deep hypnosis.*
2. *The dosage required is small—only about one-half that of many other barbiturates.*
3. *There's less drug to be inactivated, shorter duration of effect, wide margin of safety and little tendency toward morning-after hangover.*
4. *In equal oral doses, no other barbiturate combines quicker, briefer, more profound effect.*

All are sound enough reasons for your prescription to call for short-acting NEMBUTAL. How many uses have *you* tried? Abbott

For brief and profound hypnosis Try the 0.1-Gm. (1½-gr.) NEMBUTAL Sodium Capsule

New Horizons in Antibiotic Therapy

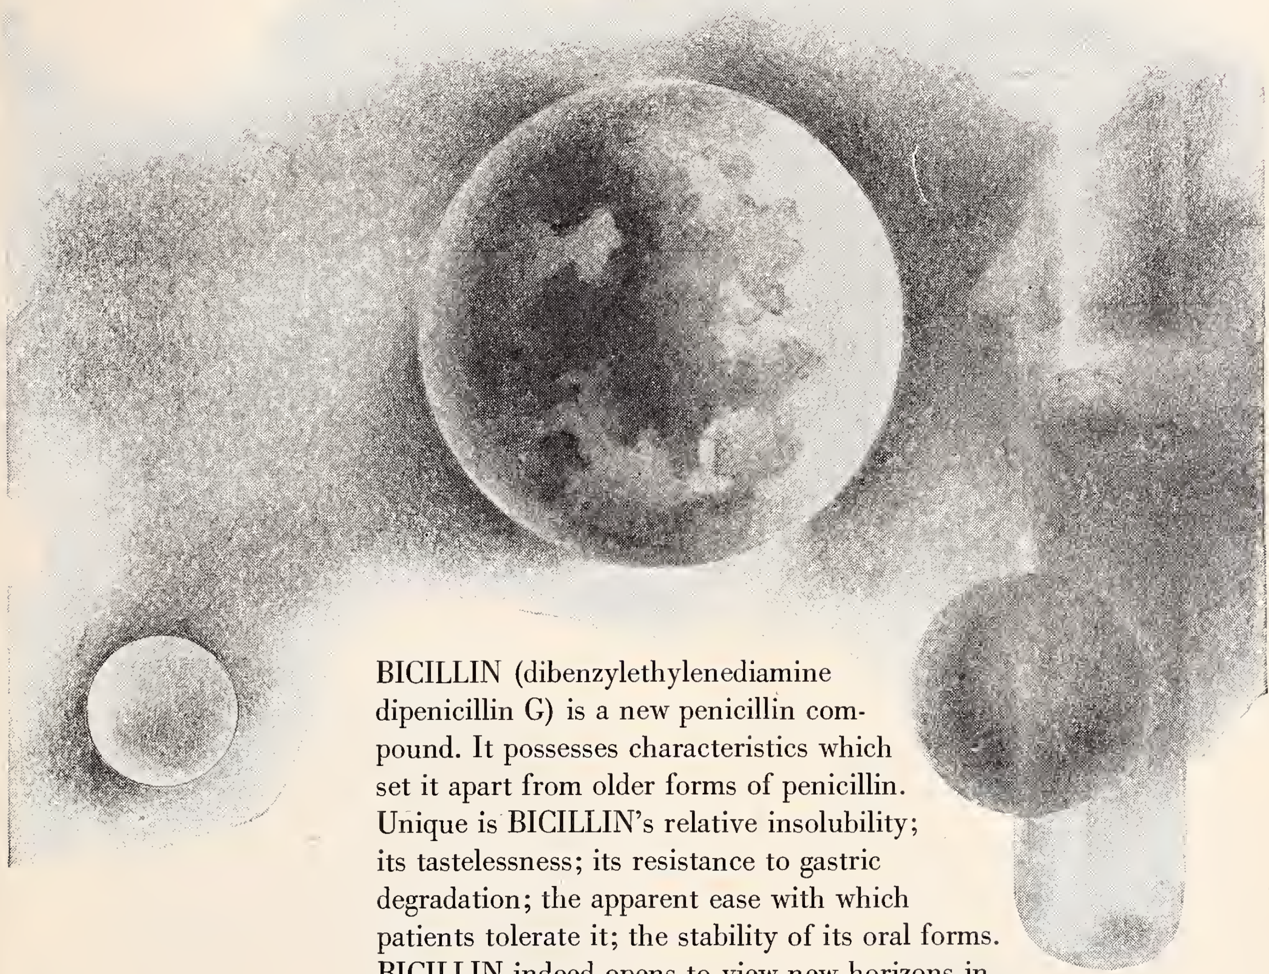
BICILLIN®

Dibenzylethylenediamine Dipenicillin G

A NEW FORM OF PENICILLIN

***NOW*... Council Accepted**

ACCEPTED COUNCIL ON PHARMACY AND CHEMISTRY AMERICAN MEDICAL ASSOCIATION



BICILLIN (dibenzylethylenediamine dipenicillin G) is a new penicillin compound. It possesses characteristics which set it apart from older forms of penicillin. Unique is BICILLIN's relative insolubility; its tastelessness; its resistance to gastric degradation; the apparent ease with which patients tolerate it; the stability of its oral forms. BICILLIN indeed opens to view new horizons in antibiotic therapy . . . new applications of penicillin—drug of choice in a wide range of infections.

BICILLIN is available in oral suspension, tablet and injectable forms

Wyeth® Philadelphia 2, Pa.

2 Convenient dosage forms

'Ilotycin,' Crystalline, Tablets
(ERYTHROMYCIN, LILLY)

'Ilotycin Ethyl Carbonate, Crystalline'
(ERYTHROMYCIN ETHYL CARBONATE, LILLY)

Pediatric

- Taste-tested by Lilly's Junior Taste Panel, the flavor of *'Ilotycin Ethyl Carbonate, Crystalline,' Pediatric*, is sure to please your young patients—as well as adults who prefer liquid medication.
- Well tolerated—There is minimal gastric irritation, nausea, and diarrhea.
- 'Ilotycin' does not predispose to monilial superinfection or vitamin B complex deficiency.

AVERAGE DOSAGE: Thirty-pound child, 1 teaspoonful 'Ilotycin Ethyl Carbonate, Crystalline,' Pediatric, every six hours; others, in proportion to weight. Adult, 200 mg. every four to six hours.

SUPPLIED: 'Ilotycin,' Crystalline, in 100-mg. or 200-mg. specially coated tablets. 'Ilotycin Ethyl Carbonate, Crystalline,' Pediatric, is supplied in 60-cc. packages. Each teaspoonful (5 cc.) contains 100 mg. of 'Ilotycin' as the ethyl carbonate.

THE PHYSICIAN AND HIS ESTATE

HARRY A. BLACKMUN, LL.B.
Rochester, Minnesota

YOU, a professional person, hear much of estate planning. Your insurance man, your banker, your attorney, your accountant—all stress it. It is my guess that because you have heard so much of executors and wills, of insurance options and tax-free payments, of joint tenancy and tenancy in common, and of the marital deduction and intestacy, you have been overwhelmed by the detail and wonder why a thing which ought to be simple has become so complex. It is my intent today to emphasize not the details or the complexity but, instead, the position in which you find yourself in 1953, and the consequent necessity of doing something about it.

Let us go back to the year 1910. That is only a little over forty years ago and well within the memory of many of you. So far as taxes are concerned, life then was really very simple. There was no Federal income tax for that law was effected only as of March 1, 1913. There was no Federal death or estate tax. That came on the statute books only in 1916. There was no Minnesota income tax. That statute became effective January 1, 1933. There was no Minnesota inheritance tax. While several attempts had been made to create one, the statute which finally withstood the challenge of unconstitutionality was enacted only in 1911. Thus, in 1910, estate planning consisted of little more than determining the fundamental question of who was to receive what.

In contrast, consider 1953 and your own situation as a physician. Unless yours is a very special situation, you have already run head-on into some seemingly frustrating facts. You may have grown up in rather modest circumstances and obtained your academic and professional education only with a struggle paid for through sacrifice or by the assumption of debt or with the help of someone willing to support you while you went through medical school. Before these obligations were paid off, children came along and needed support and education and insurance protection. With ever mounting income taxes, you felt yourself fortunate if you were able to pay your debts and your current obligations from day to day. Saving tax-paid dollars for retirement has proved almost impossible. Yet if you surmount these obstacles, you are not yet through. It costs money to die. It is still a question of net, of gross less the respective bites taken by the hospital, the physician, the undertaker, the creditors, the lawyer and, most important of all, the tax collectors, both Federal and state. The size of these tax bites, if you are not aware of them, can be staggering.

Let me emphasize this in another way. It seems to me that you, as a physician, are confronted with certain "inevitables" in your life. First of all, you are a professional man and you are busy. You have little time beyond the demands of your profession and the reasonable ones of your family. Further, you have loved ones or, as the law sometimes calls them, "natural objects of your bounty." You will, whether or not you choose to face it, eventually die. That will be an emotional time for your family. When you die, there will be necessary court and administrative and tax steps to be taken. There will be costs,

---

Read at the Centennial Meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 20, 1953.

From the Section of Administration, Mayo Clinic, Rochester, Minnesota.

perhaps fairly substantial ones. There will be taxes to pay. Do not be deceived into thinking that your estate is not large enough to incur a tax. The state inheritance tax exemption is usually small. The Federal one is $60,000, but even that is not large when one considers that insurance and your home are counted for Federal death tax purposes. Furthermore, those taxes must be paid. Only the net of what is left after the payment of debts, expenses and taxes will be left for your survivors. The last "inevitable" is not really one, but it is my guess that it applies to most of you. It is the probability that your estate plan, if you have one, is not up-to-date. One can say truly that it is obsolete if you are married and your will was drawn or your plan was formulated prior to April, 1948, only five short years ago.

Let us consider some of the legal terms and procedures which death may involve. If you die without a valid will, you die intestate and your property then descends according to the intestacy statutes. In other words, in those circumstances the legislature determines who your beneficiaries are and to what extent each benefits. There is an exception to this with respect to property held in joint tenancy with right of survivorship or with respect to insurance contracts where your named beneficiaries survive. A will is an instrument which, when properly executed by a competent person, operates to distribute the net estate of the testator. Subject to certain legal limitations, you may dispose of your estate by will just about as you choose. Probate is the procedure which the law has developed for the orderly collection of a decedent's assets, the payment of his debts, taxes and other obligations and the distribution of the remainder to the persons entitled thereto either by the intestacy statutes or by the will. Bear in mind that originally there were no rights of inheritance or to make a will. Those rights are among many others which are the product of centuries of human struggle and of legal development. Intestacy laws and laws concerning the formalities of wills vary from state to state, and death taxes in the various states are not uniform. Generally, the law of the state where you live applies to your intangible personal property, such as stocks, bonds and bank accounts, but the law of the place where your real estate is located governs the disposition of that real estate. Thus, if you die intestate owning real property in several states, it does not necessarily follow that all of the real estate will end up by inheritance among the same people and in the same shares.

Let us look at the death tax statutes a little. Under the Federal law, the gross estate in effect includes every property interest you own at your death (except foreign real estate) and even some you may not own. It includes property held in your own name, insurance, property owned by you and another in joint tenancy (with specified exceptions), certain transfers you have already made, et cetera. There are some deductions for administrative expenses, debts, gifts to charitable and similar organizations and a specific exemption. There is also the marital deduction for property passing from you to your surviving spouse, if any. Rates run in brackets beginning at 3 per cent and rapidly mounting. Except for property passing to a surviving spouse or to a charitable or similar organization, who gets what makes no difference under the Federal law. Under the Minnesota law, who gets what does make a difference, for the rate and the exemption depend on the closeness of the relationship between you and the particular beneficiary.

Why should you plan your estate? There are, of course, several reasons. Here are a few:

1. You plan in order to effect tax savings, that is, to enable your estate to reach the objects of your bounty with as little tax as possible. Take an example. Suppose you have a net estate of $100,000 before the specific exemption. You have a wife and three children, but your wife has no assets. Prior to 1948, if your desire was to give your wife the benefit of that estate so long as she lived and then to have your children enjoy it, this could have been done by a testamentary trust, and the plan would have incurred a Federal death tax of $4,800. Today, by proper planning, that estate can be brought down into the next generation at no Federal death tax cost whatsoever. Obviously, that is a very easy way to save $4,800.

2. By planning, you, and not the legislature, determine who gets what. By taking all your property interests, including insurance, into consideration, you can evolve usually a very effective and satisfactory plan. If you wish to use the trust device, you can project your wishes into the future to a substantial degree.

3. You determine where certain burdens are to rest. I have in mind such things as taxes, mortgage obligations and the like.

4. You choose, within limits, the representative who will be responsible for your estate during the probate period. Otherwise, the appointment of this representative is up to your survivors and the court and may itself be the subject of litigation.

5. If you have minor children, then in Minnesota you may by will nominate a guardian of those children to act after the death of yourself and your spouse. This nomination is subject to veto by the child when he becomes fourteen, but it is a rare case where the parent's testamentary nomination is not persuasive.

6. You eliminate the otherwise ever-present complaint that, "If Uncle Joe had only made a will, I know I would have been taken care of."

7. You are compelled to exercise your best judgment in the disposition of property which you have taken a lifetime to accumulate. The problem deserves the exercise of that judgment.

8. You seriously consider ways of reducing the cost of dying and, strangely enough, you often obtain amazing results in that direction.

9. You are compelled to select an attorney. Your selection may also suffice for your survivors who otherwise must make that decision among many others at the time you die.

10. You become acquainted with the problems that are present and you assist in their solution. Otherwise, you leave that task to your beneficiaries.

I suggest, in general, the following for proper estate planning:

First.—Assemble your facts. Know what you own and where the evidences of title are. It is always helpful to prepare a list of your properties and their location so that your survivors and the attorney do not have to indulge in long guesses.

Second.—Select the very best legal counsel you can obtain. Usually, this does not entail any additional expense.

Third.—Reveal everything to your attorney. Do not hold back any facts or attempt to hide them. His advice is deficient if it is based on insufficient facts.

Fourth.—If possible, let your spouse participate and plan your respective estates together. The marital deduction provisions of the Federal law almost compel this. If you have a mature son or daughter, consider having him or her share in the discussions.

Fifth.—Have your attorney investigate the possibilities of the marital deduction and do not let it be brushed aside without some consideration or because it is too complicated.

Sixth.—Provide for sufficient liquidity in your estate and for proper flexibility. An estate can be too rigidly planned.

Seventh.—If you practice as a partner, and do not have a formal partnership agreement, you should consider the advisability of executing one. That agreement, in my opinion, should contain a specific provision as to what happens in the event of the death of a partner.

Eighth.—Choose your executor with care.

Ninth.—Discuss the identity of a guardian for your children with your wife and, if possible, with the person you have in mind to act in that capacity.

Tenth.—Bear in mind that while taxes are important, they are not necessarily the governing factor in estate planning. Your desires and the needs of your loved ones are more important, but usually they can be made effective even in the light of proper considerations for the tax burden.

Eleventh.—Keep your estate plan up-to-date. Do not work on it now and assume that it is good for the rest of your life. Laws change, people die and are born, and your wishes change. This is particularly true where your family is a growing one. What is desirable in 1953 may not be what you want in 1957.

Twelfth.—Give your wife some idea of your desires as to the use of your property after your death. Should she continue to live in the house? Where should she go for investment advice and general counsel? There are many tax savings possibilities during probate and after it, and an able lawyer can help her in many ways.

Bear in mind certain other things. The first is that tax avoidance is not the same as tax evasion. Tax evasion based on dishonesty is reprehensible. Tax avoidance is not. You would not pay $3 for a book at one store when you can buy the same book for $2 next door. Further, always assume that every property interest is taxable and do not

(Continued on Page 1060)

THE DOCTOR AS A MEDICAL WITNESS

RAYMOND SCALLEN
Minneapolis, Minnesota

TO PARTICIPATE in your Centennial Meeting is a profound honor, and as a member of the legal profession I congratulate you most heartily on the achievements of your profession during the century which now becomes history.

In view of the historical significance of this occasion, it is regrettable that time does not afford an opportunity of making some observations with reference to the beginnings of medical testimony in Minnesota. Those beginnings were auspicious and of great interest in view of the development of medical testimony in the courts today. Regrettably, then, for practical considerations they must be left for examination at another time and we direct our consideration to the doctor as a medical witness today.

Usually the testimony of a doctor in court is that of an expert witness. What, then, is an expert in contemplation of law? An expert is a person of superior experience, knowledge or skill in any science, art, trade or business. The opinions of witnesses possessing peculiar skill are admissible whenever the subject of inquiry is such that inexperienced persons are unlikely to prove capable of forming a correct judgment without such assistance. The doctor's place in modern litigation is therefore of great importance. The marked increase in litigation involving injuries and death arising out of industry and the operation of motor vehicles has brought medical witnesses almost daily into our courts. The doctor's presence in the courts is not so much a matter of choice as of necessity. It may well be essential to the administration of justice. Certainly in the defense of a malpractice case, for instance, it is of the highest importance to the defendant that members of his profession stand willing to put aside their work for a period of time so that he may have a proper defense. In any event, the medical witness's place in modern litigation is of high importance to the profession because, when the doctor enters the courtroom, he becomes a public relations envoy for good, evil or indifference as far as his profession is concerned. He ought, then, to measure up to the highest standards of a noble profession. The seeds of paternalistic, governmental control can be sown far more often in the courtroom than most people realize when these standards are not maintained; nor is the profession helped by the individual who disdainfully holds himself aloof with ill-concealed contempt for the courts and their procedures. It is obvious that if the best minds of the profession should adopt this attitude, then our judges and juries would never hear the outstanding member of the profession. Fortunately this is not true, and in a proper case some of the great leaders of the medical profession with real modesty and humility appear in court and make a substantial contribution not only to the knowledge of the judge and the jurors with respect to the medical points in question, but also by impressing upon these good people the alertness and indefatigable industry of the medical profession. But viewed from another angle there is a far different type of expert who sometimes comes to court—the man who is recognized by the laity as being in the profession only for money, who is callous and hard, who departs from ethical standards, who charges inordinate fees to people who cannot afford them—such a physician is likely to make little impression on the average jury despite professional brilliance. But upon the exceptions we need not dwell, so we address ourselves to the appearance of the average practitioner, its effect upon him and upon the court.

Keeping in mind that some phases of the case may well depend upon medical testimony (and with reference to malpractice cases almost without exception the case *will* turn upon the question of medical testimony because such a case is concerned with standards of care and proximate results), it should be observed that, first of all, the medical expert is coming into a friendly atmosphere. From the standpoint of accommodation, most trial counsel and judges are very considerate in giving priority to medical testimony. There are occasions, though, when the medical witness will be well advised to spend some time in the

courtroom and hear the testimony of those who precede him, because then he is testifying from a knowledge of a more complete picture, from a broader canvas, and may really save himself some professional embarrassment. He will know when he testifies that he is not talking out of context. Remember, too, that most people highly respect doctors. This, of course, includes juries. The jurors usually listen with great interest to a medical witness. If he is fair and reasonable, they feel that they are learning something, and, in turn, the medical witness may feel that he has made a contribution to the administration of justice and has enlarged his circle of friends. He has brought, moreover, sound medical doctrine before this judge and jury and has made an impression that is deep and lasting. Most juries sympathize with the doctor—they understand that he is human, that he works under great pressure, strain and responsibility—so don't be afraid of juries, the chances are they will like you.

Naturally a medical witness should know what he is talking about, particularly the facts pertaining to the diagnosis, therapy and prognosis of the case with which he is concerned, and of course the medical principles applicable. He should be prepared, of course, on the matter to be covered by his testimony. He should know and understand his records and should have studied them before he comes into court. But he should be prepared in a wider sense. In a greater degree than is realized, this preparation takes place in the formative years, the pre-medical years. Nobility of soul, depth of character, and integrity do not usually come unbidden and without perseverance. They are the first essential of the medical witness. Of course there must be competent professional training and experience, but after all it is a man who is speaking—a man who should merit the respect of his listeners in the solution of the problems involved, and he should show them that he possesses the fundamental prerequisites that make him a man worthy of belief. On the technical side, he should have command of language, enunciate clearly without affectation, and possess a didactic faculty. These qualities are not acquired quickly, but come with constant study and the every-day habits of the man. His bearing should be dignified and gracious without condescension. He should have an ease of manner which may be inspired by the *aequanimitas* of Sir William Osler. He should listen carefully to the questions propounded and respond with truthfulness, precision and promptness, unless the question is obscure, confused or meaningless. He is not required to give a yes or no answer, unless obviously that is the only type of answer responsive to the question. And if the question is clear, but beyond the knowledge or experience of the witness, he should not hesitate to say so. The medical witness who stays within the scope of his knowledge and experience and bases his testimony on sound medical principles is on completely safe ground.

It is a good rule to avoid volunteering testimony. To do so suggests partisanship and may disturb the orderly presentation of proof by experienced trial counsel. A trial lawyer has his plan of action—on him rests the responsibility for presenting the case. If he desires a general statement or narrative he will put a question that will enable you to answer in general, descriptive terms. And if he is alert, he will give you the opportunity on redirect examination to clear up anything that needs explaining, particularly when you may have had a hard time under cross-examination. It is better, then, to let counsel try the case.

Above all, be yourself. That is far easier than imitation, no matter how great a regard you may have for the forensic accomplishments of some member of your fraternity. And you may be surprised to learn that you are better than your mental model. This knowledge will bring you comfort and make you feel confident of your own ability.

A great deal has been written about cross-examination. It has its place in the trial of a lawsuit. Properly conducted it is the best test we have of accuracy and truthfulness in the disposition of issues of fact. And the medical witness who stands on the safe base of which we have previously spoken, within the limits of his knowledge, experience, and sound medical doctrine, need have no fear of cross-examination. Usually the cross-examiner will let you alone, but if he does decide to question you at some length do your best to maintain your gentlemanly demeanor, even if in your opinion he is not coming up to that standard. Patience and forbearance are great qualities. They are illustrated by the story, perhaps apocryphal, which is concerned with the interview between a doctor and a patient whose wife had a temperament leaving something to be desired. The doctor, marveling at the calmness by which this man had maintained domestic tranquillity for many years, finally asked him,

"Well, certainly, during the period of your life, you have had many differences of opinion with your wife?"

"Certainly," the patient said, "and some very marked differences of opinion."

"Well," said the doctor, "didn't these differences of opinion cause a turmoil in your household?"

"Oh, not at all," said the patient, "because I never told her of those differences."

Well, perhaps you are not required to exercise such great restraint, and if you reach the point where you feel that your patience has been pressed beyond reason you may console yourself with the episode of the cross-examiner for the defense in a case involving injury to an elderly man who entered upon some dangerous premises although they were clearly marked as such by a placard fixed at the entrance. Defense counsel's inquiry centered upon an examination which the doctor had made of this man's eyes. It ran something like this:

"Doctor, you made an examination of the eyes of this plaintiff, did you not?"

"Yes."

"And by your examination you found nothing organically wrong with those eyes?"

"That is correct."

"And those eyes responded to light and accommodation, did they not, Doctor?"

"Yes."

"And that indicated that the man's eyes were functioning?"

"Yes."

"Then, Doctor, if you made such a complete examination, will you kindly explain to this court and jury why this patient of yours, whose eyes were in the good condition you have explained, entered upon these dangerous premises although there was a sign which plainly designated them as such?"

The doctor said, "Yes, I can explain."

"Well, Doctor, will you kindly explain?"

"The explanation is simple," said the doctor. "My patient couldn't read."

And normally, too, unfair cross-examination, which is really quite rare, if anything enlists the sympathies of the jury toward the witness, and most trial lawyers know it.

One point that is frequently referred to is the question of textbooks. Actually the analysis of this point could be made the subject of special treatment. The rule is that textbooks may be referred to only on cross-examination for the purpose of impeachment—that is, showing that the witness doesn't know what he is talking about, or worse, that he is not telling the truth. A textbook, of course, is something that has been written by some man or group of men presumably learned in the field on which they write. If a textbook is shown to you, first of all be sure that it is a standard work. Notice whether or not it is a recent edition. It cannot be used against you on cross-examination unless you admit that it is a standard text, but if you do admit that it is such a text, observe carefully the quotation which will be presented to you and see whether that statement is completely destroyed by something that follows. In other words, see whether the doctrine set forth in the textbook really is taken out of context. The use of a textbook by a cross-examiner may turn out to be a greater boomerang to him than the mightiest product of the Australian aborigine.

By your presence in the courtroom you represent the members of an honorable profession, you represent that host of devoted men and women who have worked so arduously for the good of mankind—industrious, faithful doctors, who have brought comfort to those in pain, have restored the crippled to a useful life, have removed the worries and troubles of many, have restored a father to his fireside and a mother to her home, who, skilled in the care of sick children, have relieved the heartaches of worried parents, who have tenderly brought new life into the world and have eased the last moments of the dying—those men and women of your profession whose very greatness caused them to recognize with deep reverence and humility the profound truth that they used their skill as humble agents of Almighty God in the merciful administration of the healing art.

So when you cross the threshold of the courtroom and take your place on the witness stand, let your words re-echo the great deeds and high principles of those mighty heroes of your profession and you will experience no greater professional reward than to know that you are worthy of them.

A COUNTRY NEWSPAPERMAN WANTS MORE "HORSE AND BUGGY" DOCTORS

ALAN C. McINTOSH
Luverne, Minnesota

THE medical profession is guilty of being the worst practitioners of understatement of any of the four estates, medicine, the law, the clergy, and the press.

You usually preface some painful bit of minor torture by saying with a hypocritical smile, "This may hurt a little bit."

I've always thought Dr. Sherman's* great moments in life come when he gets a chance to wash out my ears—or to rip off an adhesive bandage. I think no kid shooting off a Roman candle has as much fun as Sherman, when Doc gets a chance to rip an adhesive bandage off a hairy-chested man. And you always say, "This may hurt just a little."

When I say today, "This may hurt a little," believe me it is not from a desire to get even for the pain and bills I have endured, but with loving affection. It may hurt a little but I didn't come up here to waste a day of my time in apple polishing.

I say that America needs more "horse and buggy doctors." When I say that, I do not advocate turning back the clock. When I say "horse and buggy," I do not denote a bygone era. When I say "horse and buggy" I do not imply a place, such as a rural community. Neither does the "horse and buggy doctor" label pertain to a general practitioner nor to a specialist.

I use the term to pay tribute to a philosophy of service—an idealism of the soul, a state of mind as regards humanity—as an emblem of glorious service. Because—not *every* doctor is entitled to that emblem. We have far too many doctors, who never make a night call. We have far too many specialists, percentage-wise. We have far too many dollar-chasing doctors. We have an adequate number of phoneys. But we have a crying need for *more* "horse and buggy doctors." This may be an atomic age but the "horse and buggy" philosophy toward mankind is not outmoded.

It would be easy for me to thumb through my mental scrapbook and get terribly cynical in my remarks. I made a comment about Dr. Sherman washing out my ear—I am completely deaf in one ear because a damn fool doctor in North Dakota treated me with cherry cough syrup for a cold instead of for a mastoid. I am bitter about the surgeon in a state to the south of us who prays ostentatiously before every operation. I am not jeering at religion but I always thought his praying was mostly showmanship inasmuch as he was a notorious fee-splitter. I always thought he was trying to impress the family rather than talk with God. I burn when I think of the specialist who walked off on a young woman losing complete vision in one eye because he didn't want to miss a golf tournament. I think of the helpless patient trapped between the "ethics" of two doctors, the one who suggested a cardiograph and the other who told him to mind his own business. The patient suffered a heart attack and a stroke and lingered on as an invalid the rest of his life. I am still mad at the doctor in a San Francisco hotel who walked down one floor, picked up a knife and lanced a tiny swelling, then charged me $15.

But I am not here because I am cynical, but, because I love doctors. To me they are heroes in disguise. I have a great love for them and for the American system of medicine.

You doctors have sold your profession to us on the basis of a painting which you have hung in your offices all over the country. I'm telling you that it is high time you started making good on that painting, redeeming in full all the pledges you have made. No need to remind you of that famous painting of Sir Luke Fildes. You all know it—the painting of the little child lying on her bed, the agonized father and the terror stricken mother in the deep watches of the night by the flickering bedside light, and in the foreground the calm, reassuring face of the doctor—a source of strength and hope. The Doctor! In the noblest sense of the word! Is it a specialist sitting there? No! Is it one of those 10 a.m. to 4 p.m., appointments only, Park Avenue doctors sitting there? No! Is it a ghost surgeon sitting

*C. L. Sherman, M.D., of Luverne, Minnesota.

there? No! You infer that it is a horse and buggy doctor, watching the flicker of life on that little girl's face.

You, and you alone, have to make good on that picture for America tomorrow. That picture is my concept of a doctor. You have to make that picture come to life every day of the year if you are to keep the faith. And if you break faith with the spirit of that picture, then God help you, the people won't. I am not advocating, when I say we need more horse and buggy doctors, turning the clock back on the tremendous advances made by researchers of medicine during the past decades. I am not turning my back on the advances that will be made this month, this year, next year, and the years to come. I'm pleading that you *reconsecrate* yourselves to the glorious idealism and the devoted service of the doctor in the picture, the horse and buggy doctor who is a tower of strength to the family.

The good will that the medical profession enjoys today was not built up by your specialists although they make the most money. This good will was built up by the general practitioner. I'm telling you that there is danger in finding that your public account of good will will be overdrawn and exhausted by the high fees charged by some of the profession, usually the specialists. We see disturbing little signs that trouble us—signs that indicate there is danger of bankruptcy of your resources of good will. The boy over in the University of Minnesota that told me he was going to be a doctor and specialize because that's where the big dough is . . . and the way to be prominent in society. It's true, that the specialist does make 22 per cent more money than the general practitioner. And I could concede that the picture is changing, that ten years ago only one in ten medical graduates went into general practice, that today six out of every ten are going into general practice. It's about time. The "two platoon system" used by the specialists, when one good general practitioner could have done many of the jobs, has broken many a man financially. I'd like to toss an orchid to the Minnesota State Medical Association for providing scholarships that will filter medical graduates back to the rural areas. For we haven't enough to go around.

We see a disturbing sign in the public's attitude because of the high cost of sickness. There is this growing suspicion of specialists and their bills. We see a growing horror of hospital bills. The doctors have a long road ahead of public relations and you'd better get busy telling your story. It's hard to get a man excited about the "American way" if he has a fistful of medical bills, that will take him years to pay off. Ill-health used to be personal misfortune. Today sickness is stark economic disaster, a luxury, if you can call it that, reserved only for the very well to do.

Something will have to be done. The doctors are going to have to take the lead in meeting this problem of expense. It won't be solved by walking coldly aloof on the other side of the street, with only your ethics to keep you warm. Otherwise this issue will be grabbed by the lefties and the political do-gooders, the cheap politicians and the Oscar Ewings (maybe the Humphreys) and they'll solve it on the basis of socialism. Pray God that day never comes for America.

You're going to have to remember that basically, and generally, the people love you, and trust you. They may never erect any monuments to you. They'll reserve those monuments for the statesmen, and even cheap politicians. But who wants a monument of cold granite anyway? I think the monuments you have are so much more beautiful—people walking up and down the streets of Minnesota, laughing, loving, working, enjoying life. People who, had it not been for your skill would have long ago been only a memory. I think of Warren Schoon, the Ford dealer in Sioux Falls who would have had a crippled arm for life; I think of Vonnie Hatting, who by right should be dead—head broken, a battered, bleeding fragment of a woman . . . but today a vibrant, beautiful, living woman. Yes—these and thousands more are the monuments of American doctors—the kind of monuments I like to see.

You have had the most brilliant firm of public relations counselors any group could have had, but it's going to take more than Whittaker and Baxter to tell your story. You're going to have to start telling it yourselves. Some of you, as individuals and as medical societies, are doing an utterly stupid job of basic public relations. Probably 25 per cent don't belong to your Chamber of Commerce. Don't expect the press and your community to play Paul Revere for you if you shirk your professional and community obligations. I think some of you are shirking these community obligations. Some of you are short-cutting on your professional obligations and some of you are ducking your moral obligations. You're the ones who overdraw the good will account of the medical profession. You worry more about your bank accounts than your patients.

Let's get one thing straight. I want to pick my own doctor. I want my doctor to be wealthy. I don't want any stumblebum failure working on this old hypochondriac.

I was in Europe last fall. I made a special point of investigating public reaction to socialized medicine, from the northernmost tip of Scotland to the south of England. It's in England to stay. The people now have the insidious habit. It's like taking sleeping pills—they know it's not good for them, but it's an opiate because they think it's "for free." I want none of that type of medicine for my wife; nor for my little four-year-old girl; nor for myself. I repeat—I want a doctor that worries about ME and that I, not a government, pay for his worry.

I was sitting at a banquet one night, several years ago with Dr. Adson. He was thumbing through a pack of little memo cards. I asked him what he was doing. He said: "I'm looking over the cards of the patients I'll be seeing tomorrow, their histories and their needs."

Do you think that five years from today your British doctor is going to be studying his patients' case histories when he is out for the evening? Not on your life. He's going to be a hack, working from 9 a.m. till 4 p.m., dishing out handfuls of pills, seeing too many patients, not caring enough. And not making enough.

All the integrity and zeal in the world to serve, seldom survive when there is no incentive for profit. Minnesota doctors enjoy the highest income of any state in the nation—and I think that's fine. Maybe that's got something to do with Minnesota's longevity record, and maybe not, anyway I want my doctor to be well off. That's small compensation for cardiac conditions, overwork, hypertension. But I don't want 35 per cent of the doctors doing all the hard work and the others skimming the easy gravy. If you want me to be blunt about it—not all the members of this audience deserve the title "horse and buggy doctors"—some of you don't have the ideals of service of a second-rate plumber.

I want the University of Minnesota School of Medicine to do more plugging for general practitioners, realize the great need for more of these doctors, and lay less emphasis on specialization; I want the University to give the students a course of ideals and consecrated service as well as teaching them how to cut up a cadaver. I love doctors. I like the ones we have in Rock county—I think of Doc Bofenkamp in a blizzard, going by car, by jeep, and then by tractor ten miles through the drifts to see a dying man; or Doc Martin running through the knee-deep snow to reach a boy lying shot in a corn field; or Doc Boone who spent one whole night fighting drifts trying to reach an emergency case; or Doc Sherman, my most beloved "horse and buggy doctor," who still gets up in all weather and in all hours, after fifty-three years of practice, to answer calls for help.

I gave my supreme personal tribute to my doctor at the Mayo Clinic a few years ago, Dr. Lou Prickman. I presented him with a copy of "A Doctor of the Old School" by Ian MacLaren—and greater recognition I cannot give. You can find the "horse and buggy doctors" anywhere from the dingy office on a small town's Main Street, to the marble halls of a clinic. A "horse and buggy doctor" doesn't pertain to an era, as I said, neither does it specify a community, nor whether a man is a general practitioner or a specialist. "Horse and buggy" denotes a state of mind and a responsiveness to an obligation. It bespeaks a philosophy. It is that type of philosophy and service we need for the doctors of America.

I can't help thinking of what doctors have meant to me through the years. I never have left Rochester in twenty years that I haven't from either a pullman window or a car window, looked back at the clinic tower and said, "Thank you God." Although it may be the home of advanced medicine it still lives and breathes in its marble halls with the burning idealism of service of the original country doctor Mayo. I think of what Doc Prickman has meant, not only as a fine doctor, but a friend, a confidante, a person to whom I've run for help in time of trouble. And I've always had the feeling that I'm not a number on a card but a friend.

But these fine things can be lost. Let me tell one more remembrance of the Great Dr. Adson. He told me how he had to let a most promising assistant go because the man didn't like to have to get up at night for emergency cases. And Adson boasted to me how quickly he could answer the phone, be out of bed and dressed and on his way. "We've got a lot of brilliant young men," he said, "but they haven't got the faculty of getting the good will of the patient. They want to stop at 5 p.m. I asked them to put themselves in the patient's place, where time means everything, and a doctor who won't work past 5." The great Adson told me that he regarded himself as a bridge, trying to be a link between the "horse and buggy" philosophy of the original Mayos and the new medical generation.

I'm going to wind this up. I've probably made a few of you mad and bored the rest. If I have any advice to doctors it is this: Never forget the sacredness of your profession, never get so blasé that you forget that to the patient lying on the sickbed, or to the parents of a sick child, you enter that room, not as a tradesman. You may be only five feet two inches tall, but you walk in the room as a big man, and there is a silent prayer on our lips as patients and parents, that God walks in with you. Remember, you come in the sick room as the bearer of strength, courage, hope, and faith, as well as technical skill. You can be a hero to your patients if you will let that inner light of zeal shine through.

Speaking of the country doctors of the old school, if I had my way, the University of Minnesota Medical School, and every medical school, would add one requirement to its courses. Before any man or woman could be graduated he would be required to know that classic by Ian MacLaren, "A Doctor of the Old School." I'm not ashamed to say that I read it every year and read it unashamedly, with tears in my eyes, as I scan through those familiar passages. And last fall I visited the rugged highland country in Scotland where that famous Scotch author made the locale for this all-time classic. Even if it is written in Scotch dialect, it's all beautiful—every word about Dr. MacLaren and all I can say is that if you can read it without a wisp of a tear, then frankly, "damn you."

The most poignant passage of all is the final chapter, "The Mourning of the Glen." Dr. MacLaren has died, and a terrible blizzard has buried the Scotch highland area beneath mountainous, impassable drifts. A handful of the good doctor's friends are bemoaning the weather—that otherwise everyone would have come to the country doctor's funeral. James Soutar didn't think that there would be more than five besides the minister at the service. Then one of the highlanders looks up and shouts, "There's a puckle of Dunleith men coming."

Then they report three more Urtach shepherds fording the icy river up to their waists and eighty-two-year-old Adam Ross has to be forcibly restrained to keep him home from the funeral. Lord Kilspindie comes from his Muirtown castle with his broken cart and exhausted horses from battling drifts for sixteen miles. So they held the funeral on that bitter day, and there were not just five there, but a hundred rugged souls of the Glen (while the women folks and children wept at home). And the minister says, "It's a bitter day, friends, and some of you are old, perhaps it might be wise to cover your heads before I begin to pray."

Lord Kilspindie, standing erect and grey-headed between the two oldest men, replied with great dignity! "We thank you, Rev. Davidson, for your thoughtfulness. But he endured many a storm in our service and we are not afraid of a few minutes' cold at his service."

After the doctor had been laid to rest there was the bitter debate over the epitaph to be placed on the cemetery gravestone.

And Lachlan Campbell came up with the one that the community that mourns the doctor agrees is most right and fitting—"Come, ye blessed of my Father, I was sick, and Ye visited me."

What is going to be your epitaph?

HEW SURVEYS UNION AND MANAGEMENT HEALTH PLANS

A study to be released in a month or so by the Department of Health, Education and Welfare will go into the history, development and present status of health programs set up as part of management-labor contracts. It will be titled "Management and Union Health and Medical Programs," and will be available at the Government Printing Office. Discussing the project at the AFL convention, Secretary Hobby declared: "Many of your unions already have health centers. Many more need them. Our survey will provide information which may help unions to establish or improve their health services. Incidentally, one entire chapter of this booklet is devoted to the fine Labor Health Institute which your Teamsters Union operates here in St. Louis."

THE PROBLEM OF LUPUS ERYTHEMATOSUS

HENRY E. MICHELSON, M.D.
Minneapolis, Minnesota

LUPUS erythematosus in all of its manifestations still remains an etiologic, pathogenic and therapeutic problem. Despite the tremendous number of articles written on the subject there is little which explains the basis for the development of this disease. Even though the problem as a whole still confronts us, however, there are many aspects of it upon which we may speculate from such facts as have been fairly well established and from well-founded observations. Over the years a groundwork has been laid upon which new facts may be added and eventually the whole picture will be clear.

The history of the disease is well known to all dermatologists, and early recognition is possible of both the strictly cutaneous form and the type which has the signs and symptoms of a severe general malady. These two main groups are so distinctly different, however, that the question arises as to whether we may not have erred in assuming that they are diverse manifestations of one disease.

Chronic Lupus Erythematosus

Localized, discoid, or chronic lupus erythematosus was considered to be a form of lupus vulgaris in the early days of dermatology, but I believe that today tuberculosis as a cause of any type of lupus erythematosus has pretty well been eliminated; certainly it has been in this country. Having excluded tuberculosis as an etiologic factor in lupus erythematosus, no other positive or even indicative cause has been advanced. There have been speculations but none has been accepted which would serve to narrow the search.

Are there any facts about chronic lupus erythematosus which are an aid in its interpretation? The lesion is essentially a disk of chronic inflammation which progresses peripherally and heals with central atrophy. It occurs predominantly on the face or the "V" or sides of the neck, occasionally on the dorsa of the hands. It rarely occurs on covered areas of the body with the striking exception of the scalp. This leads to the assumption that light sensitivity plays a role in localizing the disease. Granting that this seems to be true as far as onset is concerned, I doubt if the sun's rays play a very important part in the continuation of the process, for many patients with the chronic form of the disease lead outdoor lives and, with the exception of some reddening of the periphery of the lesions in the early spring, no further exacerbation occurs. Further, why are the lesions discoid if sunlight is a cause? If that were the case the lesions should appear over the entire exposed areas. And why do we see scalp lesions? It seems to me that a few striking examples of sunlight sensitivity have overimpressed us.

Chronic lupus erythematosus involves the so-called seborrheic areas and thus topographically aligns the condition with the seborrheic dermatitis and psoriasis. The variations in the morphology of chronic lupus erythematosus are not unlike those of lichen planus. Plaques of these two diseases occurring on the sides of the neck, the dorsa of the hands, and on the scalp look surprisingly alike and microscopically are very similar. In fact the histology of chronic lupus erythematosus reveals a well-ordered pattern which can be applied to many skin diseases but in particular to lichen planus and psoriasis. Three main pathologic manifestations occur in sequence in the disease. First is the appearance of vascular lesions, then edema and cellular infiltration occur with subsequent effect on the connective tissues, and finally, epithelial reactions are brought about as a result of the underlying alterations. There are many minute changes of the cells in the infiltrate, for example, pigmentation, parchment-like hyperkeratosis, and others, but a comparable pathologic progress takes place in the other two diseases named. Thus I believe we might well group chronic lupus erythematosus with seborrheic dermatitis, psoriasis, and lichen planus for purposes of study and that many of the known facts, especially those pertaining to psoriasis and lichen planus, may with good reason be applied to chronic lupus erythematosus.

From the Division of Dermatology, University of Minnesota, H. E. Michelson, M.D., Director.

Read at the Centennial Meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 20, 1953.

Differentiation of Types

The Subacute Form.—The most challenging question is whether or not chronic lupus erythematosus and acute or systemic lupus erythematosus are manifestations of the same disease. When this question is posed, the usual reply is that patients with the chronic form of the disease have been known to develop unmistakable symptoms of the systemic type. This is true but percentagewise is an exceedingly rare occurrence, so rare in fact that one might suspect that the acute process was superimposed, or by mere coincidence attacked a patient who had the chronic disease.

One source of error, or at least of confusion, lies in our inability to evaluate the systemic effects in patients with chronic lupus erythematosus for there are no clinical or laboratory methods for distinguishing patients whose condition is strictly localized from those who have systemic alterations. To the latter group belong those individuals whose affection has been diagnosed as subacute lupus erythematosus. It is most difficult to define the boundaries of the subacute type. The diagnosis is made upon the character and the extent of the cutaneous lesions, upon their tendency to progress rather rapidly, upon the rise and fall of acute signs in the lesions, and upon minimal systemic findings, such as slight elevation of temperature, malaise, and other vague but persistent complaints. If the process subsides and the skin lesions behave like the chronic discoid form, the patient's chance of survival is good, but if the process continues, we must remain apprehensive. Lupus erythematous cells are not found in such cases as a rule, but if they are found we at once reclassify the case as acute even though there has been no alarming increase in the severity of the process.

The finding of the lupus erythematous cell prompts many to administer cortisone even though there are no life threatening indications. What is hoped to be accomplished thereby? An improvement in the skin signs, an improvement in the general condition, or are steroids given with the hope of preventing a more severe state? Does a maintenance regime need to be instituted? Personally I am against steroid therapy in such cases and use it only when real acuity appears. *Lupus erythematosus chronicus* (or subacutus) *in extenso* is a term the Germans use and in such patients, have used the sulfonamides and more recently the antibiotics. I believe antibiotics should be tried before resorting to steroids. Prolonged rest (as for patients with tuberculosis) cure is ideal but is not possible for most people.

I do not believe that so-called subacute lupus erythematosus is a prodromal stage of the acute disease, but rather that it is a mild form of the systemic variety, having a fair prognosis. A most rigidly ordered existence may give the patient the time that is necessary to bring the disease under control by natural means. Strangely, the cutaneous histology in most such cases is that of the chronic type.

In summary, the diagnosis of subacute lupus erythematosus is arbitrary on the part of the clinician. It should be made only after a thorough evaluation, and must take into consideration amelioration or increases in severity of symptoms. It is distinctly a diagnosis which demands flexibility of decision. In its treatment much depends upon the patient's co-operation. The steroids do not eliminate the possibility of a turn for the worse.

Acute Lupus Erythematosus.—The term acute lupus erythematosus is an inclusive one. It is a poor term but is fairly well understood. Systemic lupus erythematosus designates the main characteristic of this form of the disease but carries no connotation that it must always be acute. I have tried to coin both a term and a classification to cover both types of this form of the disease but have not succeeded. Used broadly, acute lupus erythematosus means patients who have symptoms and signs which, when viewed in their entirety, make up a syndrome.

Acute lupus erythematosus begins with a prodromal stage. There are no outstanding symptoms. The patient is neither sick nor well, but does not feel good. The prodromal stage may be short, and the change for the worse occurs with the appearance of skin lesions. This group of cases constitutes the so-called septic type. The findings are (1) fever, (2) eruption, and (3) leukopenia, with or without (a) prostration, (b) urinary findings, and (c) the finding of the lupus erythematous cell. If one or more organs such as the heart, spleen, lungs or pleura, or the joints are particularly involved, one may or may not have their attention drawn to that. The course of the disease is stormy, the prognosis guarded, mostly bad, and the outcome today depends upon the handling. The end result is not a happy one, even though the patient's symptoms are reduced below the threat to life.

The other main type of acute or systemic lupus erythematosus is that in which the prodromal period is long, lasting for months or even years, and the symptoms, having passed through a period of being vague and disseminated, tend to become fixed in some chronic complaint such as arthritis, chronic diarrhea, or chronic bronchitis among others. As the symptom or combination of symptoms progresses, the patient's condition becomes critical and correct diagnosis is imperative

Treatment

It is very difficult to outline a treatment for any form of lupus erythematosus. Every case must be individually appraised and the treatment is based on the exigencies of the particular case.

The chronic discoid type is treated with the hope of causing a disappearance of the lesion with as little subsequent scarring as possible. Remedies used are both local and systemic. There is no known application which it at all effective; in fact, all ointments and lotions seem to exert a deleterious effect and therefore should not be used at all. Freezing with a solid carbon dioxide pencil is a valuable remedy in chronic stationary lesions, but should not be used if the lesion is extending and is quite active at the periphery. Because of the light sensitivity which is often present in the lesion itself, and because exposure to sunlight has been known to cause rapid extension and even provoke acute systemic symptoms, treatment with ultra violet lamp exposures should never be done. X-ray treatment also is dangerous and is not to be recommended.

Three drugs are of value for the chronic discoid type. They are bismuth, gold and atabrine. Bismuth is given in the form of bistrimate tablets or by intramuscular injections of an oily suspension of bismuth salicylate. Bismuth has not proved to be of value in my hands and has been discarded.

Gold is given intravenously in the form of a sodium salt. Courses of well-regulated doses are administered for periods of from six to eight weeks. This treatment has some enthusiastic adherents, but gold has caused severe reactions and the results are not uniform or even reasonably satisfactory. I have also given up the use of gold.

Atabrine given in the form of 100-mg. tablets has proved to be worth a trial in most cases of chronic discoid lupus erythematosus. It has been used for about two years and is not wholly evaluated. It causes a yellow pigmentation of the skin which persists for a long while and there have been many reports of reactions of a severe nature when the drug was used as a malaria preventative. Anyone using atabrine must acquaint himself with its pharmacology and in the event of even a slight reaction the drug must be stopped. At the moment atabrine is my drug of choice in this type of lupus erythematosus.

In the treatment of the subacute variety one must consider the present state of the condition and the possibility of extension and the development of acute systemic symptoms. The patient should be hospitalized for the first weeks of treatment if possible. Thorough physical examinations are a prerequisite. The treatment must be decidedly individualized. Bismuth has been used with safety. Gold should not be used. Atabrine has been effective but the patient must be scrutinized more carefully than in the chronic cases. The blood and urine must be examined every three or four days. The general care is essentially that of guiding a patient through a moderately severe illness. Antibiotics may be needed. Prolonged observation is necessary even if there is satisfactory progress. If the patient's condition worsens or if lupus erythematous cells are found, the use of steroids may be considered but should only be used in the hospitalized patient. If the patient responds, maintenance dosage of cortisone may be given at home. The treatment of subacute lupus erythematosus requires experience and judgment; for the general practitioner consultation with a dermatologist is advisable and advice should be sought if puzzling symptoms arise.

Acute or protracted systemic lupus erythematosus should be treated only in the hospital. Expert handling is essential. It is impossible to outline the treatment. Each patient requires all of the ingenuity that men experienced in the care possess. Team work is often necessary depending upon which organs are most involved. Mental symptoms must be watched for a psychiatric consultation often is needed.

Antibiotics and steroids are usually used. Nutritional aids and general nursing are imperative. The treatment is protracted, tedious, and expen-

RED SORE EYE EMERGENCY CARE

MALCOLM A. MC CANNEL, M.D.
Minneapolis, Minnesota

BLINDNESS at any age has no peer as a problem in economic, social and personal adjustment for the person involved. One of the most annoying, exasperating, and potentially worrisome clinical entities is the red, sore eye.

The family physician is the one person the patient usually turns to when he needs emergency care for his eyes. A routine management program to follow in the care of these emergency eye cases may be of help to you as personal family practitioners.

Initial Examination and Evaluation Procedure

When the patient presents himself in your office with a red, sore, or injured eye, include vision taking as part of your routine preliminary history and examination.

A reversed lettered vision taking chart is easily obtainable, and this can be tacked to the wall behind the examining chair. If a mirror is then placed on the opposite wall ten to eleven feet away, you have achieved a twenty-foot vision lane by having the patient look into the mirror at the card posted behind his head. The examiner can then cover one of the patient's eyes with one hand and emphasize with his other hand the different lines he wishes to have the patient read. Occasionally it is at first impossible to get a good vision following an injury to the eye because of the attendant excitement, photophobia, and blepharospasm present.

After you have removed the gross dirt and cleaned the eyelids gently with cotton and saline, instill a liquid anesthetic in both eyes, such as pontocaine .5 per cent. The subsequent examination is much easier. All manipulations around the eyes are done with greater ease if the patient is instructed to keep both eyes open.

Remember that it is very difficult to explain to a patient after you have treated him for a corneal infection that the reduced vision he has in that eye is not due to a slight nebulous opacity left by the healing ulcer, but rather to a long-standing amblyopia. This is because any impairment of sight which the patient was not aware of prior to the removal of the foreign body, may be attributed to the removal procedure, especially if the foreign body was so deeply embedded in the cornea as to necessitate currettment.

I aided in the eye examinations for a time at the Ft. Snelling Induction Center early in the war, and I was amazed at the number of Minnesota farm boys, who did not realize they had poor vision in their left eye. Evidently as long as their rabbit shooting eye served them well, they had never checked on the left eye by closing their right, to realize there was an amblyopia in this left eye.

If the patient's glasses have been broken by the injury, holding a pin-hole disk or an ordinary card with a pin-hole in it in front of the eye will determine whether that eye is correctable in the absence of a corrective lens.

In evaluating the disability, it is important to check whether you feel the lesion is superficial or penetrating. Is the lesion such that the vision of the eye is at stake? What about the later complications to this injured eye? At this point in the examination you are at a cross-roads. You will either undertake the treatment and management yourself, or you will seek consultation with an oculist.

In general, the remainder of the paper will be tips on the management of such red, sore eyes as handled by the families' personal physician.

Foreign Bodies, Abrasions, and Contusions

The commonest injuries that give a red, sore eye are foreign bodies, abrasions, and contusions.

Foreign objects that affect the eye fall loosely into four categories: windborne particles, abrasions from an object (large or small), contusions, and flying splinter chips.

To adequately detect most foreign bodies, one needs good illumination and adequate magnification. A forty watt bulb on a conventional gooseneck is placed to one side in front of the patient. A small condensing lens of fifteen diopters held three inches in front of the patient's eye will give bright focal illumination. Direct the light in from the side.

Read at the Centennial Meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 20, 1953.

A Beebe binocular loupe, which goes on over your glasses, is excellent for giving two and one-half times magnification of the field. A treatment chair with an adjustable head support helps immeasurably to hold firm and still the bobbing, weaving patient's head.

The windborne foreign body that is seen floating in the conjunctival cul-de-sac is easily removed. If it is lying loose, I use a well-wetted cotton pledget on a toothpick, and by brushing across it very gently, the object often becomes embedded in the matrix of the cotton and can be removed. If the foreign body is impacted on the cornea, be very gentle in crossing the cornea since epithelium can be removed.

Learn to be delicate in pulling on the lids. A soft touch minimizes blepharospasm and jerking, and instils patient-doctor confidence. The lower lid and fornix can best be seen by having the patient look up and outward and by gently stroking outward from the nose with the thumb, everting the lid by continuous pressure.

If the eye is quite irritable looking, but no foreign body can be found, look closely at the cornea and if several vertical linear abrasions can be seen, the foreign body is usually under the upper lid. They can often be missed when they are on the little shelf or sulcus on the inner surface of the upper lid a millimeter from the lid margin.

If you can remember three points, the inspection of the upper lid can be a very simple matter. Always have the patient look down with both eyes open. Grasp the lid gently by the eyelashes and pull it slightly away from the eyeball to eliminate the surface cohesion of lid and cornea. Then localized downward pressure should be applied just above the upper margin of the tarsus, using your finger tip, cotton applicator, or a match stick. One-half per cent pontocaine just before will make the patient more relaxed.

Glass wool used in decorating Christmas trees and fiber glass insulating materials are often almost invisible and can be found in the upper cul-de-sac causing considerable irritation.

During harvest season and with grain handlers, transparent grain husks are almost invisible unless viewed with oblique illumination.

The puncta and canaliculus can form a perfect scabbard for the sword-like colorless eyelash, giving marked symptoms of a foreign body that cannot be found. Cilia are also occasionally in meibomian gland ducts.

Speaking of meibomian glands, it does not take much of a chalazion to cause considerable redness and extreme discomfort in the early stages of inflammation. Pontocaine plus a little lid pressure with a glass rod and finger tip can start drainage through normal gland opening and abort a full-blown cystic chalazion from developing.

Another little-mentioned clinical problem that I feel should get more emphasis is conjunctivolithiasis, or calcium salt concretions of the meibomian glands. These are seen as pin-point or larger yellowish deposits on the palpebral surface. If these project above the surface of the conjunctiva they cause a constant scratchy sensation of the eye. The patient gets immediate relief after their removal with the point of a cataract knife or small discission needle after pontocaine anesthesia.

Foreign body eye spuds come in many shapes and sizes. One that works, probably better than any, is found right in your own doctor's bag. I am referring to an ordinary syringe with its hypodermic needle, which is sterile, available, and efficacious.

In using an eye spud or the hypodermic needle on a syringe, bring the point in from the side while having the patient fix on a distant object. Tell him to keep both eyes open. The point should be held parallel to the surface to minimize the danger of having the eye jabbed if the patient moves too quickly.

If the foreign body is a metallic fragment and has been in longer than twenty-four hours, it is usually easy to remove the large segment, but this often leaves a considerable rust ring behind. If the rust fragments are difficult to remove, take a toothpick and wind cotton very tightly on the tip. After moistening the sharpened end with 1 per cent silver nitrate, apply it to this remaining rust ring and it will be removed easily after occlusion for twenty-four hours.

If an intra-corneal foreign body does not look quite clear or remove easily, think of an iris freckle, or a keratitic precipitate on the posterior endothelium of the cornea.

After blasts and explosions, many fine particles may be ground into the cornea. It may be necessary in removing these to remove all the corneal epithelium on the cornea.

If the foreign matter is chemically irritating, it is very important to meticulously remove all the particles, even at the expense of some damage to this corneal stroma.

If using fluorescein, utilize the technique wherein a fraction of a drop is held by surface tension on the tip of a toothpick. This is touched to the everted lower lid on its inner surface providing ample dye for the purpose. A full drop is too much and requires dilution with irrigating fluid in order to detect minute abrasions on the corneal surface. The washing is time consuming and stains the fingers. It has been said that a one-ounce bottle of fluorescein will last a busy practitioner almost a lifetime.

Argon lamps, available for under two dollars, make the light green dye fluoresce with a startling brightness in a darkened room.

If the eye has a perilimbal congestion or ciliary flush, then homatropine or possibly even atropine ointment is indicated because there is often an associated iritis. However, do not use it routinely as atropine gives annoying cycloplegic symptoms long after the foreign body irritation has been removed.

Don't be talked out of an eye pad after a corneal abrasion. There are always plenty of reasons for not having it on, but the rationale of putting the eye at rest speaks much louder.

Sodium sulfacetimide, neomycin, and bacitracin ointments rarely give allergic reactions and are good antibiotics to use before the eye pad is applied.

Examining Infants and Children

In infants, regular bottle feeding or a nipple filled with a sugar-soaked cotton pledget, plus topical pontocaine, helps in the examination for a foreign body. If too restless, a moistened seconal capsule by rectum (roughly a grain for every ten pounds of body weight), aids. The action is increased if a pin-hole is made in each end of the capsule before insertion. Sedation is optimum in about thirty minutes.

After blanket mummying, allow the child to straddle *your* lap so the nurse can steady his head as you lean over the patient to examine the eyes. Use adequate pontocaine here also to make sure the eye is almost "asleep" prior to your manipulations.

If you feel that a general anesthetic is contraindicated in a youngster with an upper respiratory infection, who has an intracorneal foreign body, and if consultation is not immediately available, put an antibiotic ointment with a little atropine in the eye and apply a bandage. The foreign body often sloughs out in a few days.

I should like to add that a good dictum is to be honest with a child, especially in the older ones, as a little explanation prior to manipulation usually secures much better cooperation than in most adults.

Abrasions

Abrasions of the eye usually heal quickly even though the conjunctiva may show a hemorrhage that appears more serious than it is. If the cornea has been abraded, however, it can be quite painful because of the exposed area of denudation. In these cases an ointment or collyrium with an anesthetic added will give a great deal of comfort. However, corneal regeneration is delayed to a certain extent by using a topical anesthetic.

A very common abrasion is that seen in young mothers, who wear glasses. An infant is attracted by the glare from the metallic trim on her glasses and, in clutching for them, often scrapes the front of the eye with his tiny finger nail. If this same finger nail has been crawling about the floor, there is a good chance that mother will have several organisms in her eye. These cases require an antibiotic and a very tight bandage—preferably with elastoplast. To save yourself a 3 a.m. call, give her one-half dozen aspirin and codeine tablets as she leaves the office.

In any abrasion case, when the epithelium on the cornea has been disturbed and a patient's threshold to pain seems low, provide a small tube of anesthetic ointment such as butyn-metaphen, or holocaine-epinephrine, with instructions to apply it in the eye if the pain becomes severe and then reapply the bandage tightly.

In that occasional patient with nystagmus, use pontocaine in the regular manner and then steady the eye by pressure through the eyelid with your finger tips.

In a red, sore eye that does not heal after several days, stain once more with your fluorescein and rule out the possibility of a faint-staining, branching, dendritic ulcer.

Pontocaine is not the anesthetic of choice in this treatment, rather use cocaine since it tends to soften the epithelium.

Use a tincture of concentrated iodine paint on a tightly wrapped cotton applicator and scrub off the corneal epithelium that contains the dendritic ulcer. Neutralize with cocaine 4 per cent and then bandage the eye for forty-eight hours with a very tight elastoplast bandage.

If the foreign body is known to be magnetic and has penetrated the cornea, but cannot be removed easily with a spud or a fine-pointed forceps, the foreign body can often be removed with an electromagnet. I recommend this only with intracorneal foreign bodies.

I deplore the tendency to buy a war-surplus electromagnet for twenty dollars to keep in your office as a diagnostic instrument. If a foreign body is thought to be intraocular, *always localize first*. Great harm can be done by applying the magnet to the eye and then asking the patient for his sensation of a pull or drag in the eye.

Contusions

Do not be overly casual with the patient who presents himself with a mouse or garden variety black eye. This injury can mask a scleral rupture, or hemorrhage into the vitreous, a dislocated lens, retinal detachment, or actual orbital fracture.

If the periorbital tissues are quite puffy and swollen, check very carefully to rule out an orbital rim fracture, for if allowed to go untreated, the patient may have an inferior oblique muscle imbalance on this side plus a facial asymmetry.

If more serious damage has been excluded, cold compresses for the first forty-eight hours to reduce the swelling and stop the hemorrhage are indicated.

After the first twenty-four hours, heat in the form of an electric lamp, hot water bottle, electric pad, or even hot compresses of boric acid (using one tablespoon of boric acid crystals to a pint of water) will speed the absorption of the blood in the ocular tissues. Use cold cream or petrolatum to protect the skin before applying hot or cold compresses.

A contusion to the anterior portion of the eye can result in lesions to the posterior pole of the eye because of a contrecoup effect. Good vision is still compatible with such an injury if the choroidal tear is to one side of the macula itself. You'll be proud you own an ophthalmoscope when you use it to catch one of these retinal lesions.

A contusion of the cornea may be so great as to fill the anterior chamber with blood. The deeper structures can then not be examined. Get this person off his feet and watch his eyes very closely for secondary glaucoma. I advise no medication such as atropine at this early stage.

Hyphemia is very serious, especially if another subsequent hemorrhage occurs. This results in secondary glaucoma and blood staining of the cornea which prevents ultimate good vision.

Increased pressure in the eye can be checked with a little practice in palpating the eyes. The normal eye tension should feel about the same as the tip of one's nose. It is too soft if it feels like the philtrum below the nose, and glaucoma is present if it is as hard as the glabella above the bridge of the nose.

Treatment of Eye Burns: Thermal, Chemical and Radiation

In chemical burns of the eye, quickness of action, implicity of treatment, and a practical outlook should characterize the treatment. Do not waste important moments searching for antidote charts or for the right neutralizing agent for an acid or alkaline burn. Rather spend the time more profitably in using immediate and thorough irrigation of the eye with plain tap water. Ideally, it could be warmed slightly and sterile. More practically, it could be irrigation with a rubber ear syringe, or putting the head under a faucet, or even immersing the head in a bucket of water and instructing the patient to blink his eyes as he ducks under.

A good set-up in a general practitioner's office would be a large open mouthed bottle on a shelf above the treatment chair, filled with physiologic saline pre-heated to room temperature. This can be stoppered so that a syphon tube, with a soft rubber tip, at the distance of three feet gives the proper pressure.

I advise irrigating from five to ten minutes when you have an ordinary irritant in the eye such as carbon-tetrachloride, battery acid, cleaning solvents, or insect sprays. I would suggest a full thirty minutes if the chemical is an unknown or doubtful one. Also the severity of the exposure would indicate more irrigation.

The constant irrigation used to remove a foreign material converts the chemical burn into a mechanical loss of epithelium. Such irrigations in a chemically burned eye are necessary even at the expense of treating eyes that could possibly have been left alone.

Delay in early meticulous care may cause too much damage and allows intense swelling of the lids that prevents adequate inspection and treatment at a later moment.

Alkaline burns are more devastating than acid burns. Acid burns are essentially non-progressive. Alkalis form soluble basic proteinates and these penetrate deeper into the corneal stroma.

Lime burns result when slaked or unslaked lime particles have been thrown or blown into the eyes as when children play around construction work. Be careful to swab away any lime particles in addition to irrigation, since the particles can act for hours and produce deep necrotic burns.

Ordinary eversion of the lid and then double eversion of the upper lid again is used in searching the cul-de-sac for particles. Ordinarily the lids would be held open manually for irrigation following topical pontocaine, but if there is too much blepharospasm even after local anesthesia, a lid retractor is a very useful aid.

With the exception of Bal, for lewisite and arsenical burns, and 1 per cent acetic acid in alkali burns such as sodium hydroxide (lye), special irrigating treatments advocated in medical literature have not been shown to give superior results to copious saline irrigation.

The degree of ultimate disability depends, of course, on the integrity of the cornea and the post-traumatic clearness of this cornea. Any conjunctival adhesions, or symblepharon, while disabling, do not produce blindness.

In a recent study, it was found that only twelve per cent of all patients with burns of the upper face showed actual burn of the eyeball itself. This attests to the marvelous protective mechanism of the eyelids.

When there is involvement of two opposing mucous membranes, adhesions will almost certainly form unless certain precautions are taken. If it is not too severe, encourage the patient to roll his eyes around in all directions several times daily. Daily passage of a glass rod deep into the fornices of the eye after the use of pontocaine anesthesia, tends to prevent these adhesions.

A short word about the actinic conjunctivitis, or red eye from sun lamps, snow brightness exposure, or high altitude glare. This type of ultraviolet radiation gives symptoms of a foreign body in the eye six to eight hours after the exposure. It also follows improperly shielded sterilization lamps, such as used in some commodes, in operating rooms, and in dish-washing sterilizers. The best treatment, of course, is to avoid the agent which caused the reaction, give a liquid anesthetic, and soothing cold packs to the eyes until the congestion subsides. Dark tinted lenses are a great comfort and prevent subsequent radiation burns.

Lacerations, Penetrations, and Perforations

Following any laceration, especially with agricultural people, which extends into the eyeball, it is wise to use a booster dose of tetanus toxoid if the patient has been previously immunized, or prophylactic tetanus antitoxin, not so much for its specific prophylactic benefit as for its foreign protein to produce antibodies and whip up a bodily reaction to resist invasion.

If the eye looks badly damaged, do not attempt to remove what appears to be a foreign body or blood clot. Manipulation of a prolapsed iris may cause extreme pain with its attendant squeezing and cause irreparable damage. If the damage seems quite severe, bandage *both* eyes to immobilize the injured eye and prevent herniation of ocular contents. Move the patient by stretcher or at least keep movement and strain at a minimum.

In washing eyelid wounds, clean with saline. Debridement is usually unnecessary because of the excellent blood supply of the lids. I have seen a patient in whom a peculiar slicing injury of the lower lid shaved off all the hair follicles on a thin strip of skin with the roots of the lashes showing through the under side; a perfect take followed the suture back in place of the strip of skin.

If in a lid laceration, a tear duct canaliculus is severed, primary repair of this is indicated before the lid itself is repaired. Function can be returned to severed canaliculus ducts by approximating them over a silk suture passed through the duct.

Remember that in eyelid injuries there are two main anatomic entities: the skin orbicularis, and the tarsal conjunctiva.

In lid repair, each should be approximated carefully one to the other to prevent disfiguring notching and a later retraction.

If the cornea is lacerated do not use ophthalmic ointments. Too often ointment droplets become anterior chamber foreign bodies complicating the original injury.

In flying splinter injury cases, instruct the relatives to bring samples of the metal involved during the injury for testing with a magnet. Stainless steel is non-magnetic unless it has been rolled or roughly handled by chipping or pounding.

If progressive loss of vision occurs after a minor eye irritation in a farmer who does his own plowshare chipping and grinding, think of an intralenticular foreign body with resultant progressive cataract. Remember that a fast-moving particle penetrating the eye from a grinding wheel does not need to cause discomfort.

Farmers, who do their own tractor repairing and mechanical work, are often not aware of the importance of wearing goggles and are good candidates for these silent intraocular foreign bodies. Fortunately, conjunctival lacerations heal very rapidly even though they look very extensive and have caused considerable hemorrhage. Be sure, however, that they do not mask a more serious bulbar problem.

Sympathetic ophthalmia is a respected entity, but not the feared condition demanding immediate enucleation as formerly thought. One has ten days to two weeks to make up his mind before he enucleates.

Cortisone aids greatly in quieting down these irritated, injured eyes.

I should like to add that following your initial treatment and bandaging of the eyes if necessary, take time to complete the details on your history card as to type of treatment, kind of work the patient was doing, tools he was using, and the prognosis of the case as you evaluated it in the first stage.

Again let me make a plea for testing the vision prior to treatment. Litigation on ocular disability following injuries can be quite a thorny matter.

Traumatic Conjunctivitis

A last word about traumatic conjunctivitis, or ordinary infectious pinkeye, which is often preceded by a history of a foreign body in the eye.

Because of the scratchy, irritable, inflamed feeling, the patient will often feel that a foreign body is present. There will be considerable secretion, invariably morning agglutination and often some photophobia; the redness is usually limited to the lids, that is, the palpebral conjunctiva and the bulbar conjunctiva, rather than perilimbal or circumcorneal portions of the eye. The most important treatment in this infectious red eye is to use many, many dry wipes—not the patient's dirty handkerchief, but kleenex or cotton balls that can be discarded. Use a liquid antibiotic, such as sodium sulfacetimide, 30 per cent. A similar ointment can be used three or four times daily. The dry wipes are most important. I speak with some feeling because this problem was studied by me in the Service.

In my series over 500 cases of conjunctivitis were studied by smear and culture. The common organisms were not the oft-quoted rare ones in the text books, but our old friends staphylococcus and streptococcus.

The dry wipe is most effective since it keeps the eye opened to air and free from moisture. Organisms like a hot, wet, dark place to multiply.

Dark glasses give quite a bit of relief from irritating light. It is true, however, that we, who see many of these cases, are finding more and more resistant strains of staphylococci and streptococci as the causative organisms and the usual simple methods of treatment no longer seem as adequate.

Conclusion

In closing, I would like to emphasize five points:

Beware of the pitfall of a too evident diagnosis. The most prominent symptoms may serve to divert your attention from more important signs of the disease of the eye.

The initial record you have of the patient's vision and the patient's version of an eye accident is far more valid than the later compensation-minded interpretation of the same event.

Immediate and copious tapwater irrigation is the most efficacious treatment for chemical burns of the eye. Advise it by phone if necessary.

If you are in doubt about the magnitude of any seemingly severe eye injury, bandage both eyes while waiting for consultation. This puts the eyes completely at rest and also induces patient immobilization because of the limitation of vision.

Remember there is no late ophthalmic treatment, no matter how deft and excellent, that can equal immediate optimum therapy.

QUINIDINE INTOXICATION OCCURRING DURING THERAPY OF AURICULAR ARRHYTHMIAS

REUBEN BERMAN, M.D., CHARLES M. SADOFF, M.D.,
and GEORGE B. GORDON, M.D.
Minneapolis, Minnesota

THE MEDICAL history of quinidine goes back to the latter half of the nineteenth century when it was used as an antipyretic and antimalarial drug.[13] In 1914 Wenckebach[16] reported successful conversion of auricular fibrillation with quinine. Frey[6] then investigated the cardiac action of various other cinchona products and in 1918, reported the regulation of eleven cases out of twenty-two auricular fibrillators with the use of quinidine. This drug was introduced to American medicine in 1921 independently by Levy[11] and Eyster and Fahr.[5] Many papers have appeared since, describing successful regulation of auricular fibrillation in forty to ninety per cent of the treated cases.[9,10,12,15,18,19] Quinidine has also been used less extensively for the regulation of other arrhythmias, especially auricular flutter and ventricular tachycardia.[7]

There are few follow-up studies concerning the fate of the regulated fibrillators. Harris[9] followed twenty-six regulated cases of auricular fibrillation out of an original group of forty-three and found that 35 per cent of these reverted to fibrillation in one month, 65 per cent in one year and at the end of two years only 20 per cent remained regulated. In Weisman's series,[15] 17 per cent remained regular five years or more.

The dangers of quinidine have been recognized since its use as an antipyretic drug in the nineteenth century. Amongst the side effects noted are fever, fall in blood pressure, nausea and vomiting, diarrhea and thrombocytopenia. However, the chief hazards of quinidine have long been considered to be arterial embolization, ventricular tachycardia, ventricular fibrillation, and respiratory failure. Deaths coincident with the administration of quinidine have been reported since its earliest use. Berman and Blumenthal[1] report six deaths in 100 cases of auricular fibrillation treated with quinidine. Smith and Boland[14] report three sudden deaths in forty-one cases, a mortality of 7.4 per cent. However, the advantages of quinidine have been much more widely publicized than the dangers. The mishaps associated with therapy with this drug in heart disease are not always appreciated.[4] It is the purpose of this paper, therefore, to report five well-observed cases of complications arising in the course of quinidine therapy for auricular arrhythmia, with two deaths and two autopsies.

Case Reports

Case 1.—C. H., a thirty-year-old white woman, was admitted to the University of Minnesota Hospital for the second time March 4, 1952, and discharged March 13, 1952. Her first admission was in December of 1951, when she entered with the complaints of cough of two years' duration and frequent hemoptyses raising as much as one cup of blood. She had had rheumatic fever at the age of twenty-four and knew of a murmur since then. She was able to continue her occupation as a waitress until a few days before her first admission. She had been taking digitoxin consistently since the fall of 1950.

The essential features of the 1951 examination revealed the heart of normal size, faint apical systolic murmur with a grade II rumbling mid-diastolic murmur at the apex. Her blood pressure was 94/60; pulse 76 and regular. The lungs were clear. There was no liver enlargement or edema. Electrocardiogram showed a regular rhythm, a high-notched P_2 and P_3, a right axis deviation with a vertical heart, a late R wave in V_1 interpreted as a right strain pattern. A chest x-ray plate demonstrated enlargement of the left atrium and slight prominence of the pulmonary artery. Cardiac catheterization showed a pulmonary mean pressure of 35 mm. of mercury. Commissurotomy was successfully performed December 13, 1951. Following this procedure, auricular fibrillation occurred and the cardiac rate was continuously controlled with digitoxin. Marked objective improvement resulted.

On the second admission, March 4, 1952, the chief change was the finding of auricular fibrillation. It was decided to regulate the fibrillation with quinidine. On March 10, 1952, quinidine 0.4 Gm. was given every four hours for four doses, a total of 1.6 Gm. On March 11, 1952, quinidine 0.4 Gm. was given at 8 a.m., 10 a.m., 12 noon and 2 p.m., a total of 1.6 Gm. At 3:30 p.m. on March 11, 1952, the patient complained of dizziness and slight nausea. She had no other complaints. At that

time a bizarre arrhythmia with runs of ventricular tachycardia was discovered (Fig. 1) and the quinidine was discontinued. She recovered uneventfully.

Summary—Case 1.—This is a case of a young woman suffering from mitral stenosis in whom auricular fibrillation followed mitral commissurotomy. Attempt at conversion with quinidine resulted in short runs of ventricular tachycardia which have never been observed before or since.

Case 2.—A. B., an eighteen-year-old girl, was admitted to the University of Minnesota Hospital July 23, 1952 and discharged August 5, 1952. The patient had an attack of rheumatic fever at the age of twelve with severe joint involvement requiring six months of bed rest. She knew of her heart murmur since this illness and her activities had been moderately limited since then. Severe dyspnea first appeared in April, 1952, when she was first told she had an irregular heart beat. In June of 1952, edema and ascites appeared. She was digitalized and fed a salt-free diet with loss of the edema.

On admission her temperature was 98; pulse, 100 and totally irregular. Her blood pressure was 110/70. The heart was enlarged to the anterior axillary line. A low-pitched rumbling diastolic murmur was apparent at the heart apex with a loud systolic murmur also. A systolic thrill was palpable at the apex. P_2 was greater than A_2. The lungs were clear; the abdomen negative. The extremities showed no edema. Blood culture was sterile. Roentgenogram showed great enlargement of the heart with enlargement of all chambers. The left border of the heart approached the lateral chest wall. Electrocardiogram showed a delayed R wave in V_1 with a right axis deviation and auricular fibrillation (Fig. 2). Digitoxin was continued at 0.2 mg. daily. Quinidine therapy was instituted July 30, 1952; 0.2 Gm. was given every two hours for five doses for a total of 1 Gm. on that day with no effect. On July 31, 1952, 0.4 Gm. was given every two hours for five doses for a total of 2.0 Gm. without effect. On August 1, 1952, 0.6 Gm. was given at 6:00 a.m. Shortly after this dose the patient became nauseated and quinidine was discontinued. At noon she felt well and went to a movie shown at the hospital. At about 2:30 p.m. she collapsed, and fell from her chair to the floor, apparently dead. She was pulseless and no respiratory movements were seen. Artificial respiration was given for a period of two minutes following which feeble respiratory movements occurred. Rapid recovery followed. An electrocardiogram (Fig. 2) taken approximately fifteen minutes later showed prolonged runs of irregularity with ventricular complexes arising from many foci. Following this incident she returned to her usual form of auricular fibrillation. There were no residual effects.

Summary and Comment—Case 2.—An eighteen-year-old girl with severe mitral stenosis and mitral insufficiency with a greatly enlarged heart was subjected to attempted quinidinization for regulation of auricular fibrillation. Severe nausea led to withdrawal of the medication. Eight and a half hours after the last dose, she collapsed with apparent cardiac and respiratory failure. She revived following artificial respiration. Gordon, Matton and S. A. Levine,[8] in 1925, found in cats that quinidine intravenously would kill by respiratory paralysis. Artificial respiration usually resulted in recovery. Artificial respiration was probably a life-saving measure in *Case 2.* The electrocardiogram revealed a profusion of beats of ventricular origin.

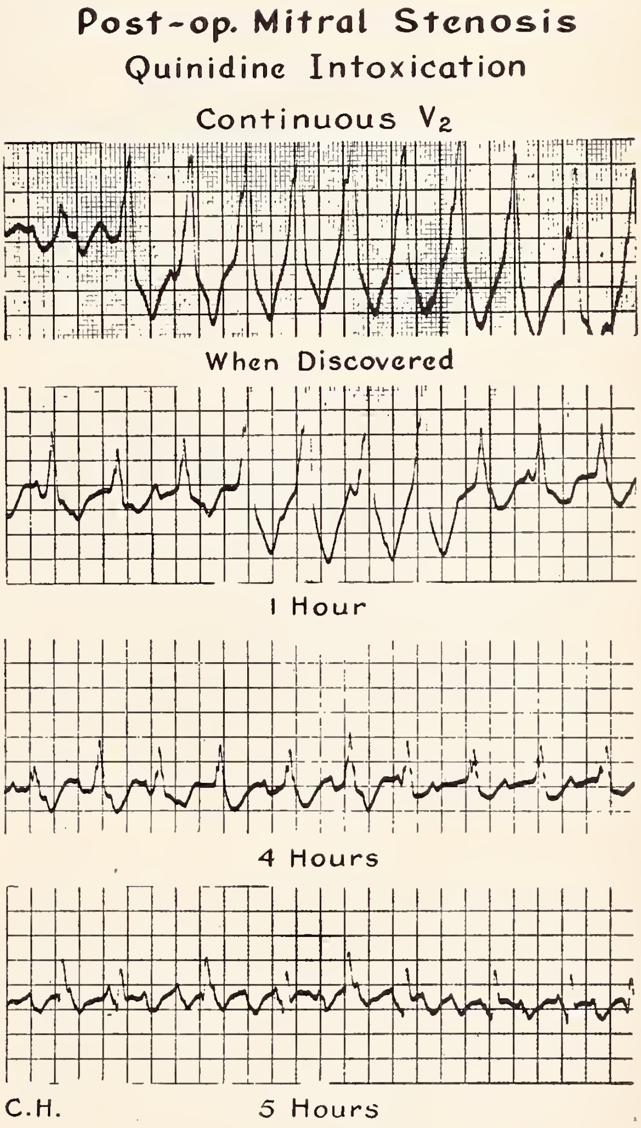

Fig. 1. Electrocardiogram in *Case 1,* March 11, 1952: described in the text.

Case 3.—O. A., a sixty-one-year-old white man, entered the Minneapolis Veterans Hospital for the third and final admission March 29, 1952, died April 21, 1952. He was first admitted April 28, 1949. His symptoms were dyspnea on exertion for one month, paroxysmal nocturnal dyspnea for one week, and edema of the feet and ankles for three days. He denied angina pectoris. Absence of breath sounds was noted at the base of the left lung posteriorly and moist râles were audible at the right base. The apex of the heart was found in the sixth interspace 10 cm. to the left of the midsternal line. The heart rate was totally irregular at 150 per minute. No murmurs were heard. His blood pressure was 130/80. The abdominal examination was negative. There was edema of the feet and ankles. A chest x-ray showed a moderately enlarged heart and bilateral pleural effusion. His vital capacity was 4,300 cc. His circulation time was 45 seconds arm to tongue with decholin; venous pressure 13.5 cm. of water. The patient was digitalized with digotoxin, fed a low sodium diet, and given mercurial diuretics. He responded well to the treatment. Following digitalization he converted to a normal sinus rhythm. The heart decreased to normal size.

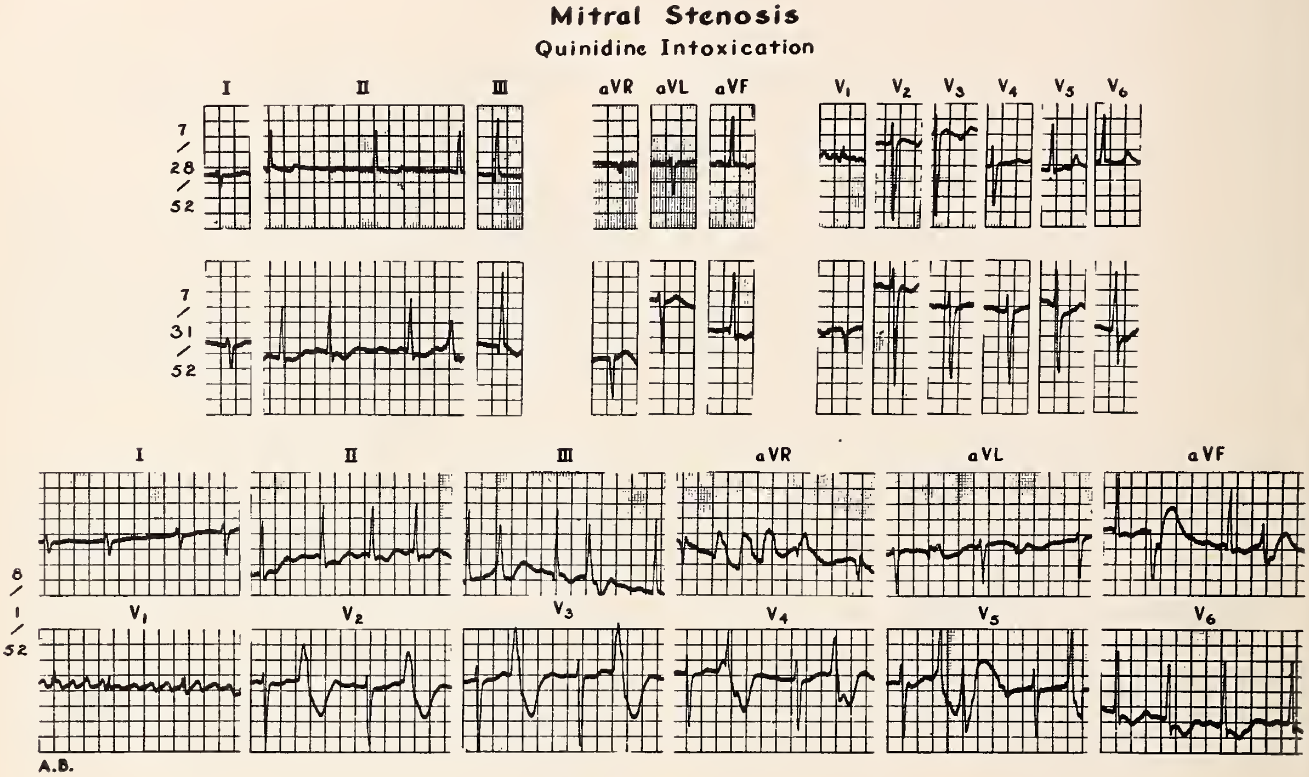

Fig. 2. Electrocardiograms in *Case 2.* July 28, 1952: digitalized prior to quinidinization. July 31, 1952: during quinidine therapy. August 1, 1952: tracing taken immediately after quinidine shock. Note burst of tachycardia with wide QRS in aVR.

The patient was readmitted on October 26, 1950, again in frank congestive heart failure with auricular fibrillation and essentially the same findings as on the previous admission. The patient had discontinued the digitoxin one month prior to admission. It was decided that a trial of quinidine would be in order. Thus following digitalization, the patient was given 1.2 Gm. of quinidine sulfate after which he converted to a normal sinus rhythm. The digitoxin was discontinued and the patient was maintained on 0.2 Gm. quinidine four times a day. He was discharged with instructions to take this medication indefinitely.

The patient was admitted for the third and final time on March 28, 1952, presenting the same clinical picture as before with congestive heart failure and auricular fibrillation. He had discontinued the quinidine therapy four months prior to admission. The staff at this time felt that the bouts of congestive heart failure were precipitated by the onset of rapid auricular fibrillation. Again following treatment of the heart failure with digitoxin and mercurial diuretics the patient was started on quinidine. On the first day of therapy March 31, 1952, he received 0.2 Gm. every two hours for a total of one gram which did not convert the rhythm. On April 1, he had 0.4 Gm. of quinidine every two hours for five doses. On April 2, he received 0.4 Gm. of quinidine at 9 a.m. and 12 noon. Then regular rhythm was discovered and the quinidine was discontinued. After eating his usual noon meal he had two short tonic convulsions. Following this a neurological examination revealed only a generalized hyperreflexia. Approximately forty-five minutes later the patient had a grand mal type of seizure and became intensely cyanotic. His pulse and blood pressure were imperceptible. He was given artificial respiration for five minutes without any change in his condition. The thorax was opened.

It was observed that the heart was not beating. After electrical stimulation the heart began to contract in a regular and efficient fashion. Thereafter the blood pressure rose to normal levels quickly and the pulse became palpable. The patient was taken to the operating room and the wound closed. He failed to regain consciousness. The cardiac rhythm varied with auricular fibrillation occurring after the operation yielding to an auricular tachycardia (or flutter) with a 4:1 block. Terminally, a sinus mechanism was restored. The electrocardiograms are illustrated in Figure 3. Death occurred April 21, 1952, nineteen days after regulation of the auricular fibrillation.

Quinidine Intoxication

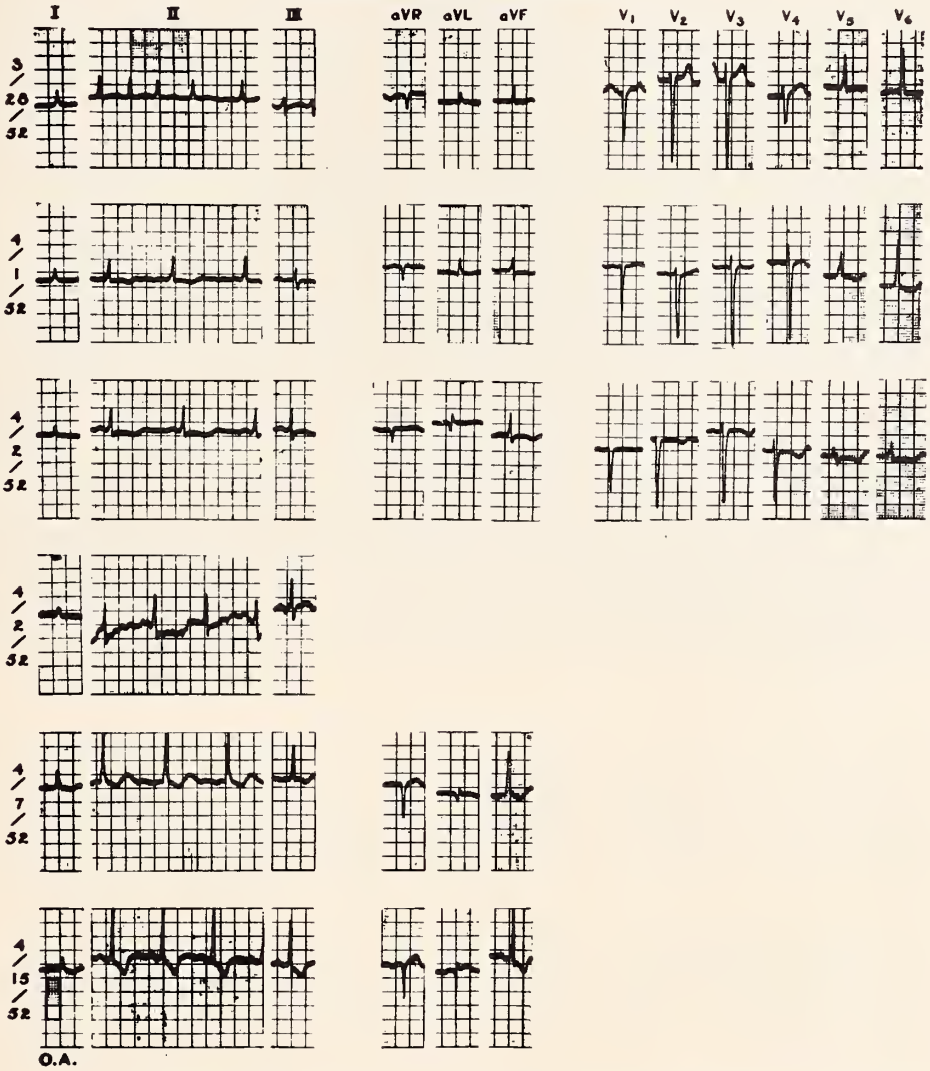

Fig. 3. Electrocardiograms in *Case 3.* March 28, 1952: admission, auricular fibrillation with ventricular rate of 150. April 1, 1952: fibrillation with rate reduced to 70 with digitoxin. April 2, 1952: (a.m. tracing, 12 leads) restoration of sinus rhythm. Note T wave changes in V_1-V_4. April 2, 1952: (p.m. tracing, 3 leads) after cardiac arrest, thoracotomy, manual and electrical stimulation. Auricular fibrillation has recurred. April 7, 1952: during long period of coma; inverted P_2 suggests auricular rhythm. April 15, 1952: restoration of sinus origin of heart beat continuing to death.

Autopsy showed severe bilateral bronchopneumonia. The right lung weighed 690 Gm. and the left 500 Gm. The heart weighed 375 Gms. The coronary arteries were completely patent throughout with only mild sclerotic changes. No clot had formed in any chamber. The valves were normal. The myocardium was grossly normal with the exception of an area of scarring 4x6 cm. at the apex of the left ventricle. Microscopically a moderate diffuse fibrosis of the myocardium was found (Fig. 4). The spleen weighed 100 Gm. and contained an old infarct 1 cm. in diameter. The aorta was free of arteriosclerosis. The brain showed some maceration of the occipital lobes. An elongated area of softness was found medial to the posterior lobe of the left lateral ventricle. The cerebellum and brain stem

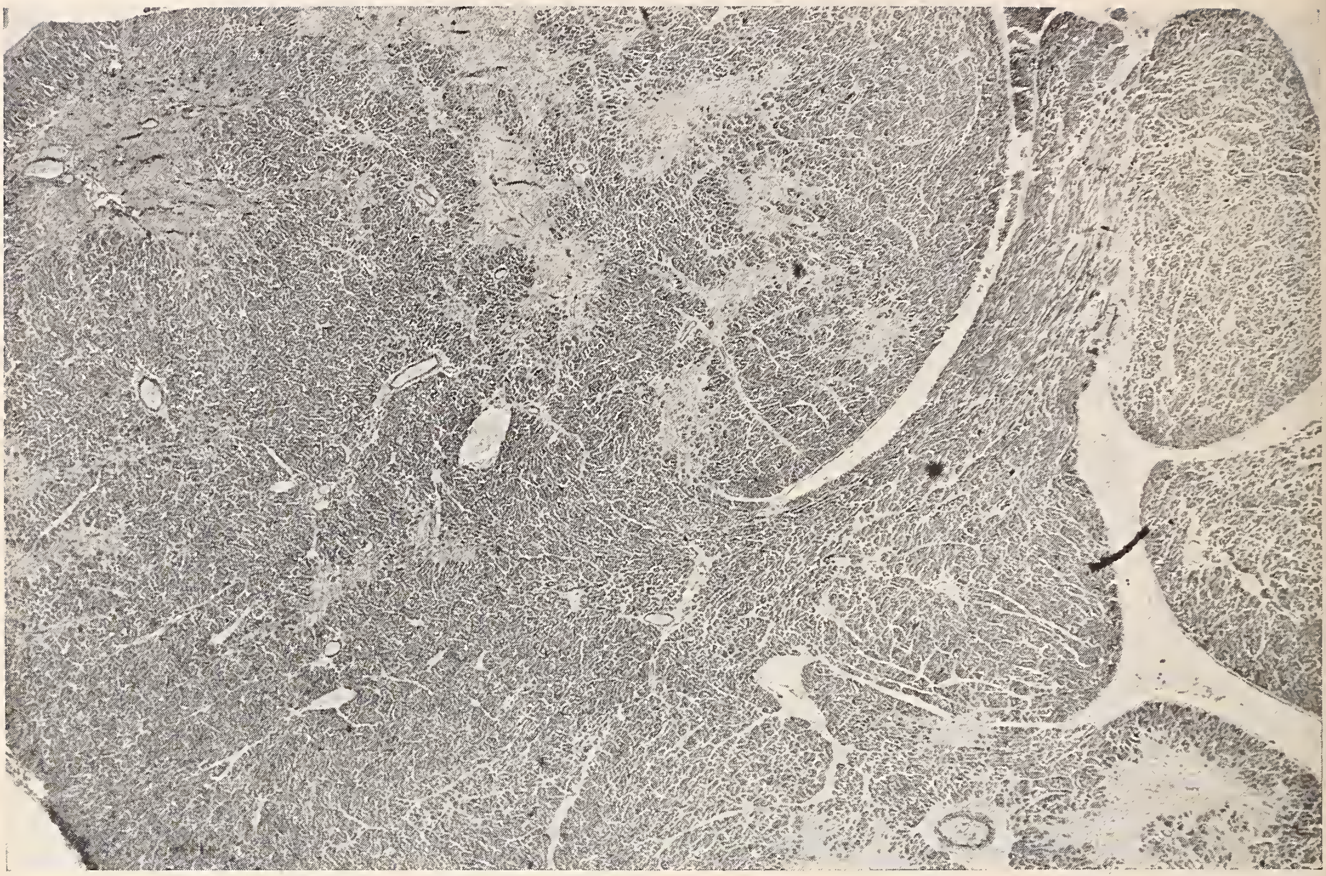

Fig. 4. Cardiac muscle in *Case 3* showing patchy areas of fibrosis (20x).

were normal microscopically and the softening did not appear to be of long duration. The neurones showed no abnormality. The blood vessels showed some increase in thickness of the walls, particularly in the smaller vessels. The pathological diagnoses included:

1. Auricular fibrillation with cardiac arrest.
2. Mild diffuse myocardial fibrosis.
3. Advanced bronchopneumonia.
4. Encephalomalacia.
5. Cerebral arteriosclerosis.

Summary and Comment—Case 3.—The patient had a diffuse myocardial fibrosis without myocardial hypertrophy. Auricular fibrillation was regulated with quinidine. The restoration of sinus rhythm was followed by convulsions and later by cardiac arrest. The patient had two previous attacks of auricular fibrillation, one reverting following digitoxin and the second restored to sinus rhythm with quinidine. This is an example of cardiac arrest following quinidine. This patient illustrates the classic story of death following quinidine under circumstances which without autopsy would have led to the conclusion that restoration of effective atrial beats had dislodged a thrombus and produced fatal cerebral embolization. The autopsy, however, revealed neither atrial thrombus nor cerebral embolus. The cerebral changes can be explained on the basis of the anoxia during the period of cardiac arrest and the subsequent nineteen days of coma.

Case 4.—F. R. L., a sixty-four-year-old white man was admitted to the Minneapolis Veterans Hospital on July 18, 1952, and expired August 9, 1952. His complaints on admission were severe exertional dyspnea and swelling of the ankles for one week. He had first noticed exertional dyspnea about eight years previously. He had been under the care of his local physician since then and apparently had been taking quinidine off and on for several years. He denied any marked dyspnea although he admitted inability to climb stairs without pausing for a rest. He had several episodes of paroxysmal nocturnal dyspnea in the past year. He knew of no hypertension, rheumatic fever, or goiter. He had occasional apical chest pains on over-exertion which were relieved by rest. About six days prior to admission he developed severe dyspnea and his ankles became markedly swollen. On admission his apical pulse was 120, radial, 70; blood pressure, 120/70; and vital capacity, 4.2 liters. The patient appeared to be a well-developed, well-nourished sixty-four-year-old white man in no acute distress. His thyroid was not palpable. His fundi were not remarkable. The lungs were clear to percussion and auscultation. The apical impulse was found in the sixth interspace in the anterior axillary line. There were no murmurs. Femoral pulses were good. The liver was palpable just below the costal margin. There were bilateral inguinal herniae and a left hydrocele. The remainder of the physical examination was essentially negative. The impression on admission was auricular fibrillation and heart failure of unknown etiology.

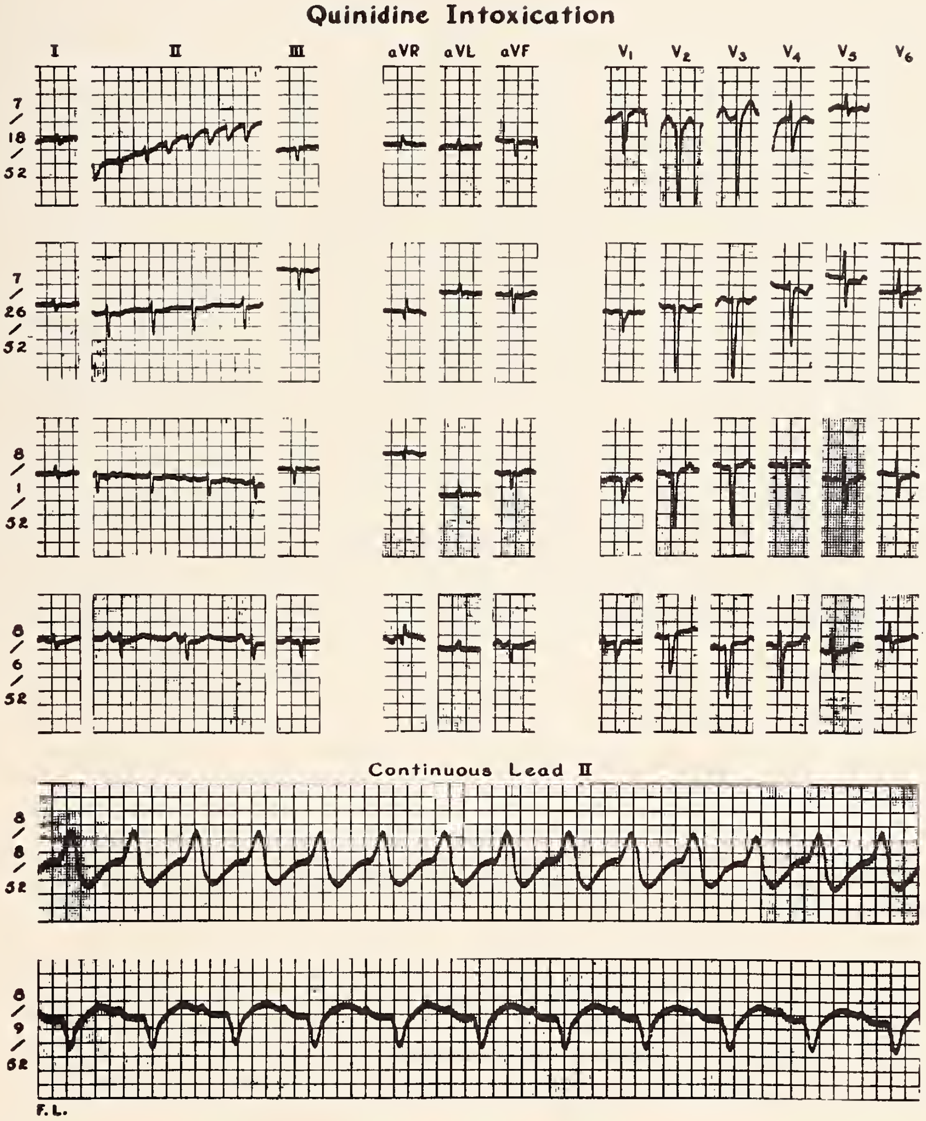

Fig. 5. Electrocardiograms in *Case 4*. July 8, 1952: fast fibrillation on admission. Note burst of ventricular tachycardia in lead II. July 26, 1952: after two days of quinidine. August 1, 1952: after first convulsive seizure; still fibrillating. August 6, 1953: regular rhythm. This was followed in twenty-four hours by second convulsion. August 8, 1953: following third convulsion; ventricular rhythm. August 9, 1953: terminal mechanism; supraventricular origin with A-V and intraventricular conduction defects.

Admission urinalysis showed five to six hyaline casts and 60-80 white blood cells per high powered field. The hemoglobin on July 21 was 15.5 Gms., white blood count, 7,303 with a normal differential. Sedimentation rate was 1 mm. The blood urea nitrogen was 15; total cholesterol was 152. Serology was negative. The basal metabolic rate was 3 per cent. Chest x-ray on July 18, showed moderate increase in cardiac size and a small left pleural effusion; on July 28, there was reduced cardiac size with complete resolution of the pleural effusion. An electrocardiogram on admission (Fig. 5) showed auricular fibrillation with rapid heart rate and periods of ventricular tachycardia. There were frequent premature ventricular beats.

The patient was served a low sodium diet and digitalized with 1.2 mg. Lanatoside C intravenously followed by 0.4 mg. digitoxin orally and a maintenance dose of 0.2 mg. digitoxin daily. He also received mercurial diuretics. His congestive failure responded well to this management. However, there was difficulty in controlling the rate below 100. The electrocardiogram showed rather frequent extra-systoles. It was deemed unwise therefore to increase the digitoxin. He was given quinidine 0.2 Gms. four times daily because of runs of ventricular tachycardia. The patient lost forty pounds following an excellent diuresis.

On July 25, 1952, he was started on a regime for regulation of his fibrillation receiving 1.2 Gm. of quinidine on a two-hour schedule. On July 26, the total dose was 1.6 Gm. This was unsuccessful. The electrocardiogram (Fig. 5) then showed T wave inversion in the chest leads. On July 27 and 28, he was given no further quinidine. On July 29, he received 1.6 Gm. (0.4 Gm. every four hours for four doses). That night, approximately four hours after the last dose of quinidine the patient was found in a convulsive state, cyanotic, apneic, and pulseless. He was seen by the medical officer on duty whose opinion was that the patient had a cerebral embolus. The patient recovered consciousness in fifteen minutes. He presented no neurological changes on the morning following the convulsion. He was entirely lucid and felt quite well. He was again given quinidine 0.6 Gm. in three hours. The patient converted to a normal sinus rhythm (Fig. 5—electrocardiogram, August 6, 1952) about two hours after the last dose of quinidine. On August 7, the patient experienced another convulsion and was treated only with oxygen. The attack was characterized by apnea, cyanosis, and absence of pulse. No heart beat was heard. The attack lasted for approximately five minutes with gradual return to consciousness. Fibrillation recurred and the patient was again given 0.6 Gm. of quinidine on August 8. Late that afternoon he experienced another similar episode. The electrocardiogram then showed an abnormal rhythm with no P waves and wide QRS complexes (Fig. 5, August 8, 1952). Pronestyl intravenously was ineffective. Terminally a supraventricular regular rhythm occurred (Fig. 5, August 9, 1952). He died at 5 a.m., August 9, 1952.

At autopsy the heart weighed 700 grams. The average thickness of the left ventricular wall was 16 mm. and that of the right ventricular wall approximately 6 mm. No mural thrombi were noted in either atrium or ventricle. The endocardium appeared normal. The myocardium on section showed no evidence of old or recent infarction. No gross myocardial fibrosis was encountered. The coronary arteries were patent throughout with moderate sclerotic narrowing. The ascending aorta presented no unusual amount of atherosclerosis. The right lung weighed 700 grams and the left, 600 grams and both contained a moderate amount of fluid. The liver weighed 1,750 grams and cut section revealed nothing unusual. The brain was grossly normal with the exception of a small area of encephalomalacia in the right cerebellum. No emboli were noted in the brain. The heart on microscopic section showed areas of moderate fibrosis scattered throughout the myocardium (Fig. 6). The diagnoses were:

1. Idiopathic myocardial hypertrophy and fibrosis.
2. Heart failure.

Summary and Comment—Case 4.—This patient had myocardial hypertrophy of undetermined etiology with some fibrosis. Following an unsuccessful attempt at regulation of auricular fibrillation with quinidine the patient developed apnea and was found in a convulsion, cyanotic, and pulseless. The clinical diagnosis of cerebral embolus was suggested. The second attempt at quinidinization resulted in return to sinus rhythm and another convulsive episode similar to the first, and fibrillation recurred. With the third exhibition of quinidine an intractable tachycardia resulted. Failure to appreciate the syndrome of convulsions and apparent death as a toxic manifestation of quinidine led twice to unwarranted resumption of quinidine therapy. The bursts of ventricular contractions one of which is illustrated (Fig. 5, July 18, 1952) were present on admission and should have been recognized as danger signals. Also present were T wave changes during quinidine therapy (Fig. 5, July 26, 1952). The autopsy revealed no cerebral emboli. This death also probably would have been attributed to cerebral embolism had no autopsy been performed.

Case 5.— E. E., a woman aged fifty-four, was admitted to Mount Sinai Hospital, Minneapolis, June 26, 1952, and was discharged July 7, 1952. The patient had hypertension of ten years' duration and was admitted for treatment of auricular flutter. At the time of her admission a regular tachycardia of 152 was found. Auricular flutter with a 2:1 block was present. Cardiac enlargement with a left ventricular contour was found on x-ray examination. The patient entered the hospital digitalized but increasing doses of digitoxin were given until the auriculo-ventricular block approximated 4:1 and 5:1. On June 29, 1952, she was given quinidine 0.4 Gm. Within a half hour she had nausea and vomited 600 cc. of fluid. Two hours later she had a clonic convulsion followed by Cheyne-Stokes breathing, and finally almost a complete cessation of respiratory motion. Artificial respiration was instituted. She had a total of five convulsions, all of them clonic in character. She continued to have nausea and vomiting. Four hours after the original dosage of quinidine her electrocardiogram revealed only the development of auricular fibrillation. The following day an electrocardiogram showed returned auricular flutter with varying A-V block.

Case 5 represents a reaction following a single small dose of quinidine. The patient had auricular flutter with hypertension. The "test" dose was followed by severe nausea and vomiting, respiratory failure and many convulsions. During the seizure the flutter changed to fibrillation with subsequent reversion to flutter again. Recovery followed artificial respiration.

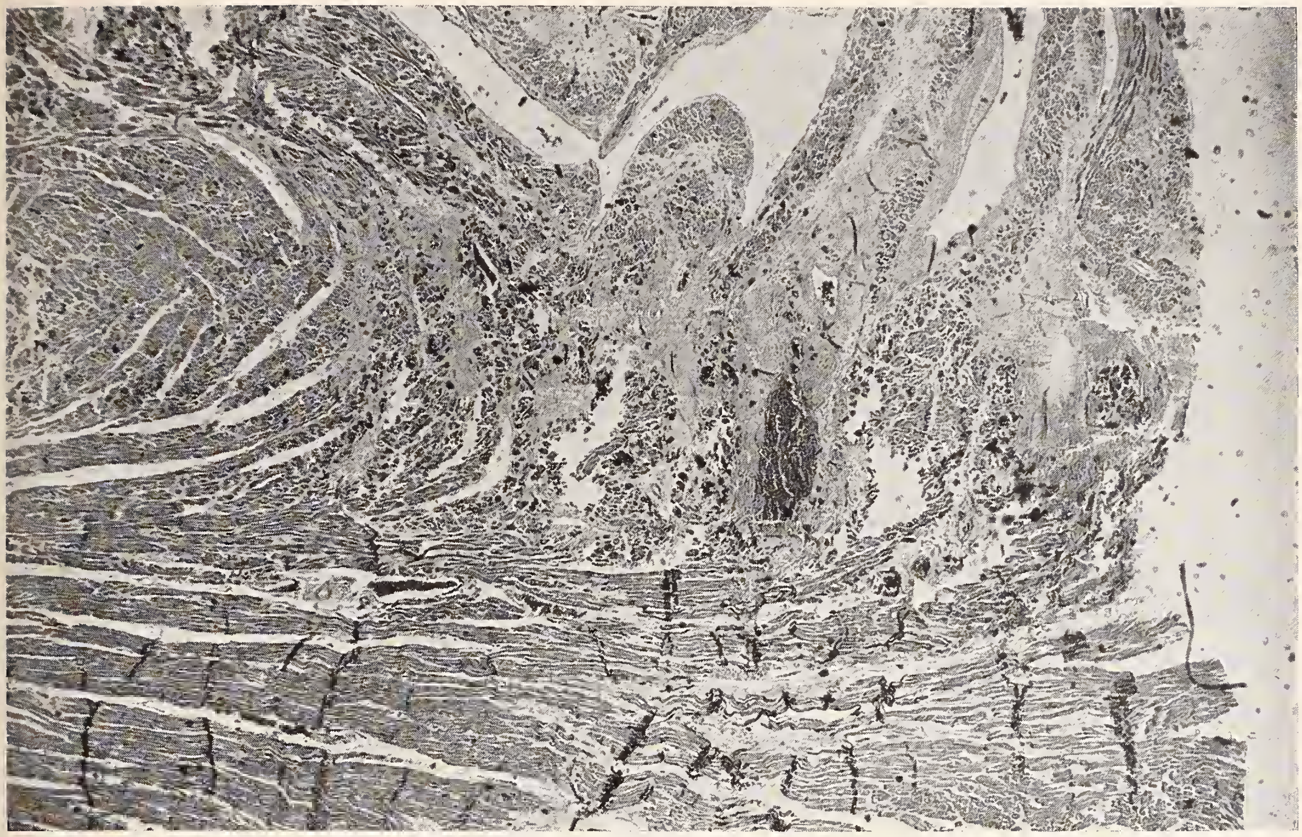

Fig. 6. Microscopic section of heart muscle in *Case 4* showing areas of fibrosis (20x).

Discussion

These five cases all showed remarkable changes in the cardiac mechanism during the period of quinidine intoxication. It is possible that the respiratory failure observed in all but the first case was a result of the acute cardiac collapse. The respiratory failure here reported differs from that observed in cats[8] treated with intravenous quinidine. These animals died in respiratory failure with vigorous heart beats continuing to the end. The value of artificial respiration shown in quinidine intoxicated cats seems also to apply to man.

Cases 2, 3, 4 and *5* showed acute cardiorespiratory failure following other evidence of quinidine effects. In *Cases 2* and *5* the collapse followed nausea and vomiting. *Cases 3* and *4* developed their fatal complications following regulation of fibrillation. *Case 4* also showed electrocardiographic changes that could be attributed to quinidine. It seems reasonable to consider the cardiorespiratory collapse also a quinidine effect.

The similar symptomatology in these cases can be grouped into a syndrome of quinidine shock. The patients who showed this picture all had convulsions during quinidine therapy. The syndrome is characterized by convulsions, respiratory failure, cardiac collapse, absent blood pressure, and pulselessness. It may be of brief duration responding to artificial respiration. The cardiac mechanism during the period of failure is variable but cardiac arrest and ineffective ventricular rhythms have been demonstrated. In each case the fatal or near fatal episode was preceded by or accompanied with other signs of quinidine effect. The syndrome resembles the effects described for cerebral embolization.[12] In our two autopsied cases emboli were not found.

The goal of quinidine in auricular fibrillation, the achievement of regular rhythm, may itself be the premonition of a serious or fatal toxic reaction to follow. It is likely that the reactions following quinidine regulation of fibrillation in the past interpreted as cerebral emboli in reality often represented this quinidine intoxication syndrome occurring shortly after regulation. It is not possible to offer rigid proof that the perverse results in these cases were in fact due to quinidine. All of our cases had serious heart disease. However exculpation of quinidine leaves no logical explanation for the syndrome described. General recognition of the possibilities of these serious reactions to quinidine should result in more cautious selection of fibrillators for regulation and more vigilant methods of exhibition of the drug. The dosages reported here are probably too high and are increased too rapidly. Weisman[15] recommends 0.2 Gm. of quinidine on the first day increased by increments of 0.2 Gm. daily to a maximum of 2.0 Gm. in any single day. It is probable that employment of such a slower schedule would have avoided some of the severe reactions reported here.

Conclusions

1. Five cases of complications arising during quinidine treatment of auricular arrhythmias are discussed. Four displayed acute cardiorespiratory collapse which was fatal in two. No emboli were found.
2. A syndrome of quinidine shock is described.
3. Artificial respiration is a useful measure occasionally life-saving when apnea follows quinidinization.

THE PHYSICIAN AND HIS ESTATE

(Continued from Page 1035)

lull yourself into false security by assuming otherwise. Next, your affairs and your estate, no matter how small, deserve and are worth putting in order. You have spent a lifetime acquiring that estate. The least you can do is to spend some hours and a few dollars in protecting it and in planning its disposition. In one sense, a will is the most important instrument you will ever sign for it disposes of all of your property. If you do not plan your estate in the light of present laws, then you must take the consequences of no planning or of poor planning. The unfortunate thing about it is that you are not the one to suffer. Your beneficiaries, instead, are the ones who sustain the real burdens of thoughtlessness and improvidence on your part.

There is a line of poetry which the author Robert Service himself characterizes as "a pregnant phrase." That phrase, "it is later than you think," is appropriately applicable to estate planning and your specific personal problems. Please keep it in mind when you consider in the future, as I am sure you have in the past, day-to-day deferral in getting your affairs in order.

THE MEDICAL TECHNOLOGIST AND THE UNIVERSITY OF MINNESOTA

WESLEY W. SPINK, M.D.
Minneapolis, Minnesota

THE INVITATION to address you this evening was extended by representatives of "The Orbs," which I have since found out is a scholastic honorary society in Medical Technology at the University of Minnesota. The assignment was gladly accepted because it would give me an opportunity to express my appreciation to the technologists and to their preceptors, all of whom are such an integral part in the care of the patients, the teaching, and the research that are carried out at the University of Minnesota Hospitals. All of us in the field of clinical investigation owe a deep sense of gratitude to you who have contributed so much to our efforts. Prior to the preparation for this talk my knowledge of Medical Technology at Minnesota was related to personalities and to the cold results of their work, rather than to an intimate knowledge of the basic purpose and philosophy of that department. And so to acquaint myself with Medical Technology at the University, the advice of instructors in the Department was sought, especially from Miss Ruth Hovde, who is Senior Adviser. I then repaired to the Archives of the University of Minnesota and read the early bulletins pertaining to the Course in Medical Technology, and examined the Annual Reports of the President of the University and the Dean of the Medical School to obtain a measurement of the program that had been made in this field of education. The results of this quest are now shared with you along with some thoughts on the function of a University.

The Orbs

The primary objective of any University is scholarship, an endeavor in which a community of scholars synthesizes and crystallizes the accumulated knowledge of the past, and also probes into the future. This objective was formally recognized by the medical technologists at the University when on March 1, 1935, an honorary society based on scholastic attainment was organized through the guidance of the late Dr. William A. O'Brien and Mrs. Gordon Erskine. The purpose of the organization was to stimulate high scholarship and to encourage honesty, accuracy and self-reliance. The name Orbs was chosen for the Society because, "it means eye. In our profession we are the laboratory eye of the doctor." And for the emblem on their pin, they had placed an eye, a microscope and a retort. But most important, eligibility for membership rested upon the attainment of a 2.0 average or above for University work by the winter quarter of the Junior year. And remember, such an average reflects genuine ability since the work of the "Med Tech" in the first two years is in the College of Science, Literature and Arts.

The Early History and Development of the Course in Medical Technology

A course in medical technology was initiated at the University of Minnesota in 1922. The first announcement on March 10, 1922, stated:

> "The demand for clinical and laboratory technicians, trained in the principles and technique of the medical sciences is increasing. The technician, so trained, is an aide to the physician, the surgeon, the medical specialist, the group clinic, the hospital, or the teaching and research laboratory. The vocation is one that offers satisfactory objectives, a large measure of usefulness, and fair compensation."[1]

The requirements for admission to this new four-year course were the same as those for entrance into the College of Science, Literature and Arts. And thereby, Medical Technology at the University of Minnesota began with high standards required of its students. A Committee of Advisers for the students was set up with Dr. R. O. Beard, as Chairman, and Dr. S. Marx White and Dr. W. P. Larsen.

In the President's Report for the years 1922-1923 we find this progress report by Dean E. P. Lyon:

From the Department of Medicine, University of Minnesota Hospitals and Medical School, Minneapolis.
Presented at the Annual Medical Technology Banquet at the University of Minnesota on May 14, 1953.

> "In the new courses in Medical Technology six students have been registered in the Medical School, but a larger number are doing the preparatory work of the first two years in the College of Science, Literature and the Arts."

Then in the President's Report for 1923-1924, President Lotus D. Coffman pointed out with cold statistics and with the accompanying table the numerical gain in the enrollment in the course of Medical Technology.

Year 1922-23			Year 1923-24			
Men	Women	Total	Men	Women	Total	Net Gain
0	5	5	1	5	6	1

Medical Technology grew slowly, but on a firm foundation. Although small numbers of students enrolled for this course, the administration, to its everlasting credit, refused to lower the standards, and we see recorded in the announcement of 1926 the basic philosophy of this course, and the continuance of the high standards.[2]

> "The demand for well-trained laboratory technicians is increasing. Positions may be secured in hospitals, clinics, and physicians' offices. Three types of individuals are holding them: (1) University graduates in technology; (2) short course graduates, and (3) those whose training has been acquired by practice under preceptors. The University of Minnesota does not offer any short courses. The regular four-year course is open to graduates of accredited high schools. The rules for admission and registration are those of the College of Science, Literature, and the Arts. The first two years are essentially the same as the pre-medic requirement. The last two years are spent in the Medical School and University Hospital Laboratory or other approved laboratory."

One interesting development in the history of this course is reflected in the announcement of 1929, the seventh year of the undertaking, and that is men were specifically advised not to enroll in the course.

> "With the rapid increase of laboratories in hospitals, clinics and medical schools, medical technology offers a splendid field for women at the present time. Men, as a rule, are not advised to take the course."[3]

One is hard put to interpret the following announcement of the course that appeared in 1930.[4] In almost an amusing fashion, it placed a premium on women for Medical Technology, and bluntly discouraged any prospective male registrants. This announcement was undoubtedly penned after the economic crash that occurred in the Fall of 1929. The depression was on. Could this fact account for the tenor of the statement?

> "Well-trained laboratory technicians are in demand. Positions may be secured in physicians' offices, clinics, hospitals, research laboratories, and medical schools. As a general rule, a student, who is able to do things with her hands, likes routine work, and excels in scientific work, will make a good technician. Ability to cook and sew is an excellent asset for would-be technicians. Men are not advised to take the course because of limited opportunities for employment at the present time."

But we must move on. As more and more quantitative methods were introduced into the practice of medicine, and clinicians placed increasing reliance upon laboratory procedures, there was a greater demand for well-trained medical technologists. We learn that by 1953, over one thousand individuals have received the degree, Bachelor of Science, from the University of Minnesota, after successfully completing the course in Medical Technology. You will note that I say "course in Medical Technology." Medical Technology does not comprise a School at the University of Minnesota, nor even a separate department. It still is a course with the work in the first two years in the College of Science, Literature and the Arts. Beginning with the third year, the student is registered in the Medical School, and the fourth year is spent in rotating through the laboratories of the University of Minnesota Hospitals.

Medical Technology at Minnesota may be divided into three eras. First, the birth of a concept that took place under the direction of a Committee headed by Dr. Richard O. Beard. The numbers of enrolled students were small at first, but a sound and thorough training was offered to the registrants. The second era was that of growth, which occurred under the leadership of the late Dr. William A. O'Brien. He was a remarkable leader. He was a good man. He liked people. He possessed that unique ability for crystallizing the important aspects of medical knowledge, and then communicating the information in simple language so that all might understand. The third era is that of arriving at maturity under Dr. Gerald T. Evans. He has welded together a capable group of administrators and supervisors so that Medical Technology plays a tremendous role in the daily activities at the University Hospitals, as I shall point out shortly. In judging the success of any department in a medical school, I do not do so on the basis of the accomplishments of the head of that department, but rather upon the abilities and achievements of the second, third or fourth individuals in the administrative hierarchy. Could the department run on just as smoothly if the leader were to suddenly drop out, and either of several other individuals were to take over? If this could be effected, then the administrator has done a good job. It is significant that Dr. Evans has recognized this. He has delegated authority along with responsibility, and hence the continued success of Medical Technology at the present time.

The fundamental strength of the training that is presented in Medical Technology is that capable students are selected, and their activities are then integrated within the University, Medical School, and the Hospitals. Because these students, including all of you, have joined a community of scholars known as a University, let us make a momentary diversion and recall specifically your relation to the University as a whole.

The Medical Technologist and the University

The word, university, is derived from the Latin, *universitas,* which originally meant a community or corporation. The university started in medieval times as a scholastic guild composed of teachers and scholars, and was probably patterned after the trade guilds. All down the ages membership in a university has been a mark of distinction, emphasizing intellectual achievement and scholarship. It is a precious privilege for any boy or girl to attend a university, and this also includes attendance at a liberal arts college. A university education has two essential goals. The first is most fundamental, and considerably more important in the long run than the second. It is concerned with the development of the human intellect. The primary concern of the college student should be an engagement in exploring his own mind and learning how to think, which in turn will aid him in how to live with himself and with the world. The distinguishing mark of a college graduate should be his choice of values—in all human activities. His selections should be made after mature thought—and not impulsively, and not on the basis of prejudice. In this process he is motivated and abetted by distinguished teachers. In the lecture room and in his studies he has placed before him the panorama of accomplishments, errors, tragedies and happiness of the ages. An inventory of this information is his for the effort. In this learning process, I am a firm advocate for a study of the humanities in a liberal arts college that brings with it excursions into history, literature, economics and philosophy. I attended and was graduated from Carleton College, which is a liberal arts college. I pursued the premedical course. But very fortunately for my own future happiness and intellectual pleasure, I was exposed to the contents of a liberal arts curriculum. The one course in college which made more of a lasting impression upon me than any other was "Nineteenth Century Prose," introducing me to the writings of Carlyle, Newman, Matthew Arnold, Ruskin and others. This served as a foundation for further reading, which persists to the present day. This enduring enjoyment of literature was motivated by a great teacher who with uncanny selectivity and enthusiasm spoke about the "purple patches of literature" and then led us to those patches where we browsed, and I have since continued to do so. My own experience and the subsequent contacts that I have had with professional people make me a firm advocate for a liberal arts education for every individual who plans to enter a profession. But I note that I have forgotten about the second goal in a college education, and that is the more utilitarian one of learning how to make a living. It seems to me that this is inevitably a by-product of the first, and that anyone who can master the art of thinking can manage the practical end of specialized knowledge, such as a profession offers, or of successively entering into the competitive business community without further university training.

That which appeals to me so strongly in the course of Medical Technology is the emphasis during the first two years in the University upon the liberal arts. First, registration is necessary in the College of Science, Literature and Arts, and second, ninety credits of electives are required. If I were advising any student in Medical Technology I would be more concerned about those electives than the scientific subjects. The careful selection of courses and teachers can only result in the expansion of the outlook of the student, and add to his intellectual dignity.

The Medical Technologist and the University Hospitals

It is in the last year that the medical technologist culminates his or her formal university training by working at the University Hospitals. Study and work are now tinged with an additional emotional glow because the student will have personal contacts with the patients and will share in the responsibility for the care of sick individuals.

The University Hospitals constitute a unique institution. There is no other like it in the State of Minnesota. The hospitals have a threefold purpose: first, the care of patients; second, the training of doctors, dentists, nurses, medical technologists, physiatrists, social service workers and hospital administrators; and third, the prosecution of medical research. In each of these fields, the medical technologist plays an important role. The primary objective of a hospital is to care for sick people. While modern medical science has made tremendous progress in the diagnosis and treatment of human disease, the successful application of this knowledge takes well coordinated teamwork within an institution. The amount of laboratory procedures carried out by medical technologists in this pursuit is phenomenal. It is in this sphere that honesty and accuracy in the performance of work are so essential. The interpretation of laboratory data supplied by the technologist may be the turning point in a patient's life. Consider the responsibility that rests upon a technologist who has cross-matched blood for a transfusion. The patient is having a serious hemorrhage on the operating table. While the operation continues and the patient is completely anesthetized, whole blood is dripped into a vein. Under these circumstances a mistake in cross-matching might go unrecognized until the patient is in serious trouble, and death might well occur. Such instances of responsibility shared by the technologists could be multiplied many times.

In the training of medical doctors, especially undergraduate medical students, interns and residents, the technologist is of considerable aid in the accomplishment of this effort. Too many physicians in every-day practice call for laboratory procedures, even the more simple ones, without much knowledge of the technique employed or the real significance of the results. It is for this reason that the medical student performs laboratory procedures himself during the course of his training under the supervision of medical technologists. At the University Hospitals, it is remarkable what a thorough briefing a student can get in the hematology laboratory. On the other hand, the medical technologists sit in on clinics in order to observe how their work is applied by the clinicians in the care of the patients. It is just as well for a technologist to know the significance of her work as it is for the physician.

No university center is worth its salt unless its personnel is contributing to new knowledge in the interest of human welfare. And so, the University Hospitals over the years have made major contributions to medical research. Fortunately, the administration under Mr. Ray Amberg and Miss Gertrude Gilman have fostered this ideal of a University Hospital. Clinical investigation calls for careful quantitative measurements and the results of the work of the medical technologists have brought universal recognition to more than one member of the Staff. A pleasing aspect of working at the University Hospitals is to note and feel the genuine interest that the medical technologists and nurses have not only in the care of patients, but also in the medical research being carried out by the Staff. And this mutual interest in that which is new is due in large part to the indoctrination by the various administrators and instructors. There is a certain thrill and pleasure enjoyed by all the hospital personnel in seeing for the first time a procedure or a drug that brings relief to human suffering.

Concluding Remarks

And now, let us again consider the motto of the Orbs—*"honesty, accuracy, self-reliance."* These words and what they symbolize in the light of human experience can be profitably shared by physicians, nurses, technologists—or anyone, charged with the care of patients. And particularly in the field of medical research, one must be objective and record the findings as they occur. This is the experimental method. But unfortunately, the great mistakes are often made

Laboratory Aids to Medical Practice

Sponsored by
The Minnesota Society of Clinical Pathologists

PRACTICAL CONSIDERATIONS IN CERVICAL CYTOLOGY

DAVID C. DAHLIN, M.D.
Rochester, Minnesota

IT HAS BEEN established that cytologic methods are an important aid in the diagnosis of preclinical carcinoma of the uterine cervix. Such invisible lesions are usually *in situ* but occasionally they show infiltration. Cervical smears are of little practical value in the diagnosis of clinical malignant disease of the cervix or fundus of the uterus, in which conventional diagnostic procedures are necessary,

Carcinoma of the uterine fundus is more evasive to the cytologist than is cervical malignancy. The former lesion is, moreover, less common and more curable than the latter. These factors combine to focus the cytologist's attention on the detection of cervical carcinoma when it is in an early, curable stage. Squamous cell carcinoma of the cervix constitutes more than 90 per cent of malignant lesions in this location and these begin, almost without exception, at the squamocolumnar junctional zone.

It appears logical that smears prepared from material scraped from this junctional zone would be more likely to contain malignant cells than would smears from the vaginal pool. This has been found to be true. Examination of a single slide smeared with material scraped off with a wooden spatula or even a cotton-applicator stick yields a high percentage of positive results in preclinical cervical carcinoma. It is important that material scraped from the endocervical canal be included in the smear. In some women, the squamocolumnar junctional zone is well above the external cervical os.

Immediate fixation of the smear before any drying can occur is the next step. Ethanol (95 per cent) is a cheap and highly satisfactory fixative which may be re-used after filtration. The cells in the smear are adequately fixed in approximately ten minutes, but slides may be kept in the ethanol indefinitely. Allowing the fixed preparations to dry before final processing causes minor but definite cellular alterations.

In the next step, which is staining, good nuclear detail is the most important result. This can be secured by staining with ordinary hematoxylin and eosin. More complicated stains afford little or no advantage to the cytologist interested in the detection of cancer.

Thorough scanning of the stained smear takes approximately ten minutes. The slide must be examined in its entirety with the aid of a mechanical stage. When any appreciable number of smears are examined in a laboratory, it is impractical not to employ trained technicians to do the initial screening. Such technicians can mark any questionable or malignant cells and the cytologist can render the verdict. A trained technician can stain and screen approximately 5,000 slides per year and also care for the associated clerical work.

Suspicious or obviously malignant cells in smears prepared as just described almost invariably come from the cervix. The incidence of false suspicious and false positive results obviously will depend on the ability of the cytologist. His goal should be to minimize subsequent fruitless investigations of patients requested as a result of this procedure.

When further study is indicated because of the cytologic findings, the appropriate diagnostic procedures are readily defined. It is imperative that the entire squamocolumnar junctional zone be delivered to the pathologist. This can be accomplished best by procuring a cone of tissue from the region of the external cervical os with a scalpel. Cauterization of this tissue should be avoided because the diagnosis of carcinoma *in situ* depends on cytologic details that are destroyed by

---

From the Division of Surgical Pathology, Mayo Clinic, Rochester, Minnesota.

cooking. Multiple punch biopsies that consume the junctional zone perhaps are nearly as efficacious as a cone specimen for the establishment of the proper diagnosis. If the atypical cells are not explained by examination of tissue from the cervix, dilatation and curettage must be done. The cytologic pathologist is unable to increase his capability in the handling of troublesome cases unless his gynecologic colleagues supply him with adequate specimens for biopsy when atypical cells have been obtained from patients. He should not be satisfied with specimens that do not reveal the origin of the cells which caused him to render a "suspicious" or "positive" report.

Properly prepared and examined smears will result in the detection of early, usually curable carcinoma of the cervix uteri in approximately 0.8 per cent of women whose cervix appears benign.

This is the ninth in a series of editorial reports sponsored by the Minnesota Society of Clinical Pathologists and designed to foster closer relationships between laboratory physicians and their colleagues. Since the pioneer work of Papanicolaou, use of the "Pap" smear technique has become widespread. Similar to the experience in many procedures, the immediate acceptance of this relatively new laboratory aid to medical practice perhaps was a bit too enthusiastic. The technique appeared to be so simple that many persons who had minimal experience with the vagaries of cytologic diagnosis drew diagnostic and therapeutic conclusions on insufficient evidence. As a result, some unnecessary treatment was given on the basis of false positive results, whereas in other instances, baseless security was experienced because of false negative results.

It is now recognized that considerable background in cytologic detail is necessary for adequate evaluation of a cervical smear for malignant cells. The pathologist, because of his training and his knowledge of cellular changes, both physiologic and pathologic, is equipped for this work, particularly in a supervisory capacity. The importance of cytologic diagnosis has been recognized to the extent that various training centers have been established to offer courses of instruction of several months' duration to both physicians and technologists.

Reprints of most of the reports in this series are available from the authors or the chairman of the editorial committee of the Minnesota Society of Clinical Pathologists. Dr. Arthur H. Wells, of Duluth, and Drs. Arthur H. Sanford and George G. Stilwell, of Rochester, who make up this committee, solicit comments concerning this series and welcome suggestions regarding material for inclusion in future reports.

George G. Stilwell, M.D.,
Chairman, Editorial Committee

Mayo Clinic,
Rochester, Minn.

THE MEDICAL TECHNOLOGIST AND THE UNIVERSITY OF MINNESOTA

(Continued from Page 1064)

not in the objective recording of the results, but in the interpretation. This second step calls for cool judgement, wisdom and freedom from prejudice. These in turn are achieved only through years of experience and a continual practice of those intellectual disciplines learned in college, or even without college.

But one may extend this motto of the Orbs into daily living. There is the need, more than ever, for honesty and accuracy in dealing with other people, with other nations. Too often, human misery results from misunderstanding, which engenders hatred and bitterness. The maintenance of human dignity means the adherence to certain principles of conduct culled from the experience and intelligence of the human race down through the centuries. A continual adherence to those principles will require self-reliance and the utmost courage at times. The pattern of a crowd culture bringing with it social and political recognition is not always too tasteful. Therefore, the individual who believes in *"honesty, accuracy, self-reliance"* may have to go it alone at times—but it is worth it.

Case Report

CESARIAN SECTION COMPLICATED BY CHOLELETHIASIS

HOWARD A. VOGEL, M.D.

New Ulm, Minnesota

While multiple procedures at operation should be avoided, it occasionally happens that the surgeon is forced to perform more than one operation on the same occasion. Mrs. H is an example.

Mrs. H's last menstrual period was on June 7, 1952, and her expected date of confinement was March 14, 1953. She had had a previous cesarean operation and she complained of attacks of severe pain located in the right upper quadrant of the abdomen throughout this second pregnancy. A cesarean section was done on March 5, 1953, because of a cephalo-pelvic disproportion or inadequate pelvic outlet. Previous section had been performed two years previous. At the time of her operation, the gall bladder was found to contain many stones. Blood and urinalysis reports were normal.

Operation—A midline incision was made under local nerocaine anesthesia, and a transverse incision was made in the lower cervical segment of the uterus. The baby was rotated and delivered as a breech. Next, the placenta was removed and pituitrin was injected into the uterine wall. Closure was made with two running catgut No. 1 chromic inverted Lempert sutures. The lower peritoneal flap was sutured to the uterus superior to the uterine incision and the upper flap inferiorly to the lower flap. Ergotrate was injected into the uterine wall, causing a firm contraction of the uterus. The gall bladder was then examined again and it was found that the patient had a large hydrops of the gall bladder and one large stone about 2 inches in length and 1 inch in diameter. There were also several small stones. This distended gall bladder extended at least 3 inches beyond the liver edge, and both my assistant and I felt that she should have it removed. We extended the incision about 2 inches, and the abdominal wall was so relaxed that we removed the gall bladder with ease. The cystic duct and cystic artery were tied separately with linen. Then we dissected the gall bladder from below and peritonealized the bed with atraumatic "0." A million units of penicillin were dropped into the region of the bed. We then examined the appendix and found it to be thickened and distended. Therefore, we did a routine prophylactic appendectomy. A million units of penicillin were dusted into the right lower quadrant. No drain was placed into the peritoneal cavity, and the uterus was again examined for bleeding. There was none. We then proceeded to close the abdomen in the routine fashion—peritoneum, muscle, fascia, fat, and skin. Six retention sutures were placed. The patient received 500 cc. of blood during the operation and left the operating room in good condition. The sponge count was correct.

On examination of the gall bladder, it was found to be greatly thickened and contained what proved to be sterile bile. It was dilated and protruded beyond the liver. It contained one large yellow stone, 2 inches in length and 1⅛ inches in diameter and about five or six small stones. The lumen of the appendix was dilated.

The histological diagnosis was as follows: "The gall bladder is 9.5 cm. in length. The wall is thick. The mucous membrane is rough. The appendix is 5 x 1 cs. The surface is smooth. Sections of the gall bladder show an active chronic cholecystitis. Sections of the appendix show no active inflammation." (Pathologist—J. S. McCartney, M.D.)

Mrs. H made an uneventful recovery, and both she and her normal male infant were discharged from the hospital on March 15, 1953.

THE PROBLEM OF LUPUS ERYTHEMATOSUS

(Continued from Page 1045)

sive. If the patient survives the acute or critical phase, prolonged convalescence with maintenance therapy will probably be necessary. The prognosis is always guarded and even if the patient survives the severe attack, invalidism usually of a profound degree ensues and relapse to a severe phase is a common occurrence.

The cure, if one may use the term, must be reckoned in months or even years. Acute or protracted systemic lupus erythematosus is indeed a severe and devastating disease and must so be considered. Undue optimism because of initial response, especially to steroids, must be discouraged.

MEDICAL HISTORY OF THE COUNTY OF YELLOW MEDICINE

MILDRED B. LEE

Granite Falls, Minnesota

(Continued from September issue)

In 1894, Dr. J. W. Donnell of Clarkfield was elected coroner, and held this office until June 16, 1898, when he himself became the subject of coroner's inquiry. On that date he committed suicide by first taking a dose of strychnine and then cutting his throat with surgical scissors.

Dr. Franklin J. Cressy of Granite Falls was then appointed coroner and held the office until after 1900.

Death by violence was rare but not unknown in Yellow Medicine County. Coroners were called to pass upon the death of John Purvis, who was murdered by his wife. Joseph Ott shot and killed his wife in a drunken rage, and was hung upon a scaffold erected in the rear of the jail; the last man upon whom capital punishment was inflicted before the repeal of the law. August Baierl of the western part of the county killed his son in an argument over money matters, and four men died in a box car at Clarkfield as a result of fire. The voters elected a doctor to this office whenever they had an opportunity to choose, showing they were not unaware of the need for a trained man for this office.

The Newspapers

To doctors the newspapers of Yellow Medicine County have ever shown a kindly interest and consideration not vouchsafed to members of any other profession, however necessary to the community. This seems to be true especially of those doctors who paid them the subtle tribute of choosing them as advertising mediums, although it does not seem that the small sum paid for the insertion of a professional card would in itself entitle the doctors to preferential treatment. In the early days of settlement the doctors were naturally often the best educated persons in the community, and they were also newsworthy as persons likely to be in the midst of interesting events.

The editor was the first to hear of the impending arrival of a new doctor, and he obliged by passing on the news to readers along with a brief and favorable statement of the doctor's intentions, qualifications, and place of origin. In a week or two this would be followed by a professional card, after which the doctor's activities would be fully chronicled. As to those who did not so advertise, the researcher is forced to the conclusion that either they were singularly retiring or that the newspaper never found out about their activities. In settlements where there were no newspapers, or where early files were not preserved, all records of the work of pioneer doctors have been lost.

The weight of editorial opinion throughout the county was that the "liquor habit" was deleterious to health and morals, and was in short the root of all evil.

There are few issues of the *Granite Falls Journal* and *Tribune* that do not contain dissertations upon the evils of strong drink. The *Clarkfield Advocate* was also much concerned about the "cigarette" habit which it considered equally dangerous; they were "coffin nails." While the *Canby News* also condemned the liquor habit, it campaigned principally against the sale of "dairy butter" and in favor of meat inspection.

The newspapers also supplied information on matters relating to health as well as morals, along with household hints and advice about the treatment and prevention of various diseases. It is noted that the juice of the pineapple was being used in Saint Paul successfully for the cure and treatment of diphtheria (1889); that "consumption" might be contagious; that chewing gum caused defective eyesight because it affected the nerves that lead from the spine to the optic nerve. It is reported that a French physician had discovered that milk absorbed germs, and had effected cures of smallpox, fevers, diphtheria, by wrapping patients in sheets dipped in milk. "A pint of milk is required." To prevent infection, "Smoke any wound with burning wool or woolen cloth. Twenty minutes of this will take the pain out of the worst case of inflammation arising from a wound," and "This simple home remedy deserves to be embossed in letters of gold in every household."

Advertisments of patent medicines were often disguised as news items and included among the current events noted, both in the "filler" of the inside pages and the locally printed columns. The various kinds of "bitters," ointments, tonics, and health appliances such as the "magnetic belt" took up a large share of the advertising space.

In January, 1887, it is reported that the temperature was forty-seven degrees below zero, but there is never any suggestion that the climate of Yellow Medicine County is anything but "bracing," exhilarating, and healthful. Freezing of feet or hands was a fairly common occurrence in severe winters, and frostbite must have been even more common but it seems to have been taken for granted that the only treatment for this was already well known. The public was supposed to be interested in all matters of health, particularly in surgery. When a young girl had to have an operation in "the city," it was noted that she "was very brave for one so young." In February, 1887, the *Granite Falls Tribune* undertook to describe an operation:

> "Large, bulky, good natured John Otis survived an operation on Thursday last that he will long remember. When a boy he hurt the small toe of his right foot and ever since it has been the source of not a little discomfort. Making up his mind to have it amputated he signified his resolve to Dr. Stratton, who sharpened up his instruments. Prostrating his physical anatomy on the hide of an animal now nearly extinct, Dr. Nare produced the conelike vase that contains the perfume of many roses known in medical parlance as ether, and taking a position exactly astride John's knowledge box proceeded to administer it,"

going on to relate how the editor and two other men were impressed for the job of holding the patient down on the table, how he struggled and howled with pain, and how the editor soon decided he had urgent business elsewhere.

The *Granite Falls Journal* was established in 1875, taking over the stock and equipment of the defunct *Granite Rock*. The *Granite Falls Tribune* was established in 1883, the *Canby News* in 1878, the *Canby Tribune* in 1882. Wood Lake had a newspaper for one year in 1891, the *Wood Lake News,* which was followed by the *Wood Lake Ledger* in 1895 and published only a short time. The *Hanley Falls Leader* was published by the *Tribune,* in 1892, also the *Hanley Falls Herald.* The *Clarkfield Reform Advocate* began publication in 1892, the *Echo Enterprise* in

1894. For the foreign born, which comprised the largest part of the population of the county, there were the *Sacred Heart Bladet,* beginning in 1891, and published in Granite Falls, the *Minnesota Folkeblad,* and other short-lived publications.

Camp Release Medical Society

Camp Release Medical Society was organized as a branch of the State Medical Society, and originally included Renville, Redwood, Kandiyohi, and other counties served by the Minneapolis and St. Louis Railroad in the area. In the early years of its existence travel to the meetings had to be by train, and this circumstance was taken into consideration when organizing the membership and arranging the meetings. At the present time its membership includes the Counties of Yellow Medicine, Chippewa and Lac qui Parle only.

The exact date of the organization of the Camp Release Medical Society is not known, as all of the early records have been lost. The earliest records now in possession of the Society date from the fall of 1916. The earliest of the minute books records the death in that year of Doctors Cressy, Stratton and Beck, all members of the Society.

Granite Falls Hospital

1898-1910

The first hospital in Granite Falls was established in the fall of 1898 by Dr. N. H. Scheldrup. It was housed in a green frame house of eight or ten rooms which had been the homestead of Henry Hill, founder and promoter of the city of Granite Falls, who had spent his entire fortune in the hope of establishing a city which would be the center of a great milling industry at the falls. The house was located at the top of the hill rising from the river, near the site of the municipal power plant and what is now Miller Street.

The hospital was intended for the accommodation of Dr. Scheldrup's patients, but any doctor was free to bring his patients there for care. Miss Marie Agee, of Chicago, a registered nurse, and of Danish ancestry, was put in charge of the hospital. She continued in this position until her marriage to Walter W. Stoppe, of Granite Falls.

Dr. Scheldrup had a large practice and did much surgery, and soon the facilities of the hospital were found to be inadequate. In 1900, Dr. Scheldrup purchased the property known as the Pinney homestead in West Granite Falls, located on Ninth Avenue and just off the main, or Prentice Street. This large, two-story home provided extra space for patients and also for a well-equipped operating room and laboratory. A registered nurse was in charge, and the doctors who brought patients there employed nurses of their own choice. These were usually practical nurses or women with some experience in the care of the sick.

In 1901 Dr. Scheldrup took into partnership Dr. Frank H. Hacking, who was then practicing at Wood Lake, and they supervised the hospital and used it in their practice as long as they remained in Granite Falls. Perhaps the most notable patient was the young man who was fatally wounded by Dr. Wintner in an argument over losses in a poker game.

Dr. Scheldrup left Granite Falls in 1906, but the hospital continued in operation. It went out of existence about 1910.

Biographies

Biographies should be written and portraits painted when the subject is at the height of his powers and the impress of his work and character is still clear.

The researcher who depends upon the recollections of those who knew him in order to clothe with some semblance of life the bare bones of statistics in any given case; finds all too often that it is the departure from the norm that sticks in memory. If, therefore, some competent and devoted doctors who went quietly about their work seem to have been slighted, it must be attributed to this propensity, and to the fact that after a lapse of more than fifty years the best of memories grow dim.

Wherever possible biographical data has been referred to relatives for accuracy. In other cases the researcher has drawn upon all available sources with the best of intentions if not the best results.

William A. Angell was born to Quaker parents in Saratoga County, New York, on March 5, 1870. His education was begun at the Academy of Glens Falls, New York, and upon completion of his studies there he came to Minnesota and entered the medical department of the University of Minnesota. He graduated in 1895, and then took examinations for appointment as house physician for St. Barnabas Hospital, Minneapolis. Receiving this appointment, he remained in this post for a year; married Jessie Langdon, a nurse, and then moved to Canby, Minnesota, to begin his medical practice.

Dr. Angell's first offices were on the second floor of a building which housed an implement store. His first home was in the rooms which adjoined his offices, in the same building. As both the Angells were friendly, unpretentious, and blessed with more than average good looks, they soon made friends in this fast-growing community.

Dr. Angell was a man of medium height, with brown hair and eyes and regular features. A photograph of him taken about 1898 shows him wearing a full but well trimmed and pointed beard, side burns, and heavy mustache above a rather full lipped mouth. His hair was parted in the middle after the fashion of the time, above a broad forehead, and his beard does not conceal a firm, rounded chin. Dr. Angell is described by a friend as "having the most beautiful personality a man ever had" and Mrs. Angell as a beautiful woman and a "grand person."

Dr. Angell soon had a large practice. He was very successful, being remembered as one of the best physicians ever to practice in Canby. As his practice grew it extended beyond Canby, throughout the county, north to Dawson, and west as far as Brookings, South Dakota. In order to cover this large territory he acquired two teams of horses and two drivers, and was often obliged to take his rest sleeping in the carriage as he went from patient to patient. He knew how to protect himself against the cold, wearing a long coonskin coat, fur mittens, felt boots in which he always kept a pair of shoes ready to be stepped into. Dressed in this manner he never seemed to feel the cold. Except for this outer clothing he wore the same weight of clothing summer and winter, which was unusual at that time.

Dr. Angell had no church affiliations in Canby. He became one of the first members and officers of the Modern Woodmen of America, North Star Camp 4214, organized in Canby in October, 1896; of the Cassiopea Camp of Royal Neigbhors, organized in 1899, and of the Modern Brotherhood of America Lodge, organized in 1899. He also served as county physician for the west eight townships of the county in 1899 and 1900. His Minnesota License was granted June 11, 1895, No. 427, Basic Science Certificate No. 3842.

Three children were born to the Angells during their residence in Canby. The first, Elizabeth, was born May 4, 1897; the second, Isabelle, born February 17, 1901, and the third, a boy, William Langdon, was born April 27, 1906.

After some years of practice in Canby Dr. Angell announced that he intended to take an extended vacation. To some of his friends he jokingly said he had made a lot of money in Canby and there wasn't any place to spend it; so he planned to stay away until it was all spent. The large home was sold, and all equipment, and when his affairs were all in order the entire family—parents, two children, Dr. Angell's parents who were visiting in Canby, and his two sisters, took the train for the family home in Indiana. From there they went to Europe, where Dr. Angell may have taken additional medical training.

Apparently Dr. Angell had indeed found a place to spend his money, for on his return to Canby the family started living as they had at first, in small quarters near his offices. He again built up a good practice, and lived in Canby until 1909 when he removed to Minneapolis. There he began specializing in eye, ear, nose and throat diseases. In 1928 he had an office at 602 Nicollet Avenue; in 1930 he was at 802 Besse Building, and 1934 at 608 Besse Building, Minneapolis.

Dr. Angell continued to practice until his last illness. He died December 11, 1935, in Minneapolis, from sarcoma of the perineum, also hypostatic pneumonia.

Dr. Angell was survived by his wife, Jessie L. Angell, and the children above named. Mrs. Angell died January 23, 1945.

Walter M. Beck was born at Delphi, Indiana, in 1862. He was educated in eastern schools and took his medical training at Ohio Medical College, from which he was graduated in 1886.

The only fact known about Dr. Beck's parents is that his father was a druggist. This appears from a story he told of having been detailed as a boy to catch the Thanksgiving turkey. He decided the proper way to kill a turkey was to give it chloroform, so he got some from his father's store and administered it. In due time the turkey made its appearance on the family table with all the trimmings; but when carved no one could eat it. Whether this story indicates Dr. Beck's early interest in medicine or his compassion for animals is debatable, but when grown he showed great love for animals and in the practice of medicine which he chose as a profession, he attained unusual skill.

Dr. Beck came to Hanley Falls in March, 1898, and according to its usual custom the *Clarkfield Advocate* introduced him in its issue of March 3, 1898:

> "Dr. W. M. Beck has moved into the Wilson Building and is prepared to receive calls any time. . . . We understand the doctor has had an extensive practice of twelve years, has diplomas from two leading eastern medical colleges and two hospitals, and for five years conducted a hospital of his own in Wisconsin, and we may judge from this that he is a physician of exceptional qualifications."

From other issues of the same paper we learn that his location just before coming to Hanley Falls was Shell Lake, Wisconsin, where he had a hospital. He had been married and divorced when he located in Hanley Falls and never remarried. He is not known to have given details of his early life. He was thought to be Irish; he had no church affiliations but was a member of the Masonic Lodge at Montevideo, Minnesota, and of the local Modern Woodmen of America. He was of medium height and heavy set, had red hair and blue eyes. He was a man of strong convictions, very outspoken, sometimes rough in his talk, but he was very popular and none of his oddities were held against him. He was a fluent and forceful speaker, a master of picturesque speech, and it was indeed a great occasion when he consented to appear on the program of the Hanley Falls Literary Society.

When the Spanish-American War broke out Dr. Beck enlisted in the hospital corps of the Thirteenth Minnesota. The *Clarkfield Advocate* says he went in as a private. The Thirteenth was one of three regiments raised in the state, and the only one to see active service. The Thirteenth Minnesota went to the Philippines and helped put down the insurrection. On the way home the regiment stopped at Japan, where Dr. Beck acquired a fine collection of silk ceremonial gowns which he proudly displayed as souvenirs of his service.

After his military service was completed Dr. Beck visited at his home, uncertain whether to return to Hanley Falls. He also purchased, or took up a claim to, some lands in North Dakota and spent some time there. Then he returned to Hanley Falls. The *Granite Falls Tribune* of March 15, 1900, reports:

> "Dr. Beck who was practicing medicine in Hanley Falls some two years ago but who left there and went to Manila as a private in the Thirteenth Regiment is now back at the old stand. Dr. Beck has had a great variety of experience in his profession while a soldier being for several months in full charge of the regimental hospital at Manila and previous to that was company doctor for "I" Company. He also distinguished himself as a sharpshooter while with the regiment at the front."

And the *Clarkfield Advocate* states:

> "The Editor passed a very pleasant hour at the office of Dr. Beck in Hanley Falls between trains last Saturday. The Doctor was with the Thirteenth Minnesota in the Philippines and has hundreds of photographic views of the country and people, which together with the souvenirs he brought back and his clear and concise descriptions, anecdotal relations, and general information, makes an hour with the Doctor seem almost as good as a trip to the Philippines. (March 12, 1900)."

The doctor gave the people of Hanley Falls and surrounding towns the benefit of his experiences in the Philippines. The *Advocate,* with strong political convictions, comments as follows:

> "Dr. W. H. Beck of Hanley Falls delivered his illustrated lecture on the Philippines to a large audience at Silver's Halls Thursday night. The woof of the lecture was historical but the warp was political. Notwithstanding this however, it was generally pronounced highly interesting and instructive. The views were very good. The doctor brought home many souvenirs of his campaign in the east which must be seen to be appreciated. (November 8, 1900)."

Dr. Beck was an expert marksman and was fond of hunting. He had a fine collection of guns and hunting dogs, the latter accompanying him on many of his calls. He enjoyed displaying his skill. On one occasion two tramps came up from the local "jungle" to get a pailful of beer. When they went back down the street toward their camp Dr. Beck got out a gun and put a neat hole through the pail they were carrying between them. The men were unaware of the shot until they saw the beer trickling out into the street. After everyone had a good laugh Dr. Beck took the men to the hardware store where they got a new pail and money to get another supply of beer.

Dr. Beck's skill with guns was the envy of every small boy in the village, and the town was full of boys with guns and dogs ambitious to be as good a shot and hunter as Dr. Beck.

Dr. Beck refused to let anything interfere with his doing what he thought was right in the practice of his profession. On one occasion he was called to a home where the patient, a boy, was very ill with pneumonia. Dr. Beck saw that it was necessary to "tap" the boy's chest at once, but the mother did not believe in "operations" and remonstrated. In spite of her protests Dr. Beck quickly put her out of the room and went about the business as if there had been no objection to it. The boy made a fine recovery.

On another occasion a farmer going home from town, where he had imbibed a little too freely, fell out of his buggy and the wheels passed over his head, gashing his cheek and cutting off an ear. He was brought to Dr. Beck's office at his home, a couple of men carrying the patient and another one carrying a jar of alcohol in which reposed the severed ear. Disregarding the man's drunken howls and protests Dr. Beck calmly shouted the man down, sewed up the gashed cheek and stitched the severed ear back on. The patient lived—with both ears—to a ripe old age and achieved a reputation as a sober and respected citizen.

In the early years of his practice in Hanley Falls Dr. Beck got around the country with horse and buggy, but as soon as automobiles became available he bought a car. He was not satisfied with the speed he could get from these early cars, and finally managed to have one geared up to much greater speed. Then he careened about the country on his calls with splendid disregard of life and limb.

In 1911, Dr. Beck moved from Hanley Falls to Clarkfield. His former patients continued to see him in this new location. Dr. Beck was greatly touched when a very old lady came by train from Hanley Falls to Clarkfield to see him rather than entrust herself to a new doctor.

About 1905, Dr. Beck had acquired an assistant, Miss Margaret Snee (she adopted the English version, Snow). She was a registered nurse who accompanied him on his calls, kept his office, looked after his meals and his living quarters and his dogs, and generally made herself useful in every department. At Clarkfield the doctor's office and living quarters were over the Clarkfield State Bank. He had a large practice and kept a set of books, but was careless about making collections. He had a large circle of friends and a splendid reputation as a doctor. He was interested in the welfare of the community, served as health officer and was active in the Humane Society. He was genial and friendly and popular with all classes.

During the summer of 1916, he performed an operation on himself, standing before a mirror. It was made necessary by an old injury, and Dr. Beck had not been able to get any physician to undertake the delicate surgery. The operation involved the removal of the upper third of his tongue. Much publicity was given to this feat by the papers of the Twin Cities as well as those of the county. The loss of a portion of his tongue affected his speech to a certain degree.

The doctor was a loyal fan of the Clarkfield baseball team, and then, as now, Clarkfield and Granite Falls were rivals in that sport. A game between the two towns was to be played at Granite Falls on August 20, 1916, and Dr. Beck took a party of friends, including Miss Snow, to see the game. On that occasion Clarkfield was the losing team, and when it appeared the game was lost Dr. Beck and his party left and started home. As usual, Dr. Beck drove the car about as fast as it would go; and about half way between Granite Falls and Clarkfield it went into the ditch. Dr. Beck was badly hurt but no one else was seriously injured. He was taken at once to St. Barnabas Hospital at Minneapolis, where he died on October 10, 1916.

The following obituary is taken from the *Clarkfield Advocate* of October 12, 1916.

"A gloom was cast over Clarkfield Tuesday morning when word was received that Dr. Walter M. Beck had passed away that morning at the St. Barnabas Hospital where he had been taken for treatment immediately after his automobile accident in which he was badly injured on Sunday, August 20.

The Doctor was unconscious for several days following his accident, but began to improve and it was thought he would recover. He received a severe setback about ten days ago, from a hemorrhage, and since that time has had several hemorrhages which weakened his system and he passed away Tuesday morning.

The Doctor had the best of medical care, some of the best physicians in the city looking after his case, and friends did everything they could to relieve his suffering but to no avail.

Dr. Beck came to Clarkfield in the year 1911 from Hanley Falls where he had been engaged in the practice of his profession for 16 years. The Doctor was a man who understood his profession and had a good practice. He was a bighearted man and did a great deal of charity work.

In his work as health officer and as a member of the Humane Society he made a number of enemies, but he did what he thought was right regardless of consequences. The Doctor was a man who was rather outspoken, but never beat around the bush and you always knew where he stood.

The Doctor was a sportsman and spent a great deal of time in the field. He was the owner of several good bird dogs and also owned some greyhounds and beagle hounds. He was a great reader, keeping abreast of the times by having a large number of the leading magazines and periodicals as well as medical journals and books.

We have very little data at hand for an obituary, and have been unable to secure any at the time of going to press. A letter was received here Wednesday morning that the Doctor had written Monday.

Dr. Beck was 54 years of age. He was a member of the hospital corps of the Thirteenth Minnesota in the Philippines. He was a member of the local M. W. of A. lodge and of the Masonic Lodge at Montevideo. His remains will be shipped to his boyhood home at Delphi, Indiana, for burial."

The nearest living relatives of Dr. Beck, according to the probate files of Yellow Medicine County, were his sister, Mrs. Alice B. Keith, of Indianapolis, Indiana, three nieces and a nephew. His personal effects included two trophies for marksmanship, five guns, one revolver, a gun cabinet, and four dogs.

(To be continued in the November issue)

President's Letter

THE AGE OF RETIREMENT

In August the House Ways and Means Committee met to hear testimony on four identical bills designed to provide means whereby the self-employed person could provide for his retirement through voluntary deductions from annual income.

Appearing in behalf of the American Medical Association were its president, Dr. Edward J. McCormick, and the director of the Bureau of Economic Research of the AMA, Frank G. Dickinson, Ph.D.

Dr. Dickinson's summary remarks express the reasoning behind the AMA's stand in favor of the law's passage. He states:

"When you think of the long history of the human race, of the centuries of pestilence, famines, wars and starvation that wiped out so many people that the average male or female didn't live long enough to have a cancer or heart problem, and then you look over the present records on vital statistics, you find we are living in a brand new era. . . . Medical progress, better food, better sanitation, better housing are keeping many people alive today. Indeed, the privilege of dying old is our national health crisis, our pension problem."

That pension problem, most acute when the age of retirement is reached without previous financial planning for it, can be solved to a great extent by the passage of a law on which the hearing was held in August.

The medical profession is not alone in actively supporting this measure. The list includes such varied groups as the dentists, veterinarians, lawyers, architects, farmers, salesmen, store owners, singers and others in the entertainment field. Those who testified on such a measure besides the American Medical Association, included the American Veterinary Medical Association, the Conference of Bar Association Presidents, the American Farm Bureau Federation, the National Society of Professional Engineers, and the Associated Actors and Artistes of America.

For years this inequity has existed. For years the law has allowed employers to purchase pension plans for employes to provide for comfort in retirement. Yet during all these years self-employed individuals have had to provide for their retirement out of income on which they have already paid income taxes.

Now the principle has been laid down, and the committee has heard much testimony in favor of passage of this legislation. But the fate of such a measure will lie in the hands of Congress after it has been reported favorably out of the committee.

The medical profession can be of great help by letting not only the committee members know their position, but also discussing the matter directly with their Congressmen while they are enjoying the current recess.

As Dr. Dickinson points out, "Until Congress takes this . . . step there will be a gaping hole in the new wall of protection that our government has thrown around our aging population."

It seems to your president that the prospect of saving up to $7,500 annually from your present income tax should create a little more interest and excitement than it has seemed to have caused.

President, Minnesota State Medical Association

THE CLINICIAN VS. THE SPECIALIST

YEARLY the Board of Internal Medicine has been certifying a group of men stating they have met the requirements and tests for the practice of Internal Medicine. They are, therefore, by the fiat of the Board termed internists.

How many of the men, who have spent three to five years in intensive study and a (*sic*) "research" or two—preparing for the ultimate test, become clinicians?

In the last ten years, a distinct cleavage has occurred between the two terms—internists and clinicians, at least in the minds of some of us.

At the time when mechanical and biochemical data were beginning to cluster about clinical medicine, Sidney Thayer made the trenchant observation that all the mechanical and biochemical aids in medicine have not shortened by one minute the period of making a good clinician.

Let us define the terms internist and clinician; that is, in their present connotation:

An *internist* is a board product, plus the co-operation of the medical schools. He is versed in all the newer gadgets—the biochemical tests, and it seems he is unable to make a diagnosis without these implements. His clinical sense has atrophied because of his dependence on these techniques—or he has never developed a clinical sense.

The *clinician* uses these gadgets and biochemical data only as a corollary to his clinical impression. In other words, he makes a diagnosis by history and physical examination and then uses these implements, mechanical and biologic, to classify rather than diagnose the condition. The clinician treats the patient—the internist treats the disease.

This, at least, is the impression of the older practitioners who have observed the younger men come into the wards and watch them operate when confronted with a clinical problem.

In 1937, Dr. Thomas Boggs, in his presidential address to The Association of American Physicians, called attention to several important points regarding Boards. He stated:

> "In these years of changes which affect all avenues of human endeavor it is not strange that the medical profession should feel the pressure of new philosophies of human relations. Of them, none is more powerful than the trend toward compulsion, by organized efforts, into a conformity called standardization.
>
> "To coordinate the scope and methods of these boards, a super board has been incorporated to direct the general trend of the standardization and centralize the efforts to put it in effect.
>
> "We then are face to face with the proposal to standardize the term Internist and certify such as are competent to fulfill the implication of that title. Let us consider for a moment the object of this proposed certification. It is according to the Board to determine who is properly an internist. I submit that no examination taken, together with any questionnaires, evidence of courses followed, theses and related documents can determine the matter. It cannot be reduced to a formula, the sum of the elements indicating the answer 'this person is an internist or not an internist.'
>
> "An internist's recognition as such really rests upon the consensus of opinion of his professional colleagues and trainers that he is so qualified. His proven value to his colleagues and patients is the only adequate test.
>
> "Thus, we may see the Boards of Trust and Administration of Hospital and Medical Schools surrendering their judgment and their responsibility under a type of urging which really amounts in plain words to a potent threat. The trend of the plan seems on close inspection to contain possibilities of methods which strike at the very root of medical education by substituting the extralegal demands of certification bodies for the considered plans and policies of those properly interested with medical education and training."

This prophetic insight of Boggs has come to pass. The medical schools and hospitals have sold out to the boards. The boards, in their efforts to standardize, have developed an educational scheme in which there is more pressure to pass an examination than for the training of a clinician.

All historical aspects in that the practice of medicine is a profession and not a business, all humanistic backgrounds have been swept aside in the mad scramble for standardization. This criticism is not true in individual instances, but it is true of the trend.

We older physicians are seeing the results of this bizarre situation in medical education. These are some of the reasons why some of us note the cleavage between an internist and a clinician.

—An Old Clinician

VICE VERSA

THE preceding editorial by "An Old Clinician" should be read without resentment by the younger internist who did not have his introduction to the field. Those who subscribe to our present method of training specialists in all fields, and in the establishment of boards to standardize formulae for acceptance, have not a few arguments in their favor, stemming from this mass production age in which we live. Perhaps the schedules of training should bring the younger men into closer contact with the disciples of the Sidney Thayers and the Thomas Boggses.

Medicine has extended its scope so widely in two world-shattering and tradition-disturbing wars that to supply the demand for recruits to all the special fields by the old apprenticeship contact method presently seems to be impossible. Furthermore, as physicians, we daily witness the fallacy of dependence upon the patient's or even our fellow physician's approval of our abilities. While stated requirements and examinations are a very imperfect way of determining ability, they are as of this date about the only measuring stick that can be applied and are certainly in general use; witness medical schools, law schools, West Point, Annapolis and the various licensing boards.

Having spent "three to five years in intensive study and a (*sic*) 'research' or two" does not make a clinician, in the "Old Clinician's" sense of the word. However, neither does graduating from medical school insure a good physician. Certainly, the various boards have encouraged a good deal of postgraduate study. How can it be said, therefore, that such postgraduate study would prevent the development of a clinician?

The distinction between an internist and a clinician is real. However, it would seem apparent that the Board of Internal Medicine has not created this situation. The three to five years of postgraduate study have some influence on a man's attitude, but they are only three to five years out of a total of approximately twenty-five years that have contributed to his development. Certainly, the other twenty years or so have had their impact in fashioning his outlook on life. It is questionable whether the medical profession or specifically those interested in internal medicine suffer any more in this regard than other physicians or other professions.

The technical information received in medical schools is no index as to whether a man is going to be a good clinician or not. It takes time to make a good clinician, but good clinicians have a certain fundament which is personal and individual and has to do only with intensive basic scientific study. One who is adequately prepared in this way, all other things being equal, would be a better clinician than one who is not trained in these subjects.

As a medical man becomes a more experienced clinician, he is more likely to use various gadgets and biochemical data intelligently and appropriately. It would not seem quite in order to argue with the medical schools and their teaching faculties by saying that a carefully laid-out planned course, including all the fundamental data with a satisfactory practice of medicine, should be greatly altered. On the other hand, medical schools should make an attempt to teach medical students more of the psychological processes, personality types, and explain the need of broad humanitarian, ethical, and cultural rapport.

The fact that the Boards of Trust and Administration of hospitals and medical schools may surrender their judgment and responsibility should not be used as an indictment of the Boards. It is a misuse of the purposes of the Boards and its correction should not lie in abolishing the Boards.

A Board Specialist

NALLINE® AND TENSILON®

DURING the past few months, two valuable drugs have been added to our armamentarium in combating respiratory depression.

Nalline® (N-allylnormorphine hydrochloride) has proven itself to be an antagonist to narcotic drugs such as morphine, methadone, Demerol®, Pantopon®, and Dromoran®,[1] Respiratory depression with rates of eight to ten respirations per minute may be doubled by 10 to 20 mg. of Nalline given intravenously. Dosage should not exceed 40 mg. Eckenhoff reports use of this drug in the prevention and treatment of narcotic induced asphyxia neonatorum. Nalline given to the mother ten minutes prior to delivery, or in-

jected directly into the umbilical cord, produced prompt establishment of respiration. Eckenoff suggests 0.1 to 0.2 mg. in 2 cc. of normal saline for injection into the umbilical cord.[2] Unfortunately, Nalline is ineffective against barbiturate depression.

Tensilon® (3-hydroxyphenyl dimethylethyl ammonium chloride) is an excellent antagonist to the actions of d-tubucurarine, Flaxedil®, Metubine®, and Mecostrin®. Postanesthetic curare depression is successfully treated by the intravenous injection of 10 mg. of Tensilon.[3] Dosage should not exceed 30 mg. per injection, but may be repeated as necessary. Transient bradycardia may be prevented by the simultaneous injection of atropine in doses of 1/200 to 1/150 grain. A warning must be given against the use of Tensilon following depression from Anectine® (succinylcholine chloride), since their combined action may further enhance respiratory depression.

HOOVER, MANION COMMISSIONS ORGANIZED

With President Eisenhower looking on, members of the Hoover Commission on Government Reorganization and the Manion Commission on federal-state relations were sworn in at the White House on successive days (September 29 and 30). The Hoover group, as expected, elected former President Herbert Hoover as its chairman, a post he held under a similar study group several years ago. The commission also (1) authorized the chairman to set up nine task forces, including one on medical services, (2) appointed a staff that includes former Republican Rep. John Hollister as executive director, Frank Brassor of the Civil Service Commission as executive secretary and Harold Metz of Brookings Institution as research director, (3) set a tentative date at the end of 1954 for its report to Congress on what federal agencies might be abolished or consolidated, and (4) agreed to hold its next meeting November 16.

The Manion Commission expects to make its first report to Congress by next March 1 on federal functions, including health and medicine, that should be given back to states and communities. It authorized its chairman, former Notre Dame Law School Dean Clarence Manion, to select a small staff and report back in thirty days and agreed to set up research subcommittees on various fields to be studied during the next few months. The Hoover Commission has found quarters in the new General Accounting Office and the Manion group in the Department of Health, Education, and Welfare.

DISEASE-FREE "ISLANDS"

Disease-free "islands" are one of the greatest mysteries unsolved by modern science, according to Dr. Eugene H. Payne, of Detroit, a leading authority on tropical diseases.

Speaking on the General Electric Science Forum over radio station WGY, he pointed out that even though it is surrounded by malaria-infested areas, one Brazil town of 15,000 people has been absolutely free of this disease for at least a century.

Dr. Payne related that a number of the land-islands free of disease have been found in South America. Some of these areas are void of heart disease and hookworm though adjacent sectors report many such cases. Similarly, he said, insanity is practically unknown to Bolivians.

He said that many theories have been developed as to why this immunity exists, but none has as yet been proven.

Dr. Payne stressed the importance of studying these remote peoples while they remain static. Once they mingle with other groups, science will lose its chance to determine how they remain free from diseases which infest regions around them.

SECRETARY HOBBY EXPECTS SOCIAL SECURITY TO HAVE PRIORITY NEXT YEAR

Secretary Hobby believes that legislation to extend social security will have high priority with Congress when the next session opens in January. The proposal under consideration has the strong support of President Eisenhower. It was presented to Congress in the closing days of the last session, but too late for action. The plan would extend Old Age and Survivors Insurance to 10.5 million more persons, including *physicians,* dentists and many other groups of self-employed.

Mrs. Hobby forecast prompt action in two addresses. Talking at a Republican party rally at Kiamesha Lake, New York, she said that social security extension "will be one of the first matters" to come up for decision in January. She added: "This bill, which is in line with the President's campaign promises, will, if passed, give the advantages of social security to more than ten million Americans who at present are left out of the system. These include many self-employed professional people—doctors, lawyers, accountants, dentists, etc.; self-employed farm operators and hired farm workers; a large number of household workers not now covered, and possibly four million state and local government workers." A few days later, addressing the American Federation of Labor convention, Mrs. Hobby again stated that social security extension would be pressed by the administration.

A House Ways and Means subcommittee under chairmanship of Rep. Carl Curtis (R., Neb.) is continuing its study of the whole social security structure, preparatory to reporting to Congress shortly after the first of the year. Chairman Reed of the Ways and Means Committee introduced the social security extension bill "by request."

The Dean's Page

CHILD PSYCHIATRY

Since 1938, the Medical School has included in its total program of teaching, research, and service a full-time children's psychiatric service. Inasmuch as the first such full time service in the United States was established in 1930 at Johns Hopkins, Minnesota ranks as one of the pioneers in this phase of medical training.

Factors responsible for the inclusion of this important area of medicine in the total medical school program are: (1) the recognition that mental illness, because of its frequent occurrence, constitutes one of our major health problems, (2) the growing awareness that significantly large numbers of disturbed children, overlooked and untreated, contribute to later and more difficult psychiatric problems, (3) the knowledge that many complaints of children suggesting physical illness could be accounted for on the basis of emotional disturbances, and, (4) the gradual realization that the physician dealing with children is in a strategic position to develop a program of preventive mental health service.

Our psychiatric service for children was begun originally on an out-patient basis. It was soon apparent that many children referred to us needed to be admitted to the hospital for study and observation. This need was partially met in 1952 when an eleven bed in-patient service was made possible by legislative appropriation. Upon the completion of the current building program, a twenty-four bed service will be in operation.

An active teaching program has been in effect for the past fifteen years. Medical students graduating today have had more than thirty hours of instruction in the basic principles of child psychiatry. In addition the staff has spent considerable time in teaching graduate fellows, residents, nurses and others. Approximately fifty graduate fellows in psychiatry and pediatrics have had three months or more on the service since 1946. Nearly a dozen students from foreign countries have spent varying periods of time with us. The staff's community work includes active participation in the Center for Continuation Study Courses, as well as the regional courses sponsored by the Medical School, the State Medical Association and the State Board of Health. Conferences on problem cases with judges, juvenile court personnel, state and local social welfare workers, teachers and others constitute an important part of the teaching program.

Since 1938 over four thousand children have been studied or seen in consultation. In the first eleven months of operation of the in-patient service, over one hundred and twenty-eight children have been admitted for intensive study. An additional forty-two have been admitted for psychiatric study on the pediatric stations.

Children suspected of psychiatric difficulties are referred to the University Hospitals in accordance with policies previously described on this page. After acceptance and preliminary study in the Pediatric Out-Patient Department, plans are made as the situation indicates. In general, one of two plans is considered: (1) the patient and his family may be followed on an out-patient basis or (2) arrangements for hospital admission may be made.

Each child accepted is given a complete study which includes a detailed psychiatric and medical history, physical studies as indicated, complete psychological testing and individual work with both the child and his parents to define the significant factors responsible for the child's difficulty. Treatment is arranged in accordance with the findings. In every case the referring physician receives a report on his patient.

It has been gratifying to note the increasing number of physicians who are recognizing the early signs of maladjustment and dealing so effectively with them. This is the preventive approach to the mental health problem so urgently needed. It is our hope that the good beginnings of mutual co-operation between the physicians in our state and the Medical School in the interests of our children's mental health will continue.

CIO URGES MEMBERS TO ACTION FOR HEALTH

The Congress of Industrial Organizations, generally referred to as the CIO, has recently reaffirmed its active support for a compulsory national health insurance program, operated by the federal government.

In a recent issue of *Economic Outlook,* the CIO states that "under present political conditions . . ." progress toward better health "lies through collective bargaining, but our accomplishments through that channel do not lessen the need for government action." The article, "Union Action for Health," urges CIO members to act: "Through our unions we can continue to bargain for healthier and safer working conditions and for improved protection against the costs of hospitalization and medical care."

The CIO believes "that other measures will not make adequate medical care available to all the population," and on that stand alone, it supports compulsory health insurance.

While it loudly claims the benefits of national health insurance, and decries the "shortcomings" of present prepayment benefit plans, the CIO tells its members to work for certain goals, some of which would be largely ineffective or even nonexistent should a national health insurance program be started. Recommended methods for unionists to improve health services are: collective bargaining, establishing their own health institutes, encouraging consumer controlled co-operatives, as citizens, to work with others to improve local health facilities, and by supporting state legislation. Some of those objectives are admirable in themselves, but others are entirely incompatible with the union's policy of support for national health insurance.

NEW PROPOSALS SENT TO HEALTH INSURANCE PLAN

Because of certain obvious facts about the Health Insurance Plan of Greater New York, the Medical Society of the County of Kings has found it impossible to endorse the group practice prepayment program, popularly known as H.I.P.

The longstanding controversy took a new turn recently when Dr. Alfred P. Ingegno, president of the Medical Society of the County of Kings, wrote a letter to H.I.P. offering six "constructive proposals" which would make it possible for the borough medical societies to endorse this group practice prepayment program.

Break Tight Monopoly

In suggesting that H.I.P. offer free choice of doctors to its subscribers, the president admitted that "it is going to hit present H.I.P. doctors right in the pocketbook. It will mean surrendering a tight little monopoly." He added, however, that "the public has a right to hope that H.I.P. will be willing to make that sacrifice."

The "put up or shut up" attitude was coupled with the following six proposals which would improve the plan, according to Dr. Ingegno:

1. That H.I.P. offer a "free choice" contract in addition to its present contract. A subscriber then could choose his own doctor or medical group.

2. That H.I.P. allow its subscribers to go to *any* medical group ready to give "comprehensive" care, not just groups chosen by H.I.P. officials.

3. That H.I.P. use "dignified" advertising methods.

4. That H.I.P. urge the city to pay half the premium of *any* medical care plan democratically chosen by a city employe group, even if it is not H.I.P.

5. That H.I.P. urge the city to pay half the *hospitalization* insurance of city employes, even if they don't join H.I.P.

6. That H.I.P. put more "practicing physicians" on its board of directors.

Evades Issues

Previously, H.I.P. had accused the medical profession in New York of being against medical care and against group practice, in view of their objection to some parts of the H.I.P. plan. In making public his latest proposal letter, Dr. Ingegno pointed out that the accusation is "a fake and an evasion of the real issues, which involve questions of broken ethics and attempted monopoly of medical practice."

The entire question now awaits an answer and possible action by officials of the Health Insurance Plan of Greater New York, and the outcome should be of great interest to the medical profession throughout the country.

MAGAZINE URGES REVIEW OF VOLUNTARY INSURANCE

A direct and critical view and review should be taken of the entire voluntary prepayment health insurance situation in the country, according to the publication *Medical Economics.* In a reprint of a chapter from his book, the editor states:

> "The time has come for a dispassionate analysis of voluntary health insurance in all its phases—including a long, hard look at both its strengths and its weaknesses."

Future at Stake

The editor states that one medical observer questioned about voluntary health insurance felt the importance of a long, hard look to be so great that

> "The future of medicine and, to a degree, the future of democracy will be shaped by what happens in the voluntary health insurance field. This whole subject and its role in American life must be explored with infinite care. Had we approached it more thoughtfully in recent years, some of the forces that now threaten our traditional democratic process would not exist."

In order to make such a comprehensive review of so large a subject, three main questions must be kept in mind, according to the editor. They are: What do we really mean when we speak of voluntary health insurance? What are we trying to accomplish with it? Can it do the job?

The editor attempts an answer to the first question in general terms. He states:

> "Such insurance is basically a means of cushioning people against the economic shock of unbudgeted illness costs. When sickness strikes then, it can be paid for without either relying on charity or depleting the patient's resources. . . .
>
> "Such insurance can't reduce the cost of medical care to the public at large. But it does minimize the immediate cost to the individual by distributing it. Because prepayment makes medical bills easier to meet, it also helps stabilize the finances of subscribing members and of participating doctors and hospitals."

Broad Interest Noted

The phenomenal growth of voluntary health insurance in all forms over the past ten or more years attests to the fact that more and more people desire protection of some kind. And, that growth also points out the fact that if voluntary health insurance is not meeting all needs adequately, then something should be done to find out why, what is wrong and what can be done to improve it. Because it is so very young in actuarial experience, voluntary health insurance cannot be expected to be perfect in all respects. But a healthy look in the mirror, while possibly a little disconcerting, would most certainly prove very educational, and undoubtedly provide a springboard to action.

The magazine editorial states:

> "Voluntary health insurance programs in operation today have been organized by medical societies, hospital associations, private insurance companies, community groups, co-operatives, labor unions, and industrial firms. This very listing indicates the variety of local community interests that have been moved to social action."

Enrollment Trends Up

The rapid increase in enrollment in voluntary health insurance plans over the years has been concentrated largely among employed groups in industrial areas. But expansion is gradually becoming the by-word. According to the article, "Until most of the well population is covered by prepayment plans, the price of providing broad service for those who fall seriously ill must necessarily remain high."

One source from which the editor quotes has this to say:

> "Unless the program can be extended rapidly to cover the rest of the population, public dissatisfaction with

mounting medical bills may at any time create the illusion that government health insurance is the lesser, instead of the greater, evil. This eventuality is independent of the course of political events."

Dr. Louis H. Bauer, recent president of the American Medical Association, is quoted as saying the following about future enrollment:

> "I believe, eventually, about 100 million people will be covered by voluntary health insurance. This will be sufficient, as 25 million now receive their medical care in whole or in part from the government; 10 million do not believe in medical care, preferring to buy what they think they require over a counter or by patronizing cultists; about 5 million are indigents whose medical care is a local responsibility; and about 10 million do not appear to be interested in insurance at all."

BASIC SCIENCE RESEARCH GETS FUND GRANT

The American Medical Association recently received a grant of $15,000 for conducting research in the basic medical sciences. The fund, from the William Volker Charities Fund of Burlingame, California, will be used for studies in the various basic sciences, such as anatomy, physiology and embryology.

The AMA's Committee on Research, through its sub-committee on grants-in-aid, will be responsible for allocating the funds, chiefly to individual researchers. According to a recent release from the AMA, "it has been felt that too much attention has been paid to clinical applications of disease treatment and not enough to action of the human body's normal cells and organs. Grants from the William Volker Fund should help to stimulate a more realistic balance between these two important phases of medicine."

PRESIDENT RECOMMENDS SOCIAL SECURITY INCREASE

Extension of social security coverage to about ten and one-half million more persons was recommended recently by President Eisenhower. The President submitted to Congress the recommendations of Mrs. Oveta Culp Hobby, secretary of the Department of Health, Education and Welfare. The new groups to be covered would include over 3 million self-employed farmers; some 3 million more farm workers and domestic workers than are now covered; and about a half million self-employed persons including doctors, dentists, lawyers, architects, accountants and other professional people. The recommendations would also cover almost 4 million members of state and local government retirement systems, under voluntary agreements between the states and the federal government if the members of the system vote in favor of coverage by a two-thirds majority.

A bill to cover these recommendations has been introduced into Congress by Representative Reed, chairman of the House Ways and Means Committee, who said that although he introduced the bill, he would not give it blanket endorsement. He felt that opinion on the merits of the bill should be withheld until recommendations of the subcommittee studying the entire social security system were completed and submitted to Congress. This report is expected to be submitted to the full House Ways and Means Committee by the end of the year.

MINNEAPOLIS BARTENDER AND ASSOCIATE SENTENCED FOR CRIMINAL ABORTION

Re. State of Minnesota vs. Virginia Mae Johnstone and Edward A. Berg

On August 4, 1953, Mrs. Virginia Mae Johnstone, twenty-nine years of age, 2229 13th Ave. So., Minneapolis, was sentenced by the Hon. Earl J. Lyons, Judge of the District Court of Hennepin County, to a term of not to exceed two years in the Women's Reformatory at Shakopee for the crime of abortion. Judge Lyons stayed the sentence and placed the defendant on probation for a period of two years.

On September 28, 1953, Edward A. Berg, a thirty-eight-year-old bartender of 2546 Dupont Ave. So., Minneapolis, was sentenced by the Hon. Levi M. Hall, Judge of the District Court of Hennepin County, to a term of not to exceed four years in the State Prison at Stillwater on a charge of abortion. The sentence was stayed for two years, however, and the defendant was placed on probation.

Both defendants were charged jointly with having committed the crime of abortion on June 27, 1953. Subsequently, on July 1, 1953, Mrs. Johnstone entered a plea of guilty to the charge before Judge Lyons. Mr. Berg, who entered a plea of not guilty on that date, later changed his plea to guilty before Judge Hall on August 25, 1953.

The defendants, neither of whom has a license to practice any form of healing in the State of Minnesota, were arrested following the hospitalization on June 29, 1953, of a nineteen-year-old unmarried Minneapolis girl. Subsequent investigation disclosed that the defendant Johnstone, who performed the abortion by means of using a solution of water, castile soap and turpentine, received $100 for performing the abortion. She admitted having performed two prior abortions. The defendant Berg, who acted as the contact in the case, received $150 for his services.

✦ Reports and Announcements ✦

NATIONAL SOCIETY FOR CRIPPLED CHILDREN AND ADULTS

Dr. Edward J. McCormick of Toledo, Ohio, president of the American Medical Association, heads a list of distinguished authorities scheduled to speak on the care, treatment and training of crippled children at the 1953 Annual Convention of the National Society for Crippled Children and Adults, November 12-14, at Chicago's Palmer House.

Another prominent personality will be Dr. Frances R. Horwich, Chicago, leading child development authority who, as "Miss Frances," has made the "Ding Dong School" a nationally famous program on television. Dr. Horwich will be principal speaker at the annual parents institute.

Dr. Henry H. Kessler, medical director of the Kessler Institute for Rehabilitation, West Orange, New Jersey, and counselor in rehabilitation to the National Society, will head up a panel on rehabilitation at the convention.

In addition to other outstanding speakers the convention program will include general sessions, seminars, exhibits, demonstrations, workshops, social events and other features planned to appeal to all rehabilitation workers, volunteers, and parents of crippled children who will attend the convention.

Dr. William T. Sanger, president of the National Society, will preside at this year's convention marking the Society's thirtieth annual meeting and thirty-second year of service to the nation's handicapped.

Architecture and its adaptations to meet the needs of the crippled will be featured for the first time at this year's three-day meeting. A forum on architectural planning for public buildings, schools and hospitals will be included. A special architectural exhibit will contain a model rehabilitation center developed by Salmon and Salmon, architectural consultants of the National Society, and sketches and blueprints from the U. S. Public Health Service, the American Hospital Association, and the Easter Seal Societies.

A traditional convention feature, a panel of distinguished persons who have outwitted their handicaps to become productive and successful members of society, is also planned for the meeting.

Recreation will be considered from the angle of planning recreational programs as part of the total program in hospitals and schools. Special emphasis in the recreation workshop will be given to the needs of the homebound.

Social functions will include an open house, luncheons and the annual President's dinner. Music will be provided by the Valparaiso University Choir of Valparaiso, Indiana.

* * *

For outstanding achievement and service through its nationwide program of employment for the crippled, the National Society for Crippled Children and Adults has been awarded the Distinguished Service Certificate by the President's Committee on Employment of the Physically Handicapped.

The award, which is the highest honor that can be conferred upon a co-operative group by the committee, was announced by Vice-Admiral Ross T. McIntire, chairman, for the nation's capitol.

Citations were also given to the Disabled American Veterans Service Foundation, Washington, D. C.; Goodwill Industries of America, Inc., Washington, D. C.; and *The Saturday Evening Post, Philadelphia.*

The Easter Seal Society was cited for pioneering many new programs and projects for the handicapped, and for the public attention its activities have focused on the national program to employ the physically handicapped. This service has been carried out by the National Society through its vast network of more than 2,000 state and local Easter Seal affiliates located in every state in the nation, District of Columbia, Alaska, Hawaii, and Puerto Rico.

Dr. William T. Sanger, of Richmond, Virginia, is president of the National Society. Headquarters of the Easter Seal Society are at 11 S. LaSalle Street, Chicago, with Lawrence J. Linck, executive director.

The National Society each year grants fellowship awards to qualified counselors, guidance teachers and other professional persons for specialized training in the placement of the cerebral palsied and other severely handicapped workers. This training is designed to encourage public and private agencies to increase their services for the handicapped and to inform industry of the vast national resource available in the employment of the disabled.

The National Society also operates a free National Personnel Registry and Employment Service, a personnel clearing house to ensure the best use of services of those qualified by training, experience and interest in work with the physically handicapped.

INTERNATIONAL SYMPOSIUM ON CARDIOVASCULAR PHYSIOLOGY AND SURGERY

Recent advances in cardiovascular (heart and blood vessels) physiology and surgery was the subject of an international symposium at the University of Minnesota September 14-16, 1953. Medical specialists from three foreign countries, fourteen states and Canada spoke at sessions in Scott Hall auditorium.

The conference was sponsored by the University and the Minnesota Heart Association. In November, 1951, they co-operated in presenting an international symposium on rheumatic fever, also held at the University.

Five doctors from abroad—Clarence Crafoord, Sabbatsbergs Hospital, Stockholm; Domingo Gomez, Havana; Torgny Sjostrand, Karolinska sjukhsuet, Stockholm; Olle Snellman, University of Uppsala, Sweden; and Erik Wetterer, University of Munich, Western

Control of Gastric Motility and Spasticity in Peptic Ulcer with Banthīne®

"The need[1] for suppressing gastric motility and spastic states is . . . fundamental in peptic ulcer therapy. Since the cholinergic nerves are motor and secretory to the stomach and motor to the intestines, agents capable of blocking cholinergic nerve stimulation are frequently used to lessen motor activity and hypermotility."

Banthīne[2] "has dual effectiveness; it inhibits acetylcholine liberated at the postganglionic parasympathetic nerve endings and it blocks acetylcholine transmission through autonomic ganglia."

It has been shown[1] to diminish gastric motility and secretion significantly as well as intestinal and colonic motility.

The usual schedule of administration in peptic ulcer is 50 to 100 mg. every six hours, day and night, with subsequent adjustment to the patient's needs and tolerance. After the ulcer is healed, maintenance therapy, approximately half of the therapeutic dosage, should be continued for reasonable assurance of nonrecurrence.

Banthīne® (brand of methantheline bromide) is supplied in: Banthīne ampuls, 50 mg.—Banthīne tablets, 50 mg.

It is accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

SEARLE Research in the Service of Medicine

INTERNATIONAL SYMPOSIUM ON CARDIOVASCULAR PHYSIOLOGY AND SURGERY

(Continued from Page 1084)

Germany—lectured on circulation, pressure and flow and cardiovascular surgery.

Differential diagnosis of congenital heart disease, diseases of the mitral and aortic valves, application of mechanical heart and lungs in cardiac surgery, hypothermia in cardiac surgery, septal defects and pulmonary stenosis were among the topics which were discussed at the conference.

Dr. William F. Hamilton, professor of physiology at the Medical College of Georgia, Augusta, Ga., delivered the annual George E. Fahr lecture at 8 p.m., September 14, in Scott Hall auditorium. He outlined "The Physiology of Congestive Failure of the Circulation."

AWARD FOR OUTSTANDING RESEARCH IN THE FIELD OF INFERTILITY

The American Society for the Study of Sterility announces the opening of the 1954 contest for the most outstanding contribution to the subject of infertility and sterility. The winner will receive a cash award of one thousand dollars, and the essay will appear on the program of the 1954 meeting of the Society. Essays submitted in this competition must be received not later than March 1, 1954. For full particulars concerning requirements of this competition, address The American Society for the Study of Sterility, c/o Dr. Herbert H. Thomas, Secretary, 920 South 19th Street, Birmingham, Alabama.

The author should append on a separate sheet of paper a short biographical sketch of himself and include a photograph to be used in the necessary publicity should he be the winner of the award.

AMERICAN COLLEGE OF PHYSICIANS

The Midwest Regional Meeting of the American College of Physicians will be held in Milwaukee, Wisconsin, November 21, 1953, at the Hotel Schroeder. There are 875 College members represented by the states of Illinois, Indiana, Iowa, Minnesota, and Wisconsin.

A scientific program of twenty-two papers of fifteen minutes each and a Clinico-Pathological Conference has been arranged. A luncheon at noon, banquet and entertainment in the evening, as well as a luncheon and entertainment at noon for the ladies are on the schedule. All physicians, members of the College and non-members are invited to attend. There is no registration fee.

Francis D. Murphy, M.D., F.A.C.P., Milwaukee, is General Chairman and Joseph W. Rastetter, M.D., F.A.C.P., Milwaukee, Chairman of Arrangements.

CANCER SOCIETY GIVES UNIVERSITY OF MINNESOTA $75,000 FOR RESEARCH WORK

Fifteen cancer research projects will be carried on at the University of Minnesota during the next year under terms of a $75,000 grant from the American Cancer society. Announcement of the award was made by Dr. C. G. Uhley, Crookston, president of the Minnesota division of the society.

According to the University's cancer co-ordinator, Dr. Bernard Zimmermann, assistant professor of surgery, the society funds will be used to support research in almost every department of the medical school: cancer biology, physiology, gynecology, the tumor clinic, pathology, biological chemistry, radiation therapy, cyto-chemistry, radiology, surgery, anatomy and medicine.

Most of the projects are relatively new and some are part of large-scale investigations which will continue for years. Three of them are concerned with hormonal aspects of cancer. Subjects of these scientific studies and researchers who will conduct them are:

Role of the pituitary gland in breast and adrenal tumors in mice: Dr. Carlos Martinez, assistant professor of cancer biology.

A study of the chemistry of cancer and the role of sulfhydryl compounds: Isaac M. Kolthoff, chief of the department of analytical chemistry, and Dr. Maurice B. Visscher, head of the department of physiology.

Radium treatment of cancer of the uterus: Drs. Roy G. Holly, assistant professor of obstetrics and gynecology, and John L. McKelvey, head of the department of obstetrics and gynecology.

Statistical studies in the tumor clinic and follow-up of patients: Drs. Zimmermann and Claude R. Hitchcock, director, Cancer Detection Center.

Studies of human cancer with newly developed methods: Drs. James R. Dawson, head of the pathology department; Joel G. Brunson, medical fellow in pathology; Robert Hebbel, professor of pathology, and Gunnbejor Aurebeck, resident in pathology.

Studies of hormones in human and animal cancer: Drs. John J. Bittner, professor of cancer biology; W. D. Armstrong, head of physiological chemistry, and Saul L. Cohen, associate professor of physiological chemistry.

Irradiation treatment of lymphoid tumors: Dr. Charles M. Nice, Jr., instructor in radiology.

Study of normal and cancerous stomachs by new physical methods: Dr. David Glick, professor of physiological chemistry.

Methods for earlier diagnosis of lung cancer: Drs. Leo G. Rigler, head of the department of radiology, and Richard L. Varco, professor of surgery.

Study of x-ray effects on tumor-bearing tissues: Drs. K. W. Stenstrom, director of radiation therapy; Halvor Vermund, research associate; James F. Marvin, assistant professor of radiology; Robert A. Ledner, fellow in radiology, and Donn G. Mosser, instructor in radiology.

Search for an intravenous dye as a cancer detection agent and technical problems in gastric and esophageal cancer surgery: Drs. Owen H. Wangensteen, chief of surgery; William D. Kelly, research fellow in surgery, and Edwin L. Brackney, medical fellow in surgery.

A study of dietary production of anemia and pre-can-

California's leading creator of scientifically designed Surgical, Corrective and fashion brassieres.

cerous conditions in swine: Drs. Jay Sautter, associate professor of veterinary medicine; Hitchcock, and J. Bradley Aust, National Cancer Institute trainee.

Clinical, endocrine and metabolic studies relating to cancer surgery and surgical removal of adrenal glands: Drs. Zimmermann, Hitchcock, and Henry S. Bloch, research associate in surgery.

A study of the effects of exhaust fumes from a gasoline engine and the fumes from heated tar on the incidence of lung cancer in mice: Dr. Hitchcock.

Treatment of breast cancer with hormones and radiation: Dr. Byrl J. Kennedy, assistant professor of medicine.

This is the largest institutional grant the American Cancer society has ever made to the University, (An institutional grant is given to a university or college to be used as the institution thinks best. The society also makes grants for specific research projects.)

LEO G. RIGLER LECTURE

The annual Dr. Leo G. Rigler Lecture for 1953 will be delivered Wednesday, October 28, 1953, at 8:15 p.m. in the Auditorium of the Museum of Natural History, University of Minnesota. The lecture will be given by Dr. Robert McWhirter, Professor and Chief of the Department of Radiotherapy, Royal Infirmary, Edinburgh, who will speak on "Simple Mastectomy and Postoperative Radiation for Carcinoma of the Breast."

HOMECOMING CLINIC TO BE HELD AT UNIVERSITY OF MINNESOTA

The Minnesota Medical Alumni Association invites all physicians to attend the Homecoming Clinics at the University Hospital on November 6 and 7, 1953. The program will get under way at 11:45 a.m. on Friday, November 6, with the Staff Meeting of the University Hospital. Luncheon will be served and the special Homecoming program will feature Dr. O. J. Campbell, president of the Minnesota State Medical Association, who will discuss "The Responsibilities of Organized Medicine." This will be followed by the annual meeting of the Minnesota Medical Alumni Association and the Homecoming Clinics themselves will be held from 2:00 to 4:30 p.m. on Friday and from 9:00 to 11:30 a.m. on Saturday, November 7. The Homecoming Game, Minnesota versus Indiana, will go on at 1:30, Saturday, in Memorial Stadium.

MINNESOTA ACADEMY OF GENERAL PRACTICE

The Minnesota Academy of General Practice will stage its annual Fall Refresher Day at the Hotel Lowry in St. Paul, Wednesday, November 4, 1953. According to Dr. C. C. Cooper of St. Paul, president of the organization, a stimulating and important day-long program has been arranged for the occasion.

CONTINUATION COURSES

Dermatology will be the subject of a continuation course for physicians which will be presented by the University of Minnesota at the Center for Continuation Study next November 19 to 21. Intended primarily for physicians engaged in general practice, the course will stress the recognition and management of the common skin disorders. The program will be presented under the direction of Dr. H. E. Michelson, Professor of Medicine and Director of Dermatology, and the remainder of the faculty will be drawn from the University of Minnesota Medical School and the Mayo Foundation.

* * *

The University of Minnesota announces a continuation course in *Obstetrics for General Physicians* which will be held in the Center for Continuation Study on December 3 to 5, 1953. Emphasis will be placed on recent advances in the field which have practical clinical application. The course will be presented under the direction of Dr. John L. McKelvey, Professor and Head, Department of Obstetrics and Gynecology.

VA HOSPITALIZING MORE NON-SERVICE CONNECTED CASES

Latest statistics from Veterans Administration show the agency is reducing its lists of service and non-service connected cases awaiting hospitalization. In August, 1952, service-connected cases waiting admission totaled 143. During July and August of this year they numbered only two. At the same time VA is getting more and more non-service connected cases into its hospitals. In August, 1952, VA listed as waiting hospitalization 22,341 cases it described as "other than disabilities adjudicated service-connected." By July of this year only 20,370 were still waiting treatment, and in August only 17,874.

Woman's Auxiliary

MEDICAL SUPPLIES NEEDED FOR SICK KOREAN CHILDREN

Truce in Korea has not reduced the overwhelming sickness, suffering and poverty among the Korean people and the need for medical supplies of all sorts, especially drugs and medicines, is still far greater than relief agencies have been able to meet.

This is the testimony of all letters from those who are helping on the front lines and from official observers who have returned recently from tours of inspection.

Collection of sample drugs by doctors' wives has therefore become more important than ever, according to Mrs. H. O. Beek, of St. Paul, who has directed a successful collection this summer for the Ramsey County Medical Society auxiliary, and auxiliary members all over the state are urged to step up their efforts to assist in the work.

In Pusan, for example, a staggering number of children estimated at more than 60,000 a month by William C. Bullitt, former United States ambassador to Russia, are cared for at a single clinic conducted by fifteen Maryknoll missionary sisters. "I have just returned from Korea," Mr. Bullitt said recently in a letter published in the *New York Times*. "Before the communist attack, Pusan was a poor town of less than 300,000. Today it is submerged by more than 1,000,000 refugees. There is no new housing. The refugees build shacks of old boxes, tin cans and paper. The winds chill their huddled undernourished bodies. Disease, led by tuberculosis, runs through their swarming streets. Into these streets fifteen Maryknoll sisters moved in the spring of 1951. All were trained physicians and nurses and they set up their clinic at the top of a teeming alley. There, by working eighteen to twenty hours a day, they treat an unbelievable average of nearly 2,000 sick children a day. . . . They stand or lie on the ground for hours awaiting treatment. . . . No work of service that I have ever seen seemed to me so surely blessed of God."

It is to the Maryknoll sisters in Pusan that the Ramsey Auxiliary has sent its collection which amounted to 500 pounds this summer. Aid is given to all who come regardless of religion or lack of it, Mrs. Beek reports, and the need for help will be tremendous for a long time to come.

Any other Auxiliary or auxiliary member who is interested is urged to write to Mrs. H. O. Beek, 900 Goodrich Avenue, St. Paul, for information and shipping instructions.

RAMSEY AUXILIARY TO VISIT RED FEATHER AGENCIES

As the Red Feather campaign will be uppermost in the thoughts of many members of the Ramsey County Medical Auxiliary at the time of their first general meeting on October 26, a program has been arranged that will give them an interesting firsthand view of Community Chest agencies.

Following a luncheon at Town and Country Club, the Auxiliary will go on a "Come and See" tour of Red Feather supported agencies including Booth Memorial Hospital and the Merriam Park Community Center. An innovation planned for the Board of Directors' meetings this year is to have board members work on cancer dressings during their business meetings.

The Ramsey County Medical Society Auxiliary has sent out approximately 500 pounds of sample medicines, clothing and other items this summer for use of the Maryknoll Sisters in their medical and nursing service among sick and needy Koreans.

In Memoriam

JOSEPH P. FLYNN

Dr. Joseph P. Flynn died August 21, at the age of seventy-nine, at his home, 7299 Oak Grove Boulevard in Richfield. He had practiced medicine for forty-nine years in the Minneapolis area before his retirement five years ago.

Dr. Flynn was born in Stillwater and received his pre-medical education at St. John's University at Collegeville and at Notre Dame. He was graduated in medicine at Rush medical college in 1900 and interned at St. Mary's Hospital in Minneapolis. He settled permanently in Minneapolis after practicing for a brief period in Madelia.

Dr. Flynn is survived by his wife, a son, Hugh E., and three daughters, Josephine, Mrs. Henry Wolff, and Mrs. Harvard Gross, all of Minneapolis, and six grandchildren.

MYRON O. HENRY

Dr. Myron O. Henry, well known Minneapolis orthopedist, died suddenly August 31, at the age of fifty-nine.

Dr. Henry was born in Minneapolis in 1893. He was graduated from the University of Minnesota medical school in 1921, and was awarded the first fellowship in orthopedic surgery ever offered by the Harvard medical school. He returned to practice orthopedics in Minneapolis in 1923 and remained there to the time of his death, serving, also, for many years, as a member of the faculty of the University.

He was best known for his work on fusion of the spine and in treatment of fractures of the hip and he was a member of many medical groups, including the American Academy of Orthopedic Surgeons and the Clinical Orthopedic Society, both of which he served as president, and the American Orthopedic Association, the International Society of Orthopedic Surgeons, the American College of Surgeons, the American and Minnesota State Medical Associations and the Hennepin County Medical Society. He was also a member of the Minneapolis Club.

Dr. Henry is survived by his wife, Lucille, a daughter, Mrs. Katherine Perry, of La Habra, California, and three grandchildren.

FRANK M. PUGLIESE

Dr. Frank M. Pugliese, former fellow in surgery of the Mayo Foundation, died on August 13, 1953, in Wilkes-Barre, Pennsylvania.

Dr. Pugliese was born February 7, 1899, at Calimera, Italy. He received the degree of M.D. in 1923 from the University of Pennsylvania, and was an intern for a year and a fellow in surgery for a year at the Robert Packer Hospital, Sayre, Pennsylvania, from 1923 to 1925. He entered the Mayo Foundation as a fellow in surgery in April, 1925, and left the Mayo Foundation in October, 1928. He practiced general surgery at Scranton, Pennsylvania, until 1930, when he went to Wilkes-Barre where he practiced surgery until the time of his death. He was associate surgeon at the Mercy Hospital and consulting surgeon at the Pittston Hospital, Pittston. During World War II he was a lieutenant colonel in the Medical Corps of the Army of the United States.

Dr. Pugliese was a fellow of the American Medical Association and the American College of Surgeons, and a member of the Lehigh Valley Medical Association and the Alumni Association of the Mayo Foundation.

SHERWOOD B. SEITZ

Dr. Sherwood B. Seitz who practiced medicine at Barnesville for fifteen years, died at his home from pneumonia and a heart ailment August 4, 1953. Dr. Seitz was fifty-three years old.

He was born at Blanchester, Ohio, and was graduated in chemical engineering at the University of Northern Ohio in 1922. He served in the Army for eighteen months during World War I and taught school subsequently for nine years in North Dakota, serving as superintendent of schools at Rhame and at Forman before entering the University of North Dakota for premedical training. He was graduated in medicine from Northwestern University and served his internship at Fairview hospital in Minneapolis.

Dr. Seitz practiced medicine continuously at Barnesville from 1937 until 1950 when he moved to Richardton, North Dakota. He returned to Barnesville the next year and was active in practice there until a short time before his death.

Survivors include his wife, Bernice, and two daughters, Mrs. John Acker of Dickinson, North Dakota, and Beatrice, of Barnesville, also one son, Donald, of Barnesville, and a sister, Mrs. K. W. Preston, of Ada, Ohio.

Metrazol is indicated for narcotic depression, for instance, in poisoning with barbiturates or opiates, in acute alcoholism and during the operation and postoperatively when respiration becomes inadequate because of medullary depression due to the anesthetic.

Inject 3 cc. Metrazol intravenously, repeat if necessary, and continue with 1 or 2 cc. intramuscularly as required.

Bilhuber-Knoll Corp. Orange, N. J.

Of General Interest

Dr. and Mrs. Walter S. Neff, of Virginia, were honored on their twenty-fifth wedding anniversary, September 1, by the community members at an open house celebration. During the fifteen years that Dr. Neff has practiced in Virginia, he has been active in community projects. Currently he is serving as a member of the Virginia School Board.

* * *

Serving as members of a panel, "What is New for the Geriatric Patient," which was presented at the meeting of the American Association of Nursing Homes the first week in September, were **Dr. G. K. Stillwell** and **Dr. Mary H. Teberg,** of the faculty of the University of Minnesota. **Dr. Robert N. Barr,** of the State Health Department, served as moderator of the panel.

* * *

Dr. Harley Racer, who has been associated with **Dr. Ralph Rayner** in the Gibbon Clinic in Gibbon, for the past year, left in August to practice in Stillwater where he will be associated with **Dr. Henry Van Meier.**

* * *

Dr. Harold Thysell, a Lion's member, of the Crookston Clinic, spoke on polio at the regular noon luncheon meeting of the Lion's Club held August 17, at the Hotel Crookston.

* * *

Dr. E. J. Engberg, of Faribault, was re-elected president of the Rice County Public Health Association at the annual meeting held in late August.

* * *

Hospital administrators and nursing leaders from all parts of the state met August 21, to discuss the necessity of providing further funds for the rural nurse education program. The program of sending student nurses on regular rural affiliations was begun as a demonstration project by the University of Minnesota School of Nursing and has been supported by various organizations such as the W. K. Kellogg Foundation and the Farm Bureau Women of Minnesota. Currently fourteen urban nursing schools send their students to hospitals in six smaller communities—Hibbing, Bemidji, Grand Rapids, Worthington, Stillwater, and Glencoe.

* * *

Dr. James W. Rae, Jr., former fellow in physical medicine of the Mayo Foundation, who has been acting chairman of the Department of Physical Medicine and Rehabilitation of the University of Michigan Medical School, was named chairman and promoted to associate professor in August.

* * *

Dr. J. R. Brown, of the Mayo Clinic, attended a meeting of German neurologists, neurosurgeons, psychiatrists and neuropathologists, held in Munich, Germany, August 26 and 27. From there, Dr. Brown went to Lisbon, Portugal, to attend the meeting of the International Congress of Neurology.

* * *

Dr. Robert N. Barr, chief of the special services section of the State Health Department, was the main speaker at the dedication of the new $636,000 addition to the St. Cloud Hospital's school of nursing. The new addition provides residence quarters for 150 student nurses, as well as classrooms, a chapel, library, lounge, and laboratories.

* * *

Dr. John R. Earl, of Saint Paul, was elected president of the Minnesota Surgical Society at the August meeting. Dr. W. J. Deweese of Bemidji, was elected vice president, and Dr. Owen G. McDonald, of Duluth, secretary-treasurer.

* * *

Dr. P. S. Hench, of the Mayo Clinic, addressed the Eighth International Congress on Rheumatic Diseases in Geneva, Switzerland, August 25. Dr. Hench spoke on "The Cortisones and Corticotropins in Rheumatic Arthritis."

* * *

Dr. E. S. Palmerton, of Minneapolis, joined the staff of the Park Region Medical Center in Fergus Falls in August. Dr. Palmerton completed a three-year fellowship, specializing in eye diseases, at the University of Minnesota, in July.

* * *

Dr. Lloyd E. Harris, of the Mayo Clinic, Department of Pediatrics, spoke August 17 on the signs and symptoms of polio to nurses and lay persons attending the Fillmore County Polio Nursing Workshop held August 17 and 18 in the courthouse in Preston.

* * *

Dr. Stanley S. Chunn, who has been in the practice of ophthalmology and otolaryngology in Pipestone for the past eighteen years, moved to Willmar in August, and now practices his specialty as a member of the Lakeland Medical Center group.

* * *

Dr. and Mrs. Charles W. Mayo, of Rochester, were guests of honor at a dinner held in the Curtis Hotel, Minneapolis, August 24. The dinner was given by the Minnesota United Nations Association honoring Dr. Mayo for his recent appointment as alternate delegate to the United Nations Assembly, and Mrs. Mayo for her service as a member of the board of directors of the Minnesota United Nations Association.

* * *

Dr. Victor Johnson, of the Mayo Clinic, represented the American Medical Association at the First World Conference on Medical Education, held in London, England, the week of August 24. As vice president, Dr. Johnson presided over the section

"That's For Me"

Every so often someone who has previously given only a casual thought to purchasing Municipal Bonds for himself finds an opportunity to learn the full story about them.

Once he becomes familiar with the inherent security and tax-exempt features of Municipal Bonds he is quite likely to believe "That's for Me."

We invite you to investigate—then give serious consideration to the purchase of Municipal Bonds for your own security.

MINNESOTA BLUE CROSS-BLUE SHIELD

An analysis and review of the Blue Shield claims filed for consultation services since October 1, 1952, discloses that the number of such claims per month has increased eightfold (800 per cent) from the first three months that this benefit was provided through the first six months of 1953. This marked increase and the consequent cost are reaching such large proportions that it emphasizes the need for review of various controlling factors considered at the time consultation services were added to the Blue Shield contract. These factors in-

HOMEWOOD HOSPITAL is one of the Northwest's outstanding hospitals for the treatment of Nervous Disorders—equipped with all the essentials for rendering high-grade service to patient and physician.

A hospital for the care and treatment of Nervous and Mental disorders. Quiet, cheerful environment. Specially trained personnel. Recreational and occupational therapy.

Dr. L. R. Gowan, M.D., M.S., Medical Director

cluded the financial difficulties encountered by one Blue Shield plan as a result of consultations, the safeguards necessary to avoid dangerous over-utilization, and the fact that consultations should be available to Blue Shield subscribers when they are vitally necessary.

First among the principal safeguards against over-utilization of consultation services inserted in the contract is the requirement that there be "a bona fide and urgent need for such consultation services." This language means that the condition involved, or the medical status of the patient, must be such as to constitute a serious threat to his life, or else that some basically difficult differential diagnosis exists which requires immediate solution for proper treatment.

Consultation services had never been provided by the Blue Shield contract prior to October 1, 1952. Prior to that date the feeling had been growing among the members of the Blue Shield Board of Directors that some provision should be made whereby consultation services could be provided in cases of urgent need. However, such a provision could not be included in the contract solely as an amplification of payment for in-hospital medical care. The necessity for leaving certain costs to the personal responsibility of the subscriber so as to prevent any spiral of rate increases still existed, yet this seemed a needed addition to the benefits for those cases involving a truly urgent need.

The second major control of over-utilization is found in the contract clause which provides that the final determination of the need for consultation services

shall be made by Blue Shield itself. Need for such a provision was apparent in cases of obvious abuse of the consultation benefit, and in cases in which differences of opinion are found to exist. Also, incorporating such a provision in the contract seemed necessary as a check upon excessive or hazardous costs of consultation services. Quite obviously, the intent of this language was not rejection of consultation claims in urgently needy cases, but administrative control if use of consultation gets out of hand.

And the third safeguard consists of the limitation of one consultation for each subscriber for each year, and the further stipulation that the consultations cannot be accumulated. The practical effect of this limitation is that a subscriber may have one paid consultation per contract year, but that if no consultation is used one year, more are not available the next year.

From the foregoing, it is apparent that the purpose of the consultation provision is to make available to the subscriber and the profession an additional benefit in those cases where such services are warranted because of the danger to the life of the subscriber, or because of a difficult differential diagnosis of vital importance to the life of the subscriber. It is not intended for cases where the patient's life was not endangered, or where the attending physician simply felt that for the patient's general welfare another physician should be consulted. In such instances, the cost must, of necessity, be left to the subscriber, or the end-result will require either a premium increase or a reduction of benefits elsewhere. It is believed that with the full understanding of the profession of all these considerations regarding consultation and the need to control its abuse or over-utilization, this relatively new benefit should be of mutual advantage to subscribers and members of the profession.

Price $7.50, flexible binding. St. Louis: C. V. Mosby Co., 1953.

TOBACCO AND THE CARDIOVASCULAR SYSTEM; THE EFFECTS OF SMOKING AND OF NICOTINE ON NORMAL PERSONS. By Grace M. Roth, Ph.D., Associate Professor of Experimental Medicine, Mayo Foundation for Medical Education and Research, Graduate School, University of Minnesota, and Consultant in Section on Physiology, Mayo Clinic, Rochester, Minnesota. 60 pages. Price $2.25. Springfield, Ill.: Charles C Thomas, ©1951.

This monograph, written by Dr. Roth, is an excellent presentation of the problem of tobacco in relation to the cardiovascular system. It contains the experimental data which have been accumulated concerning the effects of tobacco on the cardiovascular system with specific reference to nicotine. It represents an important contribution to the problems of cardiovascular disease and is a monograph which every physician and surgeon dealing with such problems should read.

Dr. Roth has had a great deal of experience in this field, and her opinions carry considerable weight.

ADRENALIN®

Introduced to the medical profession by the Parke-Davis Research Laboratories in 1901, ADRENALIN (epinephrine, Parke-Davis) is one of the best known and most widely used of all drugs. Its value and versatility are indicated by its wide application—

In Medicine, ADRENALIN is a standby for relieving asthmatic paroxysms. It is a specific in Adams-Stokes syndrome, and is of great value for protein shock, nitritoid crises, serum sickness, urticaria, angioneurotic edema, and other allergic reactions.

In Surgery, ADRENALIN is employed to prolong local anesthesia by delaying absorption of the anesthetic agent, and to control hemorrhage.

In Obstetrics, ADRENALIN is used as a uterine relaxant.

In Anesthesiology, ADRENALIN is used to overcome cardiac arrest.

In Ophthalmology, ADRENALIN reduces intraocular pressure, vascular congestion, and conjunctival edema.

In Otolaryngology, ADRENALIN controls hemorrhage and provides prompt decongestion.

FINANCIAL WORRY

We hope that you will never have to use what we have to offer for sale. Strange, isn't it. But to view it from a different angle we certainly have no desire to see you have a misfortune such as a fire—a robbery—an accident or some sickness. Yet the law of average is moving your way. The really strange thing is that few people do what they should to eliminate worries over financial loss. Just check yourself.

This misfortune might never happen to you. But isn't it wise to put away a little money each year into a plan of Accident and Health Insurance that has been critically investigated by your Association so that you won't have to worry about financial loss?

Delay offers no advantage!

Conclusive evidence

of the effectiveness and low toxicity

of Furadantin

in treating bacterial urinary tract infections

is provided in its recent

acceptance by the Council

FURADANTIN®

brand of nitrofurantoin

ACCEPTED
COUNCIL ON PHARMACY AND CHEMISTRY
AMERICAN MEDICAL ASSOCIATION

The N.N.R. monograph on Furadantin states:

"**Nitrofurantoin.—Furadantin (Eaton).—**

Actions and Uses.—Nitrofurantoin, a nitrofuran derivative, exhibits a wide spectrum of antibacterial activity against both gram-positive and gram-negative micro-organisms. It is bacteriostatic and may be bactericidal to the majority of strains of Escherichia coli, Micrococcus (Staphylococcus) pyogenes albus and aureus, Streptococcus pyogenes, Aerobacter aerogenes, and Paracolobactrum species. The drug is less effective against Proteus vulgaris, Pseudomonas aeruginosa, Alcaligenes faecalis, and Corynebacterium species; many strains of these organisms may be resistant to it. However, bacterial resistance to other anti-infective agents is not usually accompanied by increase in resistance of the organisms to nitrofurantoin. The drug does not inhibit fungi or viruses.

Nitrofurantoin is useful by oral administration for the treatment of bacterial infections of the urinary tract and is indicated in pyelonephritis, pyelitis, and cystitis caused by bacteria sensitive to the drug. It is not intended to replace surgery when mechanical obstruction or stasis is present. Following oral administration, approximately 40% is excreted unchanged in the urine. The remainder is apparently catabolized by various body tissues into inactive, brownish compounds that may tint the urine. Only negligible amounts of the drug are recovered from the feces. Urinary excretion is sufficiently rapid to require administration of the drug at four to six hour intervals to maintain antibacterial concentration. The low oral dosage necessary to maintain an effective urinary concentration is not associated with detectable blood levels. The high solubility of nitrofurantoin, even in acid urine, and the low dosage required diminish the likelihood of crystalluria.

Nitrofurantoin has a low toxicity. With oral administration it occasionally produces nausea and emesis; however, these reactions may be obviated by slight reduction in dosage. An occasional case of sensitization has been noted, consisting of a diffuse erythematous maculopapular eruption of the skin. This has been readily controlled by discontinuing administration of the drug. Animal studies, using large doses administered over a prolonged period, have revealed a decrease in the maturation of spermatozoa, but this effect is reversible following discontinuance of the drug. Until more is known concerning its long-term effects, blood cell studies should be made during therapy. Frequent or prolonged treatment is not advised until the drug has received more widespread study. It is otherwise contraindicated in the presence of anuria, oliguria, or severe renal damage.

Dosage.—Nitrofurantoin is administered orally in an average total daily dosage of 5 to 8 mg. per kilogram (2.2 to 3.6 mg. per pound) of body weight. One-fourth of this amount is administered four times daily—with each meal and with food at bedtime to prevent or minimize nausea. For refractory infections such as Proteus and Pseudomonas species, total daily dosage may be increased to a maximum of 10 mg. per kilogram (4.5 mg. per pound) of body weight. If nausea is severe, the dosage may be reduced. Medication should be continued for at least three days after sterility of the urine is achieved."

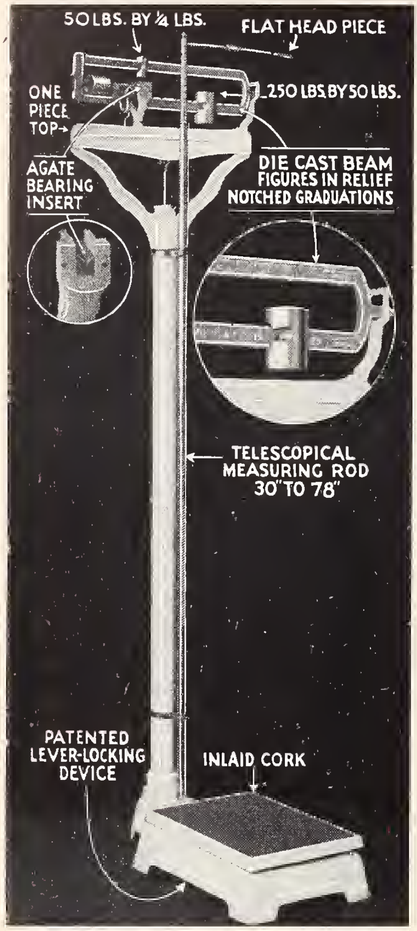
P&H PHYSICIAN'S SCALES



50 LBS. BY ¼ LBS.
FLAT HEAD PIECE
ONE PIECE TOP
250 LBS. BY 50 LBS.
AGATE BEARING INSERT
DIE CAST BEAM FIGURES IN RELIEF NOTCHED GRADUATIONS
TELESCOPICAL MEASURING ROD 30" TO 78"
PATENTED LEVER-LOCKING DEVICE
INLAID CORK

P & H Physician's Office Scale

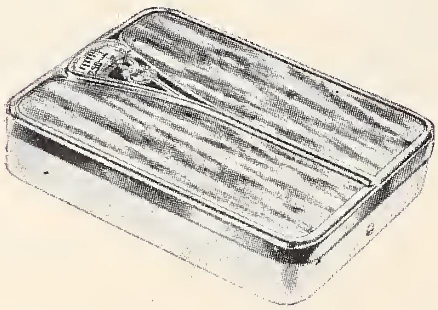
Every detail of this P & H Physician's Office Scale is designed for efficient service. Every item of material is the most substantial known to modern scale engineering. Dependability and permanent accuracy make it the greatest beam scale value in the industry.

All the important features listed are exclusive. The die-cast beam with hardened, knife edge pivots is mounted on agate bearings. All wear is eliminated at this vital point. The one-piece top does away with assembled parts that so often loosen in service and avoids unsightly screws and joints. The two piece, telescopic measuring rod is made of heavy steel tubing, black enameled. It is easy to operate and is graduated by 1/4 inches from thirty to seventy-five inches. The graduations are quickly and easily read. The platform is inlaid rubber for comfort and long wear.

Specifications: Color, standard finish oven-baked white enamel. Capacity, 300 pounds. Size: Platform 10½x14". Space required 11x22". Height overall 60".

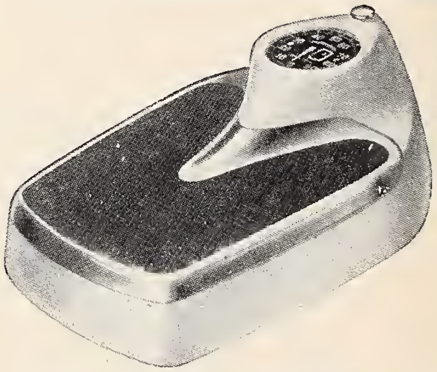
M-1153 P & H Physician's Office Scale....................$57.50 each

P & H Health Scale



Convenient size and shape permits easy storage. Weighs only 5 pounds. Capacity 250 lbs. Full circular metal dial with large numerals. Platform only 2¼" from floor. Platform size, 8x10". Rubber treads, chrome finish on platform. Has magnifying lens on dial.
M-1153-A P & H Health Scale..............$7.95 each

P & H DeLuxe Health Scale



This P & H DeLuxe Health Scale is built for long service. Hardened steel pivots and bearings are used. Dial is easily read, having large numerals. Overall size, 11x16". Platform, 8½ x11x2½". Enameled white finish. Capacity, 300 lbs.

DOCTOR:

Will Your Stethescope Be Showing When You're 65?

We're speaking figuratively, of course. But who among us doesn't think plenty about "going to pasture" and enjoying life after 65 instead of facing the old grind. We'd like to be fishin' instead of fussin' when we get about that age. Perhaps travel, golf, hunting or a partial practice is your goal . . . whatever it is, you must plan ahead for it. Here at National Life we've made a specialty of working with professional men. Our policies are tailored to your needs . . . and include:

Retirement Income!

Is your program for life insurance and retirement income all set up and adequate for your future needs? We find many men are uneasy about recent market fluctuations and anxious to take a new look at insurance with guaranteed income for a relaxed retirement.

Disability Income!

Being a doctor you know that the human mechanism is subject to repair . . . sometimes the damage is greater, beyond repair. Such a dark day can be greatly brightened if you have lifetime non-cancellable *disability income . . . an exclusive feature of National Life.

*even though not house-confined

May we check your program with you, Doctor? Just fill in this handy blank, and we'll call you. Of course there is no obligation!

To: Lloyd Swanson, General Agent
National Life Insurance Company of Vermont

Meat...

and the Important Role of Protein in Hemoglobin Synthesis

Although the relationship between iron and hemoglobin formation is widely appreciated, the important role played by protein in hemoglobin synthesis is relatively obscure. Nevertheless, since globin is just as much a component of the hemoglobin molecule as is iron, the continued synthesis of this protein is necessary for normal hemoglobin production.

It has recently been estimated that in the average adult 8 Gm. of globin is destroyed daily.[1] This means "that approximately 14% of the total dietary protein intake of the average adult [female] is required solely for the resynthesis of new hemoglobin. These data reemphasize the importance of adequate protein, as well as iron, intake for the maintenance of a normal rate of hemoglobin synthesis in man."[2]

Because meat is an outstanding source of *both* iron and high quality protein, it is always recommended in generous amounts in the dietary management of hypochromic anemia. These nutritional values, as well as its significant content of B vitamins, also make meat an important component of the daily diet of normal persons.

ANSWERS TO COMMON QUESTIONS about 'Ilotycin'

(ERYTHROMYCIN, LILLY)

Q. What is the status of 'Ilotycin' in the treatment of pneumonia?

In pneumonia caused by pneumococci and staphylococci, 'Ilotycin' is very effective. Doses of 200 mg. every four hours are recommended.

Q. Is 'Ilotycin' effective in urinary tract infections?

Yes, when the causative organism is susceptible to its action and when there is a minimum of mechanical factors such as strictures, stone, and the like.

Q. How long should a streptococcus throat infection be treated with 'Ilotycin'?

The recommended minimum course for any antibiotic is five days. 'Ilotycin' completely eradicates the organisms within five days and thereby prevents recurrence of the infection.

Q. Is there any contraindication to the use of 'Ilotycin' immediately following a parenteral dose of penicillin?

No. 'Ilotycin' does not inhibit the activity of penicillin. There is probably no specific indication for using penicillin in addition to 'Ilotycin.' Experiments both in vitro and with animals have shown no evidence that 'Ilotycin' is either antagonistic to or synergistic with penicillin or the "mycins."

Q. Are coliform bacteria less sensitive to 'Ilotycin' than to other "broad-spectrum" antibiotics?

Yes. There is less possibility of monilia and fungus overgrowth in the intestinal tract with 'Ilotycin,' since the predominant organisms of the normal intestinal flora are relatively insensitive to the antibiotic action of 'Ilotycin.'

'Ilotycin' is supplied in 100 and 200-mg. specially coated tablets . . . at pharmacies everywhere.

HAND AND FINGER FRACTURES

WESLEY H. BURNHAM, M.D.
Minneapolis, Minnesota

IT IS AN axiom in fracture treatment that the restoration and preservation of function are of fundamental importance. Nowhere must this principle be kept so constantly in mind as in hand fractures. The hand is an organ of dexterity, and the functions of the rest of the upper extremity are crude by comparison. Little useful function remains in the extremity after hand function is lost. A common and serious error among physicians is to consider finger and hand fractures as minor injuries because the parts are small. To obtain a good functional result from these injuries commonly requires a much higher grade of skill and attention to detail than is required for many "major" fractures of the long bones.

A knowledge of the function and anatomy of the hand is essential to intelligent treatment. The chief functions of the hand are thrust, hook, grasp and pinch.

Thrust is the simple function of pushing, which can be done with a flat hand or a closed fist. It is the crudest function and can be performed after amputation of the hand.

Hook is that function employed in carrying a pail, pulling levers, or hanging from the hands. It does not require the use of the thumb. It is still present when all finger joint motion is lost provided the ankylosis is in a position of flexion.

Grasp is employed in handling most of the tools of heavy labor and is typified in the use of a hammer, a saw, a shovel, and a great many other tools. The thumb is necessary to the best performance of this function.

Pinch is the most exacting of all. It cannot be performed without the thumb. It can be done with only slight motion in one finger and none in the thumb provided the parts are in the proper position of opposition. It is the position of work for precision and delicacy.

Watson-Jones[1] has given eight principles in the treatment of finger injuries which should be remembered by every practitioner who treats hand fractures.

1. *The Injured Finger Must Be Immobilized.*—This permits most rapid healing. The increased exudation which results from early exercise leads to stiffness.

2. *The Injured Finger Must Be Immobilized In Flexion.*—This is the position of function as well as that of easiest reduction in most cases. It permits complete exercise of the other fingers, which cannot be done because of the tendon connections if the finger is fully extended. The tongue blade is for depressing tongues, not immobilizing fingers.

3. *No Finger Except the Injured Finger Must Be Immobilized.*—To do so is usually a matter of convenience to the surgeon and not in the best interest of preserving hand functions.

4. *Every Uninjured Finger Must Be Actively Exercised.*—As has been stated, the object of treatment must be to preserve as well as to restore function in the hand.

5. *Passive Stretching Must Be Rigidly Avoided.*—It causes exudation and the formation of further adhesions and scar tissue. Only active exercise may be used.

Read at the Centennial Meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 18, 1953.

6. *Fractures of the Phalanges Must Be Reduced and Immobilized With Special Care.*—The phalanx is the floor of the tendon sheath, and minor displacements lead to loss of function. Because of the small size of the phalanges, a given degree of angulation appears to be less than in a long bone. A 15-degree dorsal angulation in a proximal phalanx will prevent the tip of a finger from touching the palm, and a similar degree of palmar angulation will prevent slipping the hand into a narrow space because of loss of extension. A few degrees of rotation may result in overlapping of the fingers during grasp and in significant handicap.

7. *Compound Finger Injuries Must be Treated by Immediate Operation.*—No one would question the necessity of immediate treatment of a compound fracture of a tibia, yet the occupational disability is likely to be less from the neglect of this injury than from a smaller and less bloody finger injury. Every hand wound deserves a surgeon's most diligent and skillful attention to prevent infection and to restore the parts as perfectly as possible.

8. *The Thumb Must Not Be Amputated.*—Not less than 40 per cent of the function of the hand is dependent upon the thumb. A thumb which has been denuded can be covered with skin by grafting and be useful even if joint motion is lost.

Many accepted textbooks teach methods of treatment which violate these principles. Such methods are born of laziness or ignorance and the discerning physician will not employ them.

A blow on the tip of the finger while the extensor tendon is tense may result in an avulsion fracture of the extensor tendon attachment to the distal phalanx or a rupture of a tendon near this point. This leads to the deformity of mallet finger or "baseball finger." The tendon and the fragment retract as far as permitted by the middle slip of the tendon, which attaches to the middle phalanx. Approximation of the fragments by simple extension of the distal phalanx is seldom accomplished and a permanent mallet finger deformity is the common result. Approximation of the fragments of bone or tendon can be accomplished, however, by flexing the middle joint at the same time that the distal joint is hyperextended. Since the lateral slips of the tendon move in a shorter path around the sides of the joint as the middle joint is flexed, the relaxation of the distal attachment permits approximation and union will take place in five to six weeks if the position is maintained.

Avulsion of the attachment of the middle slip of the extensor tendon to the middle phalanx results in a deformity of flexion at the middle joint and extension at the distal joint. This injury must be immobilized in a position of extension at the middle joint and flexion at the distal joint.

Fractures of the tufts of the distal phalanges do not require more than simple protection except when compounded. Infection is a danger when hemorrhage escapes from beneath the nail. Caution must be exercised in drilling the nail for release of pressure because of the risk of infection.

Fractures of the shafts of the middle and proximal phalanges usually are reduced by placing them in flexion. Traction of moderate degree assists in maintaining reduction. Fractures involving the finger joints usually require continuous traction in the flexed position. This may be obtained by pulp, fingernail, or skeletal traction. Boehler employs a volar wire splint attached to an arm cast with traction which may be obtained by bending the splint after attaching the traction wire to the end. Rubber band traction over the bent splint is also satisfactory. It should be pointed out that each of the flexed fingers points toward the tubercle of the scaphoid bone and does not parallel the corresponding metacarpal. When the finger is immobilized it must be made to point in this direction and thus avoid deformity from rotation.

A common type of metacarpal fracture in young men is the depressed knuckle from fighting with a bare fist. This is found most often in the neck of the fifth metacarpal with the distal fragment angulated toward the palm. This fracture cannot be readily reduced nor reduction maintained by an extension splint. Reduction is best accomplished by flexing the metacarpophalangeal joint 90 degrees and employing the proximal phalanx as a prop or lever to push dorsally on the distal fragment while counter pressure is maintained over the shaft of the metacarpal on the dorsal aspect. Immobilization should be in this same flexed position with appropriate padding over the pressure points. The finger can be released after two weeks and slight pressure substituted under the metacarpal head in the palm for an additional two weeks.

Oblique fractures of the metacarpal shafts tend to overriding with shortening of the knuckle. This is not a disabling deformity and simple protective splinting by plaster which extends over the dorsal and volar aspects of the bone is sufficient for good function. Permitting the fingers to freely flex controls rotation in fractures of the third and fourth metacarpals. If shortening of the knuckle is of cosmetic importance, traction on the finger over a curved splint will restore length. This traction should not be in a position of extension, as with a banjo splint, which prohibits full flexion of the uninjured fingers and leads to contracture of the collateral ligaments at the metacarpophalangeal joints with loss of flexion. Since the collateral ligaments are kept taut when the joint is in flexion, immobilization in this position does not lead to loss of motion due to their contracture.

Transverse fractures of the metacarpals may angulate and produce a prominence of the fracture site on the dorsum. This is usually controlled by a properly molded plaster after reduction. Open reduction is occasionally necessary for displaced transverse fractures.

Fractures of the first metacarpal require special consideration. These fractures usually occur near the base. Transverse fractures usually lead to angulation of the distal fragment toward the palm. Lack of reduction may limit span of the hand. After reduction, immobilization should be in abduction with the thumb in a position of opposition to the fingers. The pressure should be at the metacarpal head. The metacarpophalangeal joint should not be hyperextended.

Fractures beginning on the palmar site of the first metacarpal and extending into the articulation with the greater multangular permit dislocation of the dorsal fragment and shaft. This is known as Bennett's fracture—dislocation of the thumb. This is an unstable fracture which must be treated by continuous traction during the healing period of about four weeks. A short arm cast is applied to which a wire traction bow is attached. Collodion and gauze provide adequate purchase on the skin and rubber bands of appropriate size supply traction.

Crushing injuries of the hand present complex problems of immobilization. The presence of soft tissue wounds may make the usual methods of immobilization difficult or impossible. It is of greatest importance that such hands be immobilized in the position of function. A practical means of fixation in the early treatment period is the "universal hand splint" of stamped aluminum which is available through surgical supply dealers. This maintains the functional position of all parts.

Man depends upon the strength, mobility, and dexterity of his hands in the pursuit of his livelihood. Injuries to the hand should be treated with respect and with skill.

U. S. IMPROVES BUDGET CONTROL

Federal contributions to states for vocational rehabilitation programs will be put under closer budgetary control and gradually reduced under a new system set up by the Department of Health, Education, and Welfare. The new plan was instituted as a result of a rider to DHEW's appropriations bill, inserted by Congress at the request of the Budget Bureau.

Until now, vocational rehabilitation grants to states have fluctuated, with the federal government committed to match dollar-for-dollar money spent by the states for administration and 50 per cent of the cost of physical restorations, training and patient transportation.

Because there was no definite ceiling for each state, the federal Office of Vocational Rehabilitation frequently had to dip into a current appropriation to meet its share of a state's cost for previous years. Effective for this year, OVR allocates to each state a set sum of money, based on the overall appropriation, this year of about $23 million. Each allocation will be based on a percentage of the money the federal government granted to the state the previous year. For the current fiscal year, the allocation to each state will be 92.5 per cent of the U. S. share for fiscal 1953. However, if the state wants to match the lower federal allocation and then spend more money, the federal government will pay one-fifth of the additional costs, within limits set by OVR.

WRIST INJURIES

EDWARD H. JUERS, M.D., F.A.C.S.
Red Wing, Minnesota

WRIST injuries in the form of fractures, dislocations, and sprains continuously present to the physician a trying problem. The goal in the treatment of these injuries is to obtain good functional and anatomical results. A representative series of cases is to be presented along with a method of managing each type of case. Proper selection of treatment, that is, the method of reduction and maintaining reduction, often calls for wide experience.

First, a manipulative maneuver is to be described. The simple fractures at the wrist may be easily and quickly reduced by this maneuver. Figure 1 shows the patient in a supine position. The elbow is flexed at a right angle (local or general anesthesia may be used.) The operator grasps the patient's hand as shown. The patient's hand is grasped at the thumb and thenar eminence by the operator's corresponding hand. That is, the operator's right hand grasps the right thumb of the patient, or the left hand of the operator grasps the patient's left thumb and thenar eminence. Countertraction is produced by dropping a sling to the floor and anchoring the same by the operator's foot, or by having an assistant make pressure on the arm. Traction at the wrist can then be applied to any desired degree of force. The impaction can be broken and the fragment of the radius reduced by placing the thumb of the free hand over the distal end of the radius. The index, middle, and ring fingers are placed over the volar side of the forearm. After the reduction has been completed, the extremity is immobilized in a sugar-tong type of splint moulded out of plaster of Paris. Figure 2 shows application of the splint.

This type of splint prevents supination and pronation of the forearm. The completed splint should not extend beyond the distal flexor crease of the palm (Fig. 3). After completion of the splint, a compression dressing is applied around the fingers and thumb to prevent edema (Fig. 4). Padding should be placed between the fingers in order to avoid maceration of the skin. In bandaging this padding, it is preferable *not* to use elastic bandage. The latter may lead to some pressure necrosis of the fingers.

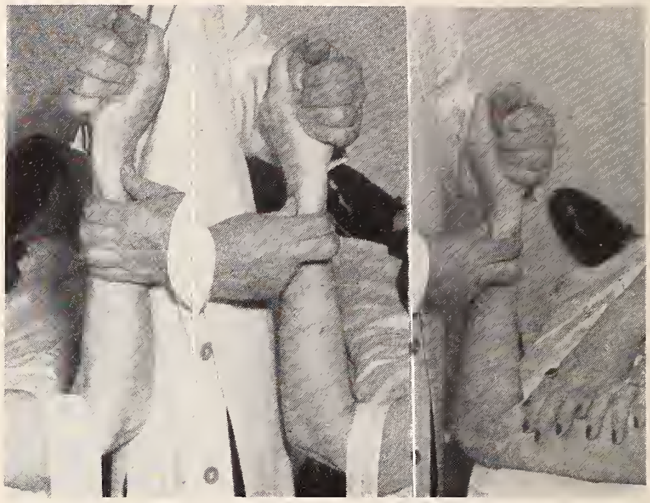

Fig. 1. Demonstration of manipulative maneuver.

Simple Colles' fractures and epiphyseal separations (Fig. 5) should be treated in the manner described. The more complicated injuries of the comminuted type should be reduced by means of a traction apparatus. Skeletal fixation is often necessary in order to maintain reduction. Two half pins or through and through Kirschner wires may be used (Fig. 6 and Fig. 7). Two half pins, one inserted into the base of the second and third metacarpals, and the other into the proximal shaft of the radius, are the most satisfactory. These pins may be inserted before reduction is carried out in the traction apparatus.

Oblique fractures of the radius, or radius and ulna may be reduced and the position maintained by means of an intramedullary Kirschner wire (Fig. 8). The wire is inserted through a drill hole made under the direct vision through an operative incision. Postoperative fixation by means of a sugar-tong splint is usually adequate immobilization. The pin is permitted to protrude through the operative site and it is removed after adequate callous has developed to maintain satisfactory position of the fragments. Three to six weeks of fixation is usually necessary.

The radiographs should always be carefully in-

spected to rule out fractures of the carpal bones, especially fractures of the carpal navicular. Unusual injuries such as dislocation of the carpal semilunar bone may be encountered (Fig. 9a). Perilunar dislocations are also occasionally found (Fig. 9b). These injuries if not recognized and if not treated early may result in considerable disability.

Summary

1. Description of a simple manipulative maneuver for the reduction of Colles' fractures.

2. Immobilization of fractures at the wrist with sugar-tong plaster of Paris splint in order to prevent rotation of the forearm. The splint must stop at the flexor crease of the palm.

3. Emphasis on the use of compression dressing over the fingers for four to seven days to prevent edema of the hand and fingers, thus avoiding ischemic contracture of the intrinsic muscles of the hand.

4. Evaluation of fixed traction to maintain reduction of comminuted or oblique fractures.

5. Emphasis on the importance of recognizing unusual injuries of the carpal bones, e.g., dislocation of the semilunar bone, perilunar dislocation, and fractures of the carpal navicular.

OCCULT DISLOCATION OF THE ANKLE

D. KEITH MILLETT, M.D., and MYRON O. HENRY, M.D.
Minneapolis, Minnesota

MANY so-called "sprained" ankles are not sprains at all. They are in reality much more serious injuries—spontaneously reduced dislocations of the ankle joint. Following a forcible inversion injury of the ankle, the lateral ligaments are often partially or completely torn, allowing the talus to dislocate from the ankle mortise without a fracture of any of the bones making up the ankle joint. In all except rare cases following severe trauma, such a dislocation is reduced spontaneously by the pull of the peroneal muscles. The usual x-ray examination shows no fracture or deformity of the ankle joint and the diagnosis, by exclusion, is "sprained ankle." Since the true injury remains hidden to the usual methods of examination, we have chosen to refer to it as an *occult dislocation of the ankle.*

We wish to call special attention to this entity and to emphasize the importance of a complete examination of any ankle joint injury to establish the presence or absence of this condition. Proper treatment is contingent upon proper diagnosis. There is a well known old saying that "a sprain is worse than a break." This may often be true, not because the injury is really more severe, but because the real diagnosis is overlooked and the subsequent treatment is therefore inadequate. Although the recent literature contains several reports mentioning the frequency of this injury, most are passed over as "sprains" and treated as minor injuries. These injuries are the "sprains" that yield poorer results than some fractures of the ankle. They often result in chronically weak, unstable ankles subject to recurrent "sprains," subluxations, or dislocations of the ankle following relatively minor twists.

The ankle joint is a perfect hinge joint supported on the medial side by the strong deltoid ligament and on the lateral side by three separate ligamentous bands: the anterior talo-fibular ligament, the posterior talo-fibular ligament, and the calcaneo-fibular ligament as the middle band. It is obvious, and has been shown, that the lateral capsule of the ankle joint receives most of its support from the anterior talo-fibular ligament when the foot is plantar flexed; the calcaneo-fibular ligament when the foot is in a neutral position of 90 degrees and the posterior talo-fibular ligament when the ankle is dorsiflexed. However, most inversion injuries of the ankle occur when the ankle is partially plantar flexed causing injury to the anterior talo-fibular and calcaneo-fibular ligaments. The exact position of the foot, the force of the inversion, and the state of contraction of the peroneal muscles determine which of the ligaments are injured and to what extent.

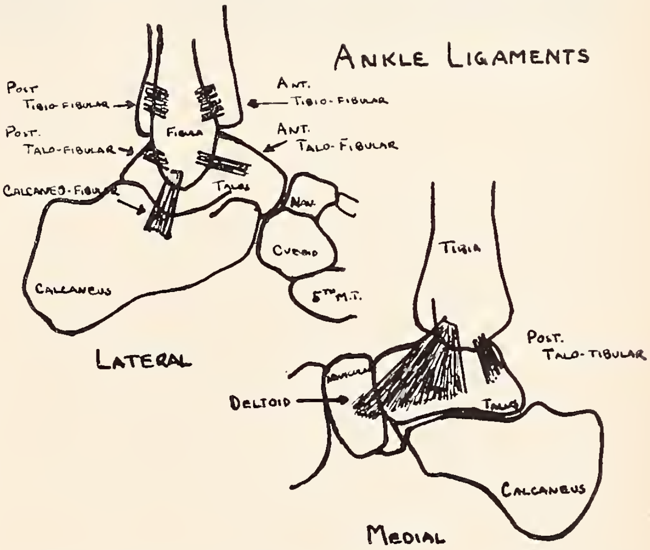

Fig. 1. Diagram showing the ligaments of the ankle joint and direction of their fibers.

A true *ankle sprain* is a partial stretching or minor tearing of the ligaments about the ankle joint without dislocation. Complete tearing of the ligaments may allow the talus to dislocate or tip in its mortise. In the absence of a fracture, the dislocation rarely persists. When it does, the deformity and the serious nature of the injury are obvious to the patient and the physician and the treatment is consequently usually vigorous. Much more frequently, however, the dislocated talus is spontaneously and instantly reduced at the time of the injury so that neither the patient nor the doctor sees the extent of the deformity and consequently does not realize the seriousness of the injury.

Read at the Centennial Meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 18, 1953.

Because of the seriousness of the injury and the frequency with which this condition is overlooked and treated for a lesser injury, we believe that every severely "sprained" ankle should be considered an occult dislocation until it is proved to be otherwise.

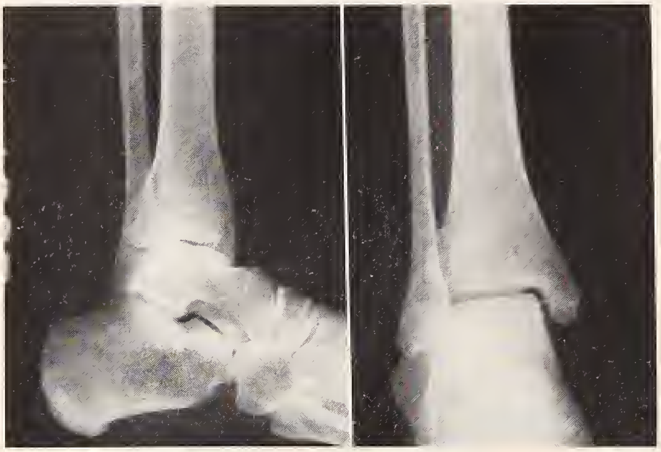

Fig. 2. (a) Routine lateral view of the ankle and (b) routine anteroposterior view. These views show no abnormality.

These injuries usually occur while the patient is walking over irregular terrain, or otherwise makes a mis-step causing the foot to invert suddenly under the force of the body weight. Women's shoes with narrow, high heels and men's shoes with run-over heels add to the hazard. The twist occurs too suddenly for the peroneal muscles to contract and assist the lateral ligaments in supporting the ankle joint. Thus, the sudden force stretches and tears the ligament and forces the talus out of its mortise.

The symptoms are similar to those of a sprain, but usually more severe. Swelling and ecchymosis usually occur at the site of, and distal to, the point of injury. Pain is a usual occurrence and is aggravated by motion of the affected part, especially motion in the direction of injury. The examiner may frequently be able to palpate a sulcus below the lateral malleolus and feel the talus tip out of the mortise as he inverts the ankle in the direction of injury. Most often there is point tenderness over the involved ligament. Frequently a large subcutaneous hematoma develops rapidly.

If an occult dislocation of the ankle is suspected from the history and physical findings, confirmation of the diagnosis depends upon proper x-ray examination.

Routine anteroposterior, lateral, and oblique x-rays of the injured ankle should be taken and studied as the first step. If no fracture is present, the integrity of the lateral ligaments of the ankle should be determined by an anteroposterior x-ray taken while the ankle is forcibly inverted in the direction of the injury. The technique of inverting the ankle for the x-ray is very important because if it is not properly done, the results will be misleading. Someone thoroughly acquainted with the mechanism of the injury and the purpose of the procedure should hold and invert the ankle while the x-ray is taken.

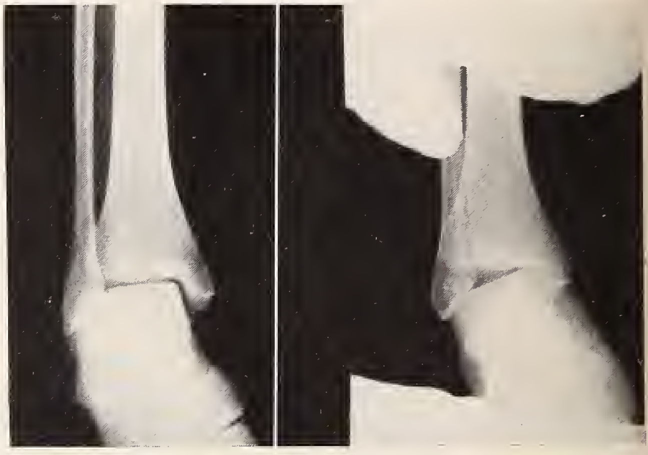

Fig. 3. (a) Anteroposterior view of the ankle improperly inverted. The patient was told to invert her own ankle. (b) Anteroposterior view showing proper method of forced inversion. Note the lead-gloved hands above the ankle and grasping the heel and instep. The talus tips in the mortise revealing an *occult dislocation.*

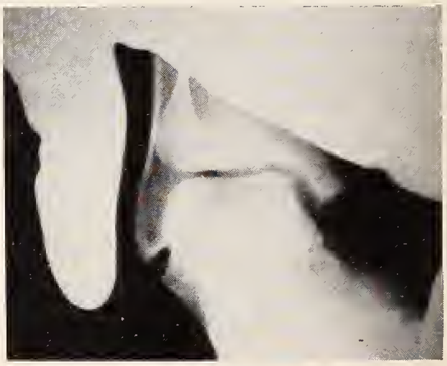

Fig. 4. Anteroposterior view of a normal ankle in forced inversion. Note that the ankle joint surfaces remain parallel and no tipping occurs.

The examiner should wear lead gloves to protect his hands because adequate inversion cannot be accomplished without a firm grasp just above the ankle with one hand, and around heel and instep with the other hand. If the examiner's hands do not appear on the x-ray picture, the procedure probably has not been properly carried out. The ankle is inverted in the direction of the injury as determined by the history of the mechanism of the injury, correlated with the location of the swelling and point of maximal tenderness. If every detail is made in readiness before the actual twisting of the ankle, so that the examiner and technician work together as a team, the manipulation can be accomplished with a minimal amount of discomfort to the patient. It is wise to explain your intentions to the patient and forewarn him of the possibility of some pain. In this way, his co-operation for better relaxation may be obtained. Some authors have advocated the use of anesthesia, either general or local, while making the inversion examination. While this may be advantageous in some cases, we have not found it necessary in most of our cases. Without anesthesia, this examination is a simple office procedure which can be carried out routinely in only a few moments. It is certainly much better to take the inversion x-ray without anesthesia than to omit the test entirely for want of anesthesia. Comparable inversion films of the opposite ankle may often be helpful in interpreting the x-ray pictures. If the lateral ligaments are intact, inversion of the foot occurs at the subtalar joint so that the articular surfaces of the tibia and talus remain parallel. If the ligaments are torn or avulsed, inversion also occurs at the ankle joint so that the talus tips in the ankle mortise and the articular surfaces of the tibia and the talus form an angle.

Before the proper treatment of an individual case can be decided upon, it must first be established whether the present injury is a fresh or acute occult dislocation, or if it is a recurrent or chronic subluxation of the ankle as a result of a previous injury. A history of previous recurrent "sprains" would suggest that the present injury may be a recurrence of an old dislocation and much past the point of maximal benefit from immobilization. If doubt exists, the injury should be treated as a fresh case.

Acute occult dislocations of the ankle should be immobilized in a snugly fitting plaster-of-Paris cast with a minimal amount of padding. The foot and ankle should be placed in the neutral position or in slight eversion to assure close apposition of the ends of the torn ligaments. Ambulation is permitted with a walking appliance on the cast as soon as the cast is dry and the initial pain and swelling have subsided. It may be necessary to change the cast if it becomes loose with the subsidence of the edema. At the end of four weeks, the cast may be replaced with an Orr brace having an inside bar, an outside "T" strap, and free ankle joint motion. This is attached to a firm, low-heeled oxford with a 1/8 inch lift on the outer border of the heel to protect the injured ligament. The patient must not bear weight without this appliance for at least four more weeks. In addition, the foot and ankle are bound with an elastic adhesive dressing for at least two weeks after the removal of the cast, or until all the tenderness has disappeared. Following this, a plain elastic bandage may be necessary to control swelling until normal vascular equilibrium is re-established.

Recurrent or chronic subluxations of the ankle joint require a different therapeutic approach. Because of inadequate immobilization at the time of the initial injury, the torn ligaments may have healed loosely in a relaxed position, or not at all. Therefore, they give little support to the ankle joint and allow recurrent "sprains" from trivial twists. Plaster or adhesive immobilization now may assist in the control of the acute symptoms of pain and swelling but accomplishes little in gaining a permanently stable ankle. These may be treated conservatively by applying a firm oxford with a low, broad heel and cautioning the patient to avoid re-injuring the ankle. If deemed necessary, an Orr brace may be used to add protection. However, if the patient is either young or very active, and particularly if his occupation demands a secure ankle for his safety, we feel that an operation should probably be performed to reconstruct the torn ankle joint ligaments. In this procedure, the tendon of the peroneus brevis muscle is detached superiorly and laced through drill holes in the distal end of the fibula and neck of the talus in such a manner as to reconstruct the torn ligaments. The after care is the same as for the acute occult dislocation.

Conclusions

1. Although most ankle sprains are relatively minor injuries, occult dislocations of the ankle are much more common than supposed and are serious injuries.

2. Because they are misdiagnosed as "sprained" ankles, they are usually inadequately treated.

3. Immobilization in plaster should be used in recent dislocations; chronically unstable ankles subject to recurrent "sprains" may require surgical repair.

THE TIMING OF FRACTURE TREATMENT

FRANK S. BABB, M.D.
Saint Paul, Minnesota

THE ABILITY to repair itself and the property of healing is an inherent characteristic of all living tissue. Bone is no exception. If protected from further injury, a broken bone will always repair itself. Certain extrinsic as well as intrinsic factors, however, influence this healing process and fracture treatment should be designed to utilize these factors to advantage. The timing of such treatment is important, and it is with this phase of fracture treatment that we are here concerned.

TABLE I.

Time since injury	Microscopic picture	Chemical picture	Clinical picture
1st week	Hematoma	pH—acid Histamine Vasodilatation	Fragments freely moveable
2nd week	Granulation tissue	pH—acid Phosphatase increased	Fragments less moveable
3rd week	Early callus	pH—alkaline Deposition of calcium	Fragments becoming "sticky"
10-12th week	Immature bone		Fragments clinically united
1st year	Mature bone		Fragments reshaped and recannulated

In order to better understand the timing of fracture treatment let us first of all review the gross and microscopic processes that go on following such injury. For the first few days the hematoma between the bone ends begins to organize. The blood mixed with traumatic exudate is partly fluid and partly clotted. It is soon invaded by the rapidly-growing cellular granulation tissue. After the first two to three weeks new bone called callus is first laid down in minute amounts around the blood vessels. This primary callus will eventually become bone if immobilization is continuous and uninterrupted. It will require many months, however, for mature bone with normal trabeculae to develop. In order to clinically correlate this process, consider for a moment the accompanying table.

Organization of the hematoma between the bone ends results in a scaffolding or network of fibrous connective tissue. When this is ready a chemical change takes place in the tissues by which calcium, previously in chemical combination in the blood and tissue fluids, is now released and deposited in this pre-bone matrix. Clinically we know this stage of the process has been reached when the bone ends are felt to be "sticky" and can no longer be moved freely on the other. Radiologically we begin to see evidence of callus around the fracture site. If immobilization is incomplete there may be abundant external callus due to diffusion of the hematoma. This does not necessarily insure firm bony union, however.

During subsequent weeks primary callus becomes bone by virtue of a physico-chemical process of substitution. By ten or twelve weeks weight-bearing bones under ideal circumstances are sometimes solid enough so that external splinting can be safely discontinued. An x-ray reveals a rather homogeneous mass of new bone at the fracture site and we say the fracture is united. Not for a year, however, will the healing process be completed. A new medullary cavity must be developed. Extra bone at the fracture site must be removed. The bony trabeculae must thicken and strengthen in response to normal stress and strain, until finally the fracture site becomes indistinguishable from normal bone. The healing process is then complete.

Do all fractures adhere strictly to this timetable? Obviously they do not! Many factors

TABLE II. FACTORS INFLUENCING RATE OF HEALING

1.	Age	
2.	Type of fracture	Transverse vs. oblique Compound vs. closed
3.	Blood supply	Hyperemia vs. ischemia
4.	Distraction	
5.	Interposition	

enter into the rate of repair and the healing process in two identical fractures can vary tremendously. Those factors influencing fracture healing may be summarized as in Table II.

It is a common observation that the healing process in a growing child is much more rapid than in an adult. In an infant a fractured femur exhibits callus in a few days and is solid in one month; by age five years it requires at least two months; and in an adult four to six months. An oblique fracture with a wide expanse of raw bone to raw bone heals faster than a completely transverse fracture. Compound fractures are slower to unite than closed fractures. Fractures in the lower third of the tibia have a poor blood supply and as a result of ischemia are slow to heal. Hyperemia on the other hand, when it persists, will also delay union. Hence infected fractures are always slow to unite. Distraction of the fractured fragments from too much traction delays union. All of these factors so far, however, will only *delay* union—they do not prevent it. If immobilization is continued and uninterrupted, union will occur. Interposition of soft tissue, however, can render bony union impossible. A continuous hematoma no longer exists and non-union can be predicted.

Delayed union, therefore, implies a fracture that will still unite if immobilized long enough. Non-union, however, should be reserved for those fractures wherein all cellular activity has ceased. Except for interposition of soft tissue the only cause of non-union in a fracture is failure to immobilize the fracture long enough. Fractures cannot be treated by the calendar. Just because a certain fracture is not solidly united by a certain date, is no justification to abandon treatment. If a continuous hematoma exists between the bone ends all fractures will unite if completely and uninterruptedly immobilized long enough. Therefore, we must recognize delayed union due to one or more of the above factors and be prepared to continue treatment until the fracture is united. Only in this way can we keep ununited fractures in the category of delayed unions and out of the realm of non-unions, where only bone grafting can ever hope to complete the healing process.

What are the criteria for a diagnosis of non-union? When the bone ends become rounded, sclerosed and the fracture line is quite apparent on x-ray despite prolonged passage of time—non-union is established. Further immobilization will avail us nothing. Some other form of treatment is now necessary.

Before attempting to decide when to stop treatment, however, let us consider for a moment when to start treatment. As a rule this is no problem. Treatment is usually started within the first twenty-four hours. The fracture is immobilized and healing is underway. However, some fractures require more than one manipulation, and others require delayed open reduction. There is no doubt but that the sooner continuous, uninterrupted immobilization is started, the sooner bony union is complete. However, during the first week one probably does not interrupt the healing process sufficiently to jeopardize the final result. If during the second week the fracture hematoma is disturbed, the delicate new granulation tissues are destroyed and the ultimate healing process is delayed. After the third week, if surgical interference must be resorted to, some type of bone grafting procedure should be considered, to insure early union. Needless to say, compound fractures require immediate attention; so do fracture dislocations, for not infrequently the integrity of the overlying skin if not the blood supply to the limb itself may be in jeopardy. Fractures of the femoral neck perhaps do not require the same urgent attention, but where the blood supply to the femoral head has already been embarrassed I feel the earlier the fracture is reduced and immobilized the better will be the result. In addition, patients in an older age group who fall and break a hip are seldom in better physical condition for surgery than the day of the accident.

To decide when to stop treatment is a more difficult decision. The diagnosis of a healed fracture involves a correlation of some several observations, as does any other diagnosis. One must consider the clinical and the radiological evidence as well as the length of time since the fracture was first immobilized. The diagnosis of a healed fracture is based on (a) clinical findings, (b) x-ray findings, and (c) calendar findings.

After considering those factors influencing the rate of healing, one can turn to the calendar and then arrive at a rough estimate of the "due date." In fracture treatment this is the date before which one would *not anticipate* union to be complete. On this date the cast or other external fixation can be removed. The fracture site is examined clinically. It is tested for motion. It is tested for any undue pain or tenderness. The presence of pitting edema at the fracture site alone, should be a warning signal that union is not yet sound. If, however, the clinical prerequisites for union are satisfied one then turns to the x-ray. Views must be taken in at least two planes at right angles. In addition to re-affirming satisfactory position and alignment, the radiograph is expected to reveal adequate callus formation. What else one looks for depends on the type of bone under consideration. In the case of a weight-bearing bone, the fracture line will have to be all but obliterated. *There must be continuity of trabeculae* between the proximal and distal fragments. In a non-weight-bearing bone like the clavicle, however, such continuity is not a prerequisite for discontinuing immobilization. In fact if one waited for x-ray confirmation of healing in this fracture, it might require three months. We all know from experience that the average clavicle is sufficiently healed in four to five weeks, however, and non-union is rare.

Fig. 1. Roentgenograms of a tibia in which immobilization was refused by the patient after fifteen months. The first view was taken in April, 1949; the second in October, 1950.

To return to the weight-bearing bones, however, if one discontinues immobilization before the fracture is sufficiently healed, the healing process will go into reverse, callus will be absorbed and non-union will result. The accompanying roentgenograms show a tibia in which immobilization was refused by the patient after fifteen months. Unprotected weight-bearing was resorted to. The patient then returned at eighteen months complaining of increasing pain. Immobilization was resumed after freshening the bone ends. Only after three years was this fracture finally healed. Such is the price for interrupting immobilization.

When one is in doubt as to the status of bony union in a long bone, an x-ray should be taken while springing the fracture first one way and then the other. If any angulation occurs at the fracture site, bony union of course is not yet sound. Further immobilization is necessary.

Union, delayed union, and non-union are, therefore, three diagnoses that must be carefully differentiated in timing the treatment of fractures. There is one other diagnosis that will sometimes have to be made. *Avascular necrosis* affects treatment and prognosis materially. Several bones have a precarious blood supply. Fractures that disrupt this blood supply render part or all the bone avascular. Such bone deprived of all its blood supply undergoes necrosis. If weight-bearing is permitted before a new blood supply has invaded the necrotic bone, flattening, fragmentation and distortion of the involved bone results. Therefore, the astragalus, the carpal navicular, and the femoral head in particular, must be watched, for evidence of avascular necrosis. About six to eight weeks after the fracture the necrotic bone is noted to be comparatively more dense than adjacent bone. This fracture must be protected and immobilized a long time. The astragalus and femoral head may require a year to become revascularized. The carpal navicular has been immobilized eighteen months before union was complete. Failure to do so, however, results in non-union.

In conclusion, therefore, let us not treat fractures by the calendar alone. Rather let us consider all the factors that might influence the rate of healing. Having done so, then determine the earliest date by which union might be expected to occur. Then check the fracture clinically and radiologically before discontinuing immobilization.

ACCIDENTS—CHIEF KILLER OF CHILDREN

A. B. ROSENFIELD, M.D., M.P.H., and WM. ALLEN, M.P.H.,
Minneapolis, Minnesota
and
EMERSON W. STOREY, B.S., M.S.
Saint Paul, Minnesota

CHILDHOOD is an extremely dangerous period of life from the standpoint of accidents. Few Minnesota children die from diseases between the ages of one and fifteen years, but accidents are the leading cause of death in that age group—and, indeed, in every age group from one to thirty-five years of age.

One-third of all the deaths of Minnesota children in 1952 were due to accidents. In that year accidents caused more deaths in youngsters aged one to fifteen years than the combined total caused by poliomyelitis, cancer, pneumonia and influenza, rheumatic fever, infectious meningitis, tuberculosis, measles, and chickenpox (Fig. 1). The year 1952 was the worst poliomyelitis year Minnesota has ever experienced, with a total of 3,926 cases and eighty-nine deaths in children under fifteen. Yet during that same period there were 283 deaths in this same age group from accidents.

For all ages, a total of 1,658 accidental deaths occurred in Minnesota in 1952, a decrease of 8 per cent from the 1951 total of 1,804 deaths. Among the ten leading causes of death, accidents continue to hold fourth place, year after year. Home accidents were responsible for more than one-third of all accidental deaths (591 deaths, 35.6 per cent), a slight decrease of 2.3 per cent over the 1951 total. Of all accidental deaths, 17 per cent occurred in children under the age of fifteen years, an increase of 2 per cent over 1951.

Chief Causes of Childhood Accidents

Two-thirds of the 1952 accident fatalities occurred in boys and one-third in girls. Home accidents claimed the lives of 141 Minnesota children under fifteen years of age, one-half of all accidental deaths during childhood. But home accidents were responsible for only one-third of all accidental deaths for all ages.

Motor vehicle accidents accounted for more than one-fourth (27 per cent) of all childhood accident fatalities (seventy-six deaths). Of these twelve were actually home or farm accidents although tabulated under motor vehicle accidents.

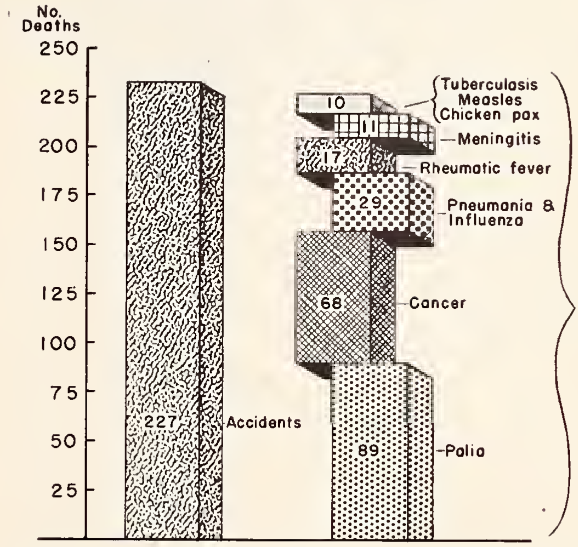

Fig. 1. Leading causes of death among children one to fifteen years—Minnesota 1952.

Motor vehicle fatalities outranked every other cause of fatal injury in each specific age group except infancy. Nine of the children who died in motor vehicle accidents were babies under one year of age, twenty-four between one and five years, twenty-six were five to ten years, and seventeen were between ten and fifteen years.

Extreme watchfulness is necessary to decrease the toll of motor vehicle accidents. The danger of leaving the ignition key in an automobile is illustrated by a fatal farmyard accident which occurred in Nobles County. Because the key had been left in the ignition of a car, which had been parked and left in gear, a twenty-month-old boy was able to start the vehicle. It lurched ahead until it rammed a second car behind which a three-year-old boy was playing. This child was crushed beneath the wheels of the car. As the result of other public accidents sixty children (21 per cent) were killed (Fig. 2).

Dr. Rosenfield is Chief, Section of Maternal and Child Health; Mr. Allen is Health Educator, Section of Public Health Education, and Mr. Storey is Statistician, Section of Vital Statistics, Minnesota Department of Health.

The second leading cause of accidental death under the age of fifteen was drowning, responsible for forty-seven deaths. Burns and conflagrations were responsible for thirty-seven deaths; mechanical suffocation in bed or cradle accounted for twenty-seven; obstruction or suffocation by food or vomitus, by external means, or pressure, resulted in twenty deaths; firearms, thirteen; poisoning, eleven; falls and accidents from machinery, nine deaths each. There were two deaths from electric current (Table I).

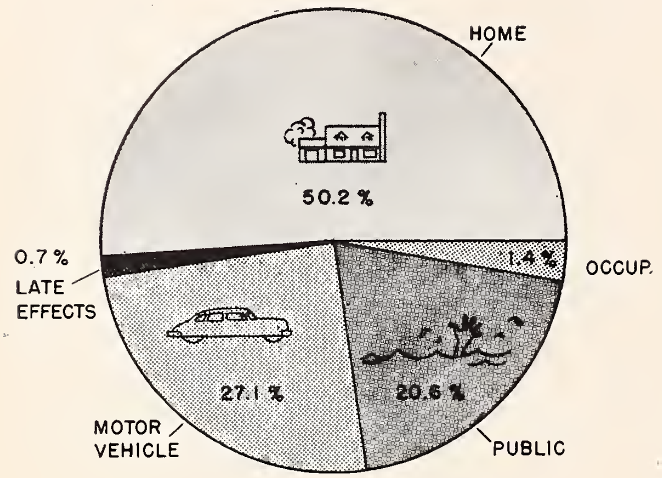

Fig. 2. Accidental deaths by major classification, by percentage during childhood (infancy to fifteen years), and by occurrence in Minnesota, 1952.

TABLE I. PRINCIPAL CAUSES OF ACCIDENTAL DEATHS IN CHILDHOOD (UNDER AGE FIFTEEN) OCCURRING IN MINNESOTA, 1952.

Type of Accident	Total Under Age 15		Under One Yr.	1-4 Years	5-9 Years	10-14 Years
	No.	Per cent	Number	Number	Number	Number

Drowning

Drownings were responsible for one-sixth of all accidental deaths in children in 1952. Among these, twenty-three were preschool children between the ages of one and five years; thirteen were in the age group five to nine years; and eleven were in the age group ten to fourteen years.

"He may have been chasing a frog, which he loved to catch," the mother of a three-year-old drowning victim wrote in describing the accident in which her son died. She explained that her child had never gone into the water alone to wade. In attempting to reconstruct the events that led up to his drowning, she guessed that he might have stepped onto a board floating on the farmyard pond while trying to catch a frog or turtle and had slipped into the water. No one was watching him.

A one-year-old boy in Wadena County drowned in a road ditch in front of his home. He was playing near the ditch when the hired girl called him. He turned to look at her and she went back into the house. He apparently lost his balance and fell into the ditch unseen. In suggesting how the accident might have been avoided, the grieving father wrote that a fence around the yard might have averted the tragedy.

Playing alone in the milk cooler shed at her Otter Tail County farm home while the rest of the family worked in the fields, a two-year-old girl tumbled into the milk cooler and drowned. Artificial respiration and then a resuscitator were used for several hours in a vain attempt to revive her. Four other children drowned in stock tanks in Minnesota, indicating the danger of leaving young children unsupervised.

Failure to repair the top of a cistern, to fill it in or otherwise to protect it, resulted in the deaths of a four-year-old Douglas County boy and his three-year-old brother. The children were playing in the yard and climbed on the cistern cover. They fell through the faulty cover and were drowned. In another accident a child drowned in a septic tank which was not properly covered.

Creeks, ponds, pools, and potholes on farms, as well as lakes which border farm property, claimed the lives of eight other children who did not have the protection of fences or play pens. Three children were drowned in boating accidents in the State, stressing the necessity for the use of safe boats, the wearing of life-jackets, the avoidance of standing or moving about in boats, and the danger of overloading boats. Twenty-four children drowned while wading or swimming in unsupervised lakes and rivers in the state during 1952. All children should learn to swim and should wait for at least an hour after eating before swimming. Swimming and diving should be done only in supervised areas.

Winter, too, takes its toll. Four youngsters fell through thin ice and drowned. The need for teaching children safety rules and supervising their play is emphasized by these accidents (Fig. 3).

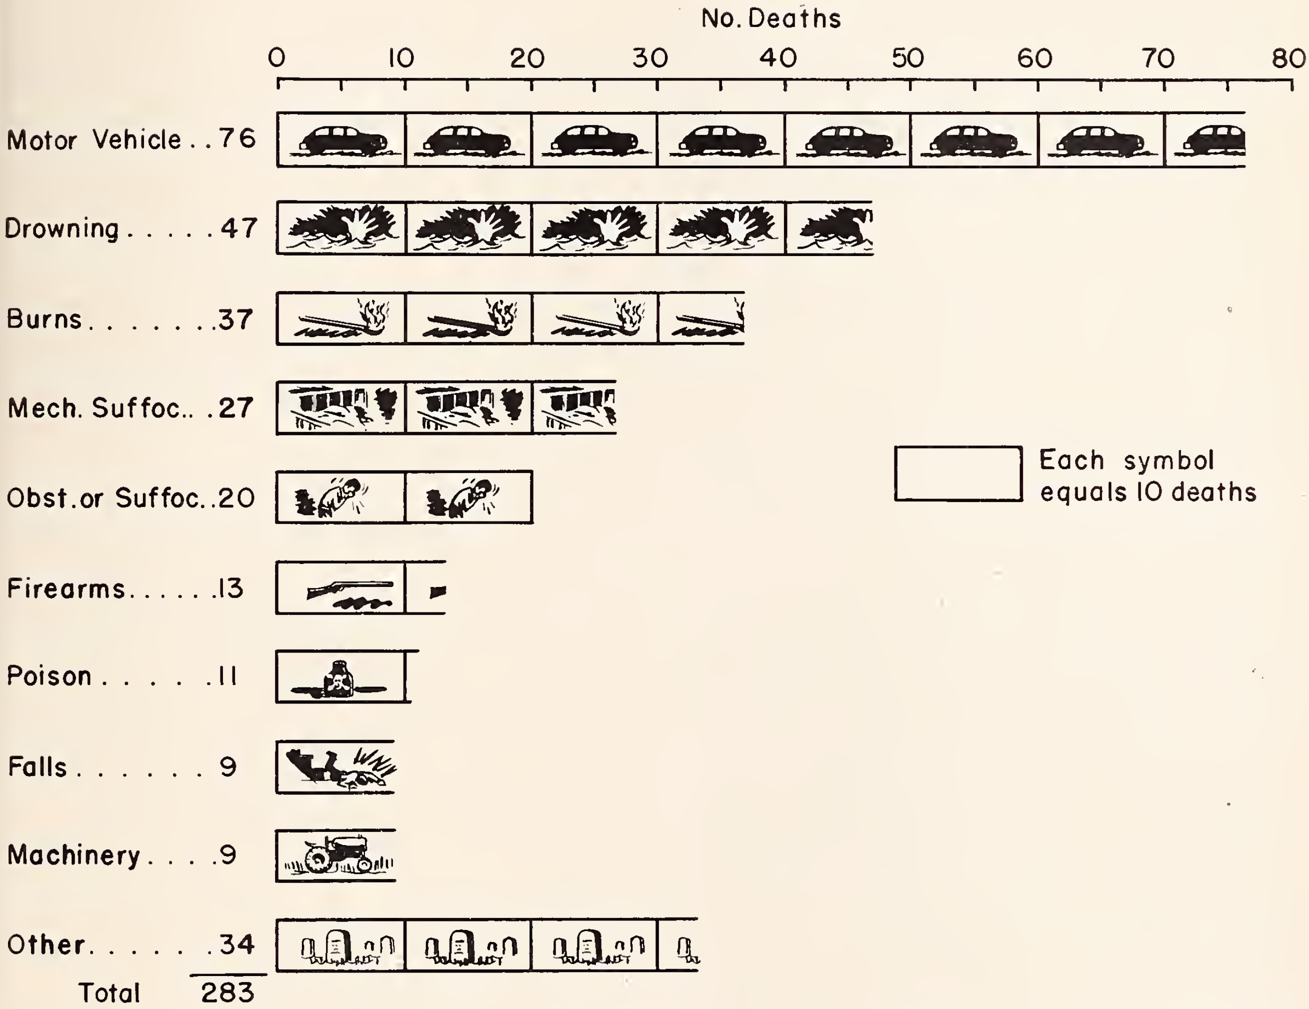

Fig. 3. Major causes of fatal accidents in childhood (infancy to fifteen years) by occurrence in Minnesota, 1952.

Burns

Burns caused by hot liquids, fires and conflagrations took the lives of twenty-four children in the age group up to four years; eight in the age group five to nine, and five in the age group ten to fourteen.

As the result of faulty heating equipment, fifteen children lost their lives in fires and conflagrations. The igniting of a floor joist by a hot steam pipe not properly protected in a Minneapolis apartment resulted in the year's worst fire tragedy. Sixteen persons lost their lives in this blaze, nine of them children under fifteen. In commenting on this accident the chief of the Minneapolis Fire Prevention Bureau said these deaths could have been prevented by having proper protection around steam pipes and by having a qualified, licensed person operating the boiler.

In a home fire in Pine County, two sisters, one four years and the other ten months, were burned to death, when an overheated stovepipe set fire to the wall. The home had no chimney, the pipe from a stove in the basement passing through the floor and then through a wall, without proper insulation. The girls' father was badly burned in a futile rescue attempt.

Playing with matches or lighted candles resulted in the deaths of five children. "Her dress was all aflame, it happened so quickly," one mother wrote about the death of her six-year-old daughter who had found a book of matches and had ignited her clothing while playing with the matches in the kitchen. This accident points up the necessity of keeping matches and cigarette lighters out of the reach of children.

Another mother was awakened by the smell of smoke while taking an afternoon nap. She rushed into the adjoining bedroom where her two-year-old son was in his crib. The child's clothing was aflame, but the mother managed to get him out of the crib, although she was badly burned in doing so. Despite the mother's heroic efforts, the child died from smoke inhalation and second degree burns. How did the fire start? Matches had been left within the child's reach.

In Becker County, one little three-year-old was out of his parents' sight less than ten minutes, but in that time he found some matches, went behind the garage and was fatally burned.

A lighted candle caused the death of a five-year-old girl in Isanti County. While playing in the attic of her home, the child's dress caught fire from a candle which her brother had lighted. She died twelve hours later from second degree burns and shock.

In Fillmore County, a fourteen-year-old youth was fatally burned in an explosion caused by kerosene he was using to start a fire in an old stove. According to a Rochester official, the accident could have been prevented if the lad had not used a flammable liquid to start a fire.

Three children in the state died as a result of burns suffered while playing near bonfires or trash fires in spite of repeated warnings of the danger. In a northern Minnesota town, a mother was burning grass in the yard while her three children played nearby. When the mother went to the backyard, her four-year-old son started to play with the fire which had almost burned itself out. His shirt caught fire and two days later he died from his injuries.

Handles of pots and pans on the stove should be turned inward. Failure to observe this and other precautions and otherwise to protect children from hot liquids resulted in the death of four children under fifteen years of age. In one case a fatal accident was caused when a one-year-old boy pulled a cup of boiling coffee from the table and the contents spattered on his face and arms. In summarizing the accident, the bereaved mother wrote, "I had just poured a cup of coffee. My son was standing by the table. I turned my back. He grabbed the cup."

The use of a steaming inhalant to treat a child's cold led to a fatal accident on a Minnesota farm. The six-months-old infant had been placed next to the stove which held a kettle of boiling water containing an inhalant. A blanket had been spread over the child and the kettle. The mother left the room for a few seconds. When she returned she found that the infant had jerked the blanket, overturning the kettle, and had been scalded on the face, chest, and arms by the boiling liquid. In commenting on how the accident might have been avoided, the father wrote, "Those few seconds my wife was away cost us the life of our beloved son." The use of safe steam inhalators will prevent such an accident.

Failure to test the bath water by a thermometer or the elbow or wrist before bathing a baby resulted in the death of an infant in Beltrami County. An eight-year-old girl placed her infant sister in scalding water in an attempt to bathe her. The mother was not at home when the accident occurred.

Two children in the state were electrocuted in 1952. A one-year-old boy in Blue Earth County was instantly killed when in playing he touched a live wire left on the ground which was wet at the time. In Hennepin County a three-year-old girl was electrocuted when she touched the base of an electric mangle. To prevent electrocution of youngsters, live wires should be protected, electric cords should be in good repair, safety-type wall receptacles should be used and all electrical appliances should be grounded.

Mechanical Suffocation

Mechanical suffocation in bed or cradle was listed as the cause of death in the accidental deaths of twenty-seven children, all but one of whom were under one year of age. Three-fourths of these deaths occurred in babies less than five months old. The usual story is that the baby was put to bed, apparently perfectly well, and was found dead the next morning. It was frequently stated that the baby was found face down in the mattress or blanket or tangled in the bed clothes. While practically all of these deaths were coroner's cases, in only three instances were autopsies done.

Many so-called cases of suffocation by bed clothes are actually the result of an acute respiratory infection, frequently virus in origin. Coroners have failed to carry out adequate autopsies to determine the actual cause of death. Only occasionally is it possible for an infant to become wedged between the foot of the crib and the edge of the mattress and to die from suffocation. Only infrequently is it likely that a plastic sheet may accidentally be pulled over the baby's face, resulting in suffocation. In one instance in this series a one-year-old infant who was pinned into a sleeping bag tried to get off the bed and suffocated as a result. A soft mattress, a feather tick or a pillow, none of which should be used in a baby's bed, may contribute to the possibility of suffocation of a weak infant. But such deaths will continue to be attributed erroneously to mechanical suffocation as long as physicians and coroners neglect to seek the actual cause of death by an adequate autopsy. Under such circumstances parents, too, should insist that an autopsy be done. Only by this means will it be possible to avoid the "guilt complex" that parents may develop in the belief that carelessness was responsible for the death of their baby; or the other extreme, expressed by a few parents, "It was an act of God."

Other Types of Obstruction or Suffocation

Obstruction or suffocation by food or vomitus, by external means or by pressure, caused the death of twenty children. Six infants choked to death from vomitus or mucus in the trachea; two choked on milk. A one-year-old child in Todd County choked to death on a handful of the hulls of sunflower seed resulting in aspiration pneumonia; another child of the same age in Ramsey County suffocated from a piece of bacon lodging in the trachea. A four-year-old child in Meeker County choked on a piece of meat. In St. Louis County, a five-year-old child died from suffocation as a result of a piece of carrot lodging in his trachea.

In Hennepin County a one-year-old retarded child fell between the bed and wall. Because he was not strong enough to pull himself up, he suffocated. A three-year-old Martin County youngster suffocated while playing on a gasoline truck when the heavy metal cover of one of the tanks fell and held his face down over the gas tank.

An eight-year-old child in McLeod County was locked in a cedar chest while playing with a brother and sister. Before the self-locking door could be opened the child had suffocated.

A highly prized belt caused the death of a nine-year-old boy in Traverse County. He climbed on an upper bunk bed to reach clothing which was hanging above the bed. He apparently grabbed the belt which was loose and buckled and threw it over his head. He then reached for the rest of his clothing. In throwing the belt over his head he had unknowingly hooked the belt over a bedpost as well as around his body. When he jumped from the bunk he slipped through the belt until it caught him by the throat. Since his back was against the poster he was unable to twist around to loosen the belt and strangulation resulted.

A somewhat similar accident in Ramsey County caused the death of a two-year-old girl. Playing during her nap-time in a double-deck bunk, the child strangled when her head caught in a hair ribbon looped over a poster of the bunk. In Anoka County a five-year-old tumbled while climbing a tree. He strangled when his head became wedged in a crotch of the tree.

While playing in her McLeod County home, a one-year-old girl tied a venetian blind cord about her neck. She then lay down. The cord tightened as she lay down, and she strangled.

One of the most unusual deaths occurred in Hennepin County when a three-year-old boy was playing in a snow bank with two dogs. Each of the dogs grabbed the ends of the scarf the child was wearing and pulled in opposite directions. Strangulation resulted.

Firearms

Firearms caused the deaths of thirteen Minnesota children under fifteen years of age during 1952. Almost as many children were killed by firearms in and around their homes as were killed in actual hunting accidents.

To cut down the toll of firearms accidents, guns and ammunition should be kept in separate places and under lock and key. Cleaning guns, dropping them or knocking them off a support, exhibiting them or leaving them where children can find them, are the main causes of gun accidents. Before handling a gun the breech should always be opened and the magazine checked. A good safety rule to follow is never to bring a loaded gun into the house. Never point a gun at a person under any circumstances.

"The child took apart a shotgun shell, and tamped the powder into the muzzle. He then discharged the gun, and the breech exploded sending the firing pin into his brain." In this way a St. Louis County official described an accident in which a fourteen-year-old boy was injured in the woods behind his home while playing with a .22 caliber rifle. Death resulted five hours later. "Parental supervision while the child was using the rifle would have prevented the accident," the official thought.

A gun shot wound in the chest caused the death of a seven-year-old boy in Ramsey County. He was shot by his brother while the two boys were playing in the kitchen. In commenting on the incident, the father wrote that the accident could have been prevented if the gun had not been left where the boys could get it.

The happiness and excitement of preparing for a birthday party were cut short by a tragedy in a Jackson County home. In getting ready for his sister's birthday party, a ten-year-old boy was killed when a 16-gauge shotgun was accidentally discharged. The victim and his older brother were playing in the bathroom hall when the fatal shooting occurred.

In Sibley County a twelve-year-old was killed when the accidental discharge of a shotgun struck him in the chest. He was playing with other boys in the yard of his home when the accident took place. How could the accident have been prevented? "By teaching a boy how to handle firearms and their dangers," the father of the victim replied.

Poisoning

Accidentally taking poison caused eleven deaths among Minnesota children under fifteen years of age during 1952.

In Rice County, a one-year-old girl used a chair to climb to the medicine shelf. She reached a bottle of pills and swallowed a handful of them. The pills were digitalis and fatal poisoning resulted. The father wrote that the accident could have been prevented by more careful storage of medicine. A three-year-old boy died under similar circumstances in Ramsey County.

Storing medicine in a locked medicine cabinet and keeping all poisons in another locked cabinet will prevent such tragedies. All poisons should be correctly labeled. Cleaning compounds used in the kitchen or bathroom, such as lye, drano, ammonia, and silver polish should never be stored under the sink or on an easily accessible shelf, but should be kept in a locked cabinet.

Poisoning from swallowing and inhaling gasoline caused the death of a one-year-old girl in Koochiching County. She found a bottle of gasoline in the yard while playing with other children and drank the contents. Again, proper storage would have prevented the accident.

Only eleven hours elapsed between the time a three-year-old boy in Renville County drank antifreeze which he found in the garage and the time he died of ethylene glycol poisoning.

A one-year-old boy in Hennepin County died of poisoning after swallowing several aspirin tablets. For every fatal aspirin poisoning there are many non-fatal ones in which emergency action is necessary to save the lives of the victims. Aspirin poisoning ranks high as the cause of poisoning accidents among young children. A two-year summary of the experience in the emergency room of one Minneapolis hospital showed that in this period, there were 168 poisoning cases in children under the age of five years, and that sixty-five of these cases were aspirin poisonings (Fig. 4).

These accidents often occur in less time than it takes to tell about them. Recently, in Hennepin County, the mother of three small children was attending to the youngest who was ill. She had left a bottle of sugar-coated aspirin on the table and in the few seconds that she left the room to carry the baby to his bed, the other two children had each gobbled a handful of the aspirin tablets.

Fortunately, her husband was home at the time, and after phoning the family doctor, he rushed the children to the hospital. They were given emergency treatment and were well in a few days, but as the mother said afterwards, "It was much too close for comfort!"

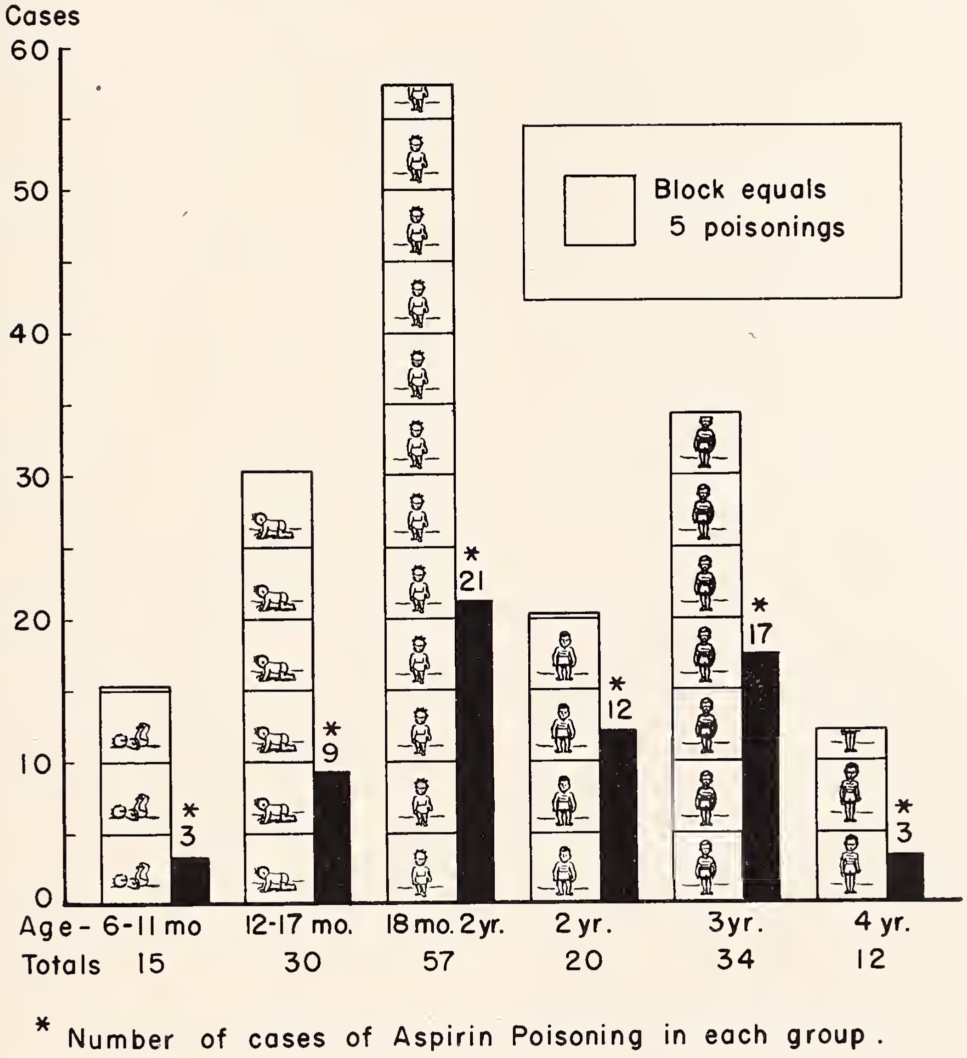

Fig. 4. Poison cases under age five, treated in the emergency room of Northwestern Hospital, Minneapolis, 1951-1952.

Before giving or taking medicine, the container label should always be read twice. A list of antidotes should be posted near the medicine cabinet. In case of poisoning give the proper antidote and call a physician at once.

The death of a one-month-old baby in McLeod County as a result of nitrate poisoning from well water deserves special comment. Since 1947, when the first case was reported in Minnesota, 175 cases including eighteen deaths from methemoglobinemia due to excessive amounts of nitrates in well water have been reported. Most of these cases occurred in southwestern Minnesota. This condition occurs only in infants less than six months of age and is usually quickly cured when diagnosed promptly. It requires a prompt change to low-nitrate water such as water from a municipal supply or distilled water. Farm well water, especially in southwestern and midwestern Minnesota, should not be used for infant feeding unless it is known to be low in nitrate content. The Minnesota Department of Health will analyze such water samples for nitrate content, free of charge.

Attention should be called to the danger of leaving children in parked cars with the motor running. In Itasca County, a thirteen-year-old boy and his eleven-year-old sister died of carbon monoxide poisoning, when they were left in the car while the parents went shopping for several hours.

Falls

Falls rank high as a cause of accidental death among the elderly but they also occur among the very young. During 1952, nine Minnesota children under fifteen years of age were killed in falls.

"If the fence had been left around the septic tank excavation, the accident would not have occurred," explained the father of a four-year-old Hennepin County girl who was killed in a fall in the front yard of her home. The child had been playing alone in the front yard. Venturing too close to the excavation, she had tumbled in.

Failure to put up the guard rail on an upper bunk resulted in the death of a six-months-old boy in Otter Tail County. The child, who had been put to bed in the upper bunk, rolled over the side and plunged to the floor.

In Washington County, a brother and sister played together in the hallway of their home. During their play, the little girl bumped against the door to the basement which was shut but unlocked. The door opened, and the two-year-old child fell down the entire flight of stairs, striking her head on the basement floor. It appeared that except for slight nausea she had suffered no effects from the fall, but she died from the injury twenty hours later.

Only minutes after coming home for lunch, a Ramsey County father learned that his two-year-old daughter had been seriously injured in a fall while waiting to greet him. The little girl had gotten permission from her mother to wait outside for the father. When the father came into the house and said he had not seen his daughter the worried mother ran out of the house to look for her. The child lay sprawled on the concrete below a roof porch where children living in the building played. Because a gate which separated the porch and the flight of stairs had been locked, the child had tried to climb over the gate and had tumbled over the railing of the landing at the head of the stairs. She died three hours later.

A fall from a chair caused the death of a one-year-old boy in Lac qui Parle County. The father, who was putting on storm windows, heard a thump. He hurried into the house and found his son lying on the floor. In falling, the child had struck the back of his head. Death resulted from this injury.

The attempt of a one-year-old girl in Hennepin County to climb a flight of stairs led to her death. After climbing some of the steps, the child lost her balance and toppled backwards. According to the mother, the accident could have been prevented by having a gate at the bottom of the stairs and by inspecting the steps for defects.

Farm Accidents

Childhood accidents occurred in urban areas in 45 per cent of the deaths (126); in rural areas in 55 per cent. Since only 45 per cent of the population live in rural areas it is apparent that more accidents occur there than in urban areas. Of all rural fatalities (157), 25 per cent (thirty-eight deaths) were farm and 75 per cent (119) were non-farm. Four boys (ages eleven, twelve, fourteen and fourteen) were killed while working with farm machinery. Three were killed by tractors and one by a manure lift. Included in the thirty-four farm home accidental deaths were thirteen drownings, eight burns and five due to machinery. A two-year-old girl was killed when she fell off a tractor while riding on it. Three boys (ages two, two and seven) were killed by tractors backing up on them. A ten-year-old boy was killed by the power belt of a saw rig. The chief dangers from fatal accidents on the farm are machinery (there were seven tractor fatalities), drowning in stock tanks, cisterns, ponds or creeks, and burns. It should be noted, that seven deaths tabulated under motor vehicle accidents actually occurred on farms.

Summary

Accidents continue to be the leading cause of death in children between the ages of one and fifteen years in Minnesota. They were responsible for one-third of all childhood deaths in 1952. Accidents caused more deaths than the combined total of all childhood deaths due to poliomyelitis, cancer, pneumonia and influenza, rheumatic fever, meningitis, tuberculosis, measles and chickenpox.

The leading causes of accidental deaths during childhood were motor vehicles, drowning, burns, suffocation and obstruction, firearms, poisoning, falls, and machinery. One-half of these were

RUPTURE OF THE INTERVENTRICULAR SEPTUM SECONDARY TO MYOCARDIAL INFARCTION

JOHN F. BRIGGS, M.D.
Saint Paul, Minnesota

RUPTURE of the interventricular septum following myocardial infarction is much less common than is rupture of the ventricular wall itself. Perforations usually are single in number, but they may be multiple and most often occur in the lower central part of the septum. The size of the perforation, of course, varies with the degree of infarction. It has been assumed that one can easily diagnose rupture of the interventricular septum secondary to a myocardial infarction because of the appearance of a loud, harsh, blowing systolic murmur often accompanied by a thrill over the precordium. In addition, the patient almost invariably goes into acute heart failure, although patients may survive and live for a number of years. Death usually occurs in most of the individuals shortly after the perforation. Another complication of myocardial infarction is a rupture of the papillary muscle. When this occurs, the same physical findings as those of rupture of the interventricular septum are present, but a blowing to and fro murmur may be present, and the patient usually develops signs of collapse and dies within a short time. Occasionally, patients have survived both these complications. Since it has been stated that a diagnosis of a ruptured interventricular septum is easily made during life, the following cases are recorded for our experience with these complications.

Case Reports

Case 1.—Mrs. B. E. S., a white woman of seventy-two, was admitted to Ancker Hospital on November 8, 1946. Just prior to admission to the hospital, she had had an attack of severe substernal pain which radiated down both arms. It had persisted for a few hours and then had disappeared.

On examination the patient was found to be acutely ill. Her blood pressure was 180/110; pulse 70 and irregular. The heart was found to be enlarged to the left and there was a soft systolic murmur at the apex. The electrocardiogram was diagnostic of an acute anterior infarction.

On the second hospital day, the patient had a friction rub over the precordium and on the fifth hospital day, she became very restless, complained of severe precordial distress, and developed dyspnea and cyanosis. The blood pressure was 87/60. On this day, a very loud, harsh, systolic murmur was heard over the precordium. The patient died on the sixth hospital day of intractable heart failure. It was believed that she had had a rupture of the interventricular septum.

Autopsy examination revealed the presence of a massive myocardial infarction with a rupture of the interventricular septum near its lower portion on the postero-anterior surface. A large thrombus was also present over the wall of the left ventricle and there was a rupture of the right ventricular wall adjacent to the septum and this rupture measured 2.5 cm. in length. The pericardial cavity was filled with 150 cc. of unclotted blood. This patient had the obvious story and physical findings which indicated the diagnosis of a ruptured interventricular septum.

Case 2.—The patient was admitted to Ancker Hospital on June 2, 1948, because of pain in his chest which had awakened him at 2 a.m. on the morning of admission. The pain was burning in nature, deep in the chest and varied in intensity. It had been so severe that he broke out into a cold sweat. The pain radiated across the chest into the upper regions of both arms. There was no nausea or vomiting.

Examination revealed the patient to be comfortable and on physical examination his blood pressure was 158/94, temperature 99.2 and pulse 104. The physical findings showed the heart to be enlarged to the left. No murmurs were heard. The electrocardiogram was diagnostic of a posterior myocardial infarction.

At the end of the first day in the hospital, a friction rub was heard over the precordium. On the third hospital day, the patient was free of pain and the heart rate was slow and regular. He did complain of some pain in the back. He developed dyspnea and was placed in an oxygen tent. The physical findings remained unchanged. The patient again was having pain in his back. The resident stated that should the pain continue, he would get a portable chest x-ray to determine the nature of the pain. When seen at 7 p.m., the patient was dead.

Autopsy examination of the heart revealed an infarction involving the posterior portion of the interventricular septum and the posterior portion of the right ventricular wall. There was an area of perforation in the region of the apex and right ventricular wall posteriorly, as well as a perforation of the interventricular septum posteriorly to the area of the infarction.

Case 3.—A sixty-year-old white widower was admitted to Ancker Hospital on October 11, 1946, in an unconscious condition. The informant stated that ten days previously, the patient had had three very severe anginal attacks during one evening, each seizure being relieved by nitroglycerin. The week before admission to the

---

Dr. Briggs is Clinical Associate Professor of Medicine at the University of Minnesota.

hospital, he had been able to work every day and carried on his usual activities. On the day he was admitted to the hospital, he was in his office apparently well, when he made a sudden outcry and a neighbor rushing into the office found him on the floor unconscious. About one-half hour later, he was admitted to the hospital.

On admission to the hospital he was acutely ill, in shock, and covered with a cold sweat. On occasions, he would throw his arms about as though he were struggling. Examination of the chest revealed the heart rate to be rapid and irregular. The tones were distant and no murmurs could be heard. The blood pressure was 60 systolic. An emergency electrocardiogram revealed a right axis deviation with rapid auricular fibrillation.

The patient's condition remained poor during the entire stay in the hospital. He died on October 12, 1946, some sixteen hours after admission. A few hours before death, râles appeared in both of the lung fields and the patient was obviously developing congestive heart failure.

At the necropsy, the heart weighed 436 grams. The valves were normal in appearance and there was a marked degree of coronary sclerosis. The left main branch and circumflex branch of the coronary arteries were practically occluded, but no thrombus was present. The myocardium was pale in appearance and normal in consistency with an area of old fibrosis in the wall of the left ventricle high on the posterior septum. There was also an area of recent infarction involving the mid-portion of the wall of the left ventricle which extended out to the apex. On the wall of the left ventricle there was a rupture of one of the papillary muscles so that it was free in the pericardial cavity. This rupture appeared to be ante-mortem and the rupture occurred at the site of the infarction at the base of insertion of the papillary muscle.

Case 4.—Mrs. A. K., a sixty-year-old white married woman was admitted to the hospital on March 17, 1947. At the time of admission to the hospital, she was unconscious.

A history was obtained from the husband who stated that the patient had been well most of her life except for mild diabetes. On March 15, 1947, two days before admission to the hospital, she had developed pain in her chest which radiated into both her arms. She had also felt very weak. Following the onset of the pain, she became nauseated and vomited, but the following day, she was able to be up and around although she was very tired.

On the day of admission to the hospital, the pain in the chest had returned with increasing severity and she had become markedly dyspneic. At the time of admission to the hospital, the blood pressure was not obtainable. The heart tones were faint and no murmurs could be heard. The electrocardiogram taken on admission revealed a recent posterior infarction. Nine hours after admission the patient died as a result of progressive heart failure.

On autopsy examination of the heart, a purulent material was found in the pericardial sac. The heart weighed 350 grams. The coronary arteries showed sclerosis but no definite interference in the size of the lumen. The main branch of the right coronary artery was sclerotic and had a fresh thrombus which occluded the artery. The interventricular septum had an infarct in the posterior border with a rupture through the septum near the base. The perforation measured 0.5 cm. in diameter.

Case 5.—Mrs. M., a white married woman, aged sixty-five, was admitted to Ancker Hospital on April 19, 1951, and died on May 13, 1951. The patient was first seen at the Ancker Hospital because of a contact dermatitis which occurred in April of 1938. She was not seen again until the present admission at which time she complained of substernal pain which radiated down the right arm. In addition, she had noticed exertional dyspnea. She had known that she had had an elevated blood pressure for many years, and on admission to the hospital it was found to be 200/140. The pulse was 115 and respirations were 18 per minute. An electrocardiogram taken on the day of admission was suggestive of an anterior myocardial infarction. On April 29, 1951, it was felt that she was in mild congestive heart failure. On May 11, 1951, the patient appeared worse, she became cyanotic and confused, and râles were present in both lung bases. She was treated with digitoxin in an attempt to correct the heart failure. On the following day, the pulse was 80, but râles were still present in the chest and on May 13, the patient suddenly became very cyantoic. The blood pressure was unobtainable, and a murmur appeared, systolic in time and loud and harsh; *suddenly it disappeared.* This led to a suspicion that a septal perforation had occurred. The patient's course worsened and she died at 4:45 p.m. on May 13, 1951. The heart at necropsy weighed 450 grams. The pericardial sac was normal. The examination of the coronary arteries revealed them to be sclerotic in all their major branches and what appeared to be an old thrombus was found in the anterior descending branch. The right coronary artery, the circumflex and the left coronary arteries revealed no occlusion. The examination of the myocardium revealed it to be thin, and there was an oval-shaped perforation measuring 1.5 cm. in size between the right and left ventricles, and occurred at the tip of the septum.

Case 6.—J. O., an eighty-two-year-old woman, entered Ancker Hospital on December 3, 1942, and died on December 4, 1942. Five days previous to admission the patient had had a very severe attack of epigastric pain which remained localized to the epigastrium. This was immediately followed by nausea and vomiting; the vomiting persisted until the day of admission. The pain was intermittent in character. The day after the onset of the pain, she had a bowel movememt, but following that time she passed no further gas or fecal material. The patient had had three similar attacks during the last few years. On physical examination, the patient was emaciated, she vomited fecal smelling material, and she was dehydrated. Râles were present in the lung bases, and the heart was enlarged to the left. A loud blowing systolic murmur was heard at the apex of the heart. The blood pressure was 160/90 and the abdomen was distended.

The only electrocardiogram the patient had was on the previous admission to the hospital on October 9, 1939, and this was normal. The patient's condition rapidly became worse. She developed cyanosis with increased dyspnea and she died three hours after admission to the hospital. The most important findings were the presence of a loud, harsh, blowing systolic apical murmur.

At autopsy the heart weighed 440 grams. The valves were normal in appearance but the coronary arteries showed a marked degree of sclerosis. The main branch of the right coronary artery was decreased in calibre. The circumflex branch of the left coronary artery was moderately sclerotic and its lumen was normal in calibre. There was a considerable amount of epicardial hemorrhage in and around the anterior portion of the septum. The myocardium revealed softening with perforation in the region of the septum in the neighborhood of the left ventricle.

Summary and Conclusion

In summary, six cases of myocardial infarction are reported in which a rupture of a papillary muscle occurred without physical findings in one case; the history and typical findings of a perforated interventricular septum occurred in another case; and in the remaining four cases, a rupture of the interventricular septum occurred in the absence of characteristic findings, although the diagnosis should have been established in *Case 5* and suspected in *Case 6*.

In conclusion, when the characteristic signs and symptoms of a perforation of the interventricular septum occur in a patient with a myocardial infarction, the clinical diagnosis is easily made. The same holds true for a rupture of a papillary muscle complicating a myocardial infarction. On the other hand, it is possible for such complications to exist in the absence of the usual physical findings so that the condition then goes unrecognized and can only be diagnosed at necropsy.

ACCIDENTS—CHIEF KILLER OF CHILDREN

(Continued from Page 1148)

home accidents—home, supposedly the safest place in the world. More than one-half of the accidents occurred in rural areas, and one-fourth of these occurred on farms.

It is important to teach children to be thoughtful and alert and to exercise judgment. Parents can help by keeping a sharp lookout, by enabling children to satisfy their curiosity safely, and by helping them to gain experience under proper supervision and guidance. Talking about accidents that happen elsewhere is not very effective. The usual human reaction is—"It can't happen to me." School and home safety programs including a reporting system, are badly needed. There should be an epidemiological study of all accidents to determine the cause, preventability, and means of avoiding a recurrence.

But any accident prevention program requires the active co-operation of parents. The success of such a program will depend on how much effort parents make to reduce the hazards of the home and to keep constant watch over their youngsters. Most accidents can be prevented by using plain common sense. It is absolutely necessary that parents, and children, too, become safety conscious, particularly in relation to drowning and burns, the chief causes of home accidents. Each one of us must do our part to cut down the appalling toll of accidents to children in the home and on the farm, as well as the highway.

CLEIDO-CRANIAL DYSOSTOSIS

E. C. PAULSON, M.D., and NORMAN STERRIE, M.D.

Worthington, Minnesota

THE RARE condition known as cleido-cranial dysostosis is in reality a multiple dysostosis. Cooper[3] has enumerated one hundred abnormalities associated with the syndrome. However, the name is still useful since the clavicular and cranial defects are the most prominent features and serve well to identify the syndrome.

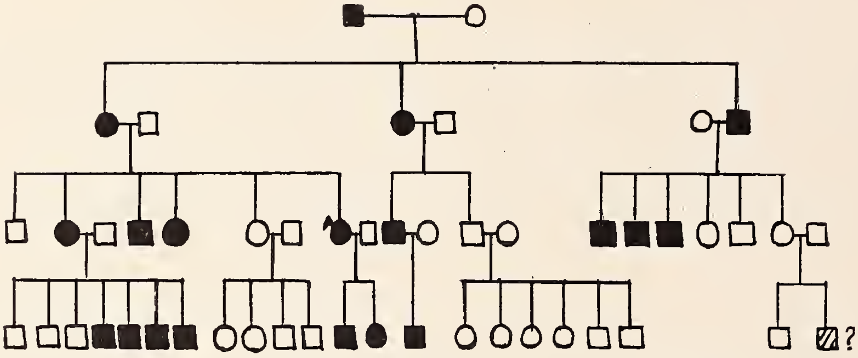

Chart 1. Family history of Mrs. M. L., who is indicated by letter "A." Squares represent males and circles females. Shaded individuals are those with, at least, absent clavicles.

In brief, the classic description involves aplasia of one or both clavicles, exaggerated transverse diameter of the cranium, delayed ossification of fontanels, and hereditary transmission. Anderson[1] says that the trait is dominant, and, consequently, affected individuals would be expected to pass the gene and trait on to 50 per cent of their children. The family tree in Chart 1 bears this out.

Among the common associated skeletal defects are delayed dentition, deficient pelvis and spina bifida. Brailsford[2] points out that the "most striking radiographic feature of the condition apart from the defective ossification of the clavicle is the apearance at all ages of delayed ossification."

Clinically, those afflicted are marked by wide foreheads with prominent frontal bosses, sloping shoulders, weakness of the shoulders, and the unusual talent of being able to approximate the shoulders anteriorly. In the case of women, the associated pelvic defects may result in such small pelves that natural childbirth is impossible and cesarean section must be employed. This is one of the practical aspects of recognition of the syndrome.

Case History.—Mrs. M. L., aged twenty-two, presented herself for care during her second pregnancy in 1948. She had several months previously delivered elsewhere a male infant by cesarean section. Physical examination showed an absence of clavicles, a palpable defect at the site of the anterior fontanel, and frontal bosses. Because of an intertuberosity outlet measurement of 5 cm., section was again indicated. After an uneventful pregnancy, section was done and a seven and one-half-pound female child delivered. Examination of the child revealed an absence of both clavicles and widely separated anterior and posterior fontanels. Further questioning of the mother indicated that the sibling also had absence of both clavicles. This child, B. L., presented for physical examination at the age of four and was noted to have, in addition to the absent clavicles, an open anterior fontanel and prominent frontal bossing.

A family history of four generations as provided by Mrs. L. is portrayed in Chart 1 and serves to indicate the hereditary and familial nature of this anomaly.

Roentgenograms of Mrs. M. L. and her older child, B. L., comprise Figures 1-6. Similar studies were also made of the other child, which were practically duplicates of those of B. L.

From the Worthington Clinic, Worthington, Minnesota.

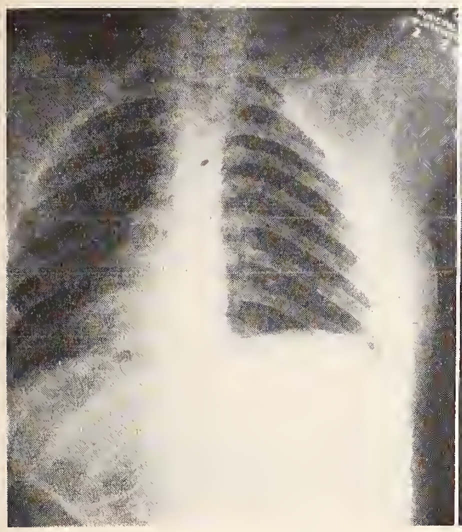

Fig. 1. Mrs. M. L., aged twenty-six; chest film showing absence of clavicles.

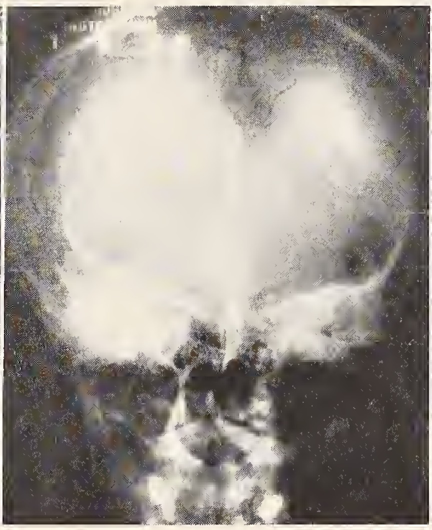

Fig. 2. Mrs. M. L., skull; note breadth of frontal region and open fontanels.

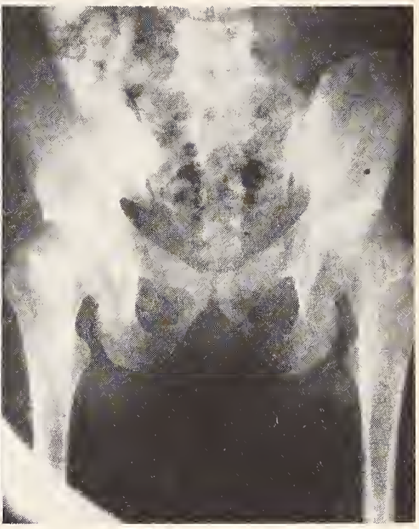

Fig. 3. Mrs. M. L., pelvis; note faulty development of pubes, small pelvic capacity and short femoral necks with valgus deformities.

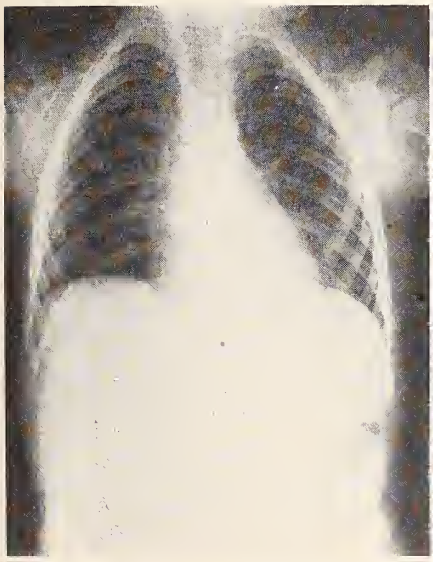

Fig. 4. B. L., aged 4, male; chest film showing absent clavicles and spina bifida of cervical and upper thoracic regions.

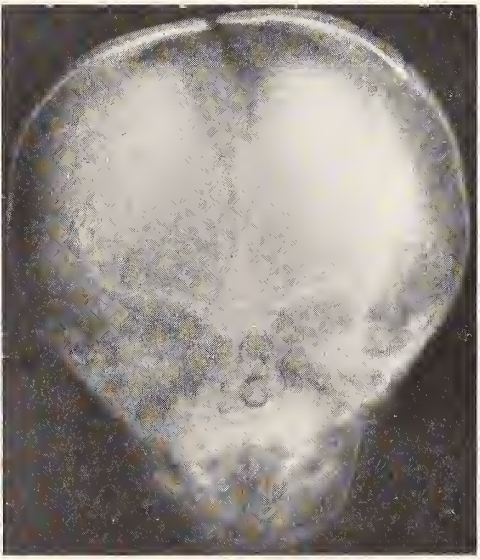

Fig. 5. B. L., skull; note unusual width of calvarium and delayed ossification of entire mid-sagittal portion.

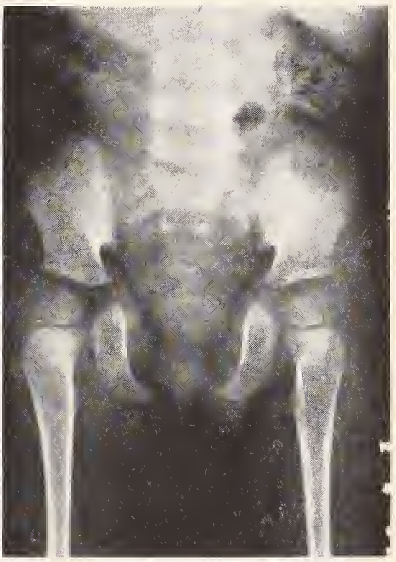

Fig. 6. B. L., pelvis; note absence of pubic ossification. The femoral necks show valgus deformities.

Summary

Cases of a mother and her two children, all with cleido-cranial dysostosis, are described with roentgenograms to illustrate the osseous defects. A family tree, extending back four generations illustrates the dominant hereditary nature of the characteristic.

HEREDITARY HEMORRHAGIC TELANGIECTASIS

THEODORE KONIG, M.D. and JOHN F. BRIGGS, M.D.
Saint Paul, Minnesota

HEREDITARY hemorrhagic telangiectasis is an inherited anomaly affecting either sex but slightly more prevalent in females. The anomaly is transmitted as a simple dominant by both sexes. It is a vascular disturbance characterized anatomically by multiple dilatations of capillaries and venules which are found in the mucous membranes and in the skin. It is characterized clinically by a tendency to bleed from the angiomatous lesions and the pathologically dilated capillaries.

The condition is sometimes overlooked because the general practitioner is not familiar with it as an entity. Bohington[1] in 1865 described hereditary epistaxis. Rendu[2] in 1896 recorded a case of telangiectasis and recognized the pathology and hereditary aspect of the disease. Sir William Osler did a great deal to establish telangiectasis as a clinical entity. The literature on hereditary hemorrhagic telangiectasis was summarized by Goldstein in 1931, by Houser, by Stock, and by Barrock in 1944.

Diagnostic criteria for hereditary hemorrhagic telangiectasis were established by Goldstein, Larrabee, and Litman. These are three in number:

1. Definite hereditary tendency.
2. Visible typical telangiectasis.
3. A tendency to bleed from these lesions.

Since the disease is transmitted by a dominant gene, it should make itself present in every generation. On several occasions, families have been reported in which the disease has been traced through six generations. Often one generation is skipped only to have the disease appear insidiously in the next generation. Some of these people do not suffer from hemorrhage and this may be the reason for the apparent skipping of individuals of an entire generation. The hereditary factor is constant and where it cannot be demonstrated this failure is due to atavism. Very careful examination usually reveals signs of the disease in one of the parents. Many authorities believe that the condition is more common than the number of families reported in the literature. Many cases are without doubt undiagnosed or not recorded.

The patients described in the literature have been chiefly of Anglo-German, Latin, Scandinavian, or Jewish stock. It has been stated that the disease appears to be more severe in people with dark skins.

Pathology

The walls of the involved vessels have been found to be extremely thin. The dilated walls of the affected vessels are composed of but one layer of endothelium and are covered by an extremely thin layer of epidermis or mucosa. There is no elastic area so once hemorrhage commences, there is little power of the walls to contract; however, this is not characteristic of all the lesions for there may be dilatation of capillaries and venules with no deficiency of elastic tissue. On the skin the lesions are more commonly found on the cheeks, nasal orifices, lips, ears, neck, scalp, fingers, and trunk. The mucosa of the nasopharynx is seeming most often affected, followed in frequency by the tongue, palate, inner cheek, pharynx or larynx. Telangiectasis has been described in almost every organ system in the body including gastrointestinal tract, genito-urinary system, respiratory system, brain, meninges, and liver. Lesions in stomach, colon, bladder, and brain are extremely rare. It is believed that large pulmonary arteriovenous aneurysms discovered clinically in some cases may be only the larger counterparts of widespread telangiectasis in the pulmonary vessel.

Signs and Symptoms

The symptoms are determined by the fragility of the lesions and the time of their appearance. Epistaxis occurs with increasing frequency from childhood onward. Bleeding is variable. Sometimes there is profuse hemorrhage which in some reported cases has caused death. The mortality in some families who have the disease is 4 per cent. Usually there is only a moderate bleeding tendency which may cause secondary anemia and

---

Dr. Briggs is Clinical Associate Professor of Medicine, University of Minnesota.

considerable incapacity from nasal or oral hemorrhage. In middle life, the skin and visceral lesions appear and often add to the blood loss. Trauma is not necessary for bleeding occurs spontaneously without trauma. Some patients may have nasal hemorrhage five or six times daily for weeks at a time. Epistaxis is conceded to be the most common complaint but bleeding may also come from telangiectatic areas in the mouth, gastrointestinal tract, genitourinary, or respiratory tract. Hemorrhage into the brain and retina has been attributed to telangiectasis but the lesions have not been demonstrated in all instances.

The lesions are small red purplish spots usually pin point in size, though sometimes they are larger and even in certain rare instances have a spider-like configuration. These lesions may or may not disappear on pressure. Pallor may or may not be present.

Fitzhugh has reported splenic and hepatic enlargement. This may be due to expanding hemangiomata. Characteristic lesions have been reported seen by both gastroscopic and proctoscopic examination.

Blood loss with resulting anemia are the usual blood findings. Bleeding time, circulation time, clot retraction, platelet count, and cuff test are usually considered essential for diagnosis. Singer and Wolfson reported a family with telangiectasia and a positive tourniquet test. There seems to be some relation and overlapping between pseudohemophilia (Von Wellebrand), hereditary familial purpura simplex and hereditary hemorrhagic telangiectasis. Pseudohemophilia is characterized by prolonged bleeding time, normal clotting time and clot retraction, a normal platelet count, and a variable tourniquet test. Hereditary familial purpura simplex presents a positive tourniquet test but a normal bleeding time. In addition to the pure types of hereditary capillary bleeding syndromes described above, patients are seen with some features of more than one condition.

I. Hereditary Familial Vascular Purpura
  (a) capillary fragility
  (b) cuff test
II. Hereditary Hemorrhagic Telangiectasis
  (a) visible telangiectasis
III. Pseudohemophilia
  (a) bleeding time positive
  (b) deficient contractibility response

One should be cautious in diagnosing the disease in childhood. Usually bleeding is not noticed until the age of twelve to fourteen and if one examines younger children of parents who have the disease, they may or may not show telangiectatic areas. Children in families with a history of telangiectasis usually have no spots on their faces until the age of twelve to sixteen years when the spots gradually appear and later start bleeding. Some authors have stated that the maximum development of these lesions tends to occur in the fourth decade. In typical cases it is well to emphasize that blood studies are normal in hereditary hemorrhagic telangiectasis unless there is secondary anemia from blood loss. Errors in diagnosis may occur, if the vascular anomalies are overlooked. These lesions should be looked for in patients with obscure anemias. One should look for lesions on the skin in unexplained bleeding from the gastrointestinal, genitourinary or respiratory tract. With internal hemorrhage in the presence of visible skin or mucous membrane lesions, every effort must be made to rule out other causes of internal bleeding.

Treatment

The treatment, which has changed but little since Osler's description of the condition, is aimed at management of the chronic bleeding and treatment of blood loss anemia. Transfusion is required for acute hemorrhage and iron is indicated for chronic blood loss. A number of agents have been recommended for destroying the telangiectatic areas. They include thermocautery, application of silver nitrate, chromic acid, trichloracetic acid, and radium. Recurrence frequently appears as rapidly as the old areas are destroyed. Electrocoagulation when judiciously used gives the most satisfactory results. Some authors have reported that rutin is of some value.

One cannot leave the subject of hereditary hemorrhagic telangiectasis without making some mention of pulmonary arteriovenous aneurysms.

In case reports of arteriovenous aneurysms there have been occasional references in the literature to its association with telangiectasia of the skin. The first case of pulmonary hemangioma was found by DeLange, DeVries, and Robbles on the postmortem examination of a two and one-half-year-old child. Reading earlier described the clinical triad of clubbing, cyanosis, and polycythemia associated with this pulmonary lesion. Of fifteen cases of pulmonary lesions reported in the literature, only three had associated hereditary hemorrhagic telangiectasis though nine had telangiectasis of nose, face, or lips of a nonhereditary or non-hemorrhagic nature. Symptoms of this disorder occur in the third decade and these are caused by chronic anoxemia. The suggestive symptoms are dyspnea, weakness, palpitation, dizziness, numbness, syncope, diplopia, thick speech, hemoptysis, and chest pain. The arterial blood shows low oxygen saturation. A striking negative finding is the absence of signs of cardiac disease which is in marked contrast to the effect upon the heart of arteriovenous aneurysms in the greater circulation. The polycythemia which occurs differs from that in primary polycythemia by the absence of immature white cells. The murmur is characterized by being late systolic diastolic in time and best heard on inspiration. By doing angiography and using intravenous diodrast, the lesion can be clearly demonstrated.

Congenital pulmonary arteriovenous fistulae are not always single lesions; on the other hand, evidence now seems to accumulate that they are more frequently multiple and may occur in both lungs.

Radiologically there are slight lobulated shadows of increased density observed in the lung. Intrapulmonary opacities are connected with hilar vessels by broad tortuous bands of increased density representing distended branches of the pulmonary artery and dilated branches of the pulmonary vein.

The tumor may show variations in size depending on change of the intrathoracic pressure. On Valsalva test (deep inspiration followed by forced expiration against the closed glottis) the mass may become smaller. Mueller's test (deep expiration followed by forced inspiration against a closed glottis) causes an increase in the mass. The steadily increasing number of cases reported suggests that the condition is more common than has been supposed. Awareness of the picture may lead to a more frequent diagnosis of the condition.

Case Report

Case 1.—Mrs. A. H. W., a white, divorced, woman aged fifty-five whose occupation was housework was seen on April 4, 1952, with the story that she had been tired most of her life but particularly so in the last ten to twelve years. She had been suffering from recurring hemorrhages from the nose and in addition was anemic. She had known for many years that she was suffering from some type of disturbance of her blood vessels that easily produced hemorrhage, and the hemorrhage usually occurred from the nose. Sometimes the hemorrhages were so severe as to require heroic measures. She had also stated that because of these hemorrhages she was anemic.

Her family history revealed the fact that the patient had relatives who bleed easily including her daughter and a grandson.

On physical examination, her blood pressure was 142/90, pulse, 72, and temperature, 99, at 2 p. m. on April 4, 1952. The only findings of note were marked areas of telangiectasia of the mucous membranes of the nose, mouth, lips, and also of the skin. The remainder of the examination was normal. Laboratory investigation on this date revealed the hemoglobin to be 10 grams, the red blood cell count 2,910,000, the white blood count 6,400 with normal differential. The urine was normal. The blood sugar 104 mg. per cent, the blood urea 30 mg. per cent, and the sedimentation rate 50 mm./1 hr. The platelet count 850,000 per 100 white blood cells.

The electrocardiogram was normal. The chest x-ray showed enlargement of the left ventricle. The Mantoux test was negative. The Wassermann test was also negative.

The patient was admitted to St. Joseph's Hospital on April 15, 1952, for further study and at this time the stools were found to be positive for occult blood. The bleeding time was 8 minutes, 25 seconds, the clotting time 4 minutes, 30 seconds, and the platelet count now 325,000. Urobilinogen was normal.

An x-ray examination of the gastrointestinal tract at this time was essentially negative except for a defect in the large bowel which was present in the distal portion of the sigmoid. This did not have the appearance of a malignancy and, on proctoscopic examination, it was found to represent an area of telangiectasia.

The bone marrow studies were normal.

The diagnosis was familial hemorrhagic telangiectasis.

The patient's daughter and the grandson reported for physical examination and in both individuals areas of telangiectasia were found on the skin and in the mucous membranes. There was no evidence of an arteriovenous fistula in the lungs.

Conclusions

An instance of familial hemorrhagic telangiectasis is reported in which the patient knew of members of her family who suffered from this disease and in whom the characteristic lesions were found in her daughter and in her grandson. Attention is called to the fact that this is not an uncommon disease and that patients who suffer particularly from epistaxis and other types of bleeding should be investigated thoroughly to determine whether or not they suffer from this particular affliction.

The Minnesota Society of Clinical Pathologists

LABORATORY DIAGNOSIS OF TUBERCULOSIS

GERALD M. NEEDHAM, Ph.D.
Section of Bacteriology, Mayo Clinic, Rochester, Minnesota

RECENT advances in the management of tuberculosis have increased the importance of proving the diagnosis before a program of treatment is planned. Although the results of physical examination may suggest tuberculosis as the diagnosis, many other conditions can produce similar findings; therefore, the clinician needs the assistance of the laboratory to establish the diagnosis. Demonstration of *Mycobacterium tuberculosis* is the only procedure that is absolute in the diagnosis of tuberculosis; therefore the laboratory aid must be of the highest quality.

The clinician must be ever mindful of the possibility of mixed infections and that the underlying cause of many infectious processes may be caused by the tubercle bacillus, despite the isolation of other organisms. It becomes the clinician's responsibility to supply the laboratory with the best possible specimen and with any helpful information that he might be able to pass along. This may pose some serious problems but there can be no compromise with adequate specimens and repeated examinations.

The bacteriologist employs three primary procedures that may aid in the diagnosis of tuberculosis: (1) smears stained for acid-fast bacilli, (2) cultures and (3) inoculation of guinea pigs. It is presumed that positive results obtained from inoculation of guinea pigs constitute indirectly a diagnosis of tuberculosis. On the other hand, the report that a smear contains acid-fast bacilli means only that organisms have been observed that are of size, shape and staining characteristics compatible with those of tubercle bacilli. It tells nothing of the cultural features and virulence of the organism. Clinical material frequently contains nonvirulent acid-fast bacilli; the latter are so common in gastric juice that the results of stains of such material are meaningless.

There are many methods for acid-fast staining, with claims for one advantage or another, but the earliest method, the Ziehl-Neelsen technique, still yields the best results. Techniques involving the use of fluorescent dyes yield good results in the hands of some investigators but further evaluation is required before they can be recommended as routine diagnostic methods. As already mentioned, acid-fast bacilli exist that are nonvirulent for guinea pigs. Positive results of an acid-fast stain, therefore, are not by themselves satisfactory evidence of tuberculosis. Likewise, negative results of examination of smears do not rule out tuberculosis. During the year 1952 at the Mayo Clinic, 34 per cent of the cultures that disclosed *Mycobacterium tuberculosis* were obtained from material in which examination of smears made at the time the cultures were begun failed to demonstrate acid-fast bacilli. The acid-fast stain is valuable in the presumptive diagnosis of tuberculosis but it needs to be supplemented by culture and inoculation of animals before a final diagnosis can be made.

On the contrary, cultures have considerable significance in the hands of experienced persons. Study has shown close correlation between cultural features and virulence. It is impossible to obtain reliable cultural results unless a dependable medium is available. The ideal medium should support growth of small numbers of bacilli, promote rapid growth and be capable of inhibiting the growth of contaminating organisms. Only properly prepared and fresh mediums will yield satisfactory results. Liquid medium is not recommended for diagnosis but serves best as a research tool, since it can be injected directly into animals. One of the greatest drawbacks in use of cultures is lack of volume of material. A number of specimens must be received in the laboratory daily to warrant establishment of the necessary special procedures required to culture the tubercle bacillus. A consistent flow of clinical material helps insure suitable reagents, fresh mediums and a technologist who is thoroughly experienced.

Although many laboratories rely entirely on the results of cultures, it has been the experience at the clinic that acid-fast bacilli found in cultures always should be checked for virulence in guinea pigs. Studies for virulence are carried out at the clinic on all newly isolated strains.

At times tubercle bacilli are so few that inoculation of animals is indicated in addition to microscopic study and culture. At the clinic, two guinea pigs are inoculated directly with the material obtained from each patient or from each organ being studied. One animal is inoculated subcutaneously over the lower portion of the abdomen and the other is inoculated intraperitoneally; each animal receives half of the total inoculum. At the end of four weeks, the animal which received the material intraperitoneally is given 0.5 cc. of old tuberculin (OT) subcutaneously. About 75 per cent of the animals which have tuberculosis as the result of the inoculation are so sensitized by this time that they will die within twenty-four to forty-eight hours after injection of this amount of OT. If the animal does not die as the result of this injection, both animals are allowed to live for an additional four weeks and are then killed. All animals are examined at necropsy for evidence of tuberculosis. Evidence obtained from study of about 2,500 animals each year indicates considerable variation in the extent and location of the disease process in these animals. A positive finding constitutes the demonstration of gross lesions that contain acid-fast bacilli. Occasionally, lesions grossly resembling tuberculosis are encountered but are proved to be those of brucellosis or coccidioidomycosis.

No matter what technique is used in the search for tubercle bacilli, one salient feature should be kept in mind, namely the more extensive the investigation the greater the likelihood of finding the organisms. Since the number of bacteria may be small and the virulence may be low, an inadequate specimen may mean the difference between positive and negative results of laboratory examination. Therefore, it is extremely important that the bacteriologic laboratory have as large a specimen as possible.

Summary

The finding of acid-fast bacilli in a smear is only suggestive of the diagnosis of tuberculosis. Similarly, a smear that does not contain demonstrable acid-fast bacilli is of little value in ruling out this disease. Cultural techniques for isolating and identifying acid-fast bacilli are satisfactory screening procedures when performed by skilled workers. All newly isolated strains of acid-fast bacilli should be tested for virulence in animals. The inoculation of guinea pigs is the most satisfactory single procedure for the detection of *Mycobacterium tuberculosis* in the wide variety of specimens submitted to the diagnostic laboratory.

* * *

This is the tenth in a series of editorial reports sponsored by the Minnesota Society of Clinical Pathologists and designed to foster closer relationships between the practicing physician and the pathologist.

Although the incidence of tuberculosis has decreased greatly during the past few years, this disease still remains a major cause of economic loss and of death, particularly among young adults. With the advent of increasingly effective chemotherapeutic agents for the management of tuberculosis, the diagnosis of the disease in its early stages becomes of great importance. As pointed out by Dr. Needham, the final positive diagnosis of tuberculosis rests with laboratory identification of the tubercle bacillus. This fact again emphasizes the vital part played by the laboratory and the pathologist in the modern practice of medicine.

The editorial committee of the Minnesota Society of Clinical Pathologists solicits suggestions and comments concerning this series of reports. Reprints of this presentation can be obtained from the author or the chairman of the committee.

GRANTS FOR SURGICAL FELLOWSHIPS

The Woman's Auxiliary of the United States and Canadian sections of the International College of Surgeons has set aside $6,500 to be used for grants for surgical fellowships, according to an announcement made by Mrs. Walter C. Burket of Evanston, Illinois, national president of the Auxiliary.

The funds as voted by the Auxiliary's board of directors will be distributed as follows:

$3,000 to finance study abroad by an American or Canadian surgeon.

$3,000 to finance study in the United States or Canada by a foreign surgeon.

$500 for a senior medical student at the University of British Columbia, in Vancouver, B. C.

Details of the grants will be announced later.

MEDICAL HISTORY OF THE COUNTY OF YELLOW MEDICINE

MILDRED B. LEE
Granite Falls, Minnesota

(Continued from October issue)

John Theodore Billington was born in Norway, of English descent. After completing his elementary education he entered the University of Christiania, from which he secured degrees in both pharmacy and medicine. He then migrated to the United States, and in order to acquaint himself with the customs and language, took a postgraduate course at Rush Medical College. He graduated in 1860.

After graduation he entered into partnership with a Chicago man and went into the drug business, at the same time starting to build up a medical practice. He also made a trip back to Norway, thinking that he should settle there, but soon came back to the United States. He was married in Chicago to a young woman of Norwegian descent.

While Dr. Billington was practicing in Chicago that city was visited by what was called "the black death" (cholera?). People died in their homes, in the streets, wherever they happened to be, sometimes after only a few hours of sickness. The demands upon the doctors for their services were so great that they could get no rest; Dr. Billington escaped occasionally by hiding in an outhouse to snatch a few hours sleep.

Dr. Billington next moved to Stoughton, Wisconsin, and practiced there for a time. During this period his wife and daughter died.

From Stoughton, Dr. Billington moved to Decorah, Iowa, where he gave much time to the examination of soldiers enlisting in the Civil War, and also for the purpose of determining eligibity for pensions. He became counsel for the Chicago and Saint Paul Railroad. He also married again, his second wife being a resident of Decorah.

In 1879, Dr. Billington came to Canby, then a settlement of less than 200 people. He practiced medicine there and also operated a drug business. In his practice he covered a wide territory, on horseback, or sleigh, or horse and buggy, according to the weather. Often he would have to stay at the homes of settlers on his trips around the country because of the great distances to be covered.

Stories are told of his experiences, and one of these is of the time he stopped at a settler's home and was told that he probably would not get any supper because the wife and mother had been bedridden for sometime. Without telling the family that he was a doctor, Dr. Billington asked permission to see the woman, which was granted. He then asked the farmer to take the family out in the yard and stay there until he called them. Doubtfully, they obeyed. In a few minutes Dr. Billington joined them; and a very short time later the family was startled to see the wife standing in the doorway, calling them to help her put out the fire. Dr. Billington had simply set fire to her mattress. She was completely cured.

This instance of application of shock for the cure of a purely mental illness shows that from the earliest times doctors were aware of the relation between mental and physical disorders. In this case the woman had not been out of bed since the birth of her last child. Such stories are told in many places of many doctors, and it may be assumed that Dr. Billington was not the first, nor the last, to use such methods.

When Dr. Billington arrived in Canby he had a family. Alec Billington, one of his older sons, well remembers Canby as it appeared in the winter of 1879, and the events of the early years. He remembered "Texas Jack" and his gang, desperadoes in flight from the authorities, who were "perfect gentlemen" as long as they stayed in Canby. He remembers the time "Black Jack" was run out of town by the outraged citizens; and the noisy saloons that ran all night in spite of a midnight closing order. Alec Billington became a druggist and was associated with his father in the drug business in Toronto.

Dr. Billington was licensed in Minnesota on December 15, 1883. At that time he was practicing in Toronto, but the *Canby News* reported him as being in Canby quite often, and planning to come back to Canby to practice. He is quoted as saying, "Canby is the healthiest place I've ever been in." His daughter Dora became the wife of Samuel J. Lewison of Canby, well-known pioneer resident and businessman; his daughter Ella Billington has taught in the Canby schools and elsewhere for more than fifty years; and Alec Billington, retired, also lives there. Another daughter, Mrs. Georgia Blackmoor, lives at Vancouver, British Columbia, and there are two other sons, Ferdinand and Otto, who live in Seattle.

Dr. Billington died in Decorah, Iowa, in 1893, at the age of seventy-five years.

Dr. W. D. Calvin came to Canby in 1895. He was married, and Mrs. Calvin was also a doctor.

The Calvins were cultured people and made many friends in the short time they resided in Canby. Dr. Calvin soon had the reputation of being a very good doctor, and prospects for building up a good practice were promising. He made friends easily and was very well liked. The general impression was that he was exceptionally skilled, a thorough gentleman, and was a credit to his profession.

Mrs. Calvin practiced a little; but in that time women doctors were rare, and received little support from the public. Mrs. Calvin was dissatisfied at her own lack of opportunity in a place where her husband seemed marked for success. It is believed that her attitude was responsible for their leaving Canby in 1896.

There appear to be no further records of the Calvins in Minnesota and these few facts constitute all that is known of them.

Carlos Lord Chambers was born at Freeport, Illinois, April 12, 1858, and in 1867, came with his parents to Mantorville, Minnesota. After completing his elementary education in the schools of that community he entered Carleton College at Northfield, graduating in 1881. He then entered Rush Medical College at Chicago, and graduated with a degree in medicine in 1883. Shortly thereafter he located at Canby, Minnesota.

Dr. Chambers was a pleasant, friendly, personable young man, and soon established himself in practice. In the first year of his residence in Canby he married a girl from Kasson. The young couple took an active part in the social life of the town, Dr. Chambers having a good singing voice and considerable ability in music, and Mrs. Chambers occasionally appearing on literary programs as a reader or in "declamations." Both young people kept in close touch with their families, and the comings and goings of the parents of each are faithfully noted in the newspapers of the time. Dr. Chambers' father was a traveling salesman for a furniture company, and regularly stopped at Canby on his rounds, making many friends in the community; and Mrs. Chambers' mother who resided at Mantorville was also a frequent visitor.

Dr. Chambers' first office was at his residence "next door to Al Williams' Wagon Shop." Next he moved to a building "over Wattner's old stand," then into the Gilberson Drug Store. This was one of the older drug stores, and the doctor and Adolph Gilberson were both fond of chess. One owned a chess board, and the other a set of chessmen. These articles changed hands one Christmas when Gilberson presented his chess board to the doctor and found himself in receipt of the doctor's chessmen.

Dr. Chambers served as county physician for the western townships of the county. He also headed many communities in furtherance of civic projects. He was in demand whenever music was needed and seems to have played an instrument on some occasions.

Dr. Chambers enjoyed a good practice and was respected for his ability. He was one of the stockholders of the Bank of Canby and was active in civic affairs.

In 1891, Dr. Chambers went into the drug business, opening a new and modern drug store in the Rund and Bing Building. He had an office at the drug store. He was not a pharmacist; and after about nine months he sold out to the man who had been acting as his pharmacist, and announced that he would accept a position at "Bellview Hospital, New York."

The Chambers family had made many friends in Canby, who "will surely regret to see them go," according to the *Canby News*. Dr. Chambers' interest in Canby, outside his profession, had been music, hunting, chess, and spirited horses. He had a smart turnout for his country calls, as frequently noted in the papers. Mrs. Chambers was also well liked, although she is remembered best for her curiously Victorian attitude toward women who required her husband's care during childbirth. "Oh, those dirty women," she would say, "Why can't they look after themselves?" The Chambers had no children.

Dr. Chambers did not go to New York as planned. He remained at Mantorville, at his wife's former home, for some time, then visited other towns and finally settled in Kasson. He practiced there until his death.

Dr. Chambers died after an operation performed for injuries sustained when he was thrown from his buggy while returning from a professional call. His death occurred December 5, 1904, in Minneapolis, Minnesota.

Franklin Judson Cressy was born in Greenfield, Franklin County, Massachusetts, July 5, 1849, the son of Francis and Lovina Cressy. Francis Cressy was a native of Bennington, Vermont, and Lovina Churchill Cressy was born in Franklin County, Massachusetts. Besides Franklin J. Cressy there were three other children, Frances L., William B., and Ernest F. Cressy.

In 1858, the Cressy family moved to Olmsted County, Minnesota, where they established their residence on a farm. When the first graded school opened in Rochester in 1868, Franklin, then eighteen years of age, attended it for two years. He then read medicine in the office of Dr. H. Galloway of Rochester. Following this he took a course of lectures at Ann Arbor, Michigan, and then entered the College of Physicians and Surgeons at Keokuk, Iowa. He was graduated in 1877.

After graduation Dr. Cressy began the practice of medicine in Howard Lake, Minnesota, and in 1879, married in that village Miss Fannie M. Taylor of Madison, Wisconsin. In the same year her sister Mary had married Florado H. Wellcome, who was a student at Rush Medical College at Chicago, and after his graduation they went to Granite Falls to practice. It is probably for this reason that Dr. Cressy and his wife also went to Granite Falls in 1880.

Being a graduate pharmacist as well as a physician, Dr. Cressy at the first opportunity bought the stock of the Gould Drug Store. This stock was destroyed by fire in the building the night after the sale; but Dr. Cressy nevertheless purchased a new stock and opened a new drug store which he operated in connection with his practice for two years. He then sold a half interest to a C. G. Johnson, formerly of Philadelphia, and at the end of another two years sold his remaining interest so as to devote all his time to his practice.

Dr. Cressy's offices were on the second floor of the Neste Building, on Prentice Street, Granite Falls, and had neither adequate heat, running water, or other facilities. His home was at the top of the hill on Eighth Avenue, a large, well-planned house with landscaped grounds. It has since been divided to make two houses, one of which still stands on the original site.

In appearance Dr. Cressy was tall, extremely slender, with dark eyes and dark hair, and rather prominent acquiline nose. He was aristocratic both in looks and bearing, in the memory of people who knew him. His manner was courteous and kind; he was a friendly man, conscientious in his work and always concerned for the welfare of his patients. His reputation and character were exceptionally good in every respect; he was highly regarded both as a doctor and as a person.

Mrs. Cressy was an attractive woman and very much interested in all cultural projects. In pleasant weather she would accompany her husband on his calls about the country, sitting out in the buggy with a book while Dr. Cressy made his calls. They were a congenial, perhaps devoted couple, taking part in the social affairs of the town and interested in all civic affairs. Mrs. Cressy was one of the members of the Hesperian Club, first women's study club in Granite Falls, and was its president for several years.

The Cressys were frugal in their habits. In a time when people ate heartily three times a day, Dr. Cressy's purchase of a "hawf pound" of meat for dinner was noted with amusement. With proverbial Yankee thrift they invested wisely in bank stock and lands, building up a substantial estate.

Dr. Cressy had a good practice, and gave it careful attention. He served as county physician, with Dr. Stratton, and then with Drs. Stratton and Schjeldrup, for a number of years. He also served on the Board of Health of the City of Granite Falls. In 1898, he was appointed county coroner to succeed Dr. Donnell who died during his term of office, and was re-elected twice. He was a member of the Masonic Lodge, of the State Medical Association, Camp Release District, and of the American Medical Association. He received his Minnesota License in 1877. In 1885, he took a postgraduate course in surgery at Rush Medical College.

The Cressys were childless. They continued to live in Granite Falls until Dr. Cressy's last illness, from which he died in Saint Paul on June 26, 1916. At the time of death he was sixty-seven years of age. He was survived by his wife, Fannie, a sister Frances Bulen, and two brothers, William and Ernest Cressy.

Dr. Albert W. Cummings graduated from the Hahnemann Medical College, Chicago, in 1884, and was licensed in the State of Minnesota (No. 928) on May 28, 1884. He began his practice in Sauk Center, where he remained until 1891, when he came to Granite Falls. In the December first issue of the *Granite Falls Tribune* this comment appears: "this gentleman is another of the medical persuasion and has an extensive business giving entire satisfaction to all whom he treats."

Dr. Cummings opened an office in a small building on the south side of Prentice Street what is now 711 Prentice Street. He was of the homeopathic school, and had a good practice. He appears to have been a quiet, rather retiring man, who took no active part in the affairs of the community. He was married and had two children.

Dr. Cummings stayed about seven years in Granite Falls and then returned to Sauk Center.

Dr. Alexander C. Dockstader was a physician of the homeopathic school, a graduate of Hahnemann Medical College and Hospital, Chicago, class of 1880. He first located in South Park, Dakota County; about 1883 he came to Granite Falls, where he had an office "next door to Nare's Drug Store." His professional card stated that he would be in his office from 8 to 9 a.m., and from 1 to 4 p.m.

Dr. Dockstader had been married on September 20, 1882, to Miss Carrie Gardner, of Saint Paul. While in Granite Falls two children were born, Mettie, who died at the age of four years, and Allen Gardner. The family occupied the house known as the Foster house, which stands just off Prentice Street on Ninth Avenue.

During the period of residence in Granite Falls, Dr. Dockstader built up a good practice and was very active in the Methodist Church, the Masonic Lodge, and several musical organizations. Both Dr. and Mrs. Dockstader appeared as soloists on the musical programs of various organizations. The doctor was also a member of the city band. In later years he became an accomplished musician, able to play almost every wind instrument.

Dr. Dockstader was also interested in sports and athletics. He was a member of the Granite Falls Baseball League, and had the distinction of being the first player to pitch a curved ball. He was also an ardent tennis player. He was fond of hunting, and after leaving Granite Falls returned many times to follow this sport in the hunting season. In appearance he was a tall, heavy set man, of jovial disposition. He made many friends wherever he went.

Mrs. Dockstader was also very popular, active in the church and social circles, and much in demand for her musical ability.

County records show the birth of a still-born child in the summer of 1885, and shortly after this the Dockstaders prepared to leave Granite Falls. They sold the home and all its furnishings, and a group of twenty-five friends gathered at a farewell party and presented them with gifts.

From Granite Falls Dr. Dockstader went to Red Wing, where he practiced for a time, probably two years; he was in Minneapolis from 1887 to 1889, in Saint Paul from 1892 to 1896, and again at South Park. He later located in Lake City where he was for many years a very successful physician and surgeon, and served as county physician for Dakota County.

Dr. Dockstader's many interests made him a welcome addition to every community, and he enjoyed life and had many friends. Three other children were born: Irma, Harold J., and Ethel who died in infancy.

In his later years Dr. Dockstader lived in Hastings, Minnesota, in the home of his son Allen. He died there on July 16, 1945, at the age of ninety-one years.

He was survived by his children, Irma, now Mrs. R. W. Cummings of Saint Paul, Allen G. Dockstader of Hastings, and Harold J. Dockstader, president of a bank at Grand Rapids, Minnesota.

(To be continued in the December issue)

President's Letter

ESPECIALLY FOR YOU

If you are a general practitioner, the annual Interim Session of the American Medical Association is planned especially for you.

The meeting, scheduled for December 1 through 5 in St. Louis, holds a wealth of material presented particularly for the general physician. More than 150 papers by outstanding physicians will cover such topics as internal medicine, surgery, pediatrics, obstetrics and gynecology, tuberculosis and other diseases of the chest, cardiovascular diseases, arthritis, dermatology, gastrointestinal diseases and neuropsychiatry.

Of special interest, in view of the traffic fatalities and methods of prevention recently employed, is the exhibit symposium on the prevention of traffic accidents. This will include a discussion of the responsibility of the doctor in telling his patient when not to drive; also what other precautions the physician should take in such special situations as the testing of the drinking driver and the care of the injured after an accident. Representatives from the National Safety Council and several police departments will participate.

The usual exhibit features, obstetric manikin demonstrations, a diabetes exhibit and a question-and-answer conference are also planned, with special attention given to the interest of the general practitioner.

The St. Louis meeting will again present color television, showing motion pictures covering all the important problems which the general practitioner faces. This is a continual showing and many authors will be present to discuss their work.

Scientific and technical exhibits are also slanted toward the specific interests of the general practitioner. About eighty displays appear in the scientific exhibit, while the technical exhibits will number to about 160 booths covering all types of office and medical practice needs.

The importance of this meeting to the general physician cannot be over-emphasized. Those of you who have attended annual meetings of the AMA have seen the extent of the entire session and possibly have felt that more material for the G.P. could be incorporated into the meeting.

The Interim Session fills that need. Every physician should make an effort to attend at least part of this session, for its value is extensive, its scope is broad, and its interest is high.

President, Minnesota State Medical Association

GERIATRICS—MEDICAL OPPORTUNITY

THIS NATION is the most favored nation on the face of the earth today. Its wealth is tremendous. Its people are relatively free, and its lands have not been destroyed by the invading hand. As a nation, we have been profligate of our great natural resources in the past. At present we are extremely profligate of our human resources. The economic usefulness of some 10,000,000 people is discarded at age sixty-five, and the burden of their support is in large measure placed upon those in a younger age group who are economically productive. The individual is taught from early life to think of retirement and pension, rather than to think in terms of continued usefulness as long as he lives. We destroy 40,000 people annually on our highways.

We are in ideological conflict with opponents who have unlimited manpower, whose citizens have great mental capacity, whose people are capable of great scientific achievement, and whose leaders are dedicated to the objective of world domination. If we are to meet our adversaries successfully, we need to conserve our total human resource.

Society, in general, must provide youth with unlimited challenge; it must present youth with great opportunity and the mental, physical and emotional capacity of our young people must be developed to the utmost. In our social structure, citizens with mature minds must be motivated to work to their greatest capacity, and must be allowed to work unhampered by economic restriction, blind prejudice or consuming envy.

The increasing median age of our citizens, the fact that there are approximately 15,000,000 of our people in the over-sixty age group, and the knowledge that the average life expectancy is now approaching seventy years, emphasizes to us the importance of the geriatric problem in our economic and social structure. Necessity suggests that we keep this older age group economically useful. We are short in manpower as compared to our ideological opponents.

The foundations for senescence are laid in the years of youth and maturity. The peak incidence of chronic disease occurs in the two decades between thirty-five to fifty-four years, while the peak incidence of disablement and invalidism is found in the period from fifty-five to seventy-four years of age. The person who develops good mental habits, excellent emotional attitudes and useful physical skills in youth, who keeps the mind alert by continued study, the body strong and supple by proper nutrition and physical activity, and the spirit fed by "faith, hope and charity" during maturity, will often remain useful and alert, and an important member of our society during his waning years. It is important for this individual to know that society appreciates his abilities, and is eager to use them as long as they exist.

The physician is in a key position to aid in the social conservation of those people who have reached maturity, and are mellowing with age. Knowledge, now existent, can be applied more effectively to the fields of nutrition. We are well, but not wisely, fed in this nation. Much remains to be done in guiding our eating habits as a nation. Existing information provides a foundation for better work in prevention and treatment of such diseases as obesity, myxedema, primary and secondary anemia, diabetes and malnutrition, cancer, and tuberculosis. The prevention of accidents and sound public instruction in the matter of alcoholic abuse will yield large human dividends. Much can be done to guide social attitudes in regard to aging, and to motivate the individual to remain useful as long as he lives.

The problem of chronic disease and its resultant invalidism has been spoken of as "medicine's number one problem." Research and practice in this field will enable the physician to make a notable contribution in the conservation and wise utilization of our greatest national resource, its human resource.

REACTION TO REACTION

A COMPLIMENT deftly turned never fails to please. Pride in our State Medical Association is given an extra boost by the editorial, Minnesota Centenary, in the September 10 issue of the *New England Journal of Medicine.* We are grateful for that boost and editorial notice.

This circumstance also gives us the chance to write our bit about the *New England Journal.* Ordinarily, we do little more than skim through the editorial pages of the medical periodicals that cross our desk. Not so with the *New England Journal.* Despite the universally recognized high quality of its scientific articles, we *read* the editorials first. Why? Because they have the most scholarly, straightforward and readable discussions of practical medical and medico-social (if a difference exists) problems we find.

We know none of the editorial staff personally, but we are willing to vouch, just from their writing, that they are men of good will. May their sincere reasonableness continue to shine through their editorials.

H. G. M.

TUBERCULOSIS IN MINNESOTA

MINNESOTA holds an enviable position in tuberculosis control. Its mortality rate has been reduced to one of the lowest positions on earth. Its morbidity rate has been greatly decreased and so has its infection attack rate. Nevertheless, on the basis of sample testing of people of all ages, approximately one million of our citizens harbor tubercle bacilli. No one knows how many of them will have the disease evolve to clinical proportions, but the number will be sizable.

The majority of Minnesotans in whom tubercle bacilli reside are in the upper age brackets. They were children when most persons who died from tuberculosis did so in their homes and when tuberculosis was still abundant among the cattle herds. In necrotic and caseous lesions, they are still harboring the descendants of the tubercle bacilli which invaded their bodies while they were children and young adults. It is in these older people where the bulk of morbidity and mortality is now occurring. In fact, of the 205 persons who died in Minnesota in 1952, 83.9 per cent were forty years or older and 40.5 per cent were sixty-five or over.

Among those who have attained the age of twenty or thirty years, tubercle bacilli have invaded the bodies of relatively few; consequently, morbidity and mortality are at low ebbs. Indeed, only ten persons under the age of twenty-five years died from tuberculosis in Minnesota in 1952. Thus, in more than the first third of life's span, only 4.9 per cent of the total number of deaths occurred.

Minnesotans have practically stopped talking about controlling tuberculosis and have substituted the thought of eradicating the disease. This is well within the realm of physical possibility, but it will require a long time and much more arduous and painstaking work than that of the past.

With eradication in mind in the early 1930's, Minnesota physicians began considering adoption of special techniques that would offset the impending sense of false security that was sure to develop as mortality and morbidity rates decreased. In other words, as the glamour disappeared there must be special methods to stimulate and maintain interest and activity until eradication is accomplished. It was recognized that the time would probably come when in some years no deaths would be reported and no one would be ill, yet a serious tuberculosis problem would exist among those who still react to tuberculin by reason of residual, caseous and necrotic lesions containing tubercle bacilli.

Such techniques were discussed on a number of occasions by the Committee on Tuberculosis of the State Medical Association. This group decided to recommend to the Council that the State Association and allied groups draw up plans for accrediting counties on the basis of accomplishment in tuberculosis work. This was only a part of the state-wide tuberculosis program of the Minnesota State Medical Association. The Council approved and the House of Delegates unanimously accepted this plan. The Governor, the State Board of Health and, later, the Minnesota Tuberculosis and Health Association were invited to be active participants in the projects. The following requirements were established, by which counties could be accredited.

1. The average tuberculosis mortality rate for the immediately preceding five years must not exceed ten per 100,000.

2. At least 90 per cent of all the high school

UNIVERSITY OF MINNESOTA SCHOOL OF NURSING

Most physicians are painfully familiar with the current nursing "shortage" but not all are aware of the basic causes for this, nor of the intensive efforts and the diverse methods used to increase the over-all supply of nursing personnel.

There are today more nurses practicing their profession than ever before. In spite of this, the demand for nursing services exceeds the supply. Contributing to this condition are the construction or expansion of hundreds of hospitals throughout the country, the recruitment of some 5,000 nurses by the armed forces, the introduction of new and better medical techniques and therapeutic procedures, the decrease in the length of the work week in hospitals in line with practices in other fields, and the delegation to nurses of many procedures that were formerly carried out by physicians.

To meet this situation, effective action along three lines is essential. First, every possible effort must be made to recruit even more qualified young women for nursing services. Intensive recruitment campaigns for both professional and practical nurses are conducted year-round by the nursing profession at the national level in co-operation with the American Medical Association, the American Hospital Association, the National Foundation for Infantile Paralysis, the United Civil Defense Fund and the Advertising Council. On the local level many communities are doing a spectacular job of telling the story of nursing, the needs in the profession, and the satisfactions to be derived from participation in this aspect of the health field. The effectiveness of this recruitment program in Minnesota is evidenced by the fact that in 1951 there were 49 young women per 100,000 population admitted to schools of nursing in Minnesota as compared to 27 for Wisconsin, 32 for Iowa, 22 for Michigan and a national average of 28.

Second, nursing services and duties which can be performed by less skilled personnel should be delegated to them. This requires expert leadership and supervision on the part of nurse administrators. Experience has demonstrated that such supervisory and administrative ability is seldom innate; therefore education for and practice in supervisory and administrative skills are two of the "musts" before smooth and efficient utilization of augmented nursing staffs can be achieved.

And, third, physicians and hospital administrators must find ways to reduce to a minimum the demands for nursing services and to achieve the greatest possible efficiency in the performance of hospital functions. In accepting its responsibility in helping to meet these demands, the University of Minnesota School of Nursing offers preparation of nursing personnel in all major areas. The School prepares professional nurses for the practice of nursing in a sixteen-quarter program and practical nurses in a four-quarter curriculum. In co-operation with the School of Agriculture it offers a six-quarter program in practical nursing and home management. The University of Minnesota is the only center in the state of Minnesota, and in this region, preparing head nurses and other administrative, teaching, and supervisory personnel, as well as preparing graduate nurses through advanced study for more skilled practice in the many areas of clinical nursing such as medical, surgical, pediatrics, obstetrics, psychiatric, operating room, rural, and tuberculosis nursing.

In short, a great part of the answer to the "shortage" of nursing personnel lies in conservation of human resources by improving the skills of all who administer or participate in the care of the patient and by intelligent fitting of the worker to functions within his or her scope of interest and ability. The University of Minnesota through its School of Nursing is attempting to make the greatest possible contribution toward meeting this important community need.

George Earl, M.D., Chairman

FEDERAL AID SOUGHT FOR MEDICAL CARE PLANS

New impetus has been put on the proposal to provide federal aid to voluntary prepayment medical and hospital care plans in the country.

The House Interstate Commerce Committee has been asked to give early consideration next year to a health insurance bill to provide federal and state grants for this purpose.

A group of Republican senators and representatives introduced the bill. They are: Senator Ives of New York, Senator Flanders of Vermont, Representative Javits of New York, Representative Hale of Maine, and Representative Scott of Pennsylvania. Ives, Flanders and Javits spearheaded introduction of substantially the same measure in 1949, at which time Vice President Nixon, then a member of the House, also was a co-sponsor.

According to a recent issue of *Insurance Economics Surveys*, the proposed program calls for Federal grants-in-aid to those States which agree to participate. Representative Javits stated that "the people are offered the maximum in health assistance with the minimum of government interference. Primary responsibility for the development of adequate health services is placed in the states and local communities and in non-profit cooperatives and group practice units with the fullest encouragement to the local initiative."

It should be noted here that the bill would provide aid to *all* plans which requested it in a cooperating state. It should be noted also, parenthetically at least, that very few states have refused to be "cooperating states" where federal aid to something or other is in the offing.

An official stand against this bill has been taken by the medical profession. A similar bill was actively opposed when introduced in the 81st Congress, and active opposition by the profession is anticipated if the forthcoming bill is reported out of Committee in the next session of Congress.

Commission's Recommendations

The proposed legislation is consistent with the recommendations made last December by President Truman's Commission on the Health Needs of the Nation. But it is also consistent with recent statements by Health, Education and Welfare Secretary Oveta Culp Hobby that adequate medical care for all could be achieved by "expanding and perfecting the system of voluntary, non-profit, privately operated health-insurance programs."

Local Basis Noted

Representative Javits, in reporting the bill to the committee, pointed out that local people would determine the "yardsticks of medical care" made possible by community medical resources, on which the scope of plans would be based. He explained that the plan is based on a fee of a percentage of income by those who elect to use it, thereby permitting anyone to join a plan, with the grants-in-aid helping to make up the difference between the standard fee and what an individual might be able to afford in premium charges.

Not Compulsory

"No one is compelled to join," he stated, "but non-joiners lose the benefit of limited public support for the health plans." He also asserted that despite the fact that more than half of the nation's population has some sort of insurance coverage against sickness, this protection in many instances is inadequate.

Survey Cited

To make his point stronger, Representative Javits called the committee's attention to a survey by the University of Michigan Survey Research Center, made for the Federal Reserve Board. This study found that unpaid medical bills are owed by nearly one family out of five.

Insurance Economics Surveys quoted these figures:

> "The average debt for each of the 10,200,000 families is $105, or a total of over $1 billion, according to the study. Nearly one-third of the 15 million families in which the family head is less than 45 years of age and the children are under 18 owes medical bills. And of all the money spent privately for medical care in the United States about $1 out of every $9 remains as a debt to a doctor, hospital or pharmacist."

President Quoted

Representative Javits also quoted President Eisenhower's statement on health insurance, to support the proposed legislation. He called for early consideration of the proposed measure and pointed out that the President, in a campaign speech October, 1952, called action to make adequate medical care available to all, "a sound investment." The President also said that the way to accomplish this would be "to build on the system of voluntary, non-profit health insurance plans which our people have already developed at an amazing rate," and added that "the usefulness of Federal loans or other aid to local health plans should be explored."

Summing up his testimony before the committee, Representative Javits felt that hearings should be scheduled early in the next session "so that the Congress may have before it a thorough study on which to base legislation on this most important issue before the American people."

No doubt, the medical profession will exhibit high interest in the progress of this bill next session.

ANNUAL SURVEY SHOWS HEALTH INSURANCE GAIN

Record high levels for voluntary health insurance in America were reported recently for the year 1952. The Health Insurance Council has just released its annual survey of accident and health coverage for the nation. Every section of the country participated in the gains, the Council said.

Minnesota's part of the gain showed up in the following figures: 2,383,000 persons protected against the expense of hospitalization; 1,895,000 persons protected against surgical expense; and 1,171,000 against medical expense. Minnesota's population is about 3 million as of 1950.

Cash Benefits Up

In releasing the report, the Council stated that cash benefits flowing from voluntary health protection aggregated more than $2 billions in 1952. The release said: "About half this amount went to help meet the cost of hospitalization, and over a half billion dollars more went towards operations and doctors' bills. Another half billion dollars represented benefit payments by insurance companies replacing income lost due to accident or sickness." Thus voluntary health protection is now taking care of a substantial part of the nation's health bill, the Council stated.

More Folks Covered

A significant increase in the number of persons covered for various types of health and accident insurance was also noted in the report. The total number of persons covered against hospital expense approached the 92-million mark at the end of last year. This represented an increase of more than 5½ million, or 7 per cent over 1951. Surgical expense coverage was carried in 1952 by more than 73 million persons. This figure jumped 12 per cent over 1951, or 7½ million persons. Approximately 8 million more persons than in 1951 were protected against doctors' bills under medical expense coverage at the end of last year. This increase brought the total number of persons so protected to nearly 36 million and represented an increase of 29 per cent over 1951.

The number of persons protected against loss of income due to disability exceeded 38 million at the end of last year, which is a new high mark.

Also, the year saw increasing public acceptance of major-medical expense coverage, the newest form of voluntary health protection designed to help meet the catastrophic costs of very serious illness. Nearly 700,000 persons had this form of protection at the end of 1952.

The report explained that "broadly speaking, major-medical expense coverage takes up where the customary forms of health protection—hospital, surgical and medical care—leave off." The report noted:

> "The development of major-medical expense coverage is further evidence of the willingness of the insurance business to experiment in the public interest and to take steps to meet a recognized public need. It testifies to

the alertness of the companies writing accident and health protection in recognizing the need for broader coverage than had heretofore been available, and thus reflects the inherent vitality of the voluntary health movement in this country."

ARMED FORCES HAVE TOO MANY DOCTORS

The number of physicians who have volunteered for active duty in the armed forces now far exceeds present medical officer requirements. And, according to a recent news release from the AMA, despite this the Selective Service System refused to cancel its latest physician draft call which forced 524 physicians to accept reserve commissions and apply for immediate active duty or be drafted as privates.

The release then outlines the disastrous long-range effects which will result from this call-up:

1. A wastage of medical manpower resulting in a reduction in the number of physicians available to care for the civilian population.

2. A tendency to use excess medical officers on nonmilitary assignments.

3. A squandering of available medical registrants under the "Doctor-Draft law" which would accelerate the call-up of doctors in priorities 3 and 4.

4. An inefficient utilization of physicians in uniform, with a resulting lowering of morale and general dissatisfaction with military service.

5. A nullification of the newly established ratio of 3.0 per thousand between medical and over-all troup strength.

Quoting from an editorial in the *Journal of the American Medical Association,* the release stated: "It appears to be certain not only that the current draft call was unnecessary but that there will be no more such calls for many, many months to come." The editorial added:

> "Acting in good faith and on the basis of the assertions by officials in Washington that medical personnel was sorely needed, many of these men have closed their offices or have discontinued their plans for additional residency or postgraduate training. In many instances this discontinuance of training was forced on them because of the prohibition that prevented hospitals from accepting priority 1 and 2 men to fill available residency vacancies.
>
> "Having terminated their civilian commitments on the assumption that they were needed immediately by the armed forces, these physicians are now faced with the prospect of an indefinite status for the next year or more. Possibly it is still not too late for many of them to change their plans, to request a delay in call to active duty, and resume their civilian occupations.
>
> "The government officials charged with the administration of the 'Doctor-Draft law' are obligated to call to active duty only those physicians who are needed and immediately to advise medical reservists as well as Selective Service medical registrants when they can expect to be called for military service."

GOVERNMENT SURVEY SHOWS VA ABUSES

Suspicions that VA hospitals were abusing the system of medical care for veterans, were confirmed this summer by studies of the government's General Accounting Office. This office tested 350 veterans recently discharged from VA hospitals, and the following was brought to light: Among the discharged veterans who had been treated free at government expense, it was found that incomes ranged from $4,000 to $50,000 a year. Over and above mere annual income they found 25 cases where the veteran possessed real property and other assets between $20,000 and $500,000.

One of the officials of the GAO had this comment to make: "It is clear that there are veterans being hospitalized on the basis of the unable-to-pay affidavit prescribed in the present law who are fully able to pay for their hospitalization and others who are able to pay in part. The present law and regulations in effect discriminate against the more honest class of applicants. In short, the veteran in ordinary circumstances must either perjure himself or be deprived of a benefit freely given to other veterans similarly circumstanced, perhaps less worthy of care at public expense."

It is clear too, that some sort of remedial action should be worked out. It is possible that a step on the way to solution will be pointed out by the House of Delegates of the American Medical Association when it meets in St. Louis in December. Much serious thinking has taken place on this matter ever since it was first brought up, and it is to be hoped that those responsible for policy will be guided by all thoughts and opinions available on this very important topic.

CHICAGO DOCTORS NOW CALLED BY RADIO

Sherman Amsden, who has operated a Doctors' Telephone Service in New York for thirty-one years, has inaugurated an Aircall Radiopaging Service in Chicago.

Aircall has been operating in New York for the past two years. Delay in bringing the service to Chicago was caused by the unraveling of red tape connected with the construction permit.

The Aircall radio station now is being built atop Chicago's third tallest building.

Minnesota Academy of Medicine

Meeting of February 11, 1953

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, February 11, 1953. Dinner was served at 7 o'clock and the meeting was called to order at 8:10 by the President, Dr. E. A. Regnier.

There were thirty-one members present.

Minutes of the December and January meetings were read and approved.

The scientific meeting followed.

Dr. Leo Culligan, Minneapolis, read his Inaugural Thesis entitled "Bowel Obstructions during the Postoperative Period." Lantern slides were shown. (To be published later.)

The meeting was adjourned.

Robert E. Priest, M.D., *Secretary*

Meeting of March 11, 1953

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and County Club on Wednesday evening, March 11, 1953. Dinner was served at 7 o'clock and the meeting was called to order at 8:15 p.m. by Dr. O. H. Wangensteen in the absence of the President, Dr. Regnier.

There were forty-seven members and four guests present.

Minutes of the February meeting were read and approved.

There was no business meeting and the scientific program followed.

Dr. Richard L. Varco, University of Minnesota, gave his Inaugural Thesis which consisted of a lantern slide talk entitled "Operative Cholangiography Techniques and their Application to Certain Hepatic and Biliary Problems."

Discussion

Dr. A. A. Zierold, Minneapolis: It is most interesting to hear Dr. Varco speak of something in which we at General Hospital have been interested for some time and to have someone present cholangiograms which are real cholangiograms. There is one thing I would like to add to what Dr. Varco intimated but did not emphasize. Operative cholangiography is not a casual thing, to be done when you have the leisure. In my practice, it is a routine procedure incidental to cholecystectomy. When we remove gall bladders, we remove them because they contain stones and for no other reason. If the gall bladder contains stones, it is potentially a cause of stones in the common duct. I am unable to identify common duct stones by inspection or palpation of the common duct. Consequently, when I remove a gall bladder, I make a cholangiogram. We are all plagued by the recurrent symptoms following cholecystectomy, but I believe that when one analyzes his own experiences together with the literature, he will find that most recurrences of so-called "gall-bladder" symptoms occur in patients who should not have had a cholecystectomy to begin with. Nevertheless, real cases do exist. Of these, some represent retained common duct stones and a few must be classed as biliary dyskinesia. These must be carefully examined. If, after the administration of morphine or codeine, the patient's symptoms can be reproduced, accompanied by a rise in serum amylase, sphincter spasm must be considered. If, after administration of banthine, this symptom complex cannot be produced by morphine or codeine, I believe that transduodenal sphincter section is indicated.

Dr. C. J. Watson, University of Minnesota: I have been delighted with Dr. Varco's interest in this subject and with the co-operation and painstaking care he has taken in a number of our cases of jaundice. I think the operative cholangiogram has largely removed the problem of residual, postoperative common duct stones. Back a few years, it was not uncommon for one of our patients to have an operation for common duct stone only to come back later with the same symptoms and the necessity of one or more additional operations. I can't remember having such a case now for five or six years. These films that Dr. Varco has shown are good evidence of why we don't see such situations any more. I take it for granted that if the common duct is opened at operation, we have to have a cholangiogram then, on the table.

A problem that requires the most meticulous care in diagnosis is in the jaundiced patient, especially when older and very sick. The distinction of biliary tract disease from diffuse parenchymal jaundice, and the consequent decision whether to operate or not, may be extremely difficult. I have seen a number of individuals who were operated upon with the thought that they had common duct obstruction, but who had hepatitis. This error is especially easy when the patient has had cholecystectomy in the recent past, and has acquired homologous serum hepatitis as a sequel to it.

We think we removed the jeopardy to the patient with marked jaundice by having a small laparotomy under local anesthesia, rather than a formal choledochostomy. If the cholangiogram shows that the common duct is open, then we feel confident the patient has diffuse liver disease as the cause of his jaundice, rather than a stone or tumor. I have been very glad to hear Dr. Varco's presentation, and I am sure he has helped us immensely.

Dr. J. Richard Aurelius, Saint Paul: It is really quite stimulating to have a discussion on operative cholangiography based on films that are of good diagnostic quality. I think Dr. Varco has shown us as interesting a group of films as we have seen for a long time. He has shown the advantage of having a Potter-Bucky type of diaphragm incorporated in the table and adequate power in the x-ray machine to enable fast techniques. I think the surgeons should be more critical of the operative cholangiograms and demand, so far as conditions permit, that the radiologic departments of our hospitals produce

Minnesota Department of Health

HOSPITAL PERSONNEL SHORTAGE

Recently the chiefs of staff of all Minnesota hospitals received a brochure entitled "Meeting Your Hospital Personnel Shortage," published by the Health Resources Advisory Committee of the Office of Defense Mobilization. This topic is of such vital importance today that it warrants serious consideration regardless of the individual hospital's present ability to secure an adequate staff. Dr. Howard A. Rusk, Chairman, Health Resources Advisory Committee, states, ". . . we may well be faced with a national emergency unless steps are taken to make better use of professional nursing skills and to recruit, train and utilize effectively, paramedical personnel and other types of hospital workers."

The brochure outlines the problem of hospital personnel shortages and suggests thirteen ways in which hospitals, physicians and nurses can act to minimize the problem. These suggestions, which have proven successful in many hospitals, call for recognition of the present trends in medical care, objective analysis of traditional staffing patterns and maximum utilization of personnel. Hospitals are called upon to adopt improved methods of recruitment, training and utilization of personnel and continuous in-service training for professional nurses, paramedical personnel and other hospital workers.

Minnesota Takes Action

Three years ago the Minnesota State Medical Association, in conjunction with the Minnesota Hospital Association, the Minnesota Department of Health, the University of Minnesota, the Minnesota Society of Clinical Pathologists and the Minnesota Radiological Society undertook to study the shortage of laboratory and x-ray personnel. This group concluded that there was a need to expand approved training facilities, to establish short courses for aides, to intensify recruitment efforts to fill vacancies in approved courses and to provide refresher training for those presently employed. During the past two years five refresher courses for laboratory technicians and seven for x-ray technicians have been held in various regions of the state under the joint sponsorships of the groups mentioned above and the societies of medical technologists and x-ray technicians. These programs have been successful in reaching many persons unable to attend state meetings, continuation courses, etc., and the subject matter has been tailored to fit the everyday problems of those attending.

Recognizing the need for organized training for medical record workers, the sponsors have joined with the Minnesota Association of Medical Record Librarians to offer a three-day Institute for Medical Record Personnel. The institute, which was held at St. Francis Hospital, Breckenridge, on October 29, 30 and 31, placed emphasis on the basic principles of medical record keeping, the use of indexes and statistics, medical terminology and the Standard Nomenclature of Diseases and Operations.

The nutritionists on the staff of the Minnesota Department of Health have held one-day group meetings for dietary service personnel at four centrally located hospitals in northern Minnesota. Pre-meeting surveys of problems were made and the discussions held on those most pertinent to the particular group. From these meetings it appears that assistance is needed with problems of special diets, menu planning and food purchasing. Similar meetings are being planned for other areas of the state and it is believed that this experience will form the basis for the development of a continuing educational program in conjunction with the Minnesota Dietetic Association. Discussion of the use of the new therapeutic nutrition manual which has been prepared by the Minnesota Dietetic and Home Economics Associations will be included in future meetings. Use of this diet manual tends to simplify the work of the hospital in special diet calculation and to keep the cost of special diets reasonable. This program appears to be especially valuable to those hospitals without a professional dietitian.

The problem of providing anesthesia services in the smaller hospitals is being considered in discussions with interested professional groups. A survey of existing and needed services and personnel will probably be undertaken this fall to develop a basis for approach. The co-operation of all hospitals will facilitate the solution of the questions involved. There has been considerable discussion relative to the possibilities of providing some basic information for hospital and medical personnel on the subject of rehabilitation.

New Courses Instituted

The training of aides or assistants is essential to make maximum use of professionally trained paramedical personnel. In accord with this thinking, a twelve-month course for laboratory aides was established this fall consisting of two quarters of theoretical training at the University of Minnesota and six months' experience in selected hospital laboratories. Although the enrolment in this first course is not large it may well be the forerunner of future courses in other teaching institutions throughout the state. A new approach to the training of x-ray technicians was instituted in July. The course consists of three months' study at the University and a minimum of one year of practical training at an established hospital school of x-ray technique or the x-ray department of a hospital supervised by a radiologist. This program relieves the hospital from the responsibility for didactic training, makes it possible for any hospital with an x-ray department supervised by a radiologist to train technicians and provides the technician with a sound preparation for further training and advancement in the field. Another class will begin in January, 1954. In June, 1953, the Council on Medical Education and Hospitals of the American Medical Association approved the establishment of courses for the training of medical record technicians. At least one Minnesota hospital has applied for approval of such a course.

Recruitment Program Under Way

Undoubtedly, an intensive recruitment program is the key to increasing the supply of paramedical workers. Although nurse recruitment has been organized on a national scale, still more nurses are needed. The recruitment for the paramedical professions in past years was almost entirely limited to the personal contacts of individual training schools and many vacancies existed each year. Those responsible for counseling young people in schools and colleges for the most part, have had little information about the hospital field and the opportunities in these professions. During the past year the state hospital, medical and nursing associations, the Minnesota Department of Health and all the other state organizations representing hospital professions have joined forces to promote recruitment activities. One of the first activities of this group was the development of a four-page brochure which was distributed to high school seniors in Minnesota and adjoining states. Copies were also sent to all physicians and hospitals throughout the state. In addition to the immediate benefit to the participating groups in the exchange of information concerning recruitment techniques and joint promotional activity, the joint committee has focused attention to the need for personnel in these fields. A number of other groups are interested. The Women's Auxiliary to the Minnesota State Medical Association has made recruitment a principal project during the coming year. School health directors and counselors, the State Departments of Education and Employment Security have become interested. Although it is difficult to assess the direct value of programs such as this, several hospital training schools report that they are receiving more inquiries than in former years. A recent publication of the U. S. Department of Labor entitled "The Shortage of Young Women Workers" points out the limited supply of young unmarried women which will exist for a number of years. With jobs of immediate promise open, the pamphlet states, it is difficult for young people to decide on a career which requires several years of additional training. It is necessary, therefore, to bring to these young people an understanding of the future of the professional fields and the rewards and satisfactions in a career in the field of health.

Individual Action Necessary

Minnesota has been alert to the need for action to meet the critical shortage of health manpower. As outlined above there has been an excellent spirit of co-operation between interested organizations at the state level. This co-operation is expected to continue and in those problems which can be approached on a statewide basis, efforts will be made to initiate remedial action. However, the brochure of the Office of Defense Mobilization, "Meeting Your Hospital Personnel Shortages" lists a great many things which can be done by the individual hospital, by the hospital administrators, trustees, physicians and personnel to conserve and to make the most effective use of personnel available The ultimate success of the program suggested lies in its application in every hospital. The success of each hospital in applying the suggested practices must be passed along so that others may benefit by this experience. Co-operation between hospitals is, therefore, imperative. Not only should there be a free exchange of ideas and suggestions but in many instances personnel may also be shared. Highly trained professional personnel often are not utilized to capacity in the smaller hospitals and sharing such services would not only make maximum use of these services but would also permit the smaller hospitals to enjoy them at a cost which it could afford.

A great deal of progress has been made in recognition of the problems existing and in suggesting solutions. It remains for all people in the health professions, individually and collectively, to analyze the situations objectively and institute appropriate actions. Only in making use of every possible means can the objective of providing the personnel for adequate patient care be met.

MINNESOTA ACADEMY OF MEDICINE

(Continued from Page 1171)

satisfactory studies. Until we do have proper physical equipment we are going to continue to give inadequate service at the operating table in respect to residual calculi in the biliary ducts. It is the small intra-hepatic duct calculus that is so hard to find. I had the privilege of visiting the University Hospital at Lund, Sweden, a few years ago and there they have been making every possible effort to search out the residual calculus. With their equipment they are able to produce operative cholangiograms at 1/10th of a second exposure using the Bucky diaphragm and full-powered x-ray generators and it has allowed them to find many calculi remaining in the ducts that otherwise would have been missed. They still find they need to re-operate about 5 to 10 per cent of their stone cases for stones that later dislodge in spite of the fact that at the operation they do a primary cholangiogram and, before closing, a second cholangiogram to see if any residual stones can be detected. It would seem, therefore, that we might do better in our hospitals in having essential equipment available in the operating room for so important a function in support of gall-stone surgery. Dr. Varco has shown us a relatively inexpensive method for operative cholangiography. We are, indeed, grateful to him for this very constructive presentation.

Dr. Carleton B. Chapman, University of Minnesota, (by invitation) gave a talk on "Michael Servetus and the Pulmonary Circulation."

The meeting adjourned.

Robert E. Priest, M.D., *Secretary*

◆ Reports and Announcements ◆

AMERICAN ACADEMY OF GENERAL PRACTICE TO HOLD SIXTH ANNUAL SCIENTIFIC ASSEMBLY

The American Academy of General Practice makes the first official announcement of its Sixth Annual Scientific Assembly which will be held March 22-25, 1954, in Public Auditorium, Cleveland, Ohio. Topflight men as Sir Alexander Fleming, Dr. Howard Rusk, and Dr. E J. McCormick, are headlining the program.

The entire program will be presented by men of equal note and by leaders in the fields to be covered. The Committee on Scientific Assembly, headed by Dr. John Mosher, of Coeymans, New York, promises that these four days will be pleasant, as well as instructive.

A quick look at the program shows symposia on peptic ulcer tuberculosis, headache and dizziness, and antibiotics; a live clinic on rehabilitation procedures, presentations on the commonly missed diagnoses of skin diseases, the almost forgotten woman—the routine multipara, and unnecessary gynecologic surgery, arthritis, anemia, surgical problems, and the reecnt advances in therapeutics, will also be covered.

To supplement the formal lecture program, the Committee is putting together a scientific exhibit section which will include more than sixty exhibits. At least half of them will be original, making their debut at this meeting. All of them will be closely integrated with the lecture program.

A social program is being planned for the wives culminating with a President's Reception, the first the Academy has had, for the entire attendance.

NEW ORLEANS GRADUATE MEDICAL ASSEMBLY

The seventeenth annual meeting of The New Orleans Graduate Medical Assembly will be held March 8 to 11, 1954, headquarters at the Municipal Auditorium.

Eighteen outstanding guest speakers will participate and their presentations will be of interest to both specialists and general practitioners. The program will include fifty-four informative discussions on many topics of current medical interest, in addition to clinicopathologic conferences, symposia, three dimensional surgical motion pictures, round-table luncheons and technical exhibits.

The Assembly has planned another interesting postclinical tour to follow the 1954 meeting in New Orleans. On Sunday, March 14, the group will leave Los Angeles via Pan American World Airways and accommodations have been secured at the Royal Hawaiian Hotel in Honolulu, Island of Oahu.

After an interesting sightseeing schedule, the group will leave on Wednesday, March 17, for the Island of Kauai, where reservations have been made at the Kauai Inn. Visits will also be made to Hilo and the Kona Coast. The party will return to Honolulu for several days prior to sailing on the *S. S. Lurline* on Thursday, April 1. Arrangements have been made for visits to hospitals and for various medical programs.

Details of the New Orleans meeting and the postclinical tour are available at the office of the Assembly, Room 103, 1430 Tulane Avenue, New Orleans 12, Louisiana.

POSTGRADUATE TEACHING FUND FOR GIFT SUBSCRIPTIONS TO HOSPITALS

The International Academy of Proctology announces the establishment of a postgraduate teaching fund to provide gift subscriptions to the *American Journal of Proctology* to 750 of the largest Hospital Libraries in this country and abroad. Inasmuch as the *American Journal of Proctology* is the only official Proctologic Journal in the world, these subscriptions will provide a continuing postgraduate course for interns, residents and hospital attending staffs in all major hospitals.

As a teaching and educational organization, the Academy is pre-eminent in Proctology. The Annual Conventions are literally postgraduate courses, and the Journal has raised the level of Proctology throughout the world.

The International Academy of Proctology recently announced the establishment of a Research Fellowship in Proctology with a grant of $1,200.00 to the Jersey City Medical Center, Jersey City, New Jersey.

MINNESOTA PUBLIC HEALTH CONFERENCE

The Minnesota Public Health Conference held its seventh annual meeting September 24-25, 1953, at the Hotel Nicollet, Minneapolis. The following officers and members of the Executive Committee were named at that time.

Officers.—President—Allan Stone, Saint Paul; First Vice President—S. A. Whitson, M.D., Albert Lea; Second Vice President—Edith Johnson, Minneapolis; Treasurer—Stewart C. Thomson, M.D., Minneapolis; Executive Secretary—D. S. Fleming, M.D., Minneapolis.

Executive Committee.—Irene Donovan, Past President, Saint Paul; Herbert M. Bosch, Minneapolis; Neola Henson, Rochester; D. R. Gillespie, M.D., Saint Paul; Mrs. C. J. Schmitz, Saint Paul; Martin H. Roepke, D.V.M., Saint Paul; W. W. Rieke, M.D., Wayzata.

MIDWINTER SEMINAR IN OPHTHALMOLOGY AND OTOLARYNGOLOGY

The eighth annual University of Florida Midwinter Seminar in Ophthalmology and Otolaryngology will be held at the Sans Souci Hotel in Miami Beach the week of January 18, 1954. The lectures on Ophthalmology will be presented on January 18, 19 and 20, and those on Otolaryngology on January 21, 22 and 23. A midweek

(Continued on Page 1176)

Various factors during pregnancy (intestinal displacement, atony, inactivity) make it virtually impossible for most women to go through the gestation period without constipation.

CONSTIPATION IN PREGNANCY:

Satisfactorily controlled with Metamucil®

Metamucil, with its physiologic principles of "smoothage" and "normohydration," is well tolerated for pregnancy constipation. This bland vegetable colloid may be used throughout the entire nine-month period without fear of forming a "habit" and without irritation to the mucosa.

Greenhill[1] suggests that Metamucil be given every other night. He also recommends that Metamucil be given in conjunction with a proper diet, during the lying-in period of the puerperium.

Metamucil is the highly refined mucilloid of Plantago ovata (50%), a seed of the psyllium group, combined with dextrose (50%) as a dispersing agent. It is accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

MIDWINTER SEMINAR IN OPHTHALMOLOGY AND OTOLARYNGOLOGY

(Continued from Page 1174)

feature will be the Midwinter Convention of the Florida Society of Ophthalmology and Otolaryngology on Wednesday afternoon, January 20, to which all registrants are invited. The registrants and their wives may also attend the informal banquet at 8 p. m. on Wednesday. The Seminar schedule permits ample time for recreation.

The Seminar lecturers on Ophthalmology this year are Dr. W. B. Anderson, Durham, N. C.; Dr. W. P. Beetham, Boston; Dr. W. C. Owens, Baltimore; Dr. A. B. Reese and Dr. M. C. Wheeler, both of New York City. Those lecturing on Otolaryngology are Dr. E. N. Broyles, Baltimore; Dr. H. P. House, Los Angeles; Dr. W. M. McNally, Montreal, Canada; Dr. Dorothy Wolff and Dr. D. Woodman, New York City.

PUBLIC HEALTH NURSE CIVIL SERVICE EXAMINATIONS

Applications for public health nurses' civil service appointments are being accepted at 109 City Hill, Minneapolis. Applicants must be eligible for nurses' registration in Minnesota; must be professionally prepared for public health nursing by "completion of an educational program in nursing approved for public health nursing by the National Nursing Accrediting Service," and in addition, must have a baccalaureate degree or, must have a minimum of one year of experience on the staff of a public health nursing agency rendering a family health service, and offering adequate nursing supervision under the latter; applicants, upon being certified to a position, must plan and carry out a program of study leading to the completion of the requirements for a baccalaureate degree.

Satisfactory evidence of meeting the education and experience requirements should be submitted at the time of filing application.

CONTINUATION COURSE

The University of Minnesota will present a continuation course in *Pediatrics for General Physicians* next January 7 to 9, 1954, at the Center for Continuation Study. Recent advances in the management of common pediatric problems will be stressed. Care of the premature infant will be discussed, and the therapy of burns will be taken up along with many other topics of general interest. The course will be presented under the direction of Dr. Irvine McQuarrie, Professor and Head, Department of Pediatrics at the University of Minnesota.

HENNEPIN COUNTY MEDICAL SOCIETY

Dr. John H. Moe was installed as president of the Hennepin County Medical Society, October 5, succeeding Dr. Claude J. Ehrenberg, who became chairman of the board of directors. Dr. Willis L. Herbert became vice president; Dr. Charles A. Aling, second vice president;

ANNUAL CLINICAL CONFERENCE

CHICAGO MEDICAL SOCIETY

March 2, 3, 4, 5, 1954 • Palmer House, Chicago

DAILY HALF-HOUR LECTURES BY OUTSTANDING TEACHERS AND SPEAKERS on subjects of interest to both general practitioner and specialist.

PANELS ON TIMELY TOPICS.

MEDICAL COLOR TELECASTS.

TEACHING DEMONSTRATIONS.

SCIENTIFIC EXHIBITS worthy of real study and helpful and time-saving **TECHNICAL EXHIBITS.**

The CHICAGO MEDICAL SOCIETY ANNUAL CLINICAL CONFERENCE should be a MUST on the calendar of every physician. Plan now to attend and make your reservation at the Palmer House.

. . . now conveniently located for faster service

You need no longer risk driving through congested traffic to examine new equipment. In this new, modern store you will find complete stocks of instruments and supplies for the physician; model displays of hospital equipment of every type; and a comprehensive range of equipment, apparatus and supplies for the modern medical laboratory. We cordially invite you to visit us at your convenience, or call us for prompt emergency service. Free parking is provided adjacent to building. Telephone: LIncoln 7601.

ALOE
A.S. ALOE CO.
a. s. aloe company OF MINNESOTA • 927 Portland Ave. • Minneapolis 4, Minn.

Dr. Conrad J. Holmberg, secretary-treasurer, and Dr. Tague C. Chisholm, librarian.

Board members include the officers and Dr. Silas C. Andersen, Dr. Ralph H. Creighton, Dr. L. Haynes Fowler, Dr. Thomas J. Kinsella, Dr. Robert F. McGandy, Dr. Robert E. Priest, and Dr. Horatio B. Sweetser, sixth district councilor of the Minnesota State Medical Association.

LINCOLN-LYON COUNTY POSTGRADUATE EXTENSION COURSE

The Lincoln-Lyon County Medical Society launched its forty-eighth semiannual postgraduate extension course at the Atlantic Hotel, Marshall, September 29. The program for the six-week period (one lecture each week) was outlined as follows:

September 29, "Liver Function Tests, and Discussion of Pathological Problems," by Dr. R. W. Kouchy, Department of Pathology, Fairview Hospital, Minneapolis.

October 6, "Urology from a Medical Standpoint. Diagnosis and Treatment of Urinary Tract Infections," by Dr. W. A. Merritt, Mayo Clinic, Rochester.

October 13, "Medical Problems," by O. J. Campbell, Minneapolis, President, Minnesota Medical Association.

October 20, "Doctor-Pharmacist"—courtesy meeting to the Lyon-Lincoln and Minnesota Pharmaceutical Associations, by K. C. Mattison, President, and Henry M. Moen, Executive Secretary.

October 27, "Endometriosis, Diagnosis and Treatment," by Leonard A. Lang, Department of Obstetrics and Gynecology, University of Minnesota Medical School, Minneapolis.

November 3, "Peripheral Vascular Disease," by H. O. McPheeters, general surgeon, specializing in vascular diseases, Minneapolis.

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

Dr. William C. Bernstein, of Saint Paul, was elected president of the Southern Minnesota Medical Association, at the annual meeting, held September 14, in Mankato. Dr. D. P. Anderson, of Austin, was elected vice president, and Dr. Charles Stroebel, of Rochester, secretary-treasurer. Winona was selected for the 1954 annual meeting.

Woman's Auxiliary

FIRST REGIONAL CONFERENCE HELD AT WORTHINGTON

The first of a series of Regional Conferences to be held in many parts of the state under the auspices of the Woman's Auxiliary to the Minnesota State Medical Association was held on Monday, September 21, at Worthington. More than twenty-five women attended the luncheon and afternoon program arranged by Mrs. Henry W. Quist, Sr., of Minneapolis, president of the state organization, and Mrs. O. M. Heiberg of Worthington, regional advisor. They came from all the southwestern counties of the state.

The program which followed the luncheon was designed to bring members of the district up to date on all organization problems and responsibilities and also on the special civic and health programs of particular interest to doctors' wives.

Mrs. Quist presided and welcomed the women on behalf of the state organization. Mrs. Peter S. Rudie, president-elect of the state auxiliary, talked over membership problems, urging all the women present to regard themselves as members of organization committees charged with the duty of bringing in new members and retaining old ones. Mrs. Rudie also asked all auxiliary members to read the *Bulletin of the Woman's Auxiliary to the American Medical Association* and the Handbook and *Today's Health* to keep up to date and urged them, especially, to regard auxiliary membership as a privilege as well as a responsibility.

Mrs. L. J. Leonard, of Minneapolis, addressed the women on the subject of mental health in Minnesota and the part that auxiliaries can play in fostering a co-ordinated and effective program in the state. She said that 25 to 30 per cent of the tax dollar went for maintenance of mental hospitals in Minnesota last year—a staggering sum amounting to considerably more than was spent for all institutions of higher learning in the state—and it went for the care rather than the cure of the mentally ill.

Doctors' wives have a tremendous opportunity to extend public education on mental health, Mrs. Leonard said, and she urged that every local auxiliary put mental health education on its program for this year. She suggested, further, that auxiliary members inform themselves on the subject in study groups, by means of lectures and motion pictures in close cooperation with medical societies and advisors.

The problem of supplying hospitals and medical groups all over the state with trained personnel was presented to the auxiliary members present by Mrs. W. G. Johanson of Saint Paul. Minnesota hospitals are short hundreds of trained people, Mrs. Johnson said, including anesthetists, dietitians, medical record librarians, medical social workers, medical technologists, nurses, occupational therapists, and x-ray technicians. She urged the women to make a new effort to reach all the young people in their communities with information about the opportunities and satisfactions to be had in all these allied medical careers. Especially, she suggested that they secure brochures on the subject for distribution to students in the ninth and tenth grades in their local high schools and inform themselves, also, about scholarships and student loan funds available to qualified applicants from both public and private sources.

Program planning was discussed by Mrs. D. J. Halpern of Brewster. "Community health plans don't just happen," Mrs. Halpern told the women. "Someone has to lay the groundwork and auxiliary members, by the very nature of their organization and association with doctors' organizations, are in a position to offer leadership in working out these plans."

For that reason programs should be suitable for medical auxiliaries, not just for women's clubs, Mrs. Halpern said. She suggested the following subjects for consideration, with the approval of medical advisors: civil defense plans in local areas; legislation reports; rural health; "Health Days" for auxiliaries; American Medical Education Foundation fund raising; cancer; heart; polio; cerebral palsy; the Red Cross blood program. In addition, she emphasized the importance of mental health and of the promotion of training for allied medical careers as subjects for auxiliary consideration. She also suggested that each auxiliary consider the following ten questions as applied to its own local community needs and with a view to the development of its own community work.

1. Who guards your community's health?
2. What agencies and organizations co-operate with the health department?
3. How do you care for the mentally ill in your community?
4. What services are available for medically handicapped children?
5. What medical and vocational rehabilitation programs are available in your community?
6. What is being done to prevent juvenile delinquency in your community?
7. What medical care, social opportunities and recreational facilities are offered to older people in your community?
8. Are health and physical fitness programs in your schools adequate?
9. How well does your community co-operate in safety programs?
10. What resources has your community for the care of the medically indigent?

Mr. Harold Brunn, field secretary of the Minnesota State Medical Association, emphasized for the women the importance of doing everything possible in each auxiliary organization to assist in recruiting personnel for hospitals.

"More trained men and women in the allied medical professions will mean better and cheaper medical service for everybody," Mr. Brunn said. The services of physicians go farther when they have properly trained assistants, he pointed out, and well-manned hospitals can take care of more people at less cost.

Mr. Brunn drew the attention of the doctors' wives to the outstanding job organized medicine has done in disciplining itself and its members. He praised, especially, the institution called the "Grievance Committee," which has been set up in many county medical societies all over the country to investigate patient complaints about medical service and fees. These committees are doing a great deal to build and cement good relations between the doctor and the public and he urged the women present to inform themselves in what their own county medical societies are doing to carry on disciplinary functions among their members and to meet and handle the occasional dissatisfied patient.

Mr. Brunn also urged the women to inform themselves and their fellow auxiliary members on the problems relating to medical care for veterans. It is the doctor's hope, he said, that the best possible care can be provided at government expense for the battle-injured veterans without overloading, at the same time, government facilities and endangering the quality of medical service for the general population.

He urged the women to work for increased membership in their organizations this year, and also for a better informed membership, since auxiliary organizations are regarded by doctors everywhere, as an indispensable aid to good public relations for the medical profession.

BLUE EARTH GROUP PLANS BUSY YEAR

Mrs. O. E. Peltola was guest speaker at the first meeting of the Woman's Auxiliary to the Blue Earth County Medical Society for the 1953-1954 season. The meeting was held October 19 at the home of Mrs. James J. Anderson, president of the organization, in Mankato. Mrs. Peltola's subject was education of the mentally retarded and, especially, recent advances in the field.

Miss Faye Reiger, head of Mankato's Rehabilitation Center and a licensed physiotherapist, addressed the Executive Board of the group at its initial session of the year, October one, at the home of Mrs. Anderson. The work of rehabilitation of the chronically disabled was described; also the usefulness of comparable treatment in easing pain and hastening recovery of patients who are suffering from acute illnesses and are referred by their physicians.

Plans for a busy year in Blue Earth county were made by the board at this meeting. Officers are Mrs. Anderson, president; Mrs. Lawrence M. Hammar, vice president; Mrs. H. Bradley Troost, secretary; Mrs. Robert B. Engstrom, treasurer; Mrs. John J. Eustermann, social chairman; Mrs. Jennings D. M. Sjoding, program chairman; Mrs. William S. Chalgren, public relations. All are from Mankato.

PLAN

Wide Medical Interest in New Knox Gelatine "Eat and Reduce" Plan

Developed and supervised by competent clinical authority, the new Knox "Eat and Reduce" Plan is intended especially for your overweight patients in otherwise normal health.

The plan has been tested on overweight patients with fine results. In addition, many physicians (and their families) have written us about their gratifying personal results with this plan.

The Knox "Eat and Reduce" Plan is a simple, sensible regimen that places no burden of exercise or hunger on the patient. Quite the contrary, it permits three tempting, solid meals daily, plus between-meal feedings. The menus have been carefully selected so as to provide an abundance of vitamins, minerals and protein. Many of the dishes utilize Knox Gelatine, which is, of course, all protein and no sugar — thus being an effective aid in weight reduction.

LEGISLATIVE MATTERS GET AUXILIARY ATTENTION

Mrs. W. R. Schmidt, Legislative Chairman

Secretary Oveta Culp Hobby, of the United States Department of Health, Education and Welfare, believes that legislation to extend social security will have high priority when Congress convenes in January.

The proposal under consideration, which has the support of President Eisenhower, would extend Old Age and Survivors Insurance to 10.5 million more persons, including physicians, dentists and other groups of self-employed.

What does that mean to the medical profession? Under the law, an employer is required to withhold 1.5 per cent of the first $300 of an employe's monthly earnings and match this with a contribution from the employer of an equal amount, making a total of $9. The physician would probably pay the $9 himself.

This payment continues to be made to Social Security every month until the employe has attained the age of sixty-five and retires—or any date beyond the age of sixty-five at which he chooses to retire. The individual is then entitled to receive a monthly payment from the government of $85 per month. When his wife reaches sixty-five she receives a sum of 50 per cent of that paid to her husband or $42.50. Total income per month is $127.50, and this only if the individual retires completely or earns less than $900 per year.

The American Medical Association, American Bar Association, American Dental Association, American Institute of Accountants, National Society of Engineers, American Farm Bureau Federation and virtually all other organizations representing the self-employed favor, instead, legislation of the Jenkins-Keogh bill type which would allow physicians and other self-employed persons to defer income tax payments on a portion of their income (suggested maximum figure $7,500 per year) which would be put into restricted annuity programs for eventual use as a personal retirement fund. At the time of use, of course, it would become subject to taxation as current income, but at a lower rate. Not one cent of such a retirement fund would be paid by the government.

The tax-deferral provision would be of particular benefit to physicians who go through long and costly training periods and whose earnings are compressed into a comparatively short period.

According to latest statistics the average physician begins his practice at the age of thirty-two years. After a period of years of building a practice he reaches a peak earning power which continues for an average of only fifteen years during which he is subject to high income tax which seriously handicaps him in setting up an adequate fund for his later years. Most physicians prefer to ease up their activity rather than to retire completely.

These then are the facts. It is impossible for doctors and their wives to remain apathetic in a matter so

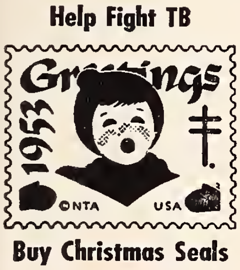
vital. If Auxiliary members take no action at this time others will make the decision for them.

The Treasury Department views the Jenkins-Keogh proposal with disfavor, but many legislators are sympathetic toward it, including Representative Walter H. Judd of Minnesota and Representative Carl Curtis of Nebraska, chairman of a Ways and Means sub-committee now analyzing the Social Security program.

Now is the time for doctors' wives to discuss these plans, to make a choice, and to make certain that legislators are made aware of medicine's views. A personal letter in longhand carries great weight with Senators or Representatives. Do not postpone writing it until it is too late.

MRS. QUIST ASKS MEMBERS TO SUPPORT CHRISTMAS SEALS



"The singing child on the 1953 Christmas Seal asks for your help—to defeat tuberculosis, a disease which threatens his future and that of all children everywhere. Members of our Auxiliary, throughout Minnesota, have taken an active part for many years in helping the Christmas Seal sale through volunteer services of many kinds and in assisting our Christmas Seal organizations in their work. This 1953 Christmas Seal, symbolizing the protection of children from disease, should inspire us to even greater efforts."

This is the appeal in behalf of the 1953 Christmas Seal sale, which begins in Minnesota and throughout the nation on November 16, made by Mrs. Henry W. Quist, Sr., President of the Woman's Auxiliary to the Minnesota State Medical Association.

The present status of the tuberculosis problem in 12 midwestern states was revealed to some 700 public health workers and physicians attending the Mississippi Valley Conference on Tuberculosis in Minneapolis recently (October 15, 16 and 17). A giant chart indicated that in this area with a population of approximately 44,000,000 and 141 tuberculosis sanatoria, there were 7,093 deaths from tuberculosis in 1951 and 27,568 *new* cases of tuberculosis in 1952.

Speakers at the conference emphasized that:

Drugs Are Life-Saving

New methods of treatment—the new drugs and surgery—are saving the lives of many tuberculosis patients who otherwise would have died.

More cases of unsuspected tuberculosis are being found through X-ray surveys of the general population and of special groups, such as the x-raying of all patients admitted to hospitals for any cause.

With *more living patients* being discharged from tuberculosis hospitals to return to their families and the community, there is more work to be done in helping the tuberculosis patient and his family back to normal living.

"As I travel through the state, I am always impressed by the active part our membership is taking in tuberculosis control," Mrs. Quist said. "Auxiliary members serve on Speakers Bureaus giving many groups information about tuberculosis. They help prepare the Christmas Seal letters for mailing. They sell Christmas Seals from booths in stores and post offices. Many of our members attend the annual course for volunteer tuberculosis workers at the University's Continuation Center. We help with the sales of handwork made by tuberculosis patients, usually assuming the entire responsibility for this project.

Efforts Must Be Increased

"Since the protection of the health of our people is one of our basic purposes, we are interested in all of the work being done by our tuberculosis organizations to prevent the spread of this disease. The present situation in tuberculosis control—the fact that the number of living patients has not decreased, and in some places is actually increasing, means that we should increase our efforts to help in this work."

Last year, Christmas Seal Mobile Units gave Minnesota people more than 100,000 free chest x-rays. Tuberculosis associations aided our hospitals in establishing and maintaining a chest x-ray service for all patients and hospital staffs. Thousands of children and adults were given information about tuberculosis. Boards of education were urged to require annual chest x-rays of all teachers. Tuberculin testing of pre-school age children was urged to locate unsuspected sources of infection among adults. These and many other services are made possible by the annual sale of Christmas Seals.

In Memoriam

ARTHUR EDWIN BENJAMIN

Dr. Arthur Edwin Benjamin, a distinguished Minneapolis surgeon and gynecologist for more than sixty years, died at Northwestern Hospital in Minneapolis, Thursday, October 1, 1953. He was eight-four years old.

Dr. Benjamin received his degree in medicine from the University of Minnesota medical school in 1892 and by 1915, after extensive postgraduate study in New York, London and Vienna, he had assumed a position of leadership in the rapidly expanding fields of surgery and gynecology which he held for half a century in Minneapolis.

He was born in Hutchinson, Minnesota, in 1868, in a family of physicians. His grandfather and his father, Dr. John Benjamin of Hutchinson, were both physicians and he is survived by two sons, Edwin G. and Harold G., both of whom are practicing medicine in Minneapolis.

It was in 1915 that Dr. Benjamin became chief of the gynecological section at Minneapolis General Hospital; but he had been associated as a teacher with the medical school since 1890 when he became clinical instructor in gynecology and he remained on the teaching staff as Assistant Professor of Obstetrics and Gynecology until his retirement in 1938, with rank of professor emeritus. He was also a captain in the Army Medical Corps from 1917 to 1918.

During all the years of his teaching and his private medical practice he was associated, often in an executive capacity, with a long list of scientific, professional, civic and humanitarian organizations and he also occupied an established position in the social and cultural life of Minneapolis.

He was a member of the staffs of St. Barnabas and Northwestern hospitals, having served as chief of staff at the latter, and he continued as consultant at Minneapolis General Hospital after his retirement in 1938 as chief of the gynecological section.

He was a former president of the Alumni Association of the University of Minnesota Medical School, a member of the Minnesota Academy of Medicine, the Western Surgical Association, the American College of Surgeons, the Southern Minnesota Medical Association, the Minnesota State Medical Association, the American Medical Association and the Hennepin County Medical Society, of which he was a former president. He was also a member of the committee of five that raised money to purchase the land on which the University hospitals now stand.

Among other associations in which Dr. Benjamin took an active part were the Foreign Policy Association, the Minneapolis Institute of Arts, the Hennepin County Tuberculosis Association, the Minnesota Historical Society and the Associated Charities. He was also a member of the Minneapolis Club, the Minneapolis Executive Club, the Six O'clock Club, and he was a former president of the Professional Men's Club. He was likewise a member of the board of trustees of Plymouth Congregational Church; and he was a Mason, a member of University Lodge, the Scottish Rite, 32nd degree, and the Zuhrah Temple of the Shrine.

The home built by Dr. Benjamin just after his marriage in 1900 at 2222 Blaisdell Avenue in Minneapolis has remained the family home and was, at that time, the first lot sold in Dayton's addition, then a country-side real estate development platted on Blaisdell's farm. Mrs. Benjamin died in 1951.

Dr. Benjamin is survived by his two sons, and two daughters, Alice, who is now principal of Summit School in Saint Paul, and Mrs. Charles J. Hoover of St. Louis Park; also a sister, Mrs. Olive Bacon of San Gabriel, California, and a brother, Dr. Winfred G. Benjamin of Minneapolis, a dentist.

ALPHONSE CYR

Dr. Alphonse Cyr, a pioneer Barnesville physician, died at eighty-one on September 19, 1953, in a Fargo hospital. Dr. Cyr was born in Montreal, Canada, and received his medical degree from Laval University, now the University of Montreal. He came to Minnesota in 1900 and opened his practice in Barnesville in 1906. He remained there, with the exception of fifteen months spent in the armed services during World War I, until his retirement a few years ago because of illness.

Surviving are his wife, two sons, six daughters, thirteen grandchildren and two great grandchildren.

HENRY O. HAGEN

Dr. Henry O. Hagen, who practiced medicine for many years at New Richland, died August 31, 1953, in a St. Peter hospital. He was seventy-seven years old.

Dr. Hagen was born at New Richland and was graduated from St. Olaf College at Northfield and Rush Medical College in Chicago. With the exception of a year spent as captain in the Army Medical Corps during World War I, he practiced medicine in New Richland until his health failed in 1934.

He held membership in the American Medical Association, the Minnesota State Medical Association and the Waseca County Medical Society until the time of his retirement. He was also a member of the Masonic Lodge and of the American Legion.

He is survived by his wife, two sons, L. Winston and Calvin Rodney Hagen, both of Minneapolis, and a daughter, Mrs. P. C. Krupp, of Chicago, and two grandchildren.

ALBERT CONRAD LUNDGREN

Dr. Albert Conrad Lundgren, of Minneapolis, died at Las Vegas, Nevada, September 26, 1953, on the way home from a California vacation.

Dr. Lundgren was sixty-two years old. He was born in Minneapolis and practiced medicine there for thirty-five years. He received his degree in medicine from Marquette University in 1909, spent two years in post-graduate work at the Surgical Institute in Chicago and served his internship at Swedish Hospital in Minneapolis. He practiced for a short time at Nelson, Wisconsin, and then moved back to Minneapolis. His daughter, the former Dr. Olive A. Lundgren, was graduated from the University of Minnesota Medical School and subsequently married Dr. J. Gordon Bateman, now of Long Beach, California.

Dr. Lundgren was a member of the American Medical Association, the Minnesota State Medical Association and the Hennepin County Medical Society. He was also a member of the Arcana Masonic Lodge, Anchor chapter, Darius Commandery and Zuhrah Temple of the Shrine.

He is survived by his wife and daughter, two sisters, Margaret Lundgren of Minneapolis and Mrs. William Peterson of Long Beach, California, and a brother, Alfred, of Los Angeles, California.

JOHN BANKS ROBERTSON

Dr. John Banks Robertson, a pioneer physician who practiced medicine for more than forty years in Cottonwood, died at the age of eighty-six on September 22, 1953, in Minneapolis. Dr. Robertson was the first practicing physician in Cottonwood and it was his proud boast that he had delivered 3,400 babies in a period of forty-two years and lost only one mother. After his retirement, he moved to Minneapolis in 1935 and continued, in spite of disability, to assist from time to time in the practice of his son, Dr. Murl John Robertson, now a medical officer with the Veterans Administration at Clinton, Iowa.

Dr. Robertson was born at London, Minnesota, in 1866. He was left an orphan at the age of six and his life was one of struggle and hardship. He secured an education in spite of difficulties, however, and was graduated from Rush Medical College in 1892 after attending both Carleton College and the University of Minnesota. He was licensed to practice in Minnesota in 1893 and went directly to Cottonwood. During nearly half a century of practice there, he served his community as mayor, councilman and member of the board of education. He served for thirteen years as Lyon County coroner and he was also an elder of the Cottonwood Presbyterian Church, having conducted Sunday school classes in the depot before his church was built.

At the outbreak of World War I, Dr. Robertson entered the service, the first member of the Lyon-Lincoln Medical Society to enlist, and served as captain in the Medical Corps until 1919. After that, he returned to his practice in Cottonwood and remained there until illness forced him to retire in 1936.

Dr. Robertson was a member of the American Medical Association, the Minnesota State Medical Association and of the Lyon-Lincoln County Medical Society. He also belonged to the Masonic order Scottish Rite, Zuhrah Shrine Temple and the American Legion.

He is survived by a daughter, Mrs. J. L. Anderson of Marshall, and three sons, L. J. Robertson of Elmwood, Illinois; Glen W. Robertson of Minneapolis, and Dr. Murl Robertson.

According to news reports, a Communist cell was discovered in the Iranian-American Health Service at Tehran. The organization, "Health Co-operative," is operated jointly by the U. S. Point Four Technical Assistance Fund and the Iranian Health Ministry. It employs about fifty Americans and several hundred Iranians.

The Birches Sanitarium, Inc.

2391 Woodland Avenue
Duluth 3, Minnesota

A hospital for the care and treatment of Nervous and Mental disorders. Quiet, cheerful environment. Specially trained personnel. Recreational and occupational therapy.

Dr. L. R. Gowan, M.D., M.S., Medical Director

Of General Interest

Dr. John Schut, who has been associated with the staff of the Anoka State Hospital, was married to Mary Ann Reisdorfer, August 25, in Robbinsdale. Dr. and Mrs. Schut live in Galesburg, Illinois, where Dr. Schut is associated with Dr. Harold Himwich in the study of brain metabolism.

* * *

Dr. Milton Kaiser, of New Ulm, was the speaker at the opening series of Parenthood Classes which began September 28, at the Union Hospital in New Ulm. The classes have been planned as part of the maternal and child health programs of Brown County under the direction of Ruth Johnson, County Health Nurse.

* * *

Dr. Henry Hutchinson, superintendent of the Moose Lake State Hospital and the mayor of Moose Lake, gave the welcoming speech at the fourteenth annual meeting of the Minnesota Welfare Conference, Region I, held at the Moose Lake State Hospital, September 24. Included on the speakers program for the morning session was **Dr. John E. Haavik,** Duluth psychiatrist. **Dr. K. W. Douglas,** superintendent of the Sandstone State Hospital, spoke in the afternoon on "Minnesota Plan for the Treatment of Alcoholism."

* * *

Dr. L. W. Johnsrud, of Hibbing, has been named Medical Division chairman of the Hibbing General Hospital Expansion fund.

* * *

Dr. R. E. Barnes, who recently completed his internship at Santa Clara County Hospital, San Jose, California, began practice in Aurora, in late September.

* * *

Dr. Louis C. Jensen, chief of physical medicine at the Minneapolis Veterans Hospital, retired September 30, after thirty-two years and seven months in federal medical service. Dr. Jensen has served in three different administrative agencies—the United States Public Health Service, Veterans Bureau and Veterans Administration, all of them allowing him to continue living in Minneapolis.

* * *

Dr. Benjamin M. Fuller, recently released from a tour of active duty as a medical officer at Scott Air Force Base, Illinois, has resumed his practice in Saint Paul.

* * *

Dr. George N. Kraemer, of Mankato, opened a part-time office in Nicollet, September 22, using the office space formerly occupied by **Dr. M. H. Larson.** Dr. Kraemer completed a three-year residency in surgery at Minneapolis General Hospital before beginning practice in Mankato in 1953.

Dr. Harold Elliott, formerly of New York, began medical practice in Hayfield, October 1. Dr. Elliott recently spent seven years in Bimbur, Nigeria, Africa, where he supervised the erection of a hospital for the Evangelical United Brethren.

* * *

Two new physicians recently joining the staff of the Anoka State Hospital are **Dr. G. H. Adkins** and **Dr. H. L. Terry.** Dr. Adkins has been associated with the Faribault State School and, more recently, with the Sandstone State Hospital. Dr. Terry has been with the State Hospital at Pueblo, Colorado, and later with the Pueblo Nervous and Mental Hygiene Clinic, at Pueblo, which he closed when he came to Anoka.

* * *

Dr. S. A. Whitson, of Albert Lea, was elected first president of the Minnesota Public Health Association, and **Dr. Stewart Thomson,** University of Minnesota, treasurer, at the group's annual conference held at the Nicollet Hotel, Minneapolis, September 25. **Dr. W. W. Rieke,** Wayzata, was among those named to the executive committee.

* * *

Dr. Maurice Meller, originally from Poland, joined the Brainerd Clinic, in September, where he will practice internal medicine. Dr. Meller was graduated from the Royal University of Medicine and Surgery, Prama, Italy, and practiced in Prama and in the International Settlement in Shanghai, China, for nine years before coming to the United States in 1948. Since coming to the United States, Dr. Meller has done postgraduate work in the French Hospital in San Francisco, California, and at the Eitel and Abbott Hospitals, in Minneapolis.

* * *

Federal funds, which represent 54 per cent of the income of the Minnesota State Health Department, have been reduced by some $166,000, making retrenchment measures necessary. **Dr. A. J. Chesley,** State Health Officer, said that along with the reduction in staff, the venereal disease and tuberculosis control programs will be markedly curtailed.

* * *

Dr. Joseph Brennan, staff member of the Duluth Clinic, Duluth, spoke at a noon luncheon meeting of the Duluth Kiwanis, September 9. Dr. Brennan, who was born on the Island of Malta, spoke on his experiences in the British Navy in which he served during World War II. He was a prisoner of both the Germans and Italians but escaped to work with the underground in Italy.

* * *

Dr. Robert E. Hansen, of the Adams Clinic at Hibbing, presented a paper at the staff meeting of the Mayo Clinic, Rochester, September 9. Dr. Hansen

Will you have any tax-exempt income in 1953?

TAXABLE INVESTMENT INCOME is your most expensive income since, under our progressive income tax system, it is this *"Top Layer"* income that pays the heaviest taxes.

There is little a taxpayer can do about his taxable income received from:

Professional Income
Salaries
Business Profits
Dividends from Business

These are main sources of revenues—your basic income. *"Top Layer"* income, however, your investment income, is something that you definitely have control over in that it is within your power to give such income either a "taxable" or a "tax-free" status.

The income from investments which is subject to taxation actually shrinks whenever your professional income increases and forces this taxable *"Top Layer"* income into a higher bracket. In other words, the more your active earning power is increased, the greater percentage of your taxable investment income will be paid out in taxes.

Interest income on Municipal Bonds is exempt from all present Federal Income Taxes and consequently provides a *"Top Layer"* income that remains constant regardless of changes in other income or tax rates.

The two following examples clearly demonstrate the effect of Federal Income taxes on *"Top Layer"* income:

If you are in the $12,000-$14,000 individual income tax bracket and purchase an investment to yield 4.50% you will realize about 2.35% if the income is taxable but will receive the full 4.50% if it is not taxable.

If you are in the $20,000-$22,000 individual income tax bracket and purchase an investment to yield 4.50% you will realize about 1.70% if the income is taxable but will receive the full 4.50% if it is not taxable.

We shall be pleased to send you information and descriptive circulars pertaining to Municipal Bonds.

recently rejoined the Adams Clinic staff after a two-year fellowship at the Mayo Clinic. At the staff meeting he presented a paper on "The Effect of Heparin and Intermittent Claudication Which Results from Arteriosclerosis."

* * *

At the request of **Dr. H. Kleinman**, senior physician at the Red Lake Indian Hospital, Dr. Elaine Updyke, head of the streptococcus laboratory of the Federal Communicable Disease Center at Atlanta, Georgia, and Dr. Ceci Reinstein, an epidemiologist, also from the Center, spent some time in September doing research on the large number of cases of nephritis occurring among reservation children. **Dr. A. J. Chesley**, Minnesota State Health officer, accompanied them to Red Lake.

* * *

An American Cancer Society grant of $75,000 to the University of Minnesota for cancer research was announced by **Dr. C. G. Uhley**, of Crookston, president of the Minnesota division of the American Cancer Society, in September. This is the largest institutional grant ever made to the University by the society.

Among the physicians doing research work on group projects are:

Dr. Maurice B. Visscher—the chemistry of cancer and the role of sulfhydryl compounds;

Dr. Roy G. Holly and **Dr. John L. McKelvey**—radium treatment of cancer of the uterus;

Dr. Bernard Zimmerman and **Dr. Claude R. Hitchcock**—statistical studies in the tumor clinic and follow-up of patients;

Dr. James R. Dawson—human cancer studies with newly developed methods;

Dr. W. D. Armstrong—hormones in human and animal cancer;

Dr. Charles M. Nice, Jr.—irradiation treatment of lymphoid tumors;

Dr. Leo G. Rigler and **Dr. Richard L. Varco**—methods of early diagnosis of lung cancer;

Dr. Robert A. Ledner and **Dr. Donn G. Mosser**—x-ray effects on tumor-bearing tissues;

Dr. Owen H. Wangensteen, Dr. William D. Kelly, and **Dr. Edwin L. Brackney**—search for an intravenious dye as a cancer detection agent and technical problems in gastric and esophageal cancer surgery;

Dr. Claude R. Hitchcock—study of dietary production of anemia and pre-cancerous conditions in swine;

Dr. Bernard Zimmerman and **Dr. Claude R. Hitchcock**—clinical, endocrine and metabolic studies relating to cancer surgery and surgical removal of adrenal glands;

Dr. Claude Hitchcock—a study of effects of gasoline engine exhaust fumes and fumes from heated tar on incidence of lung cancer in mice;

Dr. Byrl J. Kennedy—treatment of breast cancer with hormones and radiation.

Lectures, symposia, clinicopathologic conferences, round-table luncheons, three-dimensional surgical motion pictures, medical motion pictures and technical exhibits.

(All-inclusive registration fee—$20.00)

THE POSTCLINICAL TOUR TO HAWAII BY PLANE AND SHIP—MARCH 14-APRIL 6

For information concerning the Assembly meeting and the tour write Secretary, Room 103, 1430 Tulane Ave., New Orleans 12, La.

Dr. J. M. Hermanson, of Valley Springs, South Dakota, left his practice there to accept a residency in obstetrics and gynecology at Northwestern Hospital in Minneapolis.

* * *

Dr. J. Allen Wilson, Saint Paul, was the first speaker on the University of Minnesota Extension service seminar on "Gastroenterology," which began September 22, in New Ulm. Dr. Wilson's topic was "Diagnosis and Management of Upper Gastrointestinal Disorders."

* * *

Dr. L. J. Thill, recently separated from military service, became associated in practice with **Dr. M. B. Dahle,** of Olivia. Dr. Thill, a graduate of Marquette University, Milwaukee, Wisconsin, interned at St. Joseph's Hospital, Saint Paul, and had practiced in Indiana.

* * *

Dr. A. J. Olson, of Owatonna, spoke on the doctor's attitude on caring for polio patients in the home at the Public Health In-Service Education meeting on "Care of the Polio Patients in the Home," held at the recreation center in Owatonna, September 15.

* * *

Dr. Robert Barr and **Dr. Helen Knudsen,** of the State Health Department, inspected the new Union Hospital in New Ulm, September 9.

Dr. Tague Chisholm, Minneapolis, spoke on causes of childhood accidents, September 25, to the persons attending the Minnesota Public Health Conference at the Nicollet Hotel in Minneapolis.

* * *

Dr. Gordon E. Lee and **Dr. Robert Letson** joined the Elsey Clinic in Glenwood, in October. Both physicians are graduates of the University of Minnesota Medical School. Dr. Lee spent his early years at Fergus Falls, where his father practiced medicine for many years, and Dr. Letson lived in Alexandria most of his adolescent years, so both are natives of the area.

* * *

Dr. Charles M. Jessico, Duluth neurologist and psychiatrist, gave the concluding speech at the twelfth annual Faculty Institute held at the College of St. Scholastica, Duluth, September 10 and 11. Dr. Jessico's topic was "Mental Hygiene for Educators."

* * *

Dr. Joseph M. Ryan, chief of medicine and chairman of the isotope committee at St. Joseph's Hospital, Saint Paul, and **Dr. Elmer C. Paulson,** Worthington, attended a two-week session held in Oak Ridge, Tennessee, in September, devoted to studying the techniques of using radioisotopes in medicine.

* * *

Dr. H. L. Stemsrud, of Alexandria, was named head of the medical advisory committee of the Douglas County Chapter of the National Association for Infantile Paralysis, at the annual meeting held at the Garden Center, Alexandria, September 17.

* * *

Dr. C. L. Sherman, of Luverne, was the guest of honor at a reception given by the Luverne Chamber of Commerce, September 24. The evening, designated as "Dr. Sherman Night," commemorated the physician's fiftieth anniversary of coming to Luverne to practice medicine. The program included a talk by **Dr. E. Mendelssohn Jones,** secretary of the State Medical Board.

The following resolution was passed by the Southwestern Minnesota Medical Society in recognition of Dr. Sherman's service in the medical profession and community:

Whereas Dr. Charles L. Sherman has completed fifty years of outstanding service to his community, and

Whereas he has been for over fifty years an esteemed member of the Southwestern Minnesota Medical Society, during which period he has served one term as President, and

Whereas he has performed invaluable service as a member of the Minnesota State Board of Medical Examiners since 1927 to the present, and

Whereas he has served for thirty-nine years as President of the Board of Commissioners of Southwestern Minnesota Sanatorium, and

Whereas throughout these many years of distinguished and faithful service he has won the esteem and affection of the citizens in his community, as well as his colleagues in the practice of medicine,

Now therefore be it resolved that the Southwestern Minnesota Medical Society express to him their highest praises and deepest appreciation for the service he has rendered to humanity and his uplifting of the profession of medicine in his community and state, and

Be it further resolved that a copy of this resolution be given to Dr. Sherman and also that a copy of it be spread upon the records of the Society.

Resolutions Committee
C. A. Williams, M.D.
C. R. Stanley, M.D.
B. M. Stevenson, M.D.

nal medicine at the Veterans Hospital, Minneapolis. **Dr. C. W. Truesdale** will conduct the Glencoe Clinic alone until he can find an associate.

* * *

Dr. H. R. Basinger, of Mountain Lake, was received as a member in the International College of Surgeons, September 17, at Carnegie Hall, New York, New York.

* * *

Dr. R. W. Gifford, of the Mayo Clinic, participated in a symposium on hypotensive drugs sponsored by the Massachusetts General Hospital in Boston, September 14 and 15.

* * *

Dr. Nelson Bradley, superintendent of the Willmar State Hospital, was granted a leave of absence, beginning October 1, to take advanced studies in the field of neuropsychiatry at Pittsburgh University. **Dr. Kenneth Douglas,** of the Standstone State Hospital, was named acting superintendent of the Willmar State Hospital, during Dr. Bradley's absence. He will continue to act as superintendent of the Sandstone Hospital also.

* * *

Dr. Raymond Boyce, who recently completed a residency at St. Mary's Hospital, Minneapolis, left for Rapid City, South Dakota, in September, to begin the practice of medicine.

* * *

Dr. William C. Bernstein, of Saint Paul, was elected president of the Southern Minnesota Medical Association, at the association's annual meeting, held September 14, in Mankato. **Dr. D. P. Anderson,** of Austin, was elected vice president, and **Dr. Charles Stroebel,** of Rochester, secretary-treasurer. Winona was selected for the 1954 meeting.

* * *

Four Minnesota physicians who were guest speakers at the eighty-eighth annual meeting of the Michigan State Medical Society, held in Grand Rapids the week of September 19, were: **Dr. Leo G. Rigler,** radiology department chief, University of Minnesota; **Dr. J. A. Bergen,** gastroenterology department chief, Mayo Clinic, and professor of medicine at the Mayo Foundation; **Dr. Norman M. Keith,** professor emeritus of medicine at the University of Minnesota and consultant emeritus in medicine at the Mayo Clinic; **Dr. William L. Benedict,** professor emeritus of ophthalmology at the Mayo Foundation.

* * *

A bronze plaque honoring the memory of **Dr. Alfred W. Adson,** pioneer in neurosurgery in the midwest, was unveiled in the operating room suite of St. Mary's Hospital, Rochester, September 9. **Dr. Winchell McK. Craig,** of the Mayo Clinic, dedicated the plaque to the memory of Dr. Adson, who died in 1951. Other plaques in St. Mary's commemorating physicians are those of **Dr. Robert D. Mussey,** founder of the fifth floor section of the obstetric service, and **Dr. Melvin S. Henderson,** for his pioneer work in orthopedics.

Dr. J. Y. Feinstein, of Minneapolis, was among the guest speakers at the fourth annual convention of the American Association of Nursing Homes, held in Minneapolis, the week of September 2.

* * *

Dr. Henry Hutchinson, superintendent of the State Hospital at Moose Lake, addressed the Eveleth school teachers at an opening day workshop, September 8.

* * *

Dr. J. R. McDonald, of Rochester, spoke at the regular meeting of the Rochester Odd Fellows Lodge.

* * *

Dr. J. Grafton Love and **Dr. G. J. Thompson,** of the Mayo Clinic, presented papers at the meeting of the International College of Surgeons, held in New York, the week of September 14.

* * *

Dr. C. W. Truesdale, of Glencoe, was named County Coroner by the board of commissioners, September 10. He replaces **Dr. H. C. Goss,** who recently moved to Tucson, Arizona.

* * *

Dr. William Kosiak, chief of staff at the Community Health Center, Two Harbors, was a guest speaker at the annual convention of the CIO, held in Saint Paul, September 18.

* * *

Dr. Walter Valentine, of Tracy, presented a paper on the nursing situation in Minnesota, at the meeting of the Southern Minnesota Medical Association, held in Mankato, September 14.

* * *

Dr. I. G. Wiltrout, of Oslo, recently was presented with a new automobile by the Oslo American Legion Post, in recognition of his services to the community.

* * *

Dr. Phillip R. Beckjord, a former physician of Willmar, has been assigned to the faculty of the Army Medical Service Graduate School at the Walter Reed Army Medical Center, Washington, D. C.

* * *

Fire, apparently caused by defective wiring, damaged one wing of the Red Lake Indian Hospital, September 3. All patients were safely evacuated to surrounding homes. **Dr. Herman Kleinman** and **Dr. Samuel Silverman** are the physicians in charge of the hospital.

* * *

Dr. James T. Priestly, of the Mayo Clinic, participated in the joint meeting of the Rocky Mountain Medical Conference and the Utah State Medical Association, held in Salt Lake City, the week of September 8. Dr. Priestly served as a member of a panel discussion and gave two talks—"Surgical Lesions of the Adrenal Glands" and "Carcinoma of the Stomach."

* * *

Members of the administrative and professional staffs of twenty state institutions met at Rochester, September 10, to discuss current therapy and facili-

ties. **Dr. Magnus Petersen,** Rochester State Hospital superintendent, **Dr. Henry Dodge, Jr.,** and **Dr. Reginald Bickford,** of the Mayo Clinic, and **Dr. C. W. Sem-Jacobson** and **Dr. Jorge A. Lazarte,** of the Rochester State Hospital staff, reported on intracerebral electography. **Dr. Adelaide M. Johnson,** Mayo Clinic psychiatrist, spoke on "The Family and Its Attitudes."

* * *

Dr. M. W. Dobson, who recently completed a residency in surgery at the General Hospital of the University of Alberta at Edmonton, Canada, joined **Dr. R. G. Hassett** and **Dr. Joseph Von Drasek** in their practice in Mankato, in September.

* * *

Dr. Richard Allison DeWall, who recently completed his internship at the United States Public Health Service Hospital, Staten Island, New York, joined the Mork Clinic at Anoka, September 1.

* * *

The Journal of the American Medical Women's Association paid tribute, in a recent issue, to **Dr. Nellie O. N. Barsness,** of Saint Paul. Dr. Barsness, one of the first women physicians in Minnesota, has practiced medicine for over fifty years.

* * *

Dr. G. Charles Wilcox, formerly in practice with **Dr. C. S. Strathern,** in St. Peter, moved to Wood Lake, October 1, to begin practice in a new clinic building constructed by the people in the town and surrounding community.

* * *

Dr. Jack F. Haas, who recently completed his internship at Ancker Hospital, Saint Paul, became associated with **Dr. Glenn E. Nelson** at the Fairfax Clinic, Fairfax, August 1.

* * *

Dr. L. O. Underdahl, of the Mayo Clinic, addressed the members of the Ontario Medical Association at their district meeting held at Fort William and Port Arthur, Ontario, the week of September 8. Dr. Underdahl's subject was "Myxedema as Compared With Low Basal Metabolic Rate Without Myxedema." He also participated in several clinics and clinico pathologic conferences.

* * *

Dr. Martin Nordland, of Minneapolis, was recently named to the Board of the First Robbinsdale State Bank.

* * *

Dr. L. W. Morsman, of Hibbing, reported on plans for the million dollar hospital expansion campaign at Hibbing, at a meeting of the Chamber of Commerce, held August 25.

* * *

Dr. Aylmer Foster-Carter, medical superintendent of the Brompton Hospital Sanatorium, London, England, was a guest on the Doctor's Roundtable over

WCCO-TV, Sunday, September 13, with Dr. E. A. Boyden, professor of anatomy, and **Dr. J. Arthur Myers**, professor of preventive medicine, at the University of Minnesota.

* * *

Plans are being made to expand facilities at Children's Hospital, Saint Paul, following the recommendations summarized in a report to the institution's board of trustees from **Dr. Guy W. Brugler**, administrator of Boston Children's Medical Center. Dr. Brugler made a survey of the hospital and its facilities last summer.

* * *

Among the "newsmakers of the future" in the Minneapolis community were **Dr. Robert A. Good**, associate professor of pediatrics; **Dr. C. Walton Lillehei**, associate professor of surgery, and **Dr. Lewis Thomas**, professor of pediatrics, all of the University of Minnesota. The three physicians were included in a group of 100 men between the ages of twenty-five and forty selected by a committee of "senior citizens" as representatives of future leadership. The project was sponsored by the Minneapolis Chamber of Commerce and *Time Magazine*.

* * *

Capt. Alexander Boysen (MC), formerly of Pelican Rapids, was among the prisoners of war recently released and returned from Korea.

* * *

Dr. Owen H. Wangensteen, chief of surgery at the University of Minnesota, spoke on the proposed cancer research clinical institute, at a fund-raising campaign meeting of leaders of Veterans of Foreign War groups, held in Coffman Memorial Union, University of Minnesota, September 20. The proposed building will include eleven beds, five chemical laboratories, one pathology laboratory, one radioisotope laboratory, three animal laboratories, a diet kitchen, staff library, and conference rooms.

On October 4, Dr. Wangensteen was one of four Fellows of the American College of Surgeons participating in a radio panel discussion of "What's Next in Surgery?" broadcast from Chicago, during the thirty-ninth clinical congress of the American College of Surgeons.

* * *

Dr. C. B. Will, of Bertha, attended a Public Relations Convention held in Chicago, September 2 and 3.

* * *

Dr. L. H. Blattspieler, recently of Lincoln, Nebraska, joined the staff of the Worthington Clinic as radiologist in September, succeeding **Dr. Elmer Paulson.** Dr. Blattspieler was graduated from the Nebraska College of Medicine where he also did graduate work in radiology.

* * *

Dr. Arvid J. Houglum, recently released from active duty with the Air Force where he was serving in Japan and Korea, joined **Dr. A. S. Midthune** in his practice in Lake Park, in October. Dr. Houglum is a graduate of the University of Minnesota Medical School and completed his internship at Denver General Hospital, Denver, Colorado. During World War II, from 1943 to 1946, Dr. Houglum served with the Air Corps in the South Pacific.

* * *

Dr. Otto C. Phares, of St. Cloud, was guest speaker before the joint meeting of the Wright County Medical Society and the staff of the Buffalo Memorial Hospital, held October 6, in Buffalo. Dr. Phares' topic was "Common Urinary Tract Infections and Their Treatment."

* * *

Dr. Dean J. Hempel, who recently completed his internship at Minneapolis General Hospital, joined **Dr. Harold W. Hermann**, of Minneapolis, in the practice of pediatrics.

* * *

Dr. S. W. Lipinski, a graduate of the Northwestern University School of Medicine, upon completing a year's residency in surgery at the University of Minnesota, has become associated with the Mesaba Clinic, Hibbing, where he will engage in surgery and general practice.

* * *

Dr. Bayard T. French, a graduate of the University of Iowa School of Medicine, upon completion of his internship at the St. Luke's Hospital, Duluth, has

entered general practice in Chisholm, in association with the Adams Clinic.

* * *

Dr. Robert E. Hansen has joined the Adams Clinic, Hibbing, where his practice will be limited to internal medicine. He recently completed a fellowship in internal medicine at the Mayo Clinic in Rochester.

* * *

An article about the **one-hundredth annual meeting** of the Minnesota State Medical Association, the centennial issue (May, 1953) of Minnesota Medicine, and the centennial celebration of St. Joseph's Hospital, appeared in a recent issue of *Minnesota History,* published by the Minnesota Historical Society.

* * *

Dr. F. D. Bucher, formerly of Starbuck, is now serving with the United States Navy aboard the U.S.S. Olmsted. He writes that the U.S.S. Olmsted is named after Olmsted County in Minnesota.

* * *

Dr. James L. Benepe, of Saint Paul, has been chosen as delegate from his Alma Mater, Washington University of St. Louis, Missouri, to the inauguration of the new president of Hamline University, Paul H. Giddens, October 9, 1953.

* * *

The Committee on Tuberculosis of the State Medical Association, all members of committees on tuberculosis of local medical societies throughout the state, Governor C. Elmer Anderson and other interested persons were guests at a dinner meeting of the Minnesota Tuberculosis and Health Association, 614 Portland Avenue, Saint Paul, October 9. A plan for immediate action leading to the accreditation of the entire eighty-seven counties of Minnesota was drawn up at this meeting.

* * *

Dr. Owen H. Wangensteen, chief of the University of Minnesota's surgery department, has been selected to serve on the National Advisory Heart Council. Announcement of his appointment was made November 3 by Surgeon General Leonard A. Scheele of the United States Public Health Service.

As a member of the National Advisory Heart Council, Dr. Wangensteen will advise and make recommendations to the Surgeon General on programs on the National Heart Institute, established by Congress through the National Heart Act in 1948. This is one of the seven National Institutes of Health at Bethesda, Maryland, main research arm of the Public Health Service.

A fifteen-member group composed of outstanding leaders in medicine, science, education and public affairs, the Council was also established by the National Heart Act as official advisory body for the National Heart Institute. The Council reviews requests from non-federal institutions and individuals for research and teaching grants in the field of diseases of the heart and circulation. The group is the recommending authority for these grants which are awarded, from funds as appropriated by Con-

gress, by the Surgeon General after they have been recommended by the Council for approval.

In addition to appointed members of the National Advisory Heart Council, there are three ex-officio members representing the Public Health Service, Veterans Administration, and Department of Defense. The Council meets three times a year at the National Institutes of Health in Bethesda, Maryland, a suburb of Washington, D. C. Its next meeting is scheduled for November 19-21, 1953.

HOSPITAL NEWS

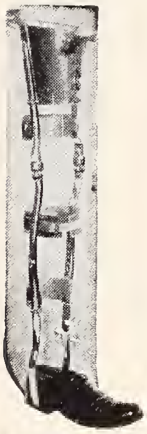
The **Chisholm Memorial Hospital**, a 30-bed, 12-bassinet new public supported institution, was dedicated on September 27, 1953, and will officially open in the latter part of October. This hospital will be operated by a Chisholm Memorial Hospital corporation. J. E. Janzen is administrator. P. H. MacFarlane, M.D., will be the first Chief of Staff.

* * *

A $1,000,000.00 expansion fund campaign to finance construction of a 100-bed addition to the **Hibbing General Hospital**, Hibbing, Minnesota, is under way. The major mining producers in the area have been asked to contribute $700,000. The balance of the goal is to be raised by public solicitation. When the new addition is completed, the hospital will be a 250-bed institution.

* * *

Dedication ceremonies for the new $1,800,000 addition to **St. John's Hospital**, Saint Paul, were held September 27. The new unit, along with a completely revamped and remodeled older portion, gives the institution 165 beds. Much new equipment has been purchased.



RELIABILITY!

For years we have maintained the highest standards of quality, expert workmanship and exacting conformity to professional specifications . . . a service appreciated by physicians and their patients.

Prompt, painstaking service

Buchstein-Medcalf Co.
223 So. 6th St. Minneapolis 2, Minn.

The principal dedication speech was given by the Reverend John Schumacher, of Buena Park, California, former member of the board of directors and long identified with the activities of the hospital. Others on the program included Dr. Robert N. Barr, Minnesota State Health Department; Dr. C. Kenneth Cook, chief of staff; Dr. F. J. Plondke, founder of St. John's; Miss Magdalena M. Rau, superintendent for forty-two years, now retiring, and Carl AveLallemont, the newly appointed administrator.

* * *

The Minneapolis Veterans Administration Hospital, 54th Street and 48th Avenue S., Minneapolis, opened its doors for public inspection of its new 480-bed building, August 30. The new eight-story building was constructed at a cost of $6,270,278. Dr. John A. Seaberg, hospital manager, said that plans are being made to renovate the older buildings in the hospital unit. When this is completed, a total of 1,019 beds will be available for treatment of disabled veterans of the Upper Midwest.

* * *

Dr. Rudolph Hultkrans, of Minneapolis, was elected president of the **Northwestern Hospital** medical staff, succeeding Dr. William Hanson. Dr. Harold Miller, Minneapolis, was elected vice president, and Dr. Robert Priest, Minneapolis, secretary-treasurer.

BLUE CROSS-BLUE SHIELD PLANS

Dual claims for surgical or medical care of the same illness or condition are the source of increasing payment problems and physician dissatisfaction. Although different clauses of the contract control many of the situations which arise, partial treatment of a condition by two different doctors, insufficient information for proper interpretation or evaluation of a claim and delayed filing of claims are responsible for many of the difficulties experienced.

Among the pertinent contract clauses, the one which provides that when two or more physicians render

HOMEWOOD HOSPITAL is one of the Northwest's outstanding hospitals for the treatment of Nervous Disorders—equipped with all the essentials for rendering high-grade service to patient and physician.

Operated in Connection with
Glenwood Hills Hospitals

HOMEWOOD HOSPITAL
Corner Penn and Plymouth Avenues North

medical service simultaneously, benefits shall be provided for the services of only one physician, is the most limiting. However, the clause pertaining to medical care during a surgical or obstetrical admission is almost as clear-cut in its limitations. This clause states that medical services are not generally available simultaneously with surgical or obstetrical services except in the event of serious medical complications. Under these circumstances, medical allowances may be paid if treated by a physician other than the surgeon or obstetrician, or, if treated by the surgeon or obstetrician, medical services are not payable during pre- or post-operative, or pre- or post-partum periods.

Other contract clauses clearly exclude payment for medical services before and after surgery, and also before and after obstetrical deliveries when such services are rendered by the surgeon or obstetrician, respectively. These clauses in many instances prevent the payment of services rendered before or after delivery or surgery by a doctor other than the obstetrician or surgeon if the medical services are for conditions related to pregnancy or the condition for which surgery is performed.

Though the restrictive phrase, "a bona fide and urgent need," in the contract clause pertaining to consultation has been presented before, the limiting portion of the definition of emergency medical care requires consideration. In this clause, emergency medical services are defined as medical services of an urgent nature rendered at a time when the life or health of the patient is in immediate and serious danger. According to this definition, claims for emergency medical care which involve night calls, severe pain or great distress of the patient but no serious threat to the patient's life are not eligible for the fees of emergency medical care.

With these controlling provisions of the contract, delayed filing of claims often leads to paying the wrong doctor because a claim for the same service has already been paid to another physician. In such instances it is often necessary, in order that the claim be paid properly, to ask for a refund from one doctor before payment can be sent the second one. Such actions often give rise to dissatisfaction which could easily be avoided if other physicians who render care listed on the Medical Service Report, or if both physicians would submit claims simultaneously.

Blue Shield's very purpose is to pay all claims as liberally as the contract and fee schedule will permit. Nevertheless some limitations and restrictions are necessary so that the premium may be kept at a competitively low level and within the reach of the greatest number of people. Since some limitations are necessary, their selection is based on the principle of providing the broadest scope of benefits for the greatest number of people, both subscribers and doctors. In this manner, with the support and help of the medical profession, it is felt that Blue Shield will evolve a free enterprise solution for the economics of modern medicine.

During the month of August, Blue Cross incurred claims totaling $1,161,296 and to date this year $9,830,154. Hospitalization expense to date this year was 94.6 per cent of the total payments made by subscribers.

TUBERCULOSIS IN MINNESOTA

(Continued from Page 1166)

seniors of the county must be tested with tuberculin with no more than 10 per cent reacting.

Lincoln County was the first to qualify and was officially accredited on December 11, 1941. Lyon County was the twenty-fifth to qualify and was accredited on April 20, 1953.

Thirty-nine additional counties have now qualified from the standpoint of mortality rates. As soon as the physicians and co-workers in these thirty-nine counties test 90 per cent or more of the seniors in the high schools, they will be ready for accreditation, since there is little likelihood that more than 10 per cent in any county will react to tuberculin. Several of the remaining twenty-three counties in Minnesota apparently will soon be qualified for accreditation, and it now appears that the entire state can be accredited within less than five years.

Minnesota is the first state in the nation to have committees on tuberculosis in all of its medical societies and is the first area in the world to adopt the accreditation plan. Already this has proved to be one of the most productive projects ever introduced in Minnesota from the standpoint of combatting tuberculosis.—J. F. B.

Tuberculosis cases reported to the Minnesota Health Department in the fifteen years from 1938 to 1952 totaled 42,273.—*Christmas Seal Health News Service.*

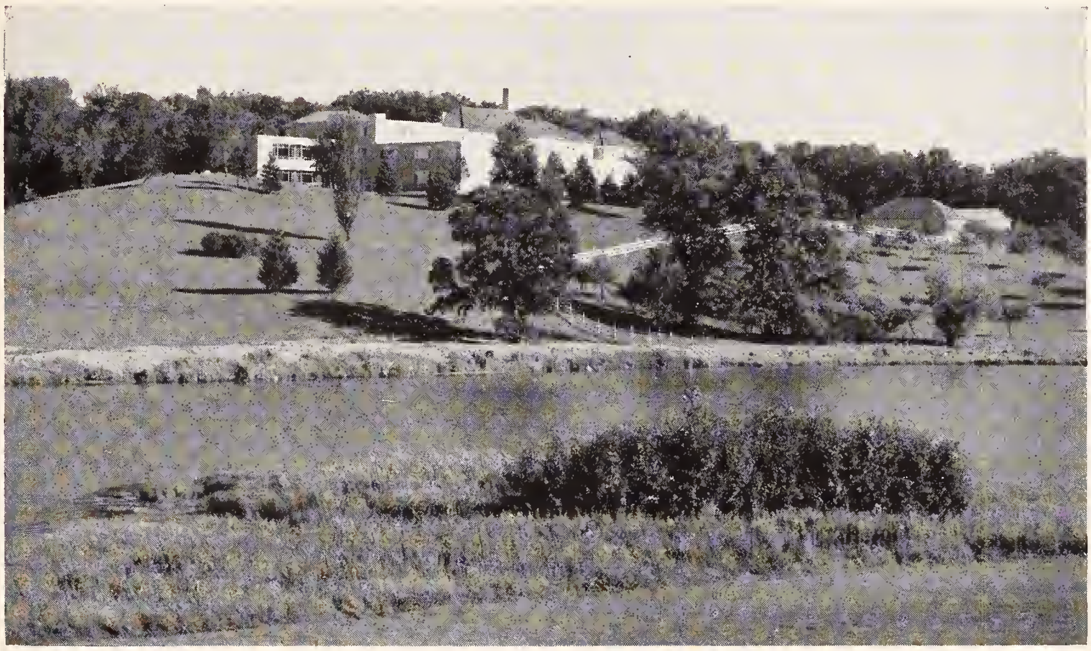
DOCTOR...*This is Your Hospital and Your School of Neuropsychiatric Nursing*

(By that we mean that not only have these institutions undertaken to constitute a haven of help for patients, but they form, in your interest a *remarkable facility for you professionally.)*



View of hospital, school, buildings and environs, 7 minutes from downtown Minneapolis

A COMPLETE NEURO-PSYCHIATRIC HOSPITAL

Up-to-date in all respects, new, functional buildings, set in spacious grounds, rehabilitation center, electroencephalography, therapies, laboratory. One of the largest neuro-psychiatric staffs in the United States. A voluntary, non-profit, non-sectarian institution of which this region may be proud.

SCHOOL FOR NEURO-PSYCHIATRIC NURSING

To offset the existing universal shortage of nurses, Glenwood Hills conducts a one-year course in neuropsychiatric nursing for both young men and young women. You have observed the skill and attitudes of our graduates and trainees. Recruit one or two in behalf of your profession as a "contribution" stipulating that we send them back to you when trained. We will. Meanwhile tuition, room and board are free.

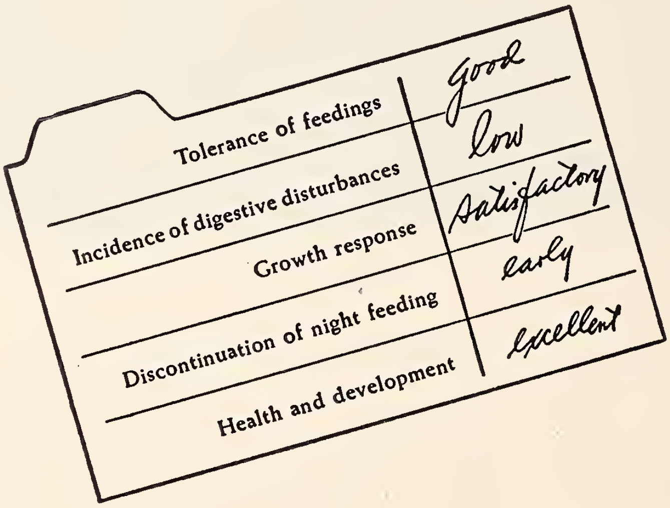
uncomplicated progress...



Tolerance of feedings	good
Incidence of digestive disturbances	low
Growth response	Satisfactory
Discontinuation of night feeding	early
Health and development	Excellent

The uncomplicated nutritional progress[1] of infants fed Lactum® speaks for its sound rationale. Lactum is Mead's liquid formula made from whole milk and Dextri-Maltose.® It provides generous milk protein for sturdy growth and sound tissue structure, with sufficient calories to spare protein and meet the infant's energy needs.

Lactum is convenient and easy to prepare—simply mix equal parts of Lactum and water for a formula supplying 20 calories per fluid ounce.

1. Frost, L. H., and Jackson, R. L.: J. Pediat. 39: 585-592, 1951.

THEELIN

pure crystalline estrogen of natural origin

By promptly relieving symptoms and imparting a characteristic sense of well-being, THEELIN has helped minimize the distress of the menopause for hundreds of thousands of women. The *first* estrogen to be isolated in pure crystalline form and the *first* to attain clinical importance, THEELIN has, moreover, demonstrated a most notable freedom from side effects.

Available as THEELIN IN OIL—for rapid estrogenic effect and—as THEELIN AQUEOUS SUSPENSION—for more prolonged action—THEELIN facilitates individualized treatment schedules. And for greater economy, both THEELIN IN OIL and THEELIN AQUEOUS SUSPENSION are available in multiple-dose Steri-Vials® as well as in ampoules. Each mg. of THEELIN represents 10,000 international units of ketohydroxyestratriene.

THEELIN AQUEOUS SUSPENSION

Ampoules

1-cc. ampoules of 1 mg. (10,000 I.U.)
1-cc. ampoules of 2 mg. (20,000 I.U.)

..."*truly extraordinary*" *results in intractable bronchial asthma*

Cortone®

ACETATE

(CORTISONE ACETATE, MERCK)

In a review article on hormonal therapy,[1] complete relief of symptoms was reported in 62 per cent of 116 asthma patients. Another 24 per cent were made "quite comfortable." Duration of relief varied widely, with remissions occasionally lasting as long as several months. The author calls these results "truly extraordinary."

1400 HARMON PLACE – MINNEAPOLIS 3, MINNESOTA

Doctor, would it be helpful to you in your practice to know that there is a food available at reasonable prices in the stores the year round having these attributes:

1. High public acceptance as to flavor and palatability—billions eaten annually.
2. One of the best of the "protective" foods with a well-rounded supply of vitamins and minerals.
3. Low sodium—very little fat—no cholesterol.
4. Sealed by nature in a dust-proof package.
5. One of the first solid foods fed babies.
6. Can be easily digested by old folks as well as infants.
7. Can be readily eaten out of hand, in milk shakes, on cereals, or in salads.
8. Can be baked, broiled or fried.
9. Can be used as an ingredient product in breads, pies, cakes and desserts.
10. Useful in bland and low-residue diets.
11. Mildly laxative.
12. May be used in the management of both diarrhea and constipation.
13. Can be used in reducing diets.
14. Can be used in high-calorie diets.
15. Useful in the dietary management of celiac disease.
16. Useful in the dietary management of idiopathic non-tropical sprue.
17. Useful in the management of diabetic diets.
18. Valuable in many allergy diets.
19. Belongs among foods useful in certain acute intestinal infections.
20. A protein sparer.
21. Favorably influences mineral retention.
22. Useful in the management of ulcer diets.
23. One of the easiest foods to eat or prepare.

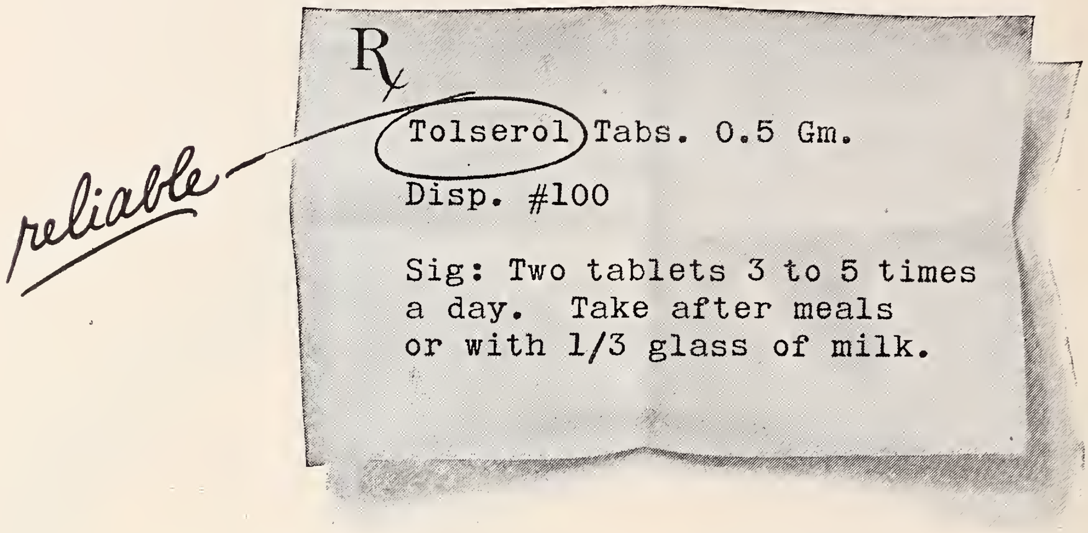
RAPID ABSORPTION—*MAXIMUM THERAPEUTIC EFFECT*



reliable

℞

Tolserol Tabs. 0.5 Gm.

Disp. #100

Sig: Two tablets 3 to 5 times
a day. Take after meals
or with 1/3 glass of milk.

The clinical effectiveness of different brands of mephenesin tablets depends on their rate of absorption. A mephenesin tablet that disintegrates slowly is absorbed slowly. The resulting low blood levels may never produce a maximum therapeutic effect. Results with such a tablet are usually poor.

Tolserol Tablets are a result of extensive study and are formulated to disintegrate rapidly for fast absorption, thus maintaining optimum blood levels.

Tolserol

(Squibb Mephenesin)

Complete information on the use of Tolserol in muscle spasm of rheumatic disorders, in neurologic disorders and in acute alcoholism is available from the Professional Service Department, Squibb, 745 Fifth Avenue, New York 22, N. Y.

SQUIBB

NYLON elastic stockings at no sacrifice of correct support

Bauer & Black Nylons combine new beauty with established principles of correct therapeutic support

A woman's vanity can be a formidable thing—particularly when *you* want to prescribe elastic stockings that give correct support and *she* insists on beautiful appearance.

But now you can give her the beauty she demands with the support she needs in Bauer & Black Nylon Elastic Stockings. They're *fashioned to* exert greatest pressure at the ankles, with pressure gradually decreasing from ankles up, gently speeding circulation.

Open toe avoids foot constriction and promotes foot comfort.

With support like this in stockings that are sheer, inconspicuous and non-discoloring, you can expect full patient cooperation.

More women choose Bauer & Black than any other elastic stocking.

BAUER & BLACK

ELASTIC STOCKINGS

Brown & Day, Inc.
62-64 EAST 5th ST.
ST. PAUL, MINN.

NOTE THESE SUPPORT FEATURES

BAUER & BLACK FASHIONED STOCKING knitted with rear-fashioning seam so that pressure is adjusted to leg contours avoiding undesirable constriction. Pressure decreases gradually from ankle up, thus gently speeding circulation.

Shaded area indicates correct pressure pattern.

They all like

pediatric

ERYTHROCIN

TRADE MARK

STEARATE

(Erythromycin Stearate, Abbott)

oral suspension

. . . the cocci-killing antibiotic for children of all ages. Tasty, stable, ready for instant use. *No mixing required*—drug retains potency for at least 18 months.

Winter infections—otitis media, bronchitis, sinusitis, pharyngitis and pneumonia—are especially sensitive to *Pediatric* ERYTHROCIN. Also, pyoderma, erysipelas, certain cases of osteomyelitis, and other infectious conditions.

Many physicians make it a practice to always prescribe *Pediatric* ERYTHROCIN when the organism is staphylococcus, because of the high incidence of staphylococcic resistance to many other antibiotics. And when the organism is resistant or when the patient is sensitive to penicillin and other antibiotics.

Pediatric ERYTHROCIN is specific in action—*less likely to alter normal intestinal flora than most other antibiotics.* Gastrointestinal disturbances are rare. No serious side effects reported.

Pediatric ERYTHROCIN can be administered before, after or with meals. Available in 2-fluidounce, pour-lip bottles.
Your little patients will like *Pediatric* ERYTHROCIN. Abbott

1-251

DOSAGE

One 5-cc. teaspoonful
represents
100 mg. of ERYTHROCIN
25-lb. child • ½ teaspoonful
50-lb. child • 1 teaspoonful
100-lb. child • 2 teaspoonfuls

Conclusive evidence

of the effectiveness and low toxicity

of Furadantin

in treating bacterial urinary tract infections

is provided in its recent

acceptance by the Council

FURADANTIN®

brand of nitrofurantoin

ACCEPTED
COUNCIL ON
PHARMACY
AND
CHEMISTRY
AMERICAN MEDICAL ASSOCIATION

The N.N.R. monograph on Furadantin states:

“**Nitrofurantoin.—Furadantin (Eaton).—**

Actions and Uses.—Nitrofurantoin, a nitrofuran derivative, exhibits a wide spectrum of antibacterial activity against both gram-positive and gram-negative micro-organisms. It is bacteriostatic and may be bactericidal to the majority of strains of Escherichia coli, Micrococcus (Staphylococcus) pyogenes albus and aureus, Streptococcus pyogenes, Aerobacter aerogenes, and Paracolobactrum species. The drug is less effective against Proteus vulgaris, Pseudomonas aeruginosa, Alcaligenes faecalis, and Corynebacterium species; many strains of these organisms may be resistant to it. However, bacterial resistance to other anti-infective agents is not usually accompanied by increase in resistance of the organisms to nitrofurantoin. The drug does not inhibit fungi or viruses.

Nitrofurantoin is useful by oral administration for the treatment of bacterial infections of the urinary tract and is indicated in pyelonephritis, pyelitis, and cystitis caused by bacteria sensitive to the drug. It is not intended to replace surgery when mechanical obstruction or stasis is present. Following oral administration, approximately 40% is excreted unchanged in the urine. The remainder is apparently catabolized by various body tissues into inactive, brownish compounds that may tint the urine. Only negligible amounts of the drug are recovered from the feces. Urinary excretion is sufficiently rapid to require administration of the drug at four to six hour intervals to maintain antibacterial concentration. The low oral dosage necessary to maintain an effective urinary concentration is not associated with detectable blood levels. The high solubility of nitrofurantoin, even in acid urine, and the low dosage required diminish the likelihood of crystalluria.

Nitrofurantoin has a low toxicity. With oral administration it occasionally produces nausea and emesis; however, these reactions may be obviated by slight reduction in dosage. An occasional case of sensitization has been noted, consisting of a diffuse erythematous maculopapular eruption of the skin. This has been readily controlled by discontinuing administration of the drug. Animal studies, using large doses administered over a prolonged period, have revealed a decrease in the maturation of spermatozoa, but this effect is reversible following discontinuance of the drug. Until more is known concerning its long-term effects, blood cell studies should be made during therapy. Frequent or prolonged treatment is not advised until the drug has received more widespread study. It is otherwise contraindicated in the presence of anuria, oliguria, or severe renal damage.

Dosage.—Nitrofurantoin is administered orally in an average total daily dosage of 5 to 8 mg. per kilogram (2.2 to 3.6 mg. per pound) of body weight. One-fourth of this amount is administered four times daily—with each meal and with food at bedtime to prevent or minimize nausea. For refractory infections such as Proteus and Pseudomonas species, total daily dosage may be increased to a maximum of 10 mg. per kilogram (4.5 mg. per pound) of body weight. If nausea is severe, the dosage may be reduced. Medication should be continued for at least three days after sterility of the urine is achieved.”

all the patients who represent the 44 uses for short-acting NEMBUTAL®

For Insomnia or Sedative Effect try the 50-mg. (¾-gr.) Nembutal Sodium capsule.

For Brief and Profound Hypnosis try the 0.1 Gm. (1½-gr.) Nembutal Sodium capsule

- For every patient's need . . . in many dosage forms . . . *in more than 44 clinical conditions,* short-acting Nembutal offers these advantages:

1. *Short-acting* Nembutal *(Pentobarbital, Abbott) can produce any desired degree of cerebral depression—from mild sedation to deep hypnosis.*
2. *The dosage required is small—only about one-half that of many other barbiturates.*
3. *Hence, there's less drug to be inactivated, shorter duration of effect, wide margin of safety and little tendency toward morning-after hangover.*
4. *In equal oral doses, no other barbiturate combines quicker, briefer, more profound effect.*

Won't *you* remember—and compare—these advantages the next time, and every time, you write a barbiturate prescription?

'Carbo-Resin' Therapy Simplifies Control of Edema

- Permits more liberal salt intake, enhances palatability of diet
- Safely removes sodium from intestinal tract and prevents its reabsorption
- Decreases the frequency of need for mercurial diuretics by potentiating their effectiveness
- May be lifesaving therapy for patients who have developed a resistance to mercury
- Useful in congestive heart failure, cirrhosis of the liver, edema of pregnancy, hypertension, or whenever salt restriction is advisable

Eli Lilly and Company
Indianapolis 6, Indiana, U. S. A.

Suspended in orange juice

Baked into brownies or cookies

Blended into gelatin dessert

MARGINAL NEUROSES IN EVERYDAY PRACTICE

Orientation

NORMAN JOHNSON, M.D.
Minneapolis, Minnesota

IN THE HOPE that terms may come to mean about the same to each of us, may we spend a moment defining several. Our topic is concerned with "Marginal Neuroses."

Marginal is easy enough—meaning subacute, moderate in severity, early. During this symposium, keep in mind that we speak of marginal cases only, usually the result of some situation. We are not dealing with inveterate cases or those with grievous personality defects.

Neurosis deserves thought. It is a poor term and meaningless unless the whole description, "psychoneurosis" is used. "Neurosis" stems from "neurone," but there is nothing wrong with the neurones. They function splendidly. This disease "neurosis" is a result of the messages which are being sent over these neurones. They are too violent, or too severe, or totally inappropriate to the situation. To describe a disease as "neurosis" is not to describe it at all. If you will permit your imagination to establish a concept of what actually takes place in the disease we term "neurosis," it might better be called "psychemia." For its manifestations are better understood if one thinks in terms of a humoral element, circulating about the body, and modifying the reactions of every cluster of cells which it contacts. And this circulating evil humor originates in that portion of the brain which contains the emotional forces.

Disease.—A neurosis is a disease—like sarcoidosis. But this term *disease* serves a double purpose here. It also describes the status of the disease, which is a state of dis-easiness. In this world, people are either easy or they are dis-easy. The neuroses, being states of exaggerated excitability, do not allow a person to feel easy at any time.

Emotion.—We need a real understanding of this term. Its derivation indicates a force which is moving. Never think of emotion without recalling that it is a moving force—craving some method of expression. If prohibited from its natural means of expression, it will try to escape via a less natural route. But it *must* go into action and, until it does, its owner is temporarily in some degree of uneasiness. The strength of the force seeking outlet (and some other factors) will determine how severely ill he becomes.

We are all neurotic every day. Feelings, in varying degrees of strength, arise in us and create potential cellular response. The alarm reaction is dramatic in its physical expressions. Lesser degrees of feeling will produce moist palms, dry mouth for the uneasy speaker, vasodilation of the skin called blushing, urgency and frequency of urination, bad dispositions, "goose pimples," et cetera. If the degree of stimulus is sufficient, the response becomes severe or continuous; and ordinary reactions of daily life assume a status of "disease." Most of the manifestations of this stimulus, being unnatural routes of exit for the force which is at work, are really perversions. Since natural outlet is prohibited or denied, fear and anger will find a perverted form of expression. This outward manifestation is the symptom

---

Introductory remarks in the Symposium on Marginal Neuroses in Everyday Practice at the centennial meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 19, 1953.

which brings the patient to us for relief. There seems to be no bodily symptom produced by pathology which cannot be duplicated by the stimulus of a strong feeling sending messages over a neuron pathway to an organ or group of cells.

Man is, in a sense, a gadget with a purpose. The purpose is to make a response of some kind to every form of stimulus. The nature of these responses is of maximum interest to physicians. Diagnosis is dependent upon interpretation of these responses. The effects of treatment are measured by these responses. Man makes responses which are either to his advantage or to his disadvantage. But he makes responses. His responses to the stimuli of emotional forces in the neuroses are obviously disadvantageous. But they are compulsory. Never lose sight of the compulsory nature of responses to strong emotional forces. One does not find much success in controlling the blush of embarrassment or the palpitation of strong fear.

We need to appreciate that man responds to stimuli in each of these realms: (a) the realm of feeling; (b) the realm of intellect; (c) the realm of mood, and (d) the realm of the physicochemical.

If we attempt to treat the dis-ease of psychoneurosis, we must be prepared to evaluate not only the last realm (d), which is our natural interest, but also the variants which are produced in mood and intellect. A patient in whom a strong (or continuous) emotional urge exists becomes what we call "tense" through his effort to prevent the natural reaction to that feeling. His tension, if severe enough, will produce a paralysis of his ability to choose his reaction, of his abilities to be logical or reasonable in his behavior. In addition, this contained force may alter his mood; and most assuredly it can produce misbehavior of many organic structures in the body. He is trying to drive his machine with his brakes set. Hence the frequency of fatigue. His whole being is in a state of resistance. This will be evidenced by increased tonus of voluntary musculature, especially in the area of the neck and shoulders, and in the low back. He tries, by will, to propel his craft across stream to his destination while strong currents tend to force him contrariwise—even into the rapids. He is caught—trapped—between his intellectual desire to do something or to be something, while strong emotional forces prevent the usual easy progress in the direction of his choice.

Picture also that man's economy of action is based on countless reflex acts which he either inherits at birth or develops in infancy. Many of his emotional responses are based on a conditioned reflex which cannot be managed by reason or by will. Except that the will can inhibit. His response to the stimulus of emotion may be repeated so often as to attain the status of a conditioned reflex. A given situation, like criticism, is met. He learned long ago to resist criticism. It creates a reflex fear. He hides the fear; but its force stimulates the gastrointestinal tract, seeking a way out. The result is colitis; and it is the product of two reflex conditionings out of his past experience. There is no effective treatment available to him, or to you, except some method which will re-process those reflexes. Each time the pattern is repeated, the ease with which the reflex operates is improved.

So the average practitioner of medicine has a great responsibility to his patients who become diseased by this mechanism. If the marginal cases can be restored to proper response through understanding and a wee bit of wisdom in treatment, we may contribute largely to diminishing our unholy statistics in the U.S.A. One out of every ten is being supported in a state institution. We sorely need more knowledge and better treatment for cancer, for polio, et cetera. We need even more the knowledge which will entitle us to help re-adjust persons who, through ignorance and lack of training, cannot manage their own horsepower. The only power available to man resides in his emotional equipment. Strange there is nowhere any deliberate plan by which people are taught how to feed just enough power into the engine to run it properly through the traffic of life. We need to teach our fellows how to use the foot throttle, and to shift gears, in order to be in accord with the requirements of living. And we must needs wait until they are ill before we commence. Training of physical skills we have in abundance; training of intellectual skills is available to almost everyone; where is the academy which teaches skill in the use of our power plant?

This disease *neurosis* appears in two forms: (1) a loss of ability to generate power, and (2) the generation of more power than is manageable. In the first, fortunately rare (because it is more

(Continued on Page 1231)

THE PATIENT CONSULTS

F. J. HIRSCHBOECK, M.D.
Duluth, Minnesota

THE SUBJECT assigned me to discuss, invites me, I believe, to consider the patient with functional complaints as he presents himself in the consulting room; the type of person he is; his manner and characteristics as he cites his case and the nature and description of the symptoms he presents.

The lack of a term which is sufficiently inclusive and descriptive of such a person has puzzled me, but it seems to me proper to speak of him as "nervous"—a too simple term, possibly, but yet sufficiently descriptive to supply a common basis of understanding among us as to what is meant. From the standpoint of semantics, to say the "nervous patient" may be a rhetorical subterfuge, but its very simplicity is an advantage, without the adverse connotations that may be found in the patient's mind through the more or less obsolescent, but to him distasteful, terms of neuroticism and neurasthenia.

Patients do not like to be called neurotic, with the opprobrious interpretation they infer, and frequently the protest is raised that they are not and do not want the consultant to think they are neurotic, thereby immediately creating a barrier in the physician-patient relationship.

One may take exception to this simplification in terms because of a lack of suitable differentiation in types of reaction, but the patient does not understand a more scientific terminology and may resent the implications of conversions, obsessive compulsive reactions, depressions, dissociations, phobias and hysteria. These terms are all very fine in our discussions among ourselves, but mean little to the patient; no more than when we tell him a cancerous stomach is scirrhous, medullary, adenomatous or colloid. In fact, many scientific terms, even to us, are not always specific and tend to overlap in their heterogeneity. There is always the possibility, too, that too much scientific jargon in discussing a situation with the patient may increase his insecurity, and, intellectual attempts at explanation aggravate his frustration.

The patient who has the more simple anxiety and fatigue reactions, with psychosomatic symptoms, tends to consult the general practitioner or internist, as his symptoms do not have the severity associated with the major psychoneuroses and are frequently combined with psychosomatic, or, inversely, somatopsychic relationships, the latter fewer in number, but equally important. The vast number of instances of "organ neuroses" almost *postulate* consultation with physicians skilled in organic diagnosis and the implications of psychiatric possibilities are usually remote from the patient's thoughts.

It is this large group that seems to emerge as a special province of the internist and is generally thought as representing in a varying measure about one-half of the doctor's clinical practice; and it is of these I wish to speak. The more involved psychiatric problems transcending the scope of this discussion rightfully demand consultation with psychiatrists more highly skilled in psychodynamic appraisal, and their aid should be unstintingly sought. It is my belief that as nearly as one can, however, restrict the consultation in the more simple cases to a single person, the more effective diagnostic and therapeutic procedures become, provided they are consistent with good practice. A division of responsibility and the introduction of multiple personalities often leads to confusion. Even though the complexity of the situation may require additional thought and study, the integration of the problem is best unified in one person whenever possible.

Not all physicians have a similar aptitude in caring for the nervous patient, and many lack the flexibility needful in establishing a suitable rapport because of personality characteristics, organistic training or a simple lack of interest in the type of problem under consideration.

Physicians know that diagnostically psychogenic causes play a very considerable role in the production of symptoms. Statistically, Allen and his associates at the Mayo Clinic, have reported in a review of many patients, that an accuracy of over 90 per cent may be attained in the diagnosis of psychosomatic conditions merely by the expedi-

ency of careful evaluation of pertinent historical and personal data elicited at the time of the original interview and cushioned by a physical examination which may uncover or remove from consideration the welter of possible physical conditions which can be the cause of anxiety to the patient, or, concern to the diagnostician.

With the increasing availability of diagnostic laboratory and mechanical aids, it would be the height of folly to overlook any possible data which will help to make a diagnosis more certain, and all assumed functional symptoms must be carefully weighed against organic possibilities.

Failure to recognize an organic condition in one who is basically nervous seems to be an innate fear in every clinician. There seems to be no criticism so violent, nor any chagrin so deep, as when such a physical situation is discovered later by another consultant. Yet there are certain diagnostic criteria and data which one may elicit by close observation and interest in these patients which are as direct and, one might say, almost as pathognomonic as in any other field of diagnosis.

When the patient presents himself in the consulting room, what may one find in the manner of his appearance and mode of presentation of his complaint? Oftentimes the consultant gains in his first impression that of a tense and anxious patient. The patient is more often a woman than a man, probably because of woman's desire to improve her state of health—inherently a desire to be at her best; but probably because, too, of the urgent insistence of the members of the family that she seek relief from a constant trying situation. Men, by the nature of their occupation and opportunity to meet many people, interpolated with many periods of recreation and diversion, are less harried by their nerves because of these diverting factors. If the patient has reached the point of exhaustion and relative despair in regard to his complaints, oftentimes abetted by the failure to obtain a sympathetic ear, he may show the external impression of his inner strife by a discouraged and listless demeanor; but as a rule a meticulousness and perfectionism of the patient is readily apparent in the neatness of his appearance and dress and his detailed relation of symptoms and complaints. Since these patients, because of fatigability, are not able to follow the more enervating physical pursuits, they may reveal a certain cultural charm, good taste and good manners gained through years of participation in less active areas by refuge in scholarship and study and by a professional interest or a dilettante exploration into the arts. They are more studious than athletic and from numerous experiences, find it more simple and more comfortable to maintain methodical practices in their lives which they find reduce their fatigue and increase their comfort. They are less likely to wish to stay up late and tend to be people of excellent habits and like to avoid dissipation. As one listens to the patient's complaints, it is noted that they frequently codify a list of symptoms with a relative distortion of values and sometimes widespread areas of distribution. The patient has been aptly called by Charcot, "The man with the little piece of paper," from which he carefully selects his symptomatic experiences. This conscientiousness in regard to detail is also exemplified by the voluminous letters these patients frequently write to their physicians.

If the patient experiences symptoms dominantly in a specific somatic zone, with a so-called organ neurosis, his complaint may be much more direct, as, for example, the patient who has a hyperacidity syndrome, cardiospasm or tumultuous heart action. The intensity with which the patient expresses his symptoms suggests to the consultant a deep sense of self-appraisal and what seems to be an egocentricity foreign to those of broader interests and less fixation on bodily functions.

It is often noted that there is frequently an undue sensitiveness to environmental stresses, with a tendency to be easily offended and to bear hidden resentment for a long time. Overwhelmed by their anxiety and continued self-analysis, there may intervene a lack of aggression and an easy resort to submission. They like to be well thought of, but are easily frustrated. They are often affected by the deaths and illnesses of friends and relatives, particularly if they happen to die or are ill of a cause rather dramatic, and apply the condition in the interpretation of their own symptoms. If the patient is able to, or must by necessity, because of politic reasons, contain his emotions within himself, inner seething tends to break out in somatic experiences. The patient, unfortunately, often makes his dearest friends and relatives victims of his disability and the constant relation of his complaints to his family often leads those nearest to him to turn a deaf ear to the reiteration of alleged discomfort, so that the patient takes refuge in superlative language and hyperbolic expressions.

The physician soon becomes aware of the situation and in proceeding to take the history, must school himself to the need of lending a sympathetic ear, lest the patient, with his native intuitive qualities, detect a lack of interest. Though the story may be unduly prolonged, it is often the key to the diagnosis and treatment, because of its content and whatever the astute observer may note between the lines. If the patient is unusually garrulous, he may be brought back into the track of continuity by skillful conversational maneuvers. The patient must never feel that he is being unduly limited in his recital or that its thoroughness may be interrupted. After the history is given, it may need to be further elaborated in regard to the many minutiae involved and a search made into the genetic and environmental influences that may prevail. It is commonplace for the consultant to learn, in the familial background, that there are hereditary psychoneurotic complaints in other members of the family. A quiet room, uninterrupted from the outside, is essential. It is in this way that the patient is more likely to tell his story with proper continuity and is less likely to develop prejudicial ideas.

An important element in obtaining the history from these patients is the discovery of latent and active assets these patients may have within them. It is important particularly because they frequently have definite talents, sometimes in the arts, in business, in home-making and in their fidelity to responsibilities. Obtaining this information is of inestimable value in treatment as a corollary to the psychological debits which seem so overpowering.

Patients with *psychosomatic conversion* are the particular interest and problem of the consultant in a general type of practice. The fear of organic disorder leads them to the general diagnostician. Their exaggerated physiological accompaniments of constant or periodic emotional states often engender rather specific organ reactions which, to an experienced clinician, are the clue toward a diagnostic direction. The pattern of complaint tends to be duplicated more or less in successive consultations, and it is a common experience to note that patients who have circulatory symptoms tend to complain at each visit in the same dynamic zone. This is true of the patient who has a gastrointestinal neurosis, a sex neurosis or an organ phobia, as observed by the fear of cancer in various specific organs.

In each zone of the body there appear to be certain suggestive complaints and symptoms of the underlying psychosomatic reaction and their repetitive similarity is striking.

Headaches on the top of the head, the so-called "clavus" headache, or headache beginning in the nape of the neck and extending over the top of the scalp, are frequently noted as expressions of tension and fatigue. The same is true of the band-like sensation of constriction over the eyes and around the base of the scalp, symbolically expressed by the clinician as being like the wearing of a helmet; the "tete en casque" of the French. The intensity of the patient's observations of minor, but yet normal, aberrations may be seen in the misinterpretation of the patient of the significance of floaters in the eye, the muscae volitantes of the vitreous, which are noted by everyone at times, but assume fantastic proportions in the nervous person. An oddly coated, a geographic or a scrotal tongue to them indicates the possibility of serious ill health, often with cancer in mind, and several times daily the tongue is viewed in the mirror and small changes noted by what seems to be a microscopic evaluation. The manner in which the patient protrudes his tongue upon request is quite characteristic. The tongue is protruded to its full length and breadth with considerable display of energy and as he does so, the patient frequently casts his eye furtively in the direction of his tongue to note if the source of his complaint is evident. Paresthesias in the tongue with a sense of burning and a sudden discovery on the part of the patient of the normal circumvallate papillae at the base of the tongue are favorite points of interest in the cancer-phobe.

Many of the patients seems to have symptoms that are subject to the patient's sense of vision, sense of touch and sense of hearing, and it is singular that the silent organs of the body, such as the liver, kidneys, spleen and the endocrine glands are usually free from suspicion on the part of the patient because he knows nothing about them and cannot detect their presence through his senses. Usually only the visible and noisy organs attract him; hence the predilection for gastrointestinal, cardiovascular, respiratory and paresthetic symptoms.

One of the most common symptoms complained of, noted by all clinicians and recognized as the mark of a neurotic person, is the well-known globus hystericus, which must not be confused, however, with the Plummer-Vincent syndrome of the patient with total achlorhydria, and very often associated with primary anemia. The symptom is probably associated with spasm in the area and cardiospasm in the lower end of the esophagus appears to be a psychological relative.

The patient with neurocirculatory asthenia can feel the pounding of his heart, notes chest pains in the left precordium and symptoms almost everywhere in the body because of the all-pervading influence of the heart and circulation. Nervous symptoms also come into the picture, particularly strongly with tremors, trembling of the hands and paresthesias. Circulatory reaction is sometimes so vigorous that patients seem to feel the coursing of the blood in the vessels and in their description, often associated with a sense of bubbling—an anatomic and physiologic impossibility. In the examination of these patients, vasomotor imbalance reveals itself many times in pronounced dermographia and during the course of the examination perspiration drops from the axillae. The patient tends to interpolate questions during the course of the examination, proceeding with the physician from area to area to learn if anything adverse has been found. Gently but firmly, the consultant must assure the patient that all findings will be explained to him as he summarizes them in the final interview.

Various paresthetic sensations are suggestive. It is striking how frequently they involve the left side of the body as compared to the right, probably because of the knowledge that the heart is more on the left side than on the right, and to the layman, a conspicuously left-sided organ. Paresthesias on one side of the body also may be an index that the patient is in fear of a stroke, a fear which is expressed many times, too, when the paresthesia is bilateral. It is a failure on the part of the clinician, indeed, if he is not aware of these connotations in the mind of the patient, and a failure to mention their significance may be disillusionary to the complainant. Mastodynia, or painful breasts, in women, at and after the menopause, practically always occurs on the left side, and seems to be a very significant nervous expression, with or without the menopause.

Many patients who complain of so-called shortness of breath in their terminology, without having circulatory decompensation, in reality have what is known to us as air hunger, and they must be questioned as to what they mean by shortness of breath. Usually it is found they have a professed inability to fill their lungs fully to the point of satisfaction. The physiologic disturbance as a result of vigorous effort in breathing may cause hyperventilation symptoms, because of the adverse interchange of gasses.

There probably is no symptom more common to the nervous patient than belching or burping; in fact, so characteristically is it a symptom of a nervous personality that even in the presence of organic disease, when frequently performed—because it is a performance—one feels that the belching may be a somatopsychic superimposition. Churning of the bowels and borborygmi due to increased physiological activity of the intestine are likewise suggestive, and under emotional stress, a nervous patient may have so much consciousness of this complaint in the lower abdomen, that he frequently finds social contact distasteful. In describing gastrointestinal complaints, patients frequently relate with detail various characters of the excreta which they consider abnormal.

Disproportion of size or contour of various parts of the body are, to the physically analytic mind of the patient, suggestive of dire causes. This has already been mentioned in the case of the papillae in the base of the tongue. I have noted on several occasions that the discovery of a prominent ensiform process in a patient raises considerable fear as to the presence of a tumor, which the physician is sought to examine so that he may prove or disprove its importance. In women, discovery of a lack of uniformity in the two breasts or in the submammary hypochondrial prominence may lead to anxiety. When the truth of this observation, with its benign nature, is noted, I frequently recall the sensitive observation of the sculptor of the Venus de Milo who portrayed it in his marble masterpiece.

In my experience, a sex neurosis is a particularly trying subject and apparently deepseated, and I have found consultation with the urologist and sometimes the psychiatrist extremely useful in the care of these patients.

In others, the universality of painful experiences in various parts of the body, sometimes at one point and sometimes another, without any regard to anatomic or physiologic distribution, may be recognized as the patient's constant awareness of the slightest discomfort. Some of the more fixed points of pain are an expression of anxiety regarding environmental factors which have predicated the location of the pain. One sees this quite frequently in patients where such diseases as angina pectoris, coronary thrombosis and cancer have been present in near relatives and acquaintances.

There is no more important feature in consultation than the performance of a satisfactory and thorough examination, with particular reference to the elucidation of possible findings in the areas complained of. Chest film and electrocardiographic examinations, in addition to the essential and relevant laboratory data, are not only a support in the diagnosis, but also yield graphic evidences to the patient in which he may be interested. Sometimes one must run the gamut of complete gastrointestinal study, including an examination of the stool, though the extent of the examination should be predicated to a large extent upon the complaint. These patients frequently have many examinations at the hands of other physicians and the question of cost and inconvenience must be weighed in the balance, though the patient should never be led to feel that thoroughness is being sacrificed for expediency. A great saving can sometimes be made by reviewing previous laboratory and x-ray findings from the hospitals where they have been patients or through the kindness of previous consultants.

After the initial judgment as to the patient's personality, his history, his complaints and his relevant physical examination, one finally is prepared to discuss the situation with the patient on dismissal. He must be assured of the absence, or if present, the nature of any true organic disease, and the mode of production of symptoms must be explained to him in language which he can understand. His personality reactions, favorable and unfavorable, and environmental stresses need to be elucidated and interviews with the relatives, without and in the patient's presence, need to be carried out to cover the whole range of a solution for the relief of the patient's distress. Thoroughness, but above all, understanding, usually yield significant results and a co-operative and grateful patient.

MARGINAL NEUROSES IN EVERYDAY PRACTICE

Orientation

(Continued from Page 1226)

difficult to treat), are to be found the most profound exhaustions. The engine goes dead and will not start up. Such cases are completely asthenic, full of despair, and totally disorganized. The second group show all the evidences, by sign and symptom, of increased "nervous tension." Their active emotional forces cannot find a natural exit for discharge. All responses are overexcitable and overstimulated. They are mentally distraught, distractible, excitable, suffering from insomnia, faulty memory, preoccupation, emotional storms, and a host of symptoms in the physico-chemical realm. In spite of a calm exterior and placid facies, they realize that they can no longer steer well—are fearful that this means they are becoming "crazy." Yet they cannot find a source of relief from their dis-ease. If they suffered from diabetes, plenty of physicians could help reduce blood sugar levels and avoid ketosis. Yet strangely enough, we do not turn out of our schools men trained in preventing this more common disease from reaching serious proportions. But its therapy is not difficult if we begin with the marginal case. In the hope that we may contribute something from experience, we present to you the following papers in this symposium.

THE DYNAMICS OF EMOTIONS

HOWARD P. ROME, M.D.
Rochester, Minnesota

AT THE CORE of the problem of emotions and the very many ways in which these are expressed and encountered in clinical practice lies anxiety. The manner in which the patient handles his anxiety characterizes his normal or psychoneurotic or psychotic adjustment. Thus anxiety in any of its very many forms is the important clue to the patient's problem.

Anxiety is purely a subjective phenomenon. It is a state of apprehension which arises when the individual is confronted by a conflict. Anxiety therefore is a universal experience. The important feature is the change which it produces in the state of well-being of the individual. For example, in the relatively uncomplicated instance, the anxiety syndrome is easily recognized by its physiologic concomitants: a generalized feeling of tension which is expressed in the actual physical tone of the voluntary muscles and palpitation, increased rate and depth of respiration, a sense of constriction about the chest, globus, a feeling of tightness or fluttering in the abdomen, sweating, a change in the color of the skin and other more subtle evidences of stimulation of the autonomic nervous system.

The sensations of the anxiety syndrome can be looked upon partly as the way in which tension makes itself felt and partly as the awareness of these involuntary vegetative discharges. There is a tendency for certain of these anxiety responses to predominate. In other words, there are preferred channels of its expression, so to speak. These give rise to certain clinical syndromes which the patient reports as his chief complaints. Since the same stressful response is so varied and so frequently mimics other conditions, it is necessary to have a clear and comprehensive understanding of the entire setting in which it occurs. For this reason, the accompanying thoughts and feelings of the patient are important. Too often the physician is aware of physiologic effects of anxiety, while being almost wholly ignorant of the psychologic events which precede it.

A good illustration is seen in the patient whose complaint is that of lightheadedness or dizziness. He gives a lengthy account of the episodic occurrence of these more or less disabling symptoms; how it affects his everyday life by making him feel insecure physically, as if he were going to faint. It keeps him from driving his car freely; it interferes with the conduct of his business because he cannot think clearly at these times or has difficulty in concentrating on the subject at hand. He may complain about his vision—the fact that things look blurred or hazy. At times he is aware of a queasy feeling which is just short of nausea; trouble getting his breath or the need to have to consciously breathe more deeply than usual. Then, too, at other times there is a feeling of numbness or tingling about his mouth or in the distal parts of his extremities.

Only when the entire picture is put together can the horse and cart be distinguished from each other and put into proper alignment. It becomes evident and obvious, once the pattern is discerned, that the picture is neither one of a developing acoustic neuroma nor a labyrinthine disturbance of the inner ear, but rather an anxiety syndrome which is presenting in the form of symptoms brought about by hyperventilation. The combination of the understandable physiologic effects of overbreathing and the systemic repercussions of anxiety are then seen as an easily explained result. However, this is not all, for if the physician will pursue his inquiry a bit further, he will learn that there is a definite sequence of events. First, there is anxiety. The phobic quality of anxiety may be ascribed to almost anything: fear of crowds or closed places, heights, sharp instruments; fear of disease such as cancer or impending insanity or any one or several of the very many phobias which appear so commonly. The overbreathing follows secondarily, and in its wake the host of signs and symptoms of which the patient complains.

It is surprising how often one sees patients in whose instance all sorts of investigations have been carried out in an attempt to ferret out the

Read in the Symposium on Marginal Neurosis in Everyday Practice at the centennial meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 19, 1953.

cause of this common form of expression of anxiety. Because it bears a distant resemblance to the hypoglycemic syndrome, a variety of inquiries into the metabolic status have been made. At other times, the suggestion that it might be a petit mal variant has led to extensive neurologic investigation, electro-encephalography and even pneumoencephalography. In fact, any number of leads have been followed but the important one of determining the functioning psychologic status of the patient. Is he fearful, worried, anxious, nervous, concerned, frightened, troubled, bothered or upset about something? This simple cue often elicits a classical description of some emotional conflict. The anxiety which results is reacted to defensively by physiologic means, but like so many neurotic defenses it proves unsuccessful and itself creates more problems than it solves. Obviously, the need to be aware of the fact that anxiety can be discharged in this fashion is the key to setting the stage for the solution.

There is another aspect of anxiety which is overlooked frequently. Merely recognizing a certain train of signs and symptoms as the physiologic expression of anxiety and communicating this observation to the patient are not enough. Just to rule out the possibility of organic disease is not enough. The patient at this point is not possessed of the capacity to solve his basic conflict with any greater skill or more likelihood of success than he was in the beginning. What is required now is a patient inquiry into the nature of the emotional conflict, and while this is in progress the physician's regimen is one which is designed to support, to reassure, to encourage and to provide the opportunity for the patient to see his problem a little more objectively, to face his mixed feelings about himself and the important persons in his life and to be able to work through his doubts and his dependence. Unhappily, this takes time, for which there is no substitute. But by the same token, the rewards for time so spent are great.

Long before the era of psychosomatic medicine Nietzsche pointed out that "We think with our bodies." The manner in which thoughts are transmuted is not as alchemical as some would think. Man is a symbol-dealing animal whose integrated behavior depends upon his capacity to bring the past and the future into the psychologic present. This unique ability makes all of us vulnerable to anxiety. The situations and events with which we are confronted in daily living therefore mean more to us than they would appear to mean on the surface. Past experiences in this way confer confidence or apprehension sometimes out of all proportion. Just how much and what form this disproportion takes can be told only by the person himself. It is for this reason that the patient holds the solution of his conflicts in his own hands. What he has been and what he has experienced has most to do with what he is, and this cannot be told except by giving him an opportunity to talk about it. It is the physician's job to set the stage which makes such talking both possible and profitable.

The ability to deal with things in symbols vastly increases the meaning of commonplace events, and can convert one man's meat into another man's poison. This conversion is the heart of the so-called dynamics of emotion. Obviously it has two parts. The psychologic part is a product of all that has happened—big things and little things, and based upon this there is acquired gradually a set of attitudes and values. It is the essence of the meaning of these symbols. Inasmuch as the patient's emotions are both his way of life and a reflection of it, seen in this light, the difference between the normal, the psychoneurotic and the psychotic adjustment is a matter of endowment, past experience and present resources. In short, the kind of defenses available to the patient determine what sort of an adjustment he is able to make. This is the point where his immunity or vulnerability to anxiety triggers different defenses.

Everyone has the potential of anxiety. We differ from each other in the way we bind or handle our anxieties. When it gets cold enough, everyone turns up his coat collar. In the same way, when stress is sufficiently taxing, everyone reacts with anxiety. The discomfort of this experience is of such an order that it has to be assuaged in some way. Mechanisms or defenses against the conscious experience of anxiety are merely cumbersome ways of attempting to explain the complex interaction of physical and emotional events which then take place.

Man lives on two environmental fronts and is buffeted all his life by their changes. The internal environment is a metabolic, physiologic one made up of buffer systems and enzymes and hormones

(Continued on Page 1281)

FACTS AND FALLACIES IN THERAPY

NORMAN JOHNSON, M.D.
Minneapolis, Minnesota

THERAPY of the neuroses may be approached with a hopeful note. Most of the disablement is reversible, which is not so often true when cancer is discovered or polio has been diagnosed. The first consideration for the physician is to fix in his mind that he is dealing with a *disease,* which can grip the patient as assuredly as can any infectious process. Where the patient asking for help is found to be ill because of the toxins of a bacterial invasion, the indications are clear enough. We combat symptoms, but primarily we strive to eliminate the invader. Too often this approach is not the one we use in treating the neuroses, although this disease is very similar in its effect upon the human organism.

A circulating toxin may produce manifestations in the skin, upset the gastrointestinal tract, alter the heart action, vary the respiratory function, create a delirium, impair muscle or kidney function, and produce widespread dislocation within the organism. The effect of "nervous tension" (which is the circulating toxin in the disease we call "neurosis") likewise can create abnormal responses in all of these same functions. Therapy is aimed at removing cause—i.e., the presence of a persistent compelling force, originating in the emotional realm. Like a tune which sings in the head, it is difficult to be rid of an emotional force, once it becomes established. When any strong feeling occupies the seat of the soul, it dictates the thinking, the mood, and the organic behavior. It does not relent by force of will; nor can it be unseated by a process of reason and logic. Yet everyone seems to believe that these agencies, if appealed to, can turn the balance.

We have under consideration today only those cases which are marginal and can be handled in any office if the doctor knows this disease as well as he knows many of the rarer entities; and if he has acquired a bit of wisdom in effective therapy. The prime indication is to help the patient to escape from persistent, compelling overstimulation, originating in some emotion—usually a form of anger or fear. We purposely omit from this discussion a small percentage of neuroses which exhibit profound exhaustion, and complete physical and spiritual collapse. My remarks are concerned only with that large group of persons whose behavior, thinking, and physical responses have become abnormal through heightened "nervous tension."

The stimulus of tension in small quantities can be of great advantage to man. But when the tension becomes great and remains constant—even during sleep—the organism exhibits abnormal activity in each of its realms of response. Remembering that repetition creates reflex action, or habit, it should be apparent that time is an element. Remedy is simple in direct proportion to the period of habit formation. Any group of cells which has been kept hyperexcitable for any length of time becomes trained to a perverted performance. We may cite hiccough, or uncontrolled laughter, as an example. More often one sees diarrhea, or headache, or asthma, or dermatitis, or pain.

By fear, I mean fright, apprehension, worry, concern, or any other ramification of the feeling that there is an unwanted consequence from which I need to escape. By anger, I mean all of its subdivisions—rage, hostility, resentment, rebellion, impatience. Both of these basic emotions are purposeful in defense. We are here concerned with their presence in too great amount, or in situations where they are not appropriate and cannot be useful in protecting the organism. Presence of these feelings promotes tension. Tension stimulates. The resultant attitude, if the process is constantly applied for a time, is one we shall call "resistance." The need to resist becomes habitual and remains ever-present. It is evidenced by too-great muscle tonus, by loss of adaptability, and by reactions which are mechanistic rather than the product of choice. The opposite of resistance is a spirit of abandon. Our aim in therapy is to enable the patient to break with his habit of being at all times inflexibly resistant. He has many "go" buttons which keep

---

Read in the Symposium on Marginal Neuroses in Everyday Practice at the centennial meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 19, 1953.

him too ready for action. He is in a state of urgency about all things. He has lost his power of choice to come to a full stop and has become a puppet operating by whatever pulls the string. What he needs is a "stop" button. He needs to recreate the spirit of abandon.

Some do's and don't's.—It is silly to tell a patient to go home and stop worrying. If he could do this, he would not be in your office. Might as well tell him to go home and lower his blood urea nitrogen.

Never tell a patient that his pain or other symptom is imaginary. It brands you as an ignoramus and adds anger to his problem. Neither is helpful. Vomiting of functional origin leaves *real* material in the emesis basin. Fear may augment pain, or provide the stimulus for pain, or cause the patient to exaggerate the importance of the pain. But pain is the result of stimulation of some mechanism and is real, as any of you who develop a headache from fatigue can testify.

From the past we get certain ideas of therapy which include (1) sedative pills; (2) reassurance, and (3) surgical mutilation.

1. Sedation causes a symptom relief—like morphine in appendicitis. It is not a therapy. It often adds serious problems to the case and, by suggestion, subtracts from the patient's self-confidence and dependency upon his own controls for management.

2. Reassurance of the Pollyanna type does not help. The patient is no fool. He realizes things are working incorrectly within him and knows that he cannot profit by looking away. Assurance is something the physician endeavors to re-create in the patient. He is more likely to win success by the artful use of suggestion than by didactic teaching. Simple explanations of the nature of the illness and of the method of relief, carry reassurance; but more often because of the manner in which the facts are spoken than the verbiage itself. Any doctor can, by suggestion, create a neurosis in his patient ("you have a heart murmur which I think is unimportant, but—"). By reversing his usage of suggestion, he can help to unseat fear and anger from the driver's seat. And that is his therapeutic goal.

3. We see less therapy by mutilation than formerly. Not in a long time have I met a middle-aged woman with eight or ten abdominal incisions. Surgery *can* relieve complaints by extirpation of an offending organ. But it can also relieve through the establishment of faith and the restoration of confidence. It a patient believes that his abdominal pain was caused by a "chronic appendix," and that organ is removed, what then remains to be feared? His hazard is over and, through suggestion, his faith hath made him whole. The old dictum—"I'll take chronic appendicitis and you take the field"—now retreats to its place backstage, beside clitoridectomy and oöphorectomy for "chronic female complaints."

False concepts make progress difficult. The earth seemed flat to those living on its surface some 500 years ago. Holding to this fallacy bothered no one until navigation extended beyond the horizons. We hold firm to two false concepts which add great difficulty to otherwise sound efforts in therapy of the neuroses. The first is the habit of thought which insists on identifying the output, or product, of the organ called "brain" with the proud possessor thereof. Thus, the responses of my brain become synonymous with "me." We do not so regard the functions of our hearts or our livers. When they misbehave, we view them with objectivity, as organs needing readjustment. We are not embarrassed to find them out of order. But because we do exercise voluntary control over a small segment of the brain's total operation, we infer that all the rest is under our control and represents "us." Actually, a far greater portion of the total response in that organ occurs at an unconscious level; a great deal more belongs to the level of the reflex, the appetites, and whatever it is which we once called instinct. All of which brings a feeling of contempt (and in the victim, a feeling of self-condemnation) for anything short of perfection in the brain's operating responses. It is similar to the stigma attached to infectious tuberculosis a few years back. Families needed to whisper about a case in some relative.

Doctors do not escape from any attitude so universally accepted. And when I fall back into this point of view, I am apt to say to my patient "*You* did this; *you* thought that; *you* felt so and so." This reaffirms the false belief in the mind of the patient, whose natural response to any idea of blame or censure is to recoil from it. To become defensive automatically increases resistance, which defeats my therapeutic purpose. I might better have said "this happened *in* you, or *to* you; or *your brain* is doing this." The problem of treatment of a neurosis is similar in method to the problem of correcting bad grammar; conscious striving for replacement of an incorrect reflex action with a more correct technique. In so doing, we ourselves must watch our own technically grammatical errors. Knowledge is *not* power. Only the ability to convert that knowledge into use is power, as you golfers well know.

The second false concept has been mentioned. Almost all of us expect that by will-power, we can displace or change our strong feelings. The will can inhibit, and that process can be successful in hiding our feelings from the world, or preventing the action which is natural to such emotion. But the will does not alter the presence of that emotion. Nor can that emotion be unseated by the exhibition of reason or logic. If it could so happen, the patient would not be ill. To remember this will save a great many futile attempts to persuade a sick person to terminate that illness because it is not reasonable to harbor it. We do not tell the paralytic that all he needs is to move his muscles, or the diabetic to lower his blood sugar. Treatment here goes better if we eliminate didactic preachments and scrap scholasticism.

There is a vast difference in the significance of "I will" and "I am willing." Many of the patients are ill because they are continuously meeting life with "I will" but could not make themselves "willing." And there, in a nut shell, lies the difference between the diseasy type of response, made with inhibition dominant, and the easy flow of response toward accomplishment of a desired action when a harmonious feeling (force) supplies the energy to support it. To use the will to correct the inappropriate discord between action and feeling is to invite illness.

The object of therapy is to break a state of habitual resistance, and thereby to permit body and mind to become unresponsive rather than hyperexcitable. It is usually a matter of reprocessing emotional habits which are in fact conditioned reflexes. (Pavlov taught us these mechanisms in animals.) Keeping the mechanistic and compelling force of a strong feeling in mind, attack the illness objectively. You have two measures to use which yield successes.

In our country, psychological training is rather completely dependent upon the Teutonic researchers, beginning with Freud. Much of our understanding of psychic mechanisms is due to that teaching. Being Teutonic, it is ponderous, cumbersome, and in the matter of therapy, impractical for our purposes. Little seems to be known of the French school of thought; one seldom finds in the books or class-rooms, reference to Dubois or Dejerine. Yet Dejerine is one who seems to have grasped the fact that emotion can be altered by the power of suggestion. Emotions seated in the soul dictate, by their suggestion, to intellect, mood, and bodily cells, thereby producing response in these realms. The fact that a feeling is a perversion does not matter. Our various realms of response must try to match with whatever would be an appropriate reaction to that feeling. If one wishes a natural flow of response instead of a perverted one, he needs change the feeling to one more helpful in meeting the events of life. Our role as physician is to aid the patient in making this exchange. This art of suggestion is being well-exploited by advertising men, propagandists, evangelists, and rabble-rousers. Anything so potent in their hands deserves more "scientific" exploration toward usage in therapeutic techniques. We sorely need some weapon to use against a disease which paralyzes the capacity to choose reaction in reason. Already, dentists and obstetricians have found the art useful.

A Boston internist, Dr. Joseph H. Pratt, has for twenty-five years carried on, both in private and dispensary practice (by group therapy), an admirable demonstration of the effectiveness of Dejerine's method. His artful utilization of the principles of suggestion in group therapy has resulted in 80-90 per cent successes on a series of nearly 4,000 cases. By comparison with efforts in the usual handling of such cases, this figure is astounding. Yet his excellent pioneer effort is not widely followed and treatment of these patients muddles along. One of the few seedlings in the United States exists here in Saint Paul, being splendidly carried on by Dr. Harvey Beek.

The art of suggestion is a useful method of teaching in all forms of education. If I wish to train a dog to perform a new trick, I may explain to him in English what I want him to do. Or I may speak in Chinese. It makes little difference to the dog. When the trick has been learned, I will find that I have projected my ideas into his brain chiefly through the mechanism of suggestion. Your own ingenuity can supply the ways and means of handling the marginal neuroses. I have had a brilliant result by conjuring up a typical Pavlov reprocessing technique and applying it to a situation where reflex conditioning had altered a previous response. The patient actually tricked the brain into a return to its former habits.

Everywhere in the animal kingdom, there appears to be a natural reaction that is pertinent to our discussion. Coercion of any kind tends to excite resistance. Since our goal in therapy is to break habitual resistance, the use of an intellectual coercion is a poor weapon and is doomed to failure. Which may explain the phenomenon that college professors are very difficult cases to treat. They believe that an intellectual dictatorship exists in brains; but in the time of their own need, they cannot coerce their animal passions with that weapon. To quote Dejerine, "Blessed are the simple-hearted for they shall be cured."

The second successful agency in treatment is one which can be taught didactically. It utilizes a habit common to all, i.e., the ability to contract or relax skeletal musculature voluntarily. There are several simple techniques for relaxation which can be taught to a patient who is eager to understand his disease. And this is a necessary element in the therapy of neuroses because one needs to enlist the patient's interest immediately in some useful device which is objective. It is the equivalent of coaching a diabetic in his dietary needs. Besides the value it has in combatting the course of the neuroses, it has additional value in weaning the patient's attention away from his introspective habit and directing it upon a technique which can deliver him from his illness. The relaxing exercise can easily be rehearsed three times a day. In a few weeks, there develops a voluntary skill in bringing the physical body into a state of muscular hypotonus. Concurrently, there is practice in bringing the thinking processes to a full stop. After it is learned, this state of inertia can be self-dictated to the organism in a very few minutes. The benefits are manifold. The body becomes still and quiet, not because it is forcibly prevented from motion, but because all urge to react has been drained off. The index of the degree of release is a sensation. Patients learning this tactic discover for the first time in life what it feels like to be truly quiescent. In this state, the habit of being resistant is broken; there is improvement in the ability to concentrate and a loss of symptoms. By suggestion, an aura of peaceful serenity is attained, and rest, previously impossible, can be had. The habit of hyperexcitability is reprocessed and replaced with a willingness to be inactive. And as this simple technical skill improves, the power of making a choice in reason returns. Where voluntary option in response has existed, there is restoration of that option. Physical symptoms alleviate. In fact, I have seen persons well-versed in this skill undergo a complete personality change in thirty minutes. The change in them is dramatic and the relief of their torment parallels that of novocaine injections for relief of pain. Hippocrates seemed to understand these matters for he said, "As long as the brain is at rest, man enjoys his reason."

To enjoy means to "find joy in." There is no worse torment than to realize that one possesses his capacity to reason, needs to use it, but cannot switch it into the circuit. That knowledge alone will produce fear. We spend hundreds of hours in efforts to restore motion to paralyzed muscles. What prevents us from equivalent effort in trying to teach rest to an overactive brain?

CHICAGO PAPER SUPPORTS AMA POSITION

The Chicago Tribune, one of the most powerful newspapers in the country, recently upheld, editorially, the American Medical Association's position on veterans' medical care.

"Dr. Edward J. McCormick, president of the American Medical Association, is on firm ground in calling for reexamination of the extent of free medical care to be dispensed by the veterans administration," the *Tribune* said, adding:

"A racket has sprung up in the provision for extending medical care to nonservice connected disabilities when VA facilities are available to handle such cases. A year ago 65 per cent of the patients in VA hospitals fell into this category. During the year September 1, 1951, to August 31, 1952, 85 per cent of the 500,000 veterans treated were patients with nonservice connected disabilities.

"Dr. McCormick reports that there are now twenty million veterans in civilian life and the number is increasing by a million annually. The expense of any such operation would be staggering, and the loss of liberty apparent.

"It is time to call a halt to this progression and to impress upon Americans that while they may be veterans they are citizens first, that their responsibility is to take care of their own requirements instead of trying to shunt them off on their fellow citizens and that in the long run there can be no benefit even if they seem to be ahead of the game in getting something from the government.' The government is themselves, and they pay for it. Their pay will increase in proportion, if these exactions continue, precisely as we approach the point where this becomes a nation of veterans."

SOCIAL SECURITY FOR PHYSICIANS

CARL B. DRAKE, M.D.
Saint Paul, Minnesota

WHEN Congress convenes in January it will resume its consideration of bills which failed to be acted upon during the first session of the 83rd Congress. In November the House Subcommittee resumed its study of social security and its extension to professional groups including physicians. The issue is likely to be a lively one, and physicians should post themselves on the pros and cons so as to know how they stand on being included in the social security program.

House Bill H.R. 6812, which was submitted on August 3 will, if passed, make it mandatory for professional men including physicians, residents, interns, dentists, veterinarians, lawyers, architects and farmers who earn $400 or more a year, to come under social security. Mandatory coverage also is provided for farm workers who earn $50 or more, in a calendar quarter from one employer. Several other segments of the population totaling about 4 million, including state and local government employes now enrolled in retirement systems and ministers of the gospel, would be offered coverage on a voluntary basis. The proposed extension would cover about 10 million citizens not covered at the present time.

Mr. Reed, who introduced this bill at the request of the Eisenhower administration, has stated that his action is not to be interpreted as an endorsement of the plan. It apparently has been introduced in order to bring the matter of extension of Social Security up for consideration.

The medical profession went on record as opposed to the extension of social security to the self-employed group including physicians in 1949, when the AMA House of Delegates passed such a resolution.† Further action will probably be taken in December but was not known as this article went to press. Also on record as opposed to the extension of social security to their groups, are the American Dental Association and the American Bar Association. The AMA proposes instead that self-employed persons be allowed to defer income tax payments on a portion of their earnings which would be paid into restricted annuity plans.

As perhaps most people know, Old Age and Survivors' Insurance (OASI) provides for a tax on income, paid half by the employe and half by the employer, or, in the case of the self-employed, a tax at a rate higher than that paid by an employe but not equal to the sum of that paid by employe and employer. In return, the worker is entitled to collect a certain amount each month, depending on the number and age of his dependents upon his retirement at the age of sixty-five, providing he does not earn over $75 a month. In case of death the surviving dependent spouse, providing she or he as the case may be is sixty-five or over, is entitled to collect a certain amount each month (providing too that the survivor does not earn over $75 a month). If the worker leaves a widow alone, and she is under the age of sixty-five, she receives nothing. In case, however, a worker leaves a child alone, or one or more children under eighteen in addition to a widow, certain monthly payments are due, to those earning less than $75 a month.

How would OASI, extended to include the medical profession, affect the profession? Most physicians are self-employed and earn over $300 a month—the maximum amount on which anyone pays a tax. At the present rate of 2¼ per cent he would pay $81.00 a year. But beginning with the year 1954, the tax will be 3 per cent; in 1960, 3¾ per cent; in 1965, 4½ per cent and from 1970 on, 4⅞ per cent. From 1970 on he will pay $175.50 a year. A physician who begins paying the tax in 1970 at the age of thirty, will by the age of sixty-five have paid in the sum of $6,142.50, over the period of thirty-five years.

If OASI is extended to physicians, their benefits will be as follows. If the physician retires at the age of sixty-five, he will receive $85 a month in the nature of an annuity insurance (55 per cent of the first $100 of his income and 15 per cent of the $200 making up the $300 of his income). When his wife also becomes sixty-five, his monthly government check will be $127.50. If he dies his widow, over 65, will receive $63.75 monthly. If he has a wife and child under eighteen (not likely), his monthly check will be

---

†Resolution on Social Security J.A.M.A. 140:693 (June 25) 1949 and 140:791 (July 2) 1949.

$168.75. If he earns over $75 a month he will receive nothing from the government. At the age of seventy-five he may earn as much as he can without jeopardizing his insurance.

How does this compare with an annuity policy obtainable from a life insurance company? A policy taken out at the age of thirty with a yearly premium of $175.00 will bring a return of $64.26 a month at the age of sixty-five or $48.10 a month with a paid up life insurance policy of $3,130 with no ifs, ands or buts.

Most physicians practice a number of years after reaching the age of sixty-five, and earn much more than $75 a month. The median age at retirement for the doctors is 74. Most would prefer to continue practice rather than accept a small check each month from the government and limit their practice to $75.00 a month. The limitation of $75.00 a month would simply place a premium on dishonesty to which some physicians, we are sorry to state, might yield. OASI applied to physicians would thus tend, too, to decrease the number of physicians in practice, of which some think there is already a scarcity.

As far as the Survivor's Benefit portion of a physician's Social Security is concerned, a physician's widow, if childless, will receive nothing until she reaches the age of sixty-five. Then she will receive $63.75 a month providing she does not earn over $75.00 a month. Again this places a premium on dishonesty and encourages laziness. A child under eighteen will receive the same monthly allowance as the widow over sixty-five; a widow and child $127.50 a month, and a widow and two or more children, $168.75 a month (the maximum allowance). A lump sum of $255 at death would also be obtainable.

One provision of OASI which ignores insurance actuarial experience, is the ability to take advantage of the retirement benefits after contributing for only eighteen months. As Dickinson* has so clearly stated the situation: "An argument frequently used to attempt to persuade older professional persons to urge extension of the act is a so-called bargain feature; for example, to take an extreme case, it is pointed out that a person approaching the age of sixty-five can pay a minimum of $121.50 during the last eighteen months and receive a social security pension of $80 per month for himself at age sixty-five, plus a monthly pension of $40 for his wife at age sixty-five; moreover, the wife's pension would be increased to $60 per month if she outlives her husband. Actuaries estimate that the single premiums at age sixty-five for an insurance company annuity paying these benefits would be about $23,000. Monthly pensions of $120 received once or twice would exceed the minimum cost. The attractiveness of this lure is greatly lessened when a professional man approaching sixty-five asks himself: 'Who is going to pay for my pension under the Social Security Act if I do not pay for it?' The obvious answer is that the balance of the cost must be paid by the working population, by the profession's younger colleagues, by their neighbors, by their children, and perhaps by their children's children. This is a moral question for all those approaching sixty-five who are considering the desirability of coming under the Social Security Act."

This provision of the Social Security Act makes it possible for an elderly immigrant couple to take out citizenship papers, work for eighteen months, and receive substantial checks from the government the rest of their lives, although they had contributed very little during those eighteen months. Another bill presently before Congress even suggests that all citizens be covered without proof of previous income! Surely this is a country overflowing with generosity.

Of course, the whole philosophy of Social Security is to force people to provide for the disabilities of old age and for dependents in case of death. It is assumed that they cannot or will not provide security of this sort for themselves. This is true of a certain segment of the population, but OASI forces those who can and wish to purchase insurance to meet their special needs to pay a tax to provide coverage not of their choosing. If the funds provided by the tax are not sufficient to meet the guaranteed insurance payments, other taxes will meet the deficit. It should be remembered that the employer contributes as much as the employe towards this fund, and of course passes on the cost to the price of his product—an inflationary factor.

Attention should be called to the fact that the federal government has gone into the insurance business on a large scale, collecting billions of dollars yearly in competition with private insurance companies. One excuse for such a venture is that the government can do this better than the private insurance companies. Have they proven this to be true?

---

*Dickinson, Frank G.: Pension for physicians. J.A.M.A., 148:1279, (April 12) 1952.

When an insurance company collects premiums from its policy holders, such funds are in the nature of trust funds to be used for the fulfillment of its contracts. What happens to the billions of dollars collected by Social Security? Nonnegotiable interest bearing United States government bonds are exchanged for the cash collected and the cash is spent. The taxpayer not only pays in his money to the Social Security fund, but he pays interest on the government bonds which have been substituted. As a result of this questionable procedure, where will the money come from to meet the Social Security obligations if not from further taxation?

By the end of February 1948 over twenty-one billions of dollars had been collected to meet the obligations of the OASI program. With the increase in tax rates which begins in 1954 and more than doubles by 1970 the OASI fund will reach astronomical figures and will greatly aggravate the problem of the temporary disposition of such a huge sum.

From a standpoint of dollars and cents OASI would be a good buy for the young physician and for the elderly one. Private insurance cannot compete with the survivors and retirement benefits offered by Social Security, for it is estimated that the cost for the same coverage would be twice that paid by the physician for Social Security coverage from 1970 on. If the policies offered by private insurance companies are actuarily sound this means that tax funds in addition to those paid under Social Security will be called upon to meet OASI payments.

For the physician in the age group somewhere between the young and old, OASI does not offer as attractive an investment. His widow is not likely to collect for children under the age of eighteen, and she can't collect until she reaches the age of sixty-five, unless she has one or more children under the age of eighteen. Thus the so-called Social Security insurance provides nothing for the widow in a fairly large group until she attains the age of sixty-five, which is not very far from her life expectancy. Furthermore OASI insurance has no cash or loan value similar to private insurance.

The retirement features as far as the physician is concerned (and this applies to other professional groups as well) is not too inviting. As we have said, most physicians keep on practicing a considerable number of years beyond the age of sixty-five, and earn more than the stipulated $75 a month; above which income, he sacrifices his right to collect his check from OASI of $85 a month, if a widower, or $127.50 a month if blessed with a wife over sixty-five years of age. As has been stated he is not likely at the age of sixty-five to have children under the age of eighteen for which he would be entitled to collect more.

What should be the attitude of the physician towards the proposal to add the medical profession to those covered by Social Security?

Some physicians think that the profession should be permitted to share in the Social Security program inasmuch as they at present are contributing, through other taxation, to make up deficits in the Social Security program.

Others believe that OASI does not suit their needs well and contains too many ifs, ands and buts, which might make their investment in it a total loss. Some would much prefer to purchase annuity and life insurance of their own choosing which would provide them with a certain, though smaller monthly return, not dependent on their earnings after the age of sixty-five, or the age of their wife or children.

If the Reed-Keogh bill, now before Congress and backed by the AMA, is passed, the physician, and other self-employed in the professional groups, will be enabled to postpone the payment of income tax on a certain amount of their incomes invested in annuity insurance during their highest earning years when they are in their highest income tax brackets. They will be taxed on their annuity returns when their incomes are smaller. It is felt that such a law would constitute a just relief for the profession whose years of greatest productivity are limited to a comparatively brief span when they are in the higher brackets from an income-tax standpoint in comparison with other incomes.

Note. The ideas expressed in this article are those of the author and do not necessarily represent those of the Minnesota State Medical Association.

BECKER COUNTY BLOOD BANK

C. W. MOBERG, M.D.
Detroit Lakes, Minnesota

THE USE of whole blood and blood derivatives is now accepted as the procedure of choice for the treatment of medical emergencies due to hemorrhage and shock. In addition, blood products have first call for supportive therapy in many surgical procedures as well as for serious debilitating illnesses. In many cases their use is a life-saving measure. Consequently, the modern medical and surgical services require that blood and plasma shall be available at all times.

Medical emergencies occur in rural areas as well as in large metropolitan centers. Therefore, the rural physician should have at his disposal blood and plasma in order to enable him to treat these emergencies properly. A community which does not have an adequate blood transfusion program must be considered in arrears of present-day medical progress. It is our opinion that every community, even though its hospital may be small, should and can have on hand an adequate supply of plasma and a moderate amount of blood in order to be able to cope with medical emergencies which require transfusions and supportive treatment. Furthermore, we have a strong conviction that a community with hospital facilities can operate its own blood bank.

In 1942, a medical emergency which occurred in our hospital approached catastrophe because we were wanting in the necessary blood and plasma for immediate use. This experience proved to be the stimulus which brought forth the Becker County Blood Bank. We are happy to report that this blood bank has served the community well during these intervening eleven years. Although a paper has appeared[2] describing the first early adoption of the principles of this program in another community, nevertheless our program differs in several important respects from the one reported earlier, and it has been so successful that we have decided to report the details of this program so that our experience may be available to others working with similar problems.

Geographically and industrially, we are a rural agricultural area. Becker County has a population of approximately 27,000 people. Detroit Lakes, which is the county seat, has a population of 6,000 and serves as the medical center for the area. Here is located the only hospital in the county. St. Mary's Hospital is modern in every detail; it has sixty beds and fifteen bassinets; it also serves as the headquarters for our blood bank. The hospital administration, the doctors of the community, and the citizens have given our blood bank their wholehearted co-operation at all times.

In order to be successful, a transfusion service must provide the following:

1. *Personnel.*—The hospital medical technologist must be skilled in the procedures necessary for standard blood grouping, Rh determinations, and compatability tests. She must have an understanding of sensitization phenomena and be able to carry out the procedures for detecting sensitization. She must be skilled in the technique of vena puncture so as to be able to secure blood products of high quality with minimum discomfort to the donor. If the technician is not competent for this work, additional training may be acquired speedily at proper teaching centers. This technologist can do much of the executive work necessary in operating a community blood bank.

2. *Equipment.*—Proper equipment is essential for an efficient transfusion service. In addition to the standard equipment needed for laboratory blood grouping procedures, a refrigeration unit is of utmost importance for proper cooling and storage of blood. There are many standard refrigerators which are satisfactory. Vacuum bottles together with donor drawing sets and dispensing sets for the recipient are commercially available for all needs. It is highly desirable to house the Blood Bank in a separate room, or rooms, in the hospital, so that these are always ready if blood must be drawn immediately for an emergency. Thus the blood bank facilities are centralized for purposes of drawing and storage of blood and plasma. Drawing tables, desk, et cetera, may be made or acquired to meet the specific needs of the blood bank. Proper record forms can usually be printed locally or secured from stock printers. Proper shipping containers are

essential if blood is to be transported. It is not feasible for a small hospital to provide laboratory equipment and facilities for every type of analysis of transfusion problems, Rh antibody titrations, et cetera. These services are better obtained from a larger blood bank laboratory with which a small hospital bank should be affiliated.

3. *Adequate Donor Supply.*—The efficient transfusion service must be able to meet the community needs at all times via an adequate donor supply. We have a self-sufficient supply via a membership plan which will be discussed more in detail in a subsequent paragraph. The need generally falls into two categories—routine daily needs and emergency needs. Our routine daily needs are easily satisfied by maintaining a stock of 12 to 15 units of blood at all times. As will be pointed out later, this plan eliminates all losses due to outdating. Our inventory is maintained by calling in members for required blood deposits about every ten days. Emergency needs may mean either a rare type of blood or a situation which requires an unusually large amount of blood. In order to satisfy our needs for rare blood, we maintain a registry of members having rare blood types. These are held for emergency call only. They are never called for routine blood deposits. If an emergency demands large quantities of blood, we call the required number of members to come in for a blood deposit. Detroit Lakes members, by and large, are held in reserve for emergency drawings, whereas the distant and rural members are called for elective drawings.

4. *Plasma.*—Plasma reserve is always maintained on the surgical and obstetrical services for immediate need when desired. Plasma reserves could easily be expanded to include other key points of emergency treatment if necessary. But to date, we have had no demands beyond hospital services.

5. *Consultation Service.*—Consultation service is essential for the troublesome cases which appear in every transfusion service. It is not feasible for a rural bank to maintain facilities to solve all these problems. They can be satisfactorily solved by affiliation with a larger central blood bank laboratory offering consultation service for the following situations:

(a) Laboratory and clinical assistance in the study and analysis of difficult transfusion problems.

(b) To supply selected blood from its larger stock for use in difficult transfusion problems.

(c) To serve as supplementary source for rare types of blood.

(d) Transfusion reaction study especially involving rare group sensitization or confused situations.

(e) Consultation assistance in Rh determinations, Rh antibody titrations, direct and indirect Coombs tests on blood from the mother. The Coombs on newborn is done locally. It is always an emergency.

(f) Consultation laboratory service in genetic studies of parents and children where hemolytic disease of newborn has occurred.

(g) Periodic refresher study regarding new laboratory methods. We are affiliated with Minneapolis War Memorial Blood Bank. They have offered us splendid consultation assistance when special problems have occurred.

6. *Clearing House.*—Our affiliation with Minneapolis War Memorial Blood Bank has also given us a clearing house exchange service so that we can provide blood products to our members away from home. The details of this clearing house system have been described elsewhere.[3]

7. *Minimum Standards.*—The preparation of blood for transfusion is becoming a highly technical field. The many procedures evolved during the past twenty years of blood banking have been evaluated at a national level both by the American Association of Blood Banks[1] and by the National Institutes of Health.[5] The best or most acceptable of these different methods have been selected by these experts. This wealth of experience should and can be available to even the smallest rural blood bank. Affiliation of these small banks with a central bank permits the local technologist to supplement her reading with actual work experience in the central bank and permits examination of how these methods are being applied at the local bank by visitors from the central organization and even from the National Institutes of Health itself.

The Becker County Blood Bank had a meager beginning in 1942. Our initial equipment consisted of a refrigerator, a supply of vacuum type bottles, and aspirating equipment. Thirty-two members of the American Legion were sufficiently civic-minded to donate the initial stock of whole blood. Thereafter, our stock was maintained by a replacement of one unit of blood for each unit of blood or plasma received from the bank. If the blood were not used within sixteen days, then the supernatant plasma would be aspirated and pooled for processing. This plan provided us with a constant supply of plasma and cell suspensions but not a completely reliable stock of whole blood. However, this plan served us very well for approximately eight and a half years. During this period we averaged approximately 300 transfusions per year and reactions were so rare as to be almost negligible. The chief shortcoming of the plan was an occasional shortage of fresh blood in the bank due to delay in securing blood replacements. This was in part overcome by an index of donors which we maintained by keeping a record of all persons who were typed or who had given previous donations. By this means we developed a walking blood bank to support the regular bank, especially during emergencies. Occasionally we were embarrassed because the few people with rare types of blood were called upon too frequently.

In order to overcome the difficulty of maintaining an adequate and uniform number of donors, and in order to expand our blood transfusion services along more modern lines, we reorganized our blood bank services on a county-wide basis in 1951. By this reorganization we hoped to achieve the following improvements:

1. We aimed to enroll most of the people of our county as members in our blood bank system.
2. We aimed to relieve the individual recipients or the family from the necessity of finding blood donors during the period of distress accompanying the illness.
3. By affiliation with the Minneapolis War Memorial Blood Bank we hoped to modernize our transfusion program so that we could provide for our community all the services as outlined above.

The new plan is now in its second year of operation. It is working very satisfactorily. The people of our community like it, the hospital likes it, and the doctors like it. An essential part of the new system is the securing of a large membership in our blood bank system. The bank will supply blood and blood derivatives to its members in time of need. In exchange for this service, the member agrees to be a willing donor when the blood bank calls him. This constitutes a form of transfusion insurance available only to members of this system. Non-members must secure their own individual replacements. This phase of the new blood bank program is essentially a procurement procedure which: (1) provides a dependable uniform supply of blood controlled by the blood bank staff; (2) relieves members of scurrying for donors during the period of illness or accident; (3) provides community co-operative protection.

Organization

This phase of our present blood bank system was initiated at a meeting held in December, 1951. Fifteen carefully selected lay and professional persons representing every geographic area of our county were present at this organizational meeting. Included were Sister Bennett, Superintendent of St. Mary's Hospital; Sister Ann, our hospital technician; and myself as representative of the medical profession. The first order of business was a discussion of the need and the advantages of modernizing our blood bank service. This was followed by a demonstration of the equipment needed in drawing, processing, and administering blood. Prepared units of whole blood and plasma as well as empty stock bottles were shown. A brief outline of the necessary laboratory procedures was discussed. By this means the group was informed about the procedures that are necessary to prepare blood from a donor to a recipient. This feature was impressive because a lay person has no concept of the skill and effort involved in a blood transfusion. The exacting care and detail which was outlined emphasized the need for thoughtful planning and preparation so that emergencies could be handled safely.

The next order of business was to propose the establishment of a Becker County Blood Bank system and to create a board of directors of the persons present at this meeting. This was unanimously adopted. Election of officers followed immediately. Various committees were appointed from this newly constituted board to: (1) develop a constitution for the organization; (2) develop a plan of procedure to secure members and set a time for a membership drive; (3) make an appraisal of new equipment and record forms that were needed; and (4) establish fund-raising means to secure needed funds.

Weekly meetings were held until all details had been developed. By this time all the directors were thoroughly familiar with the operational details. They could speak with some authority in their respective communities. The plan was so devised that each geographic area had a director on the board. A constitution and by-laws were adopted. This document sets forth the statement of policy and principles which govern the blood bank.

Securing Members

It was decided to carry on a membership drive for a period of one month. Prior to this, extensive publicity was given by press and radio. A form letter was prepared and mailed to the president of each organization in the county. This served as an invitation to the members to join the blood bank. Many organizations participated actively in the membership drive. Blank membership cards were placed in all the banks and all the drug stores in the county through the co-operation of bankers and druggists. With these cards was placed a lithographed sheet outlining the benefits and coverage available to members. These facts were widely publicized during the membership drive. Much emphasis was placed on the constitutional provision that benefits would be available as soon as the membership reached 500. For any person securing membership after the month designated for the membership drive, there would be a waiting period of thirty days before the benefits of membership could be realized. During this membership drive, over 1,500 members enrolled as individuals or as heads of households. Since that time additional members have signed up so that at the time of this writing there is a membership of 2,150. Membership may be obtained by meeting the eligibility requirements and by signing the membership card. The member receives a portion of this card as evidence of his membership. The other part of the card is returned to the bank for filing. The family unit is used as the basis for membership. The family unit consists of husband and wife, all children through age eighteen, and all parents and grandparents over sixty years of age. The blood deposit for the membership may be pledged by any person in the family unit.

Classification and Filing

The master membership file is composed of all the membership cards filed in alphabetical order. From this report a registration book is prepared for each area director. This book lists all members in the director's geographic area. The book has entry pages for each blood type, e.g., Type A, AB, B, and O, with designations of Rh positive or Rh negative, and each member is listed in the proper section according to his blood type. If his type has not been determined, he is listed in the unclassified section of the book. As soon as his type is known, the name is transferred to the proper section. This book also records the dates when requests are made for blood donations and the date on which the blood deposit is actually made.

Procurement of Donors

Now, with the bank in full operation, when our technician wishes to increase the inventory of any type of blood, she calls one of the area directors and requests him to send in the stated number of donors of the specific blood types or a given number of ungrouped members. The area director then contacts the required number of members and requests them to make a blood deposit at the stated time. It is agreed that no member shall be called upon for additional donations until all other members have contributed. By this procedure the blood bank has an adequate and controlled supply of blood at all times. The recipient members are relieved entirely of the necessity of securing replacement donors at a time of emergency and stress or serious illness. At such times people usually have sufficient trouble without worrying about securing donors.

If blood is given to a non-member, he is required to provide a replacement donor or make a deposit of $35.00 for his unit of blood. If the blood is not replaced, this deposit is forfeited. We are not interested in the $35.00 fee, but this charge appears to be necessary as a means of encouraging non-member recipients to secure replacement donors and thus of maintaining an adequate blood balance in the bank. A service fee of $12.50 is charged each recipient. This fee covers all the services connected with preparing the blood and administering it to the patient.

Records and Forms

Accurate records are very important to a blood bank. The various record forms will not be recounted here; suffice it to say, our system embraces a detail accounting of the blood from the time a donor presents himself until the final disposition of the blood or plasma.

When a donor reports to make a blood deposit, a careful history is taken and recorded on a card. After the donation he is given a receipt card. The blood is given a number which is placed on the bottle, on the pilot tubes, and on all the forms. A card with number attached to the bottle of blood or plasma must follow the bottle until it is used. Then the card is appropriately filled out and returned to the blood bank so that the record for this particular unit may be completed and closed. (Various cards and other printed forms are available and can be obtained by writing to the Becker County Blood Bank.)

Comments

We have operated our blood bank for eleven years. During this time it has rendered a valuable service to our community. We have been largely self-sufficient and independent. We have always had blood and plasma available from our own supply. No serious transfusion problems have developed and transfusion reactions have been extremely rare. We have used whole blood, cell suspensions, and plasma transfusions for various specific needs. During the past two years we have given five replacement transfusions in severe erythroblastosis of the newborn. These have all been successful and without untoward reaction. We believe our plan is far superior for rural communities when compared to plans which propose mass donations of blood to be taken out of the community, part of which is to be returned at stated intervals. Plans which depend on mass donations from a given community may cause temporary donor depletion. The reliability of such programs is compromised by the uncertainties of weather, the uncertainties of transportation, and, at times, the capricious actions of other organizations. Consequently, there is much anxiety as to whether or not the blood will be available at the proper time in the proper amount. Such programs have no provision for emergency coverage and there is no attempt to improve technical standards or contribute to the safety of transfusions.

Since December, 1951, we have been affiliated with the Minneapolis War Memorial Blood Bank in Minneapolis, Minnesota. This has enabled us to give our community a more complete transfusion service. Specifically our benefits may be outlined as follows:

1. We maintain a blood deposit with Minneapolis War Memorial Blood Bank by shipping them our unused blood units when they are eight to ten days old. This procedure permits us to maintain a larger local inventory without loss due to outdating. At the same time, it establishes credit with the Minneapolis War Memorial Blood Bank which is available to our members who may be hospitalized in the Twin Cities or elsewhere away from home. These credits are also used to secure irradiated plasma and special rare bloods from Minneapolis.

2. Our affiliation affords an opportunity whereby our technicians may periodically visit the bank in Minneapolis to take a refresher study course so as to keep up to date on recent laboratory procedures. Dr. Matson, director of Minneapolis War Memorial Blood Bank, also visits us periodically to render assistance and keep us up to date.

3. We obtain valuable consultation service on transfusion problems which has been discussed previously.

4. It has given us an opportunity to secure liquid plasma, which has been aged, filtered, and irradiated.

At the time of this writing we have 2,150 registered members in our Becker County Blood Bank system. This represents single individuals or heads of households. Add to these the children under eighteen and the parents over sixty and one will note that a sizable group receives the benefits of membership. In addition we serve many non-members who provide their individual donors. We also provide blood to small hospitals in neighboring communities upon request. At present our membership is gradually increasing because people are so pleased with the service. It is anticipated that non-members will find it increasingly difficult to secure individual donors. This will, of course, bring additional members to our bank. Currently we are giving approximately 500 transfusions per year. At this rate with our

INGUINAL HERNIORRHAPHY

WESLEY G. SCHAEFER, M.D., F.A.C.S.
Minneapolis, Minnesota

IN THE repair of an inguinal hernia, be it indirect, potentially a congenital type of weakness, or direct, the objective is to reconstruct an abdominal wall that has been insufficiently secure and strong to withstand the stress and strain of intra-abdominal pressure. In the development of man, with the assumption of erect posture, greater pressure is exerted on the most dependent part of the abdominal cavity, thus resulting in the increase of pelvic or inguinal hernias, quadrupeds being predisposed to umbilical hernia.

Drye[2] demonstrated that the intra-abdominal pressure is about three times as great in the lower as compared with the upper abdomen. This determination was obtained using a rubber bag placed within the abdominal cavity. The bag was attached to a U manometer by a rubber catheter containing water as a medium. In the dependent abdominal wall of man, especially where traversed by blood vessels and nerves, weaknesses develop. Such sites are the passageways for the inguinal canal with the sealed or unsealed processus vaginalis that has allowed the spermatic cord to descend, the femoral and obturator sheaths with their vessels, nerves, or Petit's triangle, anterior and posterior vaginal walls, et cetera.

In my experience with frequently recurring inguinal hernia, mainly of the indirect type, I felt that improvement in repair was not being regularly obtained by the usual procedures. My experience in teaching surgical anatomy had given me ample opportunity to study the course of the inguinal canal and observe how its position favors herniation by intra-abdominal pressure. Changing its direction and obliterating the canal as much as is feasible, without interference with the viability of the cord is being advocated.

The internal inguinal ring is lateral to Hesselbach's triangle one-half inch above the inguinal ligament and lateral to the deep epigastric vessels. The cord, in passing through the abdominal wall during embryological development, pushed before it the peritoneum, subperitoneal fat, transversalis fascia, transversus muscle and fascia, internal oblique muscle and fascia. It lies, in its oblique course, beneath the aponeurosis of the external oblique muscle before making its exit at the external ring to become subcutaneous near the pubic tubercle. The greater frequency of indirect, as compared with direct inguinal hernia, is readily understood. The intact abdominal wall acts as an obstructing barrier to direct inguinal hernia.

In inguinal herniotomy, the usual oblique inguinal incision is made, exposing the aponeurosis of the external oblique muscle. The fascia is incised, starting at the external ring about one half inch above Poupart's ligament, carrying the incision two inches beyond the internal ring. The hernial sac is dissected free from the spermatic cord well down to the base and opened widely. The contents of the hernial sac are replaced into the abdominal cavity. The abdominal wall in Hesselbach's triangle is first palpated by inserting a finger through the sac. This is very important to note its strength and also to determine whether or not a direct hernia is present.

Two strands of chromic catgut No. 1 are carried through the neck of the sac into the peritoneal cavity, brought through the peritoneum and transversalis fascia and transversus and internal oblique muscles which pass through the wall 1.5 inches above the internal ring and lateral to the deep epigastric vessels, which can readily be palpated in passing the needle through the wall (Fig. 1). Holding the two strands with a forceps, the other ends are carried through at opposite sides at the base of the sac. These two sutures are tied at one side, and then carried around the sac and tied at the opposite side flush with the peritoneum (Fig. 2). The sac is severed just above where it is tied, and then the other ends of the suture are pulled taut, transfixing the stump within the peritoneal cavity (Fig. 3). This procedure eliminates a dimple that usually occurs in the peritoneal wall in either transfixing or leaving in place the stump under the transversus and internal oblique muscles (Fig. 4).

The following steps are carried out:

1. The relaxed internal ring is brought together by interrupted stitches in the transversalis fascia.
2. Further repair is the suturing of the con-

joined tendon and transversalis fascia down to Cooper's ligament. In suturing these structures, it must be remembered that the obturator artery may arise from the inferior epigastric (accessory obturator) with associated pubic vessels. These vessels can readily be visualized by going through the transversalis fascia as it reflects down to Cooper's ligament. These vessels, especially the veins, may easily be pushed aside or tied off. Also, care must be taken to avoid the vascular sheath with its adjacent femoral vein. This can easily be hooked with the suturing needle.

3. The medial flap of the aponeurosis of the external oblique is sutured under the lateral flap by interrupted sutures, to inguinal ligament, starting near the pubic tubercle and carrying up 1.5 inches above the normal position of the internal ring. The spermatic cord is left outside; about one half inch is allowed for the cord, and stitches are carried on above the cord in similar fashion. The lateral flap is then sutured to the medial flap, thus overlapping the fascia (Fig. 5).

4. The fascia immediately around the cord is cut, allowing ample space for exit. Strangulation of the cord can be avoided if the little finger can be passed readily through the sutured aponeurosis (Fig. 6). The course of the inguinal canal has now been changed, making it shorter and having it pass cephalad rather than caudad. The rational for these few changes in the procedure has been suggested by the many recurrent indirect inguinal hernias encountered. They have all been through the canal, with no femoral hernia.

Discussion

The procedure has one purpose, to prevent indirect recurrence. The transfixing of the sac

may seem trivial, but it eliminates the dimple, the first potential weakness. Many ways of disposing of the stump have been tried. Marcy[7] advocated just high ligation. MacEwen[6] plugged the internal ring on its abdominal aspect with the rolled-up sac and sutured it to the ring. Wood[9] invaginated a part of the hernial sac, and closed the wall of the canal. Bassini[1] twisted the neck of the sac, tied and amputated. Halstead[4] closed the sac with quilted sutures through the peritoneum at a level about one and one half inches higher than the level of the sac. Furguson[3] was the first to transplant the sac under the transverse and internal oblique muscles. Halstead[5] also transfixed the stump of the sac under the muscles. The suturing together of the transversalis fascia about the internal ring is of the utmost importance since this ring is usually enlarged from the hernia. Similarly, medially the internal oblique, transversus muscles and transversalis fascia are decidedly relaxed. Suturing of the fascial tissue (conjoined tendon) to Cooper's ligament as employed by McVay[8] is especially good in the recurrent inguinal hernias in which the Poupart's ligament is stretched and frayed and is a poor anchor. But some cases are encountered where it is impossible to suture to Cooper's ligament due to the tension placed on the fascia. Above all, it is a fallacy to suture the muscles to the ligament. Muscles attached to a tendon fray out, and are of no strength-producing benefit. The advantage of transplanting the cord above the aponeurosis allows for closure of the fascia snugly below, and the most dependent external ring is changed to a higher level, and subjected to less dependent pressure.

Summary

In this series of seventy-six cases, using the outlined procedure, only one recurrent hernia has

INJECTION THERAPY OF VARICOSE VEINS USING SYLNASOL FOAM

H. A. ALEXANDER, M.D.
Minneapolis, Minnesota

THE INJECTION therapy of varicose veins, using part air and part liquid, is not new. R. R. Foote recommended soapy froth for superficial spider veins, in a book printed in 1949. McPheeters has been injecting foam into spider bursts for several years. Orback has been advocating his "air-block" technique for at least five years.

The method can be used with any of the soapy solutions such as Sylnasol (Searle), Sorocin (Merrill), or Sodium Morrhuate. It can also be used with the synthetic Sotradecol (Sodium Tetradecyl Sulphate, Wallace & Tiernan). Orback believes Sotradecol is the most effective sclerosing agent, and that it causes little or no allergic trouble. In my experience the allergic tendency is the same as with the soapy solutions, and the sclerosing action is not as uniform; most patients had very satisfactory results, but a few had violently excessive local reactions. I therefore prefer Sylnasol with its more uniform action.

The method is simple. The sclerosing agent is converted into foam by passing air through the liquid several times. A few drops of the liquid are thus converted into several cubic centimeters of foam, giving several advantages. (1) The economic advantage of using less material is the least important. (2) Allergic reaction depends partly on the amount of allergin injected; a few drops will cause less trouble than several cubic centimeters. (3) A slough can be produced by injecting sclerosing agent outside the vein, but one drop of Sylnasol mixed with air will seldom produce a slough.

I believe there is less discomfort to the patient because smaller needles and fewer skin punctures have to be made; also the use of the tourniquet can often be omitted, and many patients dread the tourniquet more than they do the needles. I believe there is less pigmentation of the skin. And the possibility of deep phlebitis is minimal because the sclerosing agent would have trouble getting into the deep vein.

But regardless of advantages, there are always two questions asked. First, "Does it work? How can a small amount of substance, as foam, destroy the vein better than a larger amount of the same substance in liquid form?" Obviously, the objective is destruction of the varicose vein. The portion of the sclerosing agent that comes in contact with the vein wall, is the only portion that does any good. A thin film of sclerosing agent against the intima, is all that is required. The portion of the liquid that mixes with the blood in the center of the vein, is wasted.

The second question is, "Is it safe? Can you inject air into the vein and not have trouble with air embolism?" Obviously, no intravenous injection is 100 per cent safe. One safety factor is the positive pressure in the saphenous veins, that makes Orback, Petretti, and others feel an air embolus is impossible. More important, I believe, is the fact that only 10 cc. or less, of air, in divided doses, is injected into a high segment of vein where it acts as a roadblock to the flow of blood. Even if the entire 10 cc. of air could somehow get into the circulation, it should cause no serious difficulty. The seriousness of an air embolus depends on the amount of air, the rate of injection, and the general condition of the patient. There are no statistics or average figures, and estimates vary; some authorities believe it might take between 400 and 500 cc. of air to cause a fatal embolism in a reasonably healthy person. Some believe that as little as 10 cc. of air in a very ill or moribund patient might cause death. Certainly the injection of large amounts of air into parts of the blood stream other than the saphenous veins, without regard to blockade of the blood flow, would be dangerous. The same danger of overdose or improper use is present when one uses morphine or digitalis or any other drug. I have used this method for over three years without seeing anything resembling an air embolus.

Technique

The patient is examined while standing erect, the involved skin area is sterilized by swabbing with alcohol. Veins to be injected are marked

---

Read at the annual meeting of the Southern Minnesota Medical Association, Mankato, Minnesota, September 14, 1953.

with mercurochrome. Then the patient lies in a horizontal position with the vein to be injected uppermost. The foam to be injected is largely air and is, therefore, lighter than blood; by gravity it will displace the blood at the uppermost part of the vein. A sterile 24-gauge, 1-inch needle attached to a sterile 5 cc. syringe is forced upward through the sterilized rubber cap of an inverted Sylnasol vial and 2 or 3 cc. of air is pushed through the Sylnasol. The position of the vial, needle and syringe are then reversed and thin foam is aspirated from above the Sylnasol. Again the position of the vial, needle and syringe is reversed and the thin foam injected up through the Sylnasol. It is then reversed again and thicker foam aspirated from above the liquid. After several passages of the foam through the Sylnasol, thick foam with tiny air bubbles should be present in the syringe. The patient's skin is again sterilized, the needle inserted into the vein, blood is aspirated to make certain the needle is well placed, and several cubic centimeters of the foam are injected. The point of the needle is then pushed through the posterior wall of the vein. The syringe is removed from the needle, pressure is applied with the edge of the hand just proximal to the area injected for one-half to two minutes (to help minimize movement of blood and foam through the vein). Then the needle is withdrawn and simultaneously a sterile cotton ball or gauze pad is pressed over the area. A larger pad of cellucotton is added over the small sterile pad and fastened securely in place with tape or gauzetex. Gauzetex sticks to itself but not to the skin; those patients whose skin is sensitive to tape are very grateful for it. Gauzetex is not satisfactory for use on the thigh. Adhesive elastic is best on thigh and knee areas.

An injection into a fairly large vein will be more effective if the "Empty Vein" technique is used. After the needle point has been carefully placed in the vein, the leg is elevated for perhaps fifteen seconds. This reduces the size of the vein. Then the leg is lowered to the table and the foam is injected; because of the reduced size of the vein, the same amount of foam can destroy a larger segment of vein.

After making one injection I usually wait several minutes to make certain there is no allergic reaction, and then make two or three more injections, but never exceed a total of 10 cc. foam at one time. After all injections are finished and patients are dressed I ask them to walk the length of the hall and then sit down in the reception room for five minutes. If after that time there is still no sign of allergy, they may leave. There are perhaps 5 per cent of patients who are, or who become, allergic to Sylnasol. Because of these patients, it is advisable to have an emergency box with sterile syringes and needles, adrenalin, aminophylline, intravenous Benadryl, and an airway always quickly available. Urticaria, visual disturbances, vomiting, and even anaphylactic shock can develop very rapidly. Having once shown an allergy to Sylnasol, a patient must thereafter be treated with special care. I do not depend on memory only, but put a big warning, in red, on the front of their record and on their summary sheet. If, subsequently, they have fairly large veins to be injected, I use a mixture of salt and sugar (Varisol, Abbott). For small veins and bursts I first give the patient an anti-histaminic, and then inject only a small amount of Sylnasol. Incidentally, it does no good to switch from one soapy solution to another, hoping to avoid allergic symptoms. For example, if a patient is allergic to Sylnasol he will also be allergic to Sodium Morrhuate. And I have repeatedly tried to use the synthetic Sotradecol for these allergic patients but the result is always the same, as far as an allergy is concerned, as with the soapy solutions.

After all injections have been made, the patient stands and moves around while the dressings, especially those dressings near the knee, are examined to make certain they give snug pressure but are not too tight. An Ace elastic bandage, No. 8, four inches wide, is applied around the calf, ankle and foot. If the patient has never used an elastic supportive bandage he is shown how to apply it, starting just below the knee, overlapping 50 per cent each turn as he goes down the calf; twice around the foot and ankle as a double figure of eight; then back up the calf, overlapping as before, as far as the bandage will go. This method gives double pressure at the distal part of the calf because there is twice as much elastic bandage there. The patient is warned not to apply the bandage in any way that could give the most pressure at the top of the calf because that would act as a tourniquet. The elastic support is removed at bedtime and put on again before breakfast. It can be washed once or twice a week in warm soapy water, rinsed, squeezed (not wrung) fairly dry, and laid flat on a kitchen table or clean board, to dry; it should not be dried by hanging over a line.

Elastic stockings have two advantages over the wrap-around type of bandage; they look better and they give support around the knee. An elastic stocking can be used instead of the elastic bandage except for the twenty-four hours after injections, during which time the bulky pressure dressings at the site of injections make the stocking impractical. Patients must be warned that elastic stockings are only satisfactory as long as the elastic is new and strong.

The pressure dressings at the site of injection are removed, by the patient, after twenty-four hours—sooner if the patient's skin is sensitive to tape. Local heat helps minimize discomfort; aspirin is seldom needed. Elastic support is usually worn for several days or more after each set of injections; all day at first, then removing the support a few hours earlier each day as the discomfort and swelling diminish. Return visits for subsequent injections are usually made at weekly intervals. At these subsequent visits, inspection of previously injected areas will often reveal hard tender areas of pocketed half clotted blood. Sigg calls them "intra-vascular hematoma." The name "soft center" is simpler. They occur after about one-third of the injections. If gentle pressure with the finger tips gives the impression of fluid, a quick stab incision with a sharp pointed No. 11 Bard Parker Blade will allow the molasses-like fluid to escape; the pressure inside the vein is relieved and the patient gets relief in a matter of minutes, very similar to the quick relief that follows drainage of a boil or quinsy. Small amounts of half clotted blood can be left alone but large amounts, if unopened, cause unnecessarily prolonged discomfort, pigmentation that is avoidable, and poorer end results because half clotted blood is easily recanalized.

Many of these details are explained to the patient at the office and are summarized in mimeographed sheets given to each patient. These sheets, labeled, "Information for Varicose Vein Patients," also stress the importance of activity for at least several hours after injections. The patient may go shopping, or golfing, or dancing after injections but should not sit still at a movie, or at a card game; there should be a quick walk or other activity at least every half hour for the rest of the day.

I advise all patients with varicose vein tendency to get two rest periods of fifteen minutes each day when the legs are reasonably normal. During the period after injections and during any period when there is a tendency to edema I urge several rest periods each day.

The average patient with varicose veins is advised to return yearly for treatment of any new veins. They are also advised against allowing an undue gain of weight. All this is explained in the mimeographed sheet.

Injection therapy is only usable in comparatively small veins; large veins with definite reverse flow should be treated surgically. All veins originating from a perforator should have surgery first; the perforator should be ligated as far under the fascia as possible; then the superficial veins can be injected. Moderately enlarged veins (borderline between those definitely surgical and those easily injected) can be given a trial of injection therapy, especially if they are tortuous and superficial. Bursts can usually be improved but if diffuse, and mild, and located above the skirt line, they are best left alone. I usually tell the patient the bursts can be improved, possibly 50 per cent, but not eliminated. If the patient wants or expects perfection after treatment of the bursts, then I do not inject. Bursts are chiefly a cosmetic defect; they seldom cause definite pathology.

There is considerable individual variation in the reaction to vein injections. There is also group variation that may help. People with light complexions react, generally, more than people with dark complexions. Blonds react more than brunettes, and people with red hair react even more than blonds. If a vein or burst is very superficial and thin walled, and the patient is a light blond or has red hair, it is advisable for the first trial set of injections, to dilute the 5 per cent Sylnasol liquid with an equal volume of normal saline, and then make the foam from the 2.5 per cent Sylnasol. Too much reaction in such a thin-walled vein may cause a slough even though nothing has been injected outside the vein.

I believe the treatment of varicose veins of pregnancy, depends on whether or not the usual type of varicose veins due to valve incompetence, existed prior to the pregnancy. Women with that type of vein present before conception will benefit from ligation and stripping. Women with only the hormone inbalance type of superficial blue telangiectases should not have surgery or injection therapy. This type should have estrogens, elastic support, rest periods, et cetera.

Injection therapy is contraindicated if the patient is unable to take a short fast walk, at frequent intervals, for several hours after the treatment. If the patient has painful arthritis or a severe sprain in the lower extremities, if the patient has a bad cold or severe infection anywhere, if the patient is exhausted from care of a sick relative, if for any of these or other reasons the patient is much below par and unable to be active, I either postpone the treatment or only inject one or two small veins because the incidence of allergic reactions depends to some extent on the general condition of the patient, and excessive local reaction occurs if the patient is not active.

Patients with only minimal varicose veins but complaining of very definite symptoms such as pain, swelling or numbness, should not be injected. They should have careful examination for flat feet, arthritis, slipped disc, cardiac decompensation, peripheral vascular sclerosis, or other conditions that could produce the symptoms. Injections of small veins and bursts will not correct these other factors and will only bring disrepute to the treatment. Hypothyroidism especially can be confusing. The patient complains of edema, vague leg or low back pains, fatigue, cold feet, and dry scaly dermatitis. She blames her symptoms on moderate varicose veins that probably are not a major factor. Examination usually shows some obesity and often moderate anemia. Such patients, especially if over forty years of age, should be carefully studied for hypothyrodism. A little thyroid extract often relieves the symptoms but treatment of the veins would not.

Arteriosclerotic patients who also have varicose veins, present a special problem. It is desirable to eliminate the veins because they cause back pressure on the capillary bed and thus increase the circulatory impairment caused by the arteries. However, varicose veins of the lower calf and ankle and foot area should not be injected if the arterial deficiency is great; the inflammatory reaction around an injection can draw badly needed blood away from the toe region and precipitate gangrene.

Acute thrombophlebitis is a contraindication to sclerosing therapy until the phlebitis has been quiet for several weeks. However, most venous occlusions recanalize, and it is improper to tell the patient "never let anyone treat your varicose veins." Many of these patients will be very much in need of vein treatment later.

INGUINAL HERNIORRHAPHY

(Continued from Page 1248)

been observed. The patient was a very obese, sixty-five-year-old man, in whom the aponeurosis opened in the lower portion. Other similar cases will undoubtedly be seen.

It has been my purpose to attempt to strengthen a defective abdominal wall, taking into account the forces of gravity and internal abdominal pressure on the dependent abdominal wall.

AN ACUTE CERVICAL TUMOR IN A MENTALLY DEFICIENT CHILD

HEINZ H. BRUHL, M.D.
Faribault, Minnesota

AT THE suggestion of Superintendent Dr. E. J. Engberg I report a case of an acute cervical tumor observed on one of the patients in the Minnesota School and Colony early this year. This case presented a challenge for diagnosis and treatment.

Case 1.—D. R. L., a twelve-year-old boy, was committed as mentally deficient in May, 1944, and admitted to the Minnesota School and Colony April 10, 1945. He presented a typical case of congenital cerebral spastic infantile quadriplegia. His delivery was entirely normal but it is noteworthy that during the second month of pregnancy the mother had a severe hemorrhage with threatened abortion. His deficiency was noted in early infancy. After the patient had entered the institution at Faribault, he was placed in the infirmary for little boys. He grew physically and developed enough strength in his arms to pull himself up by the rails of his bed or any other furniture to a sitting position. He is unable to stand erect and to walk at age twelve. He can grasp things but is actually not able to make purposeful movements with his hands. It is necessary to feed him in bed or in the wheelchair. He is untidy. Though he is not blind nor deaf he does not recognize individuals, does not respond to any directions, and does not seem to mind when different people take care of him. A mental test given in May, 1953, by our psychologist, J. Throne, placed him on the mental level of a six-month-old child.

On March 30, 1953, it was observed that the boy who had previously always eaten well and without trouble, did not eat well and had difficulty swallowing. He developed a temperature of 102° F. The following day he was admitted to the hospital of our institution where the physical examination revealed that he had an acutely inflamed hard tumor about the size of an egg on the left side of the neck anterior to the sternocleido mastoid muscle. Except for much mucus, the throat and tonsils were negative. Dysphagia, stridor and respiratory difficulties were noted at that time. The temperature was 104° F. and the white blood cell count was 18,000. Mantoux tests of 1:1000 and 1:100 dilutions were negative. As the site of the tumor corresponded to the left lobe of the thyroid gland, the diagnosis of an acute thyroiditis was made. Under penicillin, 200,000 units twice daily, and cortone 25 mg. every four hours, the boy's temperature became normal in three days and the signs of inflammation subsided. There was a collection of mucus in the throat but respiratory difficulties and pressure signs from the tumor were not alarming.

On April 7, the mass which had retained its original size started to show signs of fluctuation. On April 9, it was first aspirated and then lanced by our consulting surgeon, Dr. Burton Orr. About 100 cc. of thick green pus mixed with blood and mucoid material was obtained. Many air bubbles were observed at that time. The culture done by the laboratories of the Minnesota State Board of Health showed presence of *Escheria coli, Aerobacter aerogenes* and *Hemolytic staphylococcus aureus,* and the absence of acid-fast bacilli. The pressure being relieved, the boy could swallow soft food again and apparently had less trouble with his airway. The swelling subsided, but drainage continued and there was frothy pus mixed with necrotic tissue fragments and mucoid, saliva-like fluid which continuously exuded from the wound.

At the suggestion of Drs. John F. Arnesen, Burton A. Orr, and Thomas B. Merner, the fistula was filled with diodrast by Dr. J. Gordon Beaton and myself on April 15, 1953. A chest x-ray revealed—to our surprise—an open safety pin lodged in the tissues of the anterior portion of the neck below the larynx and to the left of the trachea. The diodrast had entered the esophagus and stomach thus demonstrating an opening between the abscess cavity and the esophagus. Apparently, the boy had at some time previously managed to put the open safety pin into his mouth and had swallowed it. The pin was lodged in the upper region of the esophagus, had perforated its wall and was now working its way out anteriorly. The tumor represented a secondary abscess following the trauma created by the pin. Following the diagnosis of this condition and on the recommendation of the consultants and medical staff, arrangements were made for the patient's transfer, April 16, 1953, to the Rochester State Hospital for further treatment.

That same day he was seen there by Dr. Kenneth A. Storsteen, Division of Surgery of the Mayo Clinic, and surgical consultant to the State Hospital at Rochester. He and Dr. Magnus Peterson, Superintendent of the Rochester State Hospital, have kindly given permission for me to present this interesting case to you. I shall quote from Dr. K. A. Storsteen's letter in regard to the case:

"My findings were as follows: an open safety pin was located in the left side of neck opposite cricoid cartilage. There was a recent drainage of a cervical mediastinitis and abscess with resultant pharyngo-esophageal cutaneous fistula. There is no fever now. Recent use of cortisone is noted. Recommendations are: Cortisone preparation for forty-eight hours, esophagoscopy and then removal of the safety pin by means of cervical incision if necessary.

The patient was prepared with intramuscular cortisone and operated upon on April 20, 1953. Under pentothal-curare anesthesia the patient's pharynx and esophagus

---

Presented at the annual meeting of the Southern Minnesota Medical Association, Sept. 14, 1953. Adjudged the best case report presented, for which the author was presented with a medal award.

Dr. Bruhl is Assistant Clinical Professor of Pediatrics, University of Minnesota, and Pediatrician on the staff of the Minnesota School and Colony, Faribault, Minnesota.

were examined using both a laryngoscope and an esophagoscope. The keeper part of the open safety pin was visualized at the pharyngo-esophageal junction. The rest of the open pin had perforated through at this level and was in the soft tissues of the left side of the neck. The pin was manipulated transorally, but it was impossible to remove it by these maneuvers. Consequently the neck was opened by means of a longitudinal incision over the anterior edge of the left sternocleidomastoid muscle. The open safety pin was found in the abscess cavity and was grasped by means of straight forceps. Dr. J. M. Carey grasped the keeper part of the pin at the site of perforation under direct vision using a laryngoscope and the safety pin was cut in two. He removed half of the pin through the pharynx and I removed the other half through the neck. The pin was of average size measuring 1⅝ inches in length. Two penrose drains were inserted and the wound closed in layers. Dr. J. Carey repeated the esophagoscopy and found the area of perforation to be quite localized on the posterior and the left lateral wall of the pharyngo-esophageal area where there was granulation and necrotic tissue.

"Postoperatively the patient did very well. He was placed on penicillin and dihydrostreptomycin. The cortisone was rapidly reduced. The drains were removed after a few days. The cervical wound drained saliva and mucus but gradually closed and entirely stopped draining on May 10, 1953."

The patient was returned to the Minnesota School and Colony on May 19, 1953, and continues to get along satisfactorily.

Discussion of the Case

Before discussing the diagnostic and general aspects of this interesting case we would like to pay tribute to the splendid surgery done by Drs. Kenneth A. Storsteen and J. M. Carey. We have nothing to add except to express our admiration for the skill with which the operation was performed and which contributed so greatly to save this boy's life.

From a diagnostic point of view this case was challenging. All tumors of the upper regions of the neck like cervical adenitis, Bezold's mastoid abscess, cystic hygroma, dermoids, thyroglossal cyst, could be excluded a priori. I shall restrict my discussion to acute tumors of the lower carotid triangle and among those mainly to three: (1) acute processes of the thyroid, (2) tuberculous abscesses and (3) branchial cysts.

1. Acute inflammation of the thyroid is comparatively rare. Most cases follow any kind of infectious diseases like influenza, pneumonia, diphtheria, mumps, measles, scarlet fever, typhoid fever, et cetera. However there are a good many cases on record without any known antecedent infection. Suppuration occurs in about 10 per cent of all cases. While the nonsuppurative form is mild, afebrile, and runs a self-limiting course of ten to fifteen days, the cases which become purulent have an abrupt onset with high fever and the cardinal local signs of inflammation. Swelling and tenderness are confined to one lobe or the isthmus. There is dysphagia.

The clinical signs in our particular case corresponded to the picture of acute thyroiditis so well that we may be forgiven for having made that diagnosis though we were well aware that it is a very rare condition, especially in childhood. It happened that we had seen such a case in a woman of middle age just two weeks previously and that might have somewhat influenced us in the original diagnosis.

2. The possibility of a tuberculous process had to be considered. Caseous necrosis with abscess formation of the thyroid gland is usually associated with an advanced pulmonary tuberculosis. Cold abscesses originating from a tuberculous focus in one of the upper cervical vertebrae appear usually as retropharyngeal abscesses but will sometimes work their way down the cervical mediastinum and appear at any of the lower cervical triangles. All these abscesses are "cold" and do not have the signs of acute inflammation shown by our patient. He had no symptoms of cervical spondylitis. His chest x-ray and Mantoux tests had been repeatedly negative. To be on the safe side, however, the abscess was aspirated before being opened. The pus obtained was not of tuberculous nature and the culture was later reported negative for the Koch bacillus.

3. Finally we had to think of a branchial cyst. Branchial cysts are painless fluctuant tumors located at any level of the neck along the anterior margin of the sternocleidomastoid muscle. Those of the lower carotid triangle are embryonic remnants of the second, third, or fourth branchial pouch. Usually they date from birth or early infancy without giving signs of pressure or dysphagia, but sometimes they become infected. We had never observed this kind of a tumor in our patient prior to his acute illness. But when the fistula on his neck did not close and continued to discharge a foamy pus mixed with saliva we had to investigate this possibility. With this in mind we injected the diodrast into the fistula to take an x-ray and discovered what none of us had suspected, namely a foreign body.

General Implications

As we all know infants and children habitually, by instinct and play, tend to put all kinds of objects into their mouths. Many of them are swallowed. A most amusing selection and variety can be found in the old textbook on surgery by Warren and Gould (1904) and in the tables of Chevalier Jackson in Brennemann's Pediatrics (1949). Many of these objects are swallowed without the slightest difficulty and the accident is suspected only because of the disappearance of an object with which the child had been previously playing. In our case we did not have the slightest indication of that sort as nobody had observed the boy grasping the safety pin and manipulating it into his mouth.

All observers stress the fact that the majority of foreign bodies, even pointed or sharp ones, will pass through the whole alimentary canal without difficulty and will be eliminated spontaneously. F. Christopher states: "It is surprising how many coins, open safety pins, needles and tacks will pass without apparent injury to the esophagus into the stomach and in fact through the entire gastrointestinal tract." Also Ladd and Gross state that "only occasionally foreign bodies lodge in the esophagus and will require the services of an esophagoscopist for removal." In their series of 337 foreign bodies swallowed by children, 95 per cent passed through without giving any trouble, amongst them: thirty-five open, thirty-eight closed safety pins and twenty-two straight pins. Among the fourteen foreign bodies which required surgical intervention were eight open safety pins and three needles. They had to be removed not from the esophagus but from the region of the pylorus and duodenum.

The statistics of the bronchoscopists and esophagoscopists, on the other hand, create a far less favorable impression. In their hands all the unlucky cases are concentrated where the foreign body became stuck in the upper air or food passages. Chevalier Jackson and Ch. L. Jackson, in Philadelphia, saw over 3,300 such cases over a period of forty-five years. A foreign body will lodge in the esophagus when a disproportion exists between the body and the esophagus or when a sharp pointed object punctures the wall of the esophagus and burrows itself into its mucous membrane. Previously it was assumed that foreign objects would get stuck in any of the three narrowings of the esophagus. But Iain Matheson (London, 1949) showed in an interesting review of 602 cases that by far the majority (78 per cent) of them were found in the region of the crico-pharyngeal sphincter which by its reflex action prevents the entry of foreign bodies into the esophagus. Also in our case the safety pin became lodged in that area. The increased reflex response which is so characteristic for the child with cerebral palsy might have been a predisposing factor.

Finally, I wish to stress another point. Looking over some of the statistics on foreign bodies swallowed or aspirated by children, I was impressed by the following: In 1,300 cases tabulated by Chevalier Jackson and son (in Brennemann's Pediatrics) the greatest frequency was taken by seeds and peanuts (365), coins took second place (250), and safety pins third place with (187). In a list of 337 foreign bodies, published by Ladd and Gross (Boston), safety and straight pins rank with 28 per cent, second only to the 30.5 per cent representing pennies and nickels. However, in the group of babies under two years of age safety pins and straight pins rank first of all foreign bodies with 48 per cent. One gains a similar impression from statistics reported all over the country—E. G. Gill (Virginia), P. H. Holinger (Chicago), C. M. Norris (Philadelphia), K. A. Phelps (Minneapolis), O. W. Suehs (Austin, Texas)—70 to 88 per cent of all swallowed safety pins, "an ironic designation" (Richards), are found in children under two years of age.

In sharp contrast to these reports in our country are the experiences of Iain Matheson in England. The vast majority of his 602 cases concern fish and meat bones (290), bolus of meat (34), and dentures (28), swallowed by adults. In children under twelve years of age, coins rank first with eighty-five cases, while safety pins are on the end of the list with nine cases, pins and needles with only five cases.

I would like to quote a very interesting remark of Chevalier Jackson, "Ino Kubo, the eminent Japanese bronchoscopist, when visiting our clinic stated that no case of safety pin as a foreign body had ever been reported in Japan. Safety pins are rarely used there; they fasten their clothes by other means."

In view of these facts, I believe, one question will come into everybody's mind: Do we have to use safety pins in our nurseries? For us, in an institution with several hundred mentally retarded infirm children this really presents a problem. In the care of these children we depend largely on the work of female patient helpers. Most of our infirm patients have to wear diapers beyond infancy and, in time, become able to open the pins. Actually, one wonders why more similar accidents have not happened. After we had discovered the safety pin in our boy's throat we decided, if possible, to do away with safety pins all together in our infirmaries. We are working on a new kind of diaper which can be fastened by other means.

But this is not only a problem for our institution, it should be equally important for the general public. In spite of repeated warnings by Chevalier Jackson and other bronchoscopists, babies' dresses and diapers are still fastened with safety pins. It is the advocated method in each nurse's handbook dealing with baby care. The young student nurses are constantly reminded of the potential danger of pins and, consequently, the number of accidents in hospitals is small. Mothers at home, where most of the accidents happen, should become much more aware of the hazards involved. "Most of the accidents are due to carelessness and therefore avoidable" (Ch. Jackson). Usually, young mothers are instructed by nurses how to take care of the baby in only two or three lectures. That is not enough. Mothers should be constantly reminded that small objects like safety pins, buttons and coins have to be kept out of a baby's reach. They should learn of the statistical figures and be warned of the dangers and hazards. This could be done in the doctor's office, in newspaper articles, booklets, government pamphlets, in a nationwide educational program on radio and TV.

I know well that it is impossible to turn our civilization back and eliminate from our glorious age coins and buttons. As to the use of safety pins in the nursery, however, I believe we physicians could and should do something. Prevention is better than cure.

RURAL HEALTH CONFERENCE TO BE HELD IN DALLAS

"Let's Put More 'U' In CommUnity" will be the theme of the ninth National Conference on Rural Health, sponsored by the AMA Council on Rural Health, to be held at the Baker Hotel in Dallas, March 4-6, 1954.

Leaders in the fields of medicine, agriculture, education and public health will attend the formal sessions which begin at 2 P.M. on Thursday, March 4, and continue through Saturday, March 6, ending with a luncheon meeting at 1 P.M. Problems of nutrition and costs of medical care and methods of prepayment will be the principal subjects to be discussed.

Following the practice of the last few years, an informal pre-conference session for doctors only will be held at 10 A.M. on Thursday, March 4. Council Chairman F. S. Crockett, Lafayette, Ind., said his session would be devoted to problems confronting physicians who are members of state rural health committees or committees handling rural health problems. Physician participation at the grass roots and problems pertaining to health insurance matters are among the major subjects to be considered.

Laboratory Aids to Medical Practice

Sponsored by
The Minnesota Society of Clinical Pathologists

LABORATORY AIDS IN THE DIAGNOSIS OF VIRAL AND RICKETTSIAL DISEASES

HENRY BAUER, Ph.D.
Minnesota State Board of Health, Division of Medical Laboratories,
Minneapolis, Minnesota

SOME of the mysteries of virus diseases are rapidly unfolding with the development of laboratory tests to aid in the diagnosis of viral infections. Although we speak freely about virus diseases, much remains to be learned about their serologic relationships, the reservoirs, modes of transmission, clinical manifestations, prevention and control. In order to learn about virus diseases and in order to serve the patient and community adequately we must have teamwork, the team consisting of the local physician, the laboratory worker and the epidemiologist. There must be an adequate flow of information among these three persons so that each can perform his work efficiently and intelligently. If the laboratory is to supply maximal information, it is essential that the data card accompanying the specimen container be filled in completely and that directions for the collection and submission of specimens be followed. Failure to comply will make it impossible in most cases to perform the tests properly.

The laboratory services of the Minnesota State Board of Health in the diagnosis of viral and rickettsial diseases are limited to those tests described in this communication. Changes in procedure, methods and interpretation will be made as knowledge of virus diseases increases and facilities to perform tests become available. The tests performed by the laboratories of the Minnesota State Board of Health supplement those of the hospital and private clinical laboratory. Accordingly, such specimens as blood and spinal fluid for cell count, chemical analysis of various body fluids and tissue for sectioning should not be sent to the laboratories of the Minnesota State Board of Health.

Results of serologic tests are of significance only when a rise in antibody titer can be demonstrated between the onset of illness and convalescence. It is therefore essential that at least two samples of serum or whole blood be submitted, the first sometime during the first five days of illness and the second indicated in Table I. The first specimen will be stored in the Board of Health laboratory and tests will be run on both specimens after the second one is received. Single tests for complement-fixing, neutralizing and similar antibodies are of little diagnostic value because the presence of such antibodies may represent previous virus infection or immunization.

It should be noted that in most cases the laboratory tests will be primarily useful in making a diagnosis in retrospect because of the necessary time interval between the collection of blood specimens.

Because our resources are limited and laboratory tests for virus diseases are expensive and time-consuming, we ask your co-operation to submit only specimens of real diagnostic importance. Specimens should be collected and forwarded without delay so that they arrive at the laboratory during the working days Monday through Saturday. If it is necessary to ship frozen tissue or specimens for rabies examination so that they arrive on week ends or holidays, special advance arrangements should be made for reception of the shipment. Mailing containers for the submission of blood specimens are available on request to the Minnesota State Board of Health, Division of Medical Laboratories, University Campus, Minneapolis 14, Minnesota.

This is the eleventh in a series of editorial reports sponsored by the Minnesota Society of Clinical Pathologists.

TABLE I. SPECIMENS USED AND COLLECTION REQUIREMENTS FOR THE LABORATORY DIAGNOSIS OF VIRAL AND RICKETTSIAL DISEASES

Viral Diseases	Specimen	When to Collect
Coxsackie infection	Stool, throat washings, blood	On special arrangement with laboratory.
Encephalitides Western equine and St. Louis encephalomyelitis	7 cc. whole blood	1st: Within 5 days of onset. 2nd: 21-28 days after 1st.
	Brain and cord tissue	Aseptically at autopsy—freeze. Keep frozen in transit or place in sterile 50% glycerine solution, pH 7.0.*
Influenza	7 cc. whole blood	1st: Within 5 days of onset. 2nd: 10-14 days after 1st.
	Lung tissue	Aseptically at autopsy—freeze and keep frozen in transit.
	Throat washings	On special arrangement with laboratory.
Lymphocytic choriomeningitis	7 cc. whole blood	1st: Within 5 days of onset. 2nd: 21-30 days after 1st.
	Brain, cord tissue, spleen	Aseptically at autopsy—ship same as encephalitides.
Lymphogranuloma venereum	7 cc. whole blood	1st: When disease suspected. 2nd: As requested by laboratory.
Mumps	7 cc. whole blood	1st: Within 5 days of onset. 2nd: 10-14 days after 1st.
Pneumonia, virus	7 cc. whole blood (do not chill)	1st: Within 5 days of onset. 2nd: 10-14 days after 1st.
Psittacosis (Ornithosis)	7 cc. whole blood	1st: Within 5 days of onset. 2nd: 10-14 days after 1st.
	Lung, spleen, liver	Aseptically at autopsy—freeze and keep frozen in transit.
	Birds	Wrap in cloth soaked with disinfectant—freeze and keep frozen in transit.
Rabies	Head of animal	When animal dies or is killed.† Place head in pliofilm or similar container, seal to make waterproof. Pack waterproof container in ice and keep cold in transit.
Smallpox and vaccinia	Scrapings Vesicular fluid Crusts	On special arrangement with laboratory.
Rickettsial diseases Q fever Rickettsialpox Rocky Mountain spotted fever Typhus	7 cc. whole blood	1st: Within 5 days of onset. 2nd: 14 days after 1st.
	Spleen and liver	Aseptically at autopsy—freeze and keep frozen in transit.
Miscellaneous diseases Toxoplasmosis	7 cc. whole blood	1st: When disease is suspected. 2nd: 10-14 days after 1st.
	Brain, spleen or any organ suspected	Aseptically at autopsy—keep cool in transit—**do not freeze.**

*Equal parts of sterile distilled water and analytical or highly purified glycerine. This mixture may have a pH of 7.0 without adjustment. If necessary, add Sorenson's buffer to bring to a pH of 7.0.

†Do not kill animal suspected of having rabies. Keep animal tied up and under observation for 2 weeks after date of biting. If animal dies, cut the head off close to the shoulders. Use rubber gloves in handling carcasses of animals suspected of having rabies. Package as directed above. Address package to the Minnesota State Board of Health, Division of Medical Laboratories, University Campus, Minneapolis 14, Minnesota. Label: RUSH—PERISHABLE—KEEP COOL—ADVISE CONSIGNEE IMMEDIATELY BY TELEPHONE—GLADSTONE 5973—OF RECEIPT OF THIS PACKAGE.

Table I lists the diseases for which tests are available, the type of specimen and the time the specimen must be collected. All specimens should be shipped promptly according to directions.

Tests for poliomyelitis will be performed as soon as facilities become available and then only through special arrangements with the Division of Medical Laboratories. Physicians will be informed when we will be ready to accept specimens to be examined for poliomyelitis viruses.

Reports and Interpretation

All laboratory results should be carefully correlated with the patient's clinical picture because of certain inherent limitations of some of the tests.

Western Equine Encephalomyelitis, St. Louis Encephalomyelitis and Lymphocytic Choriomeningitis.—If antibodies are demonstrated, the neutralization index will be given and the report will indicate whether the results are to be considered diagnostically significant or equivocal. If antibodies cannot be demonstrated, a negative report will be made.

Virus isolation and identification will be reported specifically.

Influenza.—Serologic tests are of significance *only* if performed on two specimens collected according to the schedule shown in the table. A fourfold or greater rise in antibody titer between the acute and convalescent serum specimen is diagnostically significant. The hemagglutination inhibition titer will be reported in all tests demonstrating antibodies. Failure to demonstrate a rise in antibody titer of serum pairs does not rule out influenza. The inability to demonstrate a rise in titer may be due to a number of causes. For example, the patient may be infected with a virus other than the strain with which the tests are performed, the patient may have a high initial titer, which occurs especially in recently vaccinated persons, or the patient may be a poor producer of antibodies.

Lymphogranuloma Venereum.—The complement-fixation tests will be reported in terms of titer. Sera from cases of lymphogranuloma usually shows titers of 1:40 or more, although titers as low as 1:4 may be found. Sources of error that should be considered in the interpretation of this test are (1) nonspecific reactions in sera from some patients in the early stages of syphilis, (2) false positive results due to contact with viruses which are antigenically related to the virus causing lymphogranuloma venereum, such as the virus causing psittacosis, and (3) false positives because of the performance of a Frei test and resulting antibody rise.

Early administration of antibiotics may inhibit the development of complement-fixing antibodies.

Mumps.—The complement-fixation test will be reported in terms of titer. A negative or low titer in the first serum followed by a fourfold or greater rise in titer in the second specimen is indicative of a current mumps infection. If the first specimen is not obtained early in the disease, both sera may show the same titer. In this case, a titer of 1:32 or higher can be regarded as presumptive evidence of a recent infection with mumps virus, since titers of complement-fixing antibodies of 1:32 are rarely found in sera of normal persons, except those who have been infected with the virus within the preceding year.

Virus Pneumonia (Primary Atypical Pneumonia).—Cold hemagglutination tests will be reported in terms of titer. While a titer of 1:32 or higher is probably significant in a single late specimen, both acute and convalescent phase sera should be collected for more reliable results. A fourfold or greater increase in titer between the acute and convalescent serum is significant. However, cold agglutinins have been reported in such diseases as trypanosomiasis, black-water fever, mumps orchitis, hemolytic anemias, peripheral vascular disease and certain diseases of the liver. Accordingly, the results of this test should be carefully correlated with the patient's clinical history and findings.

Psittacosis (Ornithosis).—Complement-fixation tests will be reported in terms of titer. A rising titer during illness is significant if accompanied by characteristic clinical symptoms. Positive complement-fixation tests do not always supply a definite diagnostic aid, particularly the results of a single test, because of cross reactions due to antigenic relationships between members of the lymphogranuloma-psittacosis group of viruses.

Early administration of antibiotics may prevent the development of complement-fixing antibodies.

Q Fever.—Complement-fixation tests will be reported in terms of titer. A negative or low titer (below 1:8) followed by a rise in titer to 1:64 or more in the second specimen is diagnostically significant.

Rabies.—The presence of typical Negri bodies in brain tissue is to be considered diagnostic of rabies and will be reported immediately by telephone. Early in the disease, Negri bodies may not be present in detectable numbers, and, accordingly, a negative microscopic report does not rule out the possibility of rabies. Also Negri bodies may not be found if the brain is mutilated or portions destroyed by gunshot wounds or violent blows. Microscopic examinations of decomposed specimens are unreliable and are often unsuitable for animal inoculation. Results of animal inoculations, if positive, will be reported immediately by telephone. To obtain results from animal inoculation may require two weeks or more.

Rocky Mountain Spotted Fever, Typhus Fever and Rickettsialpox.—The Weil-Felix agglutination tests for Rocky Mountain spotted fever and typhus fever will be reported in terms of serum agglutination titer. Patients who have Rocky Mountain spotted fever generally may be expected to show a high titer for Proteus OX-2 and a low titer for Proteus OX-19. However, this agglutination pattern may be reversed or an elevation of antibody titer with both antigens may occur. Agglutination tests on a single serum specimen are of little value unless the antibody titer is well above 1:160. Care must be taken in interpreting the results of these tests because infections due to Proteus may give rise to agglutinins. There are other circumstances also in which nonspecific Proteus agglutinations may be obtained. Reactions in such instances are usually low in titer.

Complement-fixation tests for rickettsialpox, Rocky Mountain spotted fever and typhus will be

Case Report

MENTAL DEFICIENCY IN A CHILD WHOSE MOTHER WAS GIVEN ELECTRIC CONVULSIVE THERAPY DURING GESTATION

A Case Report

J. YAMAMOTO, M.D., E. M. HAMMES, M.D.,
and E. M. HAMMES, JR., M.D.
Saint Paul, Minnesota

SHOCK treatments have been used in the treatment of women who have become psychotic during pregnancy. The treatment of choice has been electric convulsive therapy since it has been assumed that hypoglycemic reactions would be harmful to the fetus.* Gralnick[2] reported in 1946, the cases of two pregnant women who were treated for psychoses with insulin. Both of these cases had stillbirths. Boyd and Brown[1] made a comprehensive review of the literature in 1948. Their study included two case presentations. One patient had tonic contraction of the uterus after one electric shock treatment; after another treatment, changes were observed in the fetal heart rate. A normal rate and rhythm were noted fifteen minutes after the convulsion. The child was born a few days after the last treatment and there were no discernible abnormalities. The other woman whom they treated was found after a treatment with blood over the perineum. However, she was able to continue with the pregnancy. They concluded, that in view of the hazards inherent in a psychosis during the gestation period and since the prognosis is better if treatment is instituted soon after the onset of the psychosis, that electric convulsive therapy is indicated for patients with manic depressive disease or schizophrenia. In 1950 Williams and Barrera[6] expressed the opinion that pregnancy is not a contraindication to electric convulsive therapy.

Kent[4] reported treating a patient with both electric convulsive therapy and "ambulatory insulin." Her patient had a miscarriage at four months. Simon[5] gave electric shock treatments to a gravid patient seven months before she delivered. It was reported that this case had a "stormy and toxic" pregnancy and that the child died two days after delivery. The cause of the child's death was not given.

The following is a case report of a patient referred by Dr. Ross Kilgard of Watertown, South Dakota, to the Drs. Hammes.

Case Report

Case 1.—In September of 1949, this twenty-five-year-old housewife and her husband gave the following history: Patient has always been very sensitive and with marked feelings of inferiority. She was an "A" student in college and is a graduate medical technician. In November of 1948, her first born child died after a long illness. The patient was very starey-eyed for a while after that. She said that at times while bathing this child she had had urges to take a butcher knife and slit his throat. About six weeks ago, for no apparent reason, the patient became angry with her father-in-law. She told him what she thought of him and forbade him to come into the house. She has always felt rather hostile to him and her husband admits his father is very irritating to people. She seemed to be all right otherwise.

On September 9, 1949, she seemed very nervous. She took seven or more grains of Phenobarbital during the day. The next day the husband was called home from work. The patient told him she had seen God in a vision and He told her she was going to die. She has been hearing voices and sees God, her mother, et cetera, in visions and has been talking almost constantly since then.

Her sleep and appetite were good prior to onset of the present illness. The patient's mother is an extremely domineering woman. Her parents were divorced when the patient was five years old. Her mother always told her exactly what to do and how to do it. The patient has been bitter about this at times. Her husband and her mother have had frequent arguments.

The family history and past medical history were not contributory. One son died of "encephalitis or spinal meningitis" at the age of two years. The patient's last menstrual period was in April and she was five months pregnant.

The general physical examination and the neurologic examination were negative except that the fundus of the uterus could be palpated two finger breadths below the umbilicus. Her hemoglobin was 76 per cent and the urine was normal except for a one plus sugar.

Mentally the patient was bland but cooperative. Her emotional responses were silly, labile and inappropriate. She spoke excessively and in a rambling manner and described various visual and auditory hallucinations. She had no insight into the nature of her condition.

The diagnosis was that of a schizophrenic reaction. She was hospitalized and had twelve electric convulsive treatments. Two months after the last treatment, she was dismissed after having made satisfactory progress. She was clear mentally.

Three weeks after the patient left the hospital her daughter was born. This child was examined at the age of thirty-two months.

History from the parents was that labor and delivery were normal with no postpartum complications. The child was slow in sitting up and was fifteen to eighteen months old before she could walk. She had not been toilet trained; used only one word, "mama," and the father was not sure that she used this word with comprehension. She had a terrible temper and would not obey. She threw things and cried. She was very active, and chewed her fingernails. She had a hard time going to sleep. Her appetite was good and she had gained weight regularly. She could play "patty cake" and could point to her nose and feet, but that was about all she would do. She took little interest in pictures and did not mix well with other children. She had worn eyeglasses for strabismus since the age of twenty-four months. The mother thought the baby's fontanel was never like other children's but their doctor thought it was normal.

The physical examination was negative.

The neurological examination showed that the child's pupils and eye movements were normal except for a bilateral strabismus, for which she was wearing glasses. Movements of the face and tongue were normal. We were unable to examine the fundi because of the lack of cooperation. Both upper extremities gave normal reflexes, good muscle strength, and there was no evidence of any awkward movements. The abdominal reflexes were normal. Her gait was normal. Both lower extremities responded with normal knee and ankle jerks, had had no ankle-clonus, or abnormal Babinski test.

Mentally she seemed retarded. She did not talk, and was unable to carry out simple orders.

Our diagnosis was that of a mental deficiency.

Summary

It is the consensus of psychiatric opinion[1,3,6] that electric convulsive therapy should be instituted in gravid women, when there are definite indications such as a manic depressive or schizophrenic psychosis.

A case report has been presented, with the results of the examination of the child three years after her mother was given a series of twelve electric convulsive treatments during pregnancy. The child was found to be mentally deficient. We are of the opinion that this was probably not due to the treatments.

It will be of interest to note the incidence of mentally deficient children from mothers who have received electric convulsive therapy during pregnancy.

LABORATORY AIDS IN THE DIAGNOSIS OF VIRAL AND RICKETTSIAL DISEASES

(Continued from Page 1259)

reported in terms of titer. A negative or low titer in the first specimen followed by a high titer in the second specimen is usually diagnostically significant.

Toxoplasmosis.—The serum antibody titer as determined by the dye test will be reported. It is the opinion of the Committee on Toxoplasmosis, Tropical Medicine Study Section, National Institutes of Health, that a positive diagnosis of congenital toxoplasmosis can be made when the dye-test titer is 1:256 or more in both the mother and child, provided the child is over four months of age. When a high titer is obtained during the first weeks of life, the test should be repeated at the end of four months. If the high titer was due to infection in the child, it will still be high in the second test. If the second test is negative or the titer is low, the diagnosis of toxoplasmosis cannot be made because the result of the first test was due to passive transfer of antibody from the mother. In older children, particularly over the age of six years, when the dye-test titer may be less than 1:256 in the mother or child or both, the diagnosis still can be regarded as highly probable if the child exhibits clinical manifestations that are compatible with congenital toxoplasmosis. When only the mother's serum is available for examination because the child died before congenital toxoplasmosis was suspected, a dye-test titer of 1:256 or more in the mother's serum does not prove that the child had toxoplasmosis, but a negative test or a low titer in the mother's serum within three years after delivery indicates that the child did not have toxoplasmosis. The diagnosis of congenital toxoplasmosis cannot be made in the absence of dye-test antibodies in the child, regardless of how high the titer may be in the mother's serum.

It is the opinion of the Committee that at present the interpretation of the serologic tests in other conditions still constitutes a research problem. This applies to adult chorioretinitis and other eye conditions.

Isolation and/or demonstration of the Toxoplasma parasite is diagnostically significant.

Special Arrangements.—Reports and interpretation of laboratory tests done on specimens requiring special arrangements with the laboratory will be made when the results of those tests are obtained.

President's Letter

THESE THINGS I HAVE LIKED

This final month of office finds your president torn between relief at the prospect of surrendering to his capable successor the duties and obligations of his office, and regret at the termination of what has been a most happy and rewarding experience.

Traditionally, this is the time to review events, to advise, to predict. It is my pleasure to break with tradition and to leave unsaid all of the "oughts" and "musts" which might be pontificated. Instead, I should like to list a few of the things that I have liked about the Minnesota State Medical Association.

First, I have liked and admired the men who represent you, who give freely of their time and thought and who sacrifice profession, hobby and family to carry out the business and to wrestle with the problems of the Association.

Secondly, I have liked and admired the competency and devotion of our executive staffs. I am confident that few states can equal ours. I am convinced that none excels us. The contributions to our welfare which the executive secretary and the legal counsel have made in their years of service are greater than any can realize until they have worked closely with them.

I take pride in the harmonious relationship which has existed between rural and urban memberships over a period of many years despite the fact that at times their interests may seem divergent. Each has ever been considerate of the other.

I am pleased with the development of the newly organized Minnesota Academy of General Practice. That group is doing an excellent job of educating its members toward a constantly improving service to the public.

I am pleased to believe sincerely that unwholesome and immoral practices are nowhere common and, in fact, are rare in Minnesota. The overall quality of medical care in this state is excellent and is steadily improving.

The above are only some of the things I have liked about our State Medical Association. They may be listed as assets, but as assets, they are not to be viewed complacently, but rather nurtured in the fullest realization of their value.

Leadership and good sense predominate in this Association and will carry us over many rough roads and major hurdles in years to come.

Conrad J. Campbell

President, Minnesota State Medical Association

Editorial

Arthur H. Wells, M.D., *Editor;* George Earl, M.D., Henry L. Ulrich, M.D., *Associate Editors*

DISCIPLINING A DISCIPLINE

ONE ANSWER to the present rising crescendo of adverse criticism of our profession is a better organization and development of our methods of detecting and correcting irregularities and deficiencies. The public and the scandal sheets alike are not interested in our virtues. Our extensive efforts at raising ethical and educational standards as individuals and as organized groups probably cannot be duplicated by any other profession. If our present voluntary activities of self-discipline were for sale, like other valuable services, the cost would stagger the imagination. This continuous struggle to deliver the best to the patient so frequently meets with a disastrous exposure of our ranks to both the unscrupulous and the righteous among the laity, that one might pause and wonder whether it is worth the effort. Still, we must contribute more, especially as medical organizations, to correct the less than 5 per cent dishonesty and the more than 15 per cent professional intellectual apathy which exists among us.

The recently developed and successful "Medical Audit" of the medical staff of the Grant Hospital in Chicago deserves the careful consideration of practically every hospital staff in Minnesota. Here is the present pinnacle of self-disciplining procedure in both the moral and intellectual fields designed for our hospital organizations. The record or audit committee in the Grant Hospital reviews the charts of each patient for: (1) completeness and accuracy, (2) correctness and substantiation of final diagnosis, (3) detection of errors in diagnosis, treatment or judgment, (4) complications. Each of these four categories of medical care are sub-divided into several specific entries on printed cards. There eventually results a master card record of grades given the physician on many items of importance relating to his care of each of his hospitalized patients. If this continuous record reveals important deficiencies or irregularities, he may be warned or discharged from the staff. A physician's record is available only to designated persons and to himself.

Among the various benefits to the patient, the medical staff and the hospital which have resulted from the use of this plan is a correction of the present defective Specialty Board Approval Method of selecting a hospital medical staff. The Medical Audit assures the general practitioner and the self-trained specialist of a fair and impartial trial for a competitive place in the hospital staff.

The details of staff organization, operation of the audit plan, and the record forms used, have been made available for anyone caring to meet this greater challenge of self-disciplining which is now facing the medical profession.

THE ADOLESCENCE OF VIROLOGY

UNTIL recently, most of the laboratory methods for the diagnosis of virus diseases and the identification of specific viral agents, have been so cumbersome and time-consuming, that the information gained is generally past history or postmortem for the patient in question. Its value is primarily in the field of epidemiology. Your attention is directed to the excellent service offered in the field of virus diseases by our Minnesota Health Department as it is briefly portrayed by Dr. Henry Bauer elsewhere in this issue. The tests used are undoubtedly the standard procedures adopted by the best virology laboratories. Yet, for the most part, they are inadequate from a practical standpoint, and do not compare with our modern methods of laboratory diagnosis in bacteriology. It is entirely likely that this difference in the practicality of laboratory procedures pertaining to the diagnosis of viral and bacterial diseases will come to an end, and the larger private hospitals of the state will be rendering dependable twenty-four-hour diagnoses of a variety of viral diseases.

The large sums being poured into poliomyelitis research give intimations of soon paying off in practical knowledge, which in turn may have a wide application in the field of virus diseases. In 1949, Dr. John F. Enders of Harvard discovered a method of growing polio virus in test tube cultures of non-nervous tissue. Two tissue cultures of cells from a cancer of the cervix can now be inoculated with spinal fluid or other substances. One is protected by adding polio virus antiserum. In twenty-four hours, the presence of the virus will be indicated by a destruction of the cancer cells in the nonprotected culture. The protected control cells will be healthy and growing. Thus, the need of monkeys is eliminated except for occasional control tests in some research work.

Since this discovery, teams of scientists in different parts of the country have identified three types of polio virus capable of causing human disease. More recently, Dr. Jonas E. Salk of the University of Pittsburgh has used polio virus grown on kidney tissue and killed with formaldehyde to make vaccines which, when innoculated, have produced high antibody titers for the three strains of polio virus in hundreds of human beings. The laboratory techniques of growing the virus, identifying the virus, producing the best vaccines and testing the titer of antibodies are being rapidly improved. Surely, we can expect new and practical methods of identification and prophylactics of poliomyelitis and an application of the new methods to other virus diseases.

MEDICAL EDUCATION A LA CARTE

MORE than 700 U. S. physicians and their families will sail from New York, on January 6, to participate in an "inter-cultural exchange" with some 2500 physicians from twenty-two nations of the Western Hemisphere. This sixteen-day Medical Congress of the Pan American Medical Association will undoubtedly mix recreation with its studies in six South American cities and aboard ship en route from New York. Leaders in practically all fields of medicine will present papers each morning of the Congress on ship and ashore. The afternoons will be occupied by panel discussions, presentations of scientific exhibits, and the showing of sound and color films concerning new techniques and recent results in clinical and laboratory research.

Stratoplanes will carry physicians and their wives from San Francisco to Honolulu on the night of June 25—the closing day of the American Medical Association's annual convention. This planned thirteen-day tour includes flower leis, life on Waikiki Beach, scheduled motor trips, parties, and a return trip on the *S. S. Lurline.* Oh yes, there will be a semi-annual meeting of the Hawaii Medical Association.

Either of these trips might afford an intellectually stimulating vacation for a busy physician. (At least, a fellow can't be shot for dreaming.)

BECKER COUNTY BLOOD BANK

(Continued from Page 1245)

present membership, a member will be called for a blood deposit no more often than once in four years.

Conclusions

1. An adequate blood transfusion program conducted by a community blood bank is feasible for small communities.

2. An independent community blood bank affiliated with a larger consulting blood bank center offers advantages superior to any method which proposes to come into the community for a mass donation and then ship the blood back into the community as the needs arise.

3. An outline of a successful rural community blood bank has been presented.

Acknowledgments

In developing and expanding our project, we have received invaluable co-operation from many organizations. The American Legion and Women's Auxiliary should be mentioned specifically. They assisted in fund-raising projects for equipment; they contributed man-power to make the project a success. Sister Bennett, our Hospital Superintendent, gave us two rooms for blood bank headquarters and laboratory. Sister Ann and Sister Agnes, our technicians, have worked diligently and meticulously for success. To all of these and to others who have contributed support, we acknowledge our appreciation.

THE DEPARTMENT OF PATHOLOGY

It is hard to realize that four years have passed since Dr. E. T. Bell retired as head of our Department of Pathology after thirty-nine years outstanding service to the University. Certainly few physicians in this state have been more widely respected and revered than "Tommy" Bell. Naturally, I am pleased to be able to report that Dr. Bell's successor, Dr. James Dawson, is doing an outstanding job. Many of you have already had a chance to meet him, and others of you will get to do so in the near future. I thought it would be of interest, however, to ask Dr. Dawson to tell you about recent activities in his department. Here is his report:

"The Department of Pathology is still in business at its ancient stand in the Institute of Anatomy. Our hopes to move into magnificent quarters in the new Mayo Memorial Building were not realized because of rising costs of construction. However, we will have some new space. Our surgical pathology laboratory, presently situated across from the main operating rooms, will move with the surgeons into the new Mayo Memorial where more adequate space will be available. Furthermore, plans have been completed for a new autopsy room on the ground floor near the ambulance entrance of the hospital. This room will be equipped with two new stainless steel autopsy tables and there will be more space to accommodate staff and students who wish to attend autopsies.

"These expanded facilities will enable us to utilize more satisfactorily the surgical specimens and the fresh autopsy material in our teaching program. The distance from our student laboratories to the surgical pathology laboratory and the autopsy room will still hinder us but the situation will be immeasurably improved when these new quarters are available. At present, fresh material is brought over to the Institute of Anatomy for demonstration to students but the shortcomings of this method are obvious.

"Establishment of the Bell Museum must also be held in abeyance until more space is available. The museum is desperately needed and the administration is aware of this fact. To this end a survey is being made to determine the best location for new space to satisfy the needs of our department.

"Despite our crowded quarters we have been able to maintain an excellent staff. Dr. Bell and Dr. Clawson still participate actively in departmental activities as emeritus professors. Next in seniority are Doctors McCartney, Hebbel, and Dawson. The younger staff offers great promise. First in this group is Dr. Paul Lober who graduated from the University of Minnesota Medical School in 1944. After a year's internship he began his training in Pathology under Dr. Bell acquiring his Ph.D. in Pathology in 1952. Dr. Lober has recently published an exhaustive review and an original study on the relation of aging to coronary arteriosclerosis. He is now in charge of the surgical pathology laboratory under the supervision of Doctors Hebbel and McCartney. Dr. Joel Brunson came to us from the University of Buffalo School of Medicine via Alabama, and he is in his third year at Minnesota. Besides his routine duties, he has devoted much time to teaching and to investigative work. He has recently published a paper emphasizing the common occurrence of coronary emboli in patients dying of bacterial endocarditis.

"Doctors Aurebeck and Winter have started their second year with us, and our newest fellows include Doctors Lyons, Connors, Eilers, and Goldberg. We are delighted to have Albert Ackroyd, Charles Gamble, and Robert Rydel working in our department during their optional time. Each of these men has just completed his second year in medical school and all are doing investigative work. The presence of these young people in our department augurs well for the future."

George Earl, M.D., Chairman

DIET FILM GETS GOOD RESPONSE

The entertaining cartoon film short, "Cheers for Chubby," produced by the Metropolitan Life Insurance company, has been well received throughout Minnesota.

The film tells the story of a couple who work together under a doctor's guidance to take off excess fat, and, as a result, lead healthier, happier lives. Told in an interesting and amusing manner, the film has received many favorable comments from theater audiences in the state.

Promotion for the film was aided by the Minnesota State Medical Association's Committee on Public Health Education. A total of nearly 200,000 Minnesotans have seen the film, and the showings are not quite completed. Of the 477 theaters in the state, 218 showed the colored cartoon, for a multiple total of 1,115 showings.

Comments on the picture ranged from "good" to "excellent" in the report on audience reaction from theater managers. A letter from the Metropolitan Life Insurance company regarding the completed program for the film in Minnesota, states:

> "It gives me great pleasure to send you the enclosed detailed report on the theater showings of *Cheers for Chubby,* our film on overweight, which were given under the auspices of the Minnesota State Medical Association in cooperation with the Minnesota Department of Health. As you will see, 45 per cent of the theaters in the state have shown the film. This is an excellent record and very much higher than we have ever done before. Credit for this is entirely due to the joint sponsorship of your Association and the above."

The Association's Committee on Public Health Education feels that films of this kind, well-produced and clearly presented, are of significant value in helping to keep the public informed on what medicine is doing to improve the health and welfare of people in the state and nation.

AMA STUDIES POSTGRADUATE MEDICAL EDUCATION

The Board of Trustees of the American Medical Association recently approved a special survey on postgraduate medical education. The survey will be made by the Council on Medical Education and Hospitals.

In order to get first-hand information from physicians themselves, the Council is distributing questionnaires to about 18,000 practicing doctors in all parts of the country. Physicians are asked to evaluate the various methods employed to keep them up to date in medicine—such things as medical publications, medical society meetings, postgraduate medical school courses, et cetera.

Different Approach

Previous studies of this nature, and the preliminary portion of the above survey, have undertaken to collect such data from medical schools, graduate medical schools, state and local medical societies, special medical societies, hospitals, clinics and other organizations.

But, according to a recent "Secretary's Letter" from Dr. George Lull of the AMA, "It became evident, however, that it would be necessary to canvass the views of practicing physicians in order to obtain answers to many important problems in this field." It is hoped that the study, when completed, will lead the way to an extension and improvement of the ways and means available for postgraduate medical education.

JUSTICE DEPARTMENT TO HANDLE VA FRAUD CASES

The United States Department of Justice will be called upon to handle cases of suspected fraud concerning the "inability to pay" declaration of veterans with non-service-connected disabilities. This is a new arrangement which is being put into effect by the Veterans Administration.

Under federal law, the VA is forbidden to look behind the veteran's statement that he cannot afford private treatment. Many abuses have resulted from this, according to testimony in Congressional hearings.

Details Explained

A recent issue of the AMA Washington Letter gives further information on how the plan will work:

> "The new arrangement provides that if a VA hospital manager has good grounds to suspect that the veteran's claim of indigency is fraudulent, he will confer with federal law-enforcement officials. An investigation will then be conducted by Justice Department, the regular law-enforcement arm of the federal government. If the facts justify prosecution, the case will be taken to federal court. There the government will have to prove that the veteran in question set out 'premeditatedly, purposefully and intentionally' to defraud the government."

Questionnaire Changed

Another development along this line is a recent announcement of the tightening up on the questionnaire filled out by veterans with non-service-connected conditions when he applies for VA hospitalization. The revised form calls for more information on the veteran's finances, in an effort to clamp down on those who are being given free hospitalization when they are actually able to pay. It should be noted that the Veterans Administration is required, by law, to provide the veteran with treatment if he signs the required form. However, he is subject to the above investigation if the hospital manager suspects that fraudulent motives are behind his action.

HEARINGS END ON MEDICAL RESEARCH FUNDS

Advocating increased funds for general medical research, numerous witnesses appeared recently before the hearing of the House Interstate and Foreign Commerce Committee. The hearing was the first of a series on major diseases in the United States. General comment was that funds should come from both public and private sources to combat heart disease, cancer, poliomyelitis, arthritis and rheumatism. Committee members also commented on the disparity between what is spent on medical research and on such things as liquor and cosmetics.

Chairman Sums Up

After the first week of hearings, Chairman Charles Wolverton, New Jersey, stated:

> "The committee has been concerned about the huge gaps in our research knowledge, about the astronomical economic loss and seemingly limitless human suffering caused by chronic illness, about shortages in trained scientific manpower and research facilities, about our inability to put into uniform practice all the preventive and control measures that are now known, and about the widespread lack of adequate measures to protect the rank and file of the American people from the economic burden of catastrophic illness."

Major Diseases Cost Up

All of the four groups of major diseases covered by the committee in its hearings on funds for research, cost the country staggering sums each year. In arthritis and rheumatism, the economic cost to the nation is estimated at well over $700 million a year, while medical care alone cost more than $100 million. Medical schools lack instructors and adequate facilities, and money should be made available for grants for (1) undergraduate teaching, (2) graduate training, and (3) construction grants for laboratories and clinical facilities in medical schools, according to the testimony.

The AMA Washington Letter sums up the other testimony on the remaining three major diseases considered:

> *Cancer*—Estimated cost of hospitalization for cancer patients ranges between $300,000,000 and $500,000,000 a year. About $50,000,000 of public and private funds will be spent on research this year. American Cancer Society as well as private groups say this amount is inadequate. Pressing needs include better diagnostic tests, research grants for periods longer than the usual one-year term and more cancer beds.
>
> *Heart Disease*—An estimated $2.1 billion was lost in 1951 in productivity as a result of heart disease. One estimate of annual hospitalization cost: $219,000,000. Research funds are said to be inadequate at a time when "there are sound reasons to believe that certain important solutions may be discovered reasonably soon."
>
> *Poliomyelitis*—Current needs include more diagnostic facilities, beds, nursing care and physiotherapy. More research should be done on why certain persons are stricken with the disease while others develop an apparent immunity. Office of Defense Mobilization expressed hope its gamma globulin allocation program this year "may soon give way to development of a suitable vaccine."

A Generous Congress?

Commenting on the problem that faces members of Congress because of increasing demands for more research funds, Representative Heselton of Massachusetts said he was staggered by the new estimates of needs contained in the proposed appropriation for the next fiscal year of the National Institutes of Health. This fiscal year, that group received $71,153,000 from Congress. He added: "We might as well be realistic about it. It isn't very likely Congress is going to appropriate 200 per cent more next year than this year."

INTERNS, RESIDENTS IN TRAINING DOUBLE

According to the twenty-seventh annual report on internships and residencies in the United States, prepared by the Council on Medical Education and Hospitals of the AMA, there are twice as many interns and resident physicians today completing their training and furthering the education through hospital work as there were prior to World War II. During 1952-53, there were 7,645 interns and 16,867 resident physicians on duty in the nation's hospitals, as compared to a total of approximately 12,000 in 1940.

Also, it should be noted that the number of hospitals offering approved intern training has increased 12 per cent during the last 10 years, from 760 to 856, while the number of internships available has risen 32 per cent, from 8,180 to 11,006, according to the report.

Ninety per cent of the internships offered were rotating internships, in which the intern spends two or more months in each of the major divisions of medicine—internal medicine, surgery, obstetrics-gynecology, and pediatrics. This type of internship is designed to prepare the doctor for general practice.

Residencies Increase

The report notes:

"During the year 1952-53, there were 4,635 residency programs conducted in 1,131 hospitals approved by the AMA. A total of 22,292 residency positions were available in these hospitals, 10,285 being first year appointments.

"The residency occupancy rate for all types of hospitals last year was 76 per cent. There was a total of 16,867 residents, 7,777 of whom were first year appointees. During the prior year, there were 15,851 residents, 6,376 of whom were first year appointees."

Certain specialty fields showed considerable increase in the number of residents entering each. The report states:

"During the last ten years there has been a marked increase in the number of residents entering certain specialty fields, reflecting the increased demand by the public for the services of these specialists. Considering first year appointments only, last year the largest number of residents, 1,533, entered the field of psychiatry. Internal medicine, with 1,352 residents, was second, and general surgery, with 1,256, was third."

MINNEAPOLIS WOMAN MUST SERVE TWO-YEAR TERM AT SHAKOPEE FOR ABORTION

Re. State of Minnesota vs. Lillian M. Mullane

On October 2, 1953, Lillian M. Mullane, a 56-year-old widow, 9949 Maple Avenue, Bloomington, Minnesota, was sentenced by the Hon. Levi M. Hall, Judge of the District Court of Hennepin County, to a term of not to exceed two years in the Women's Reformatory at Shakopee, following her plea of guilty on August 17, 1953, to an information charging her with the crime of abortion. Just prior to being sentenced, the defendant had admitted having been twice previously convicted of felonies, the crime of grand larceny in the second degree on October 8, 1924, in McLeod County, Minnesota, and the crime of abortion on February 5, 1948, in Hennepin County.

In the present case, Mrs. Mullane was arrested by Minneapolis Police Officers, following the hospitalization of a 26-year-old Minneapolis divorcee in General Hospital who was ill as the result of having submitted to a criminal abortion. She had paid $150.00 for the abortion. On August 19, 1953, a complaint was issued in the Municipal Court of Minneapolis charging the defendant Mullane and Vern E. Jorgensen with the crime of abortion. A warrant has been issued for the arrest of Jorgensen, but as yet he has not been apprehended. Jorgensen, 40, 5345 13th Avenue South, Minneapolis, was previously charged with the crime of abortion in the same case in which the defendant Mullane was convicted on February 5, 1948. He had previously entered a plea of guilty in Hennepin County District Court and on the latter date he was sentenced to a four-year prison term, which was stayed and he was placed on probation for five years. The defendant Mullane was also placed on probation for a period of five years, but she was required to serve the first year of her sentence in the Minneapolis Women's Detention Home.

The Minnesota State Board of Medical Examiners opposed probation for the defendant Mullane in this case because of her long record in the abortion racket. Judge Hall refused to place her on probation and she must therefore serve her sentence.

History of Medicine In Minnesota

MEDICAL HISTORY OF THE COUNTY OF YELLOW MEDICINE

MILDRED B. LEE
Granite Falls, Minnesota

(Continued from November issue)

Jared Waldo Daniels was born in Stratford, New Hampshire, on June 15, 1827. On completion of his elementary education in his home town he began his medical education in New York. After graduation he came west to Minnesota and was appointed physician to the Indians at the Upper Sioux Agency on the Yellow Medicine River in 1854. His brother, Dr. Asa Wilder Daniels, was at the same time physician at the Lower Agency at Redwood.

Dr. Daniels served as physician at the Agency for five years, during which time he gave medical attention to the members of the tribes and became very influential among them. When the civil war began both Dr. Daniels and his brother resigned in the expectation of going South with some of the regiments. After a lapse of a few months Dr. Daniels was appointed assistant surgeon to the Sixth Minnesota Infantry, but instead of going South this military unit became involved in the Sioux Uprising. Dr. Daniels served under General Sibley until the conclusion of the hostilities, and then was assigned as surgeon to the expedition sent west against the hostile western tribes. The Sixth Infantry became part of a force headed by General Alfred Sully and known as the Second Minnesota Cavalry. This contingent left Fort Snelling in May, 1864, accompanied as far as Fort Ridgely by General H. H. Sibley and his staff and a military band mounted on white ponies. On June 5, the expedition camped at Wood Lake on the site of the last battle of the Sioux uprising, and continued westward by way of what is now Watertown to the edge of the Bad Lands, where there was an engagement, then on to the Little Missouri and down the east bank of the Yellowstone. Dr. Daniels, serving as surgeon with the rank of major, made this report of the health of the soldiers en route:

> "During the Indian Campaign of 1864, the Second Cavalry endured extremes of temperature varying from 105 degrees in the shade to 6 above with snow and blizzard. The prevailing diseases were diarrhoea, dysentery, rheumatism, and mountain fever. On the march to Fort Ridgely and Fort Rice we had good water and scarcely any illness. At Fort Rice where we arrived July 11, and were encamped one week, there was a large number of cases of sickness, the result of indiscretion in the use of the post trader's supplies, and not of bad water. The June rains gave us good running water in all the streams until we crossed the Little Missouri River and we had very few on the sick list. Three camps were made between the Little Missouri and the Yellowstone, where the water was bad, and many on sick report. . . . Water was found only in pools, and was impregnated with sulphate magnesia or alkali. In many cases the disease assumed a typhoid condition within twenty-four hours after being reported. The health of the men was much better when they could get the fruit of the country, with plenty of game, an improvement on that furnished by the commissary department. In treatment of mountain fever, sulphate of quinine was an indispensable remedy. Given in doses of from 15 to 30 grains in twenty-four hours, it acts as a sedative, and its

febrifuge virtues are very perceptible. Brandy, with quinine, was given with caution. The mortality of the campaign was two killed by Indians while on picket duty, three on hospital boats, and two died in camp."*

Dr. Daniels was mustered out November 19, 1865. Having great influence with the Indians he returned to this work and became inspector of Indian Agencies. In 1877 he retired from public service and settled in Faribault. In 1900 he removed to Los Angeles where he died May 3, 1904.

Dr. J. Woodbury Donnell came to Clarkfield about 1895. He had received his medical education at Hamline University, graduating in 1884. His birthplace was Richmond, Maine.

Not much was known of Dr. Donnell's past history or of his family. He was a single man, moody, and inclined to drink to excess at times. He assisted in the operation of the B. H. Lewis Drug Store, over which he had both offices and living quarters.

In 1896, Dr. Donnell was elected county coroner, an office which he held until his death.

All that was known about Dr. Donnell was summed up in the obituary published June 16, 1898, in the *Clarkfield Advocate.*

> "The people of Clarkfield were shocked last Friday evening by the news that Dr. J. W. Donnell had committed suicide. It seems that about 6 o'clock Friday evening when Dr. Kerkhoff went to make a professional call on Donnell, who was confined to his room above the Clarkfield Drug Store with sickness, he found him lying on a cot, weltering in his own blood, which was flowing from a cut in the right side of his throat. He immediately called Druggist Lewis to his assistance, and he with several other citizens hurried to the room while the wound was being sewed up. Donnell said he wished he had finished the job better. He bade goodbye to the bystanders, told them he had taken poison and to notify his brother in Maine. He then became unconscious and in a few minutes was dead.
>
> An examination showed that the internal jugular vein had been severed, the instrument used being a pocket scissors, one point of which was broken off. He was found in convulsions, indicating he had taken strychnine. His parents were notified and the body shipped to Maine."

Dr. Donnell was forty-seven years of age, unmarried, and had lived in Clarkfield three years. He had served as health officer and as county physician for that medical district, and at the time of his death was county coroner.

John O. Dyrnes was born May 5, 1867 on the island of Smolen in Northwestern Norway, the third child of Ole Arntzen Dyrnes and his wife Anne Martha (Johnson) Dyrnes. In infancy he was small and weak, but grew up to be a normal child except that he was quite nearsighted.

From earliest years he showed an interest in study. His parents were poor farmers and the only instruction afforded was that given to groups of children in homes, but religious instruction was not neglected. The father died of brain fever in 1873 leaving the widow and three young children to fend for themselves. When the oldest son, Anton, was of an age to go he emigrated to the United States and settled in Ashland, Wisconsin; in 1883 John, then sixteen years of age, joined him, and at first worked in a planing mill. When due to economic conditions the mill shut down John worked in the woods, for a grocer, and at whatever he could find, but he never lost his desire for an education.

In the course of his various jobs he was told of the schools in Saint Paul, and

---

*From *Minnesota in the Civil and Indian Wars.*

recommended for a job as stable boy and general worker to a railroad executive. But he found it impossible to attend the public school and work at the same time; he was now a grown man who would be out of place in a grade school. Then he heard of Baldwin Seminary, which was a private school affiliated with the Presbyterian Church (later Macalester College) and he was able to attend this school by working as janitor.

John O. Dyrnes entered Augsburg Seminary in the fall of 1889 and graduated in 1892. It was his desire to become a foreign missionary, and with that in mind he entered the Theological Department of Augsburg in the fall of 1892 and graduated in 1895. While studying theology he also took up the study of medicine at the Minneapolis College of Physicians and Surgeons, then connected with Hamline University. He graduated with his medical degree in 1898.

There being no post available for him as a medical missionary at that time Dr. Dyrnes located at Hanley Falls where a friend, Rev. Strand, was pastor of the Lutheran Church. He also practiced at Morris, Minnesota. He seems to have been a busy doctor in Hanley Falls, taking care of accident cases, being called to various places, and frequently visiting in Minneapolis.

Late in the year 1899, Dr. Dyrnes received his call to enter mission service, and left for Paris in February, 1899. There he studied French and continued his study of medicine in order to receive his medical degree from the University of Paris, which was required in order to be able to practice medicine in the French colony of Madagascar. Before leaving Paris he was ordained to the Christian ministry.

Dr. Dyrnes arrived at Manasoa, Madagascar, on September 1, 1900. He was at once struck by the poor housing of the mission and the pathetically large number of graves in the cemetery of missionaries who had come to an early death at this place, so his first efforts were directed at providing better housing and creating better health conditions for the missionaries. In August, 1901, he had his first attack of the deathly blackwater fever, but recovered; and soon afterward his house burned down with all his medical books, instruments, and other possessions.

Dr. Dyrnes presided over a clinic at which he treated throngs of natives afflicted with every kind of ailment. According to the rules of the Lutheran church, natives who could pay were supposed to do so, and the money to accrue to the church. But Dr. Dyrnes was no stickler for rules. He said he could of course follow this rule, if the mission only had a large enough box for the offering. "For then I could put into it every rooster, every little bunch of bananas, or every bowlful of rice which I might receive for medical services." Asked what he would do then, he said, "I would have my cook make a good meal for the sick, or for the poor whom we always have with us. And should it ever happen that we have more roosters than we have persons in need of a good meal, I have never had any conscientious scruples in enjoying a good meal myself from part of my fees."

On June 7, 1906, Dr. Dyrnes was married to Miss Sarah Johnson of Lowry, Minnesota. The marriage took place in Tulear, Madagascar, immediately after her arrival. Mrs. Dyrnes was a very able and devoted helpmate and was herself a missionary.

In appearance Dr. Dyrnes was a rather tall man, with light curly hair, blue eyes, rather prominent nose and chin, a true Nordic type. At the time of his graduation from medical school in 1897 he wore a small mustache and appears to have been a nice looking young man. He was always cheerful and had a fine sense of humor. "Dr. Dyrnes' humor was genuine and contagious. He had a way of seeing and pointing out to others the bright side of any situation."

In 1919, Dr. Dyrnes went back to Minneapolis on furlough, but was eager to get back to his work. The mission board did not request his return when he reached the normal retirement age because he felt that Madagascar was his real home and he wished to remain there. In 1937, Dr. and Mrs. Dyrnes decided to make a brief visit home, and had gone so far as to get passports for it. But on November 20, Sarah Dyrnes died of septicaemia after a brief illness. At the time Dr. Dyrnes was away on tour, and the news was slow in reaching him, so he did not reach her bedside until she had lapsed into unconsciousness.

Although his health failed, he continued with his work.

By 1943 his sight had begun to fail, and an eye specialist diagnosed his case as diabetic cataract. His hearing had also failed somewhat but he continued to serve in the little grass churches and at the district meetings as much as he could. He suffered a great deal of pain in his legs, and developed diabetic gangrene. This responded to treatment when a fresh supply of American insulin was received, but he still suffered much pain. On December 7, 1943, he died.

Dr. Dyrnes served as a medical missionary for forty-three years and three months at Manasoa. He was buried there, in a grave beside his wife. The natives had made a coffin of beautiful hardwood.

A memorial service to Dr. Dyrnes was held in Trinity Lutheran Church in Minneapolis, to which Dr. Dyrnes had belonged in his youth there.

From the Memorial Address of Melvin A. Helland:

> "His interests were varied. Nothing human was outside his interests, and he was always trying to better conditions for others. Better homes for the missionary staff; better ways of living for the natives; the introduction of new sources of food, and better ways of tilling the soil; he was concerned about all these. And the fact that he was interested in the welfare of others, added to his medical aid, won him many friends and several very faithful native helpers.
>
> "One of these (interests) was planting. The gardens at Manasoa are a source of wonder to those who know how hard it is to keep a garden in such a place. . . . Many have been surprised to see a row of about a dozen high cocoanut trees 100 miles inland, for they usually are found only near the sea. Years ago a native brought three guava trees that he wanted to sell and the doctor gave him the equivalent of a dollar for each tree. The natives thought he was throwing his money away, but today guava trees are found near most of the villages and the natives like the fruit. . . . He experimented with different kinds of fruits and plants and also with European cattle.
>
> "There is an old wooden building at Manasoa, which for many years was used as a dispensary. It is built on posts to keep it up from the ground. On the south side, the shady side, there is a stone step of three or four risers. The stones have been worn more than half through by the bare feet of those who came for help. This is a fitting monument. Men needed him and he ministered to their need."*

Dr. E. N. Falk was in Minnesota Falls in 1873, but his place of origin or subsequent history is unknown. He practiced there until about 1876 or possibly 1878, and since he was never licensed in Minnesota it is probable that he removed from the state about that time.

Dr. Falk became Dr. Stratton's partner in a drug store and also in establishing the first newspaper of the county, the *Minnesota Sentinel*. His professional card, along with that of Dr. W. M. Stratton, appeared in the *Sentinel* but not in any later paper. The minutes of county board meetings mention Dr. Stratton and Dr. Falk as claimants for various amounts due for services performed—usually amputations—for the poor, but there is no mention of him after 1878.

---

*Andreas Helland, *Missionary John O. Dyrnes, M.D.*

Herman E. Farnsworth was born in Clinton County, New York, in 1856, and came to Minnesota with his parents when he was thirteen years old. The family settled in Goodhue County, Minnesota, where the boy completed his elementary education. In 1876 he entered Rush Medical College in Chicago and graduated in 1879.

Dr. Farnsworth began his medical practice in Canby, Minnesota, in 1880, in partnership with Dr. M. G. McLean. Dr. McLean left Canby shortly after 1880 and Dr. Farnsworth thereafter continued to practice alone.

On September 15, 1881, Dr. Farnsworth married Mary E. Wells, daughter of Perry Wells, a pioneer settler of the county. The marriage took place at the home of Rev. H. P. Satchwell, a Methodist minister who resided in East Granite Falls.

The doctor's offices were over Gerald's Drug Store. Following the great blizzard of October 15, 1880, he was called to attend Michael J. Dowling, who had been lost in the storm for two days. With the assistance of Dr. Andrews of Marshall Dr. Farnsworth amputated the legs of the boy above the knee, all the fingers of one hand, and the left arm. In spite of the seriousness of the operation young Dowling made a fine recovery and eventually became one of the state's most outstanding citizens.

In January of that year Dr. Farnsworth was named county physician for the western part of the county, and continued in this position until his death. He died November 10, 1883, of "inflammation of the bowels," leaving his wife Mary, and two children, one and three years old, Florence E. and Lottie E. Farnsworth. Mary Farnsworth did not long survive her husband. She died before probate proceedings in Dr. Farnsworth's estate could be completed, and the two children were placed in the care of Noah Farnsworth of Zumbrota.

At the time of his death Dr. Farnsworth was twenty-seven years old. Mary E. Farnsworth died May 5, 1884.

Cyrus P. Fuller was born in New York state in 1842, the son of Mr. and Mrs. Cyrus P. Fuller. He came to Minnesota with his parents at the age of fourteen, and settled at Hastings, Minnesota. In the course of his education he became a druggist and engaged in that business for a time. Then he went to Philadelphia to study medicine. After graduation he returned to Hastings and conducted a drug business until the fall of 1874 when he went to Granite Falls.

The doctor's offices in Granite Falls were located in the building described as being "first door south of Drug Store." He was the second doctor to locate in this city, and he built up a good practice and a good reputation for medical skill, as shown by the Christmas verses printed in the *Granite Falls Journal* of 1877, and reprinted in 1888, referred to elsewhere.

Dr. Fuller brought with him to Granite Falls his wife, Ada, and his son John P. Fuller, who was a boy of eight or nine at the time. In due time they acquired a home at the address which is now 260 Tenth Avenue.

Dr. and Mrs. Fuller were well educated and highly respected in the community. They were of the type generally referred to as "intellectual." Mrs. Fuller naturally became a member of the Hisperian Club, whose membership seems to have included the elite of the period. Its purpose was to study the plays of William Shakespeare, and sometimes the members acted out the plays also. As an indication of the seriousness of their purpose, the club officers also included a critic, and Mrs. Fuller served in this capacity.

In 1877, Dr. Fuller was appointed county physician. Apparently he was the first doctor to be formally appointed to that position.

In August, 1879, Dr. Fuller through some mishap received an injury which resulted in "gangren poisoning." The last entry in his drug account was of August 12, 1879, and he died August 18.

The claims filed against his small estate indicate that Dr. Fuller and Dr. Stratton were partners although they did not advertise as such. A claim for drugs and medicines sold to Drs. Fuller and Stratton was supported by the affidavit of Marion Gould, druggist, as to the partnership; but there were also individual claims, and claims for livery service, materials for the repair of his home, and necessities. During probate proceedings the homestead on Lot 10, Block 29, was sold to "provide for the care and education" of John P. Fuller, then fourteen years of age.

Mrs. Fuller and John continued to reside in Granite Falls for many years. It appears that Mrs. Fuller was occasionally employed for clerical work, and the mother and son managed to support themselves by their own efforts. In her later years she was admitted to the Jones-Harrison Home in Minneapolis, where she lived until her death.

(To be continued in January issue)

U. S. CHAMBER CHARTS GROWTH OF COMMERCIAL HEALTH INSURANCE

A United States Chamber of Commerce survey of commercial insurance companies and societies shows these organizations are making steady progress in selling individual hospital, medical, and surgical insurance policies. Not included in the survey are Blue Cross, Blue Shield, mutual benefit associations, salary-continuance plans, union benefit plans, and other methods of voluntary group coverage. Thus the findings do not show the total extent of coverage. The study covered 1952, and is based on information or estimates from 233 firms or societies issuing individual policies. By type of insurance, the survey showed:

Medical Expense (excluding surgery): The highest percentage increase, 21 per cent, from 4.2 millions covered in 1951 to 5.1 millions in 1952. *Surgical Insurance*: The largest numerical increase, with 2.8 millions more covered, from 16.4 million to 19.2 million, a percentage increase of 17 per cent. *Hospitalization*: Most popular of all, it increased 10.1 per cent from a coverage of 21.6 million in 1951 to 22.3 million in 1952, or a numerical increase of 700,000. *Disability Insurance* (payments to workers kept from the job by sickness or accident): Only a slight increase, from 12.5 millions covered to 12.6 millions.

This was the first time the Chamber surveyed the new *catastrophic* insurance so it was not possible to establish a rate of growth. At the end of 1952 more than 156,000 persons were covered by catastrophic insurance, which complements the usual hospitalization, surgical and medical policies by paying 70 or 80 per cent of the additional cost up to a usual maximum of $10,000. (A complete survey of the growth of all health insurance will be released in a few weeks by the Health Insurance Council.)

The report was printed in *American Economic Security* (Vol. 10, No. 5). Reprints are available at no cost at the U. S. Chamber of Commerce, Washington, D. C.

(The Council on Pharmacy and Chemistry of the American Medical Association has adopted the following statement which appears in New and Nonofficial Remedies, 1953, Philadelphia, J. B. Lippincott Company, pp. 171-173, 1953.)

METHANTHELINE BROMIDE.—*Banthīne Bromide (Searle)*

β-Diethylmethylaminoethyl 9-xanthenecarboxylate bromide

Actions and Uses.—Methantheline bromide, a parasympatholytic agent, produces the peripheral action of anticholinergic drugs such as atropine and the ganglionic blocking action of drugs such as tetraethylammonium chloride. Tolerated amounts of methantheline bromide exert side effects typical of atropine-like drugs, but cause less tachycardia, and also cause less postural hypotension than does tetraethylammonium chloride. Toxic doses produce a curare-like action at the somatic neuromuscular junction.

Clinical studies indicate that the drug effectively inhibits motility of the gastro-intestinal and genito-urinary tracts and, to a variable degree, diminishes the volume of perspiration and salivary, gastric, and pancreatic secretions. It also decreases mucoprotein secretion. Like atropine, it produces mydriasis and cycloplegia when applied locally to the eye or administered systemically, but until more clinical evidence becomes available, its local use for this purpose is not recommended. The value of the drug for preventing abnormal cardiac reflexes through the vagus during thoracic surgery, or as an agent for routine preoperative medication in place of atropine, requires further investigation before final conclusions can be reached.

Methantheline bromide is indicated for clinical use whenever anticholinergic spasmolytic action is desired, provided it is not contraindicated because of its atropine-like characteristics or because of a patient's intolerance to the unavoidable side effects of such therapy. It is useful as an adjunct in the management of peptic ulcer, chronic hypertrophic gastritis, certain less specific forms of gastritis, pylorospasm, hyperemesis gravidarum, biliary dyskinesia, acute and chronic pancreatitis, hypermotility of the small intestine not associated with organic change, ileostomies, spastic colon (mucous colitis, irritable bowel), diverticulitis, ureteral and urinary bladder spasm, hyperhidrosis or control of normal sweating which aggravates certain dermatoses, and control of salivation.

Methantheline bromide produces some degree of cycloplegia and mydriasis in therapeutic doses and therefore should not be administered to patients with glaucoma. It sometimes decreases the ability to read fine print. Xerostomia (dryness of the mouth) is a common, sometimes transient, side effect. Urinary retention of varying degrees may occur in elderly male patients with prostatic hypertrophy, and some patients may have difficulty emptying the rectum. Patients with edematous duodenal ulceration may experience nausea and vomiting during initial administration of the drug. These patients should take only liquids during the institution of drug therapy. All patients should be advised of the possible occurrence of side effects. Overdosage sufficient to produce a curare-like action may be counteracted by prompt subcutaneous injection of 2 mg. of neostigmine methylsulfate.

Dosage.—Methantheline bromide is administered orally or parenterally by either the intramuscular or intravenous route. Parenteral administration is not advised for patients able to take the drug orally. The average initial dose for adults, oral or parenteral, is 50 mg. For patients with considerable intolerance, 25 mg. may be employed. In the management of peptic ulcer, a beginning schedule of 50 mg. three times daily before meals, and 100 to 150 mg. on retiring is suggested. However, the usual effective dose is 100 mg. four times daily, although some patients may require more or less than this amount. The dosage may be increased to tolerance, using dryness of the mouth as a guide, and adjusted to meet the individual response of patients. Maintenance dosage in peptic ulcer is usually considered to be about one-half the therapeutic level. In the management of other hypermotile or hypersecretory states, the dosage should be adjusted to the smallest amount which will relieve the symptoms. When spastic conditions are secondary to inflammatory or other organic lesions, therapy directed toward the cause should be employed whenever possible.

G. D. SEARLE & CO.
Powder Banthīne Bromide: 2 cc. ampuls. 50 mg.
Tablets Banthīne Bromide: 50 mg.

◆ Reports and Announcements ◆

MINNESOTA ACADEMY OF OCCUPATIONAL MEDICINE AND SURGERY

A new organization of industrial physicians, called the Minnesota Academy of Occupational Medicine and Surgery, was organized at a dinner meeting held October 1, 1953, at the Minneapolis Club. The purpose of the new organization is to bring together members, of whom there are now fifty-two, for presentation of papers and informal discussions on subjects of mutual interest in the field of occupational medicine and surgery.

The organization dinner was held the night before the Upper Midwest Industrial Health Conference and the program included, beside the business meeting, a motion picture and an address by Dr. Robert E. Priest of Minneapolis on occupational hearing loss.

Officers of the new organization are: Wilford E. Park, M.D., Industrial Physician of the Minneapolis Health Department, president; John F. Shronts, M.D., Medical Director of General Mills, Minneapolis, vice president; Leslie W. Foker, M.D., Minneapolis, secretary; Herman E. Drill, M.D., Hopkins, recorder; James R. Fox, M.D., Minneapolis, treasurer. Executive board members are Edwin G. Benjamin, Minneapolis, for a two-year term and Leonard S. Arling, Minneapolis, for a one-year term.

Representatives from Duluth, the Iron Range, Austin, and South Saint Paul attended the organization meeting, as well as Twin City physicians. Out-of-state guests were Dr. Edward C. Holmblad, Managing Director of the Industrial Medical Association, Chicago; Dr. Daniel E. Dorchester, Sturgeon Bay, Wisconsin; Dr. H. Glenn Gardner, East Chicago, Indiana, and Dr. C. H. Johnston, Des Moines, Iowa.

ANNUAL PHI DELTA EPSILON LECTURESHIP

The annual Phi Delta Epsilon lectureship will be given by Dr. Mark M. Ravitch, Director, Department of Surgery, Mount Sinai Hospital, New York City, on "Present Concepts in the Management of Intussusception," January 7, 1954, 8 p.m., at Owre amphitheater.

INDUSTRIAL MEDICINE FELLOWSHIPS

The Institute of Industrial Health of the University of Cincinnati will accept applications for a limited number of Fellowships, offered to qualified candidates who wish to pursue a graduate course of instruction in preparation for the practice of Industrial Medicine. Any registered physician, who is a graduate of a Class A medical school, and who has completed satisfactorily at least two years of training in a hospital accredited by the American Medical Association, may apply for a Fellowship in the Institute of Industrial Health. (Service in the Armed Forces or private practice may be substituted for one year of training.)

The course of instruction consists of a two-year period of intensive training in Industrial Medicine, followed by one year of practical experience under adequate supervision in industry. Candidates who satisfactorily complete the course of study will be awarded the degree of Doctor of Industrial Medicine.

During the first two years, the stipends for the Fellowship vary, in accordance with the marital status of the individual, from $2,100 to $2,700 in the first year and $2,400 to $3,000 in the second year. In the third year the candidate will be compensated for his service by the industry in which he is completing his training.

A one-year course, without stipend, is also offered to qualified applicants.

Requests for additional information should be addressed to the Institute of Industrial Health, College of Medicine, Eden and Bethesda, Cincinnati 19, Ohio.

ASSOCIATION FOR RESEARCH IN OPHTHALMOLOGY

The Midwest Section of the Association for Research in Ophthalmology will hold its annual meeting February 7, 1954, at the University of Chicago, School of Medicine, Chicago, Illinois.

Papers of clinical and basic interest will be presented with many presentations of a preliminary nature. Dr. Theodore F. Schlaegel, of the Department of Ophthalmology, University of Indiana, is chairman.

The meeting will be preceded by the annual clinical conference of the Chicago Ophthalmological Society, which will be held February 5 and 6, 1954, at the Drake Hotel.

HEART PROGRAM OVER KUOM

"How's Your Heart?" a series of thirteen programs dealing with the human heart—its diseases and cures, is now being presented over University of Minnesota radio station KUOM. The show is aired at noon Thursdays.

Planned in co-operation with the Minnesota Heart association, and its director, G. Ray Higgins, "How's Your Heart?" is a fifteen-minute interview program which features guest experts who tell the story of heart diseases, cures and symptoms. The series will run through January 7, 1954.

The speakers and problems already discussed are Dr. Paul F. Dwan, clinical associate professor of pediatrics in the University medical school, "Rheumatic Fever" (November 5); Higgins on "What the Minnesota Heart Association Can Do for You," November 19; Dr. Ancel Keys, director of the University's laboratory of physiological hygiene, "Arterial Sclerosis," November 26 and December 3.

Future programs include Dr. Frank Hirschbeck, Duluth, "Chest Pain and Heart Disease," December 10; Dr. Tom Dry, member of the Mayo Clinic staff, Rochester, "Congenital Heart Disease," December 13 and 24. Two programs on hypertension are scheduled for December 31 and January 7.

The audience can participate in the shows by sending questions to "How's Your Heart?" to KUOM, Eddy hall, University of Minnesota. Dr. Charles N. Hensel, Saint Paul, who appeared on the first two programs and who has arranged for the other specialists to speak on the series, will devote certain programs to answering questions.

Michael Canfield of the KUOM staff serves as host for the programs, asking questions and introducing the guests.

ELIAS P. LYON MEMORIAL LECTURE

Professor Bernardo A. Houssay, 1947 Nobel prize winner in physiology and medicine, director of the Instituto de Biologia y Medicina Experimental, Buenos Aires, Argentina, spoke at the University of Minnesota, November 3. "Action of Sex Hormones in Experimental Diabetes" was the subject of the annual Elias P. Lyon memorial lecture which Dr. Houssay presented in the Owre amphitheater. The Lyon lectures are given annually in memory of Elias P. Lyon, former dean of the University's medical school. Dr. Houssay is a long-time leader in the opposition to Juan Peron's government in Argentina.

ALUMNI ASSOCIATION OF THE MAYO FOUNDATION

The twenty-ninth annual reunion of the Alumni Association of the Mayo Foundation was held the first of October with the following elections: Dr. Walter C. MacKenzie, Edmonton, Alberta, Canada, president; Dr. Shirley C. Lyons, New Orleans, Louisiana, first vice president; Dr. Miles Griffin, Berkeley, California, second vice president, and Dr. George Logan, Rochester, associate secretary and treasurer. Officers re-elected were Dr. Donald C. Balfour, Rochester, honorary president, and Dr. James F. Weir, Rochester, secretary.

Dr. Robert C. Bahn, native of Newark, New Jersey, now assistant to the Mayo Clinic staff in pathology, was given the annual Alumni Award in recognition of his research work on sex hormones of the human pituitary gland.

POSTGRADUATE COURSE IN DIABETES AND BASIC METABOLIC PROBLEMS

The second Postgraduate Course in Diabetes and Basic Metabolic Problems to be conducted by the American Diabetes Association will be offered at Rochester, Minnesota, January 18-20, 1954, under the directorship of Edward H. Rynearson, M.D., and Randall G. Sprague, M.D., consulting physicians, Section of Medicine, Mayo Clinic; Professors of Medicine, Mayo Foundation, Graduate School, University of Minnesota, Rochester, Minnesota.

Highlights of the course will be lectures by Charles

H. Best, C.B.E., M.D., F.R.S., co-discoverer of insulin, professor of physiology; director and professor in the Banting and Best Department of Medical Research, University of Toronto; and by Joseph Hoet, M.D., professor and head of medicine, University of Louvain, Louvain, Belgium. Dr. Best's subject is "About the Pancreas" and Dr. Hoet will give a lecture on "Prediabetes in Pregnancy."

There will be a total of over thirty-five lectures and round-table discussions. The first day of the course (January 18) will be devoted to the "Clinical Aspects of Diabetes." Dr. Best will be chairman of the morning session and Dr. Bortz will moderate the afternoon program.

"Complications of Diabetes" will be the subject of Tuesday's (January 19) program and Dr. Arthur R. Colwell of Chicago and Dr. Frank N. Allan of Boston will be chairmen of the morning and afternoon sessions, respectively.

The (January 20) morning program, headed by Dr. E. Perry McCullagh of Cleveland will be on the subject of "Nutritional Requirements and Diet in Diabetes." Dr. Randall G. Sprague, who is also president of the American Diabetes Association, will preside over the Wednesday afternoon session which will include a number of special topics such as hyperinsulinism and insulin malingering.

A dinner will be held on Monday evening, January 18, which will feature "A Practical and Metaphysical Demonstration of Visual Acuity Versus Manual Dexterity" by Oliver H. Beahrs, M.D., Ph.D. (in Prestidigitation) of the Mayo Clinic and Mayo Foundation. Tours of the Medical Sciences Building and the Mayo Clinic New Building will be conducted on Tuesday and Wednesday afternoons.

The course is open to non-member physicians as well as members of the American Diabetes Association, but the number of registrants will be limited to 125. Fees are $40 to members, $75 to non-members. Details of the three-day program and registration and hotel information may be obtained from J. Richard Connelly, Executive Director, American Diabetes Association, 11 West 42nd Street, New York 36, New York.

POSTGRADUATE COURSE ON DISEASES OF THE CHEST

The Council on Postgraduate Medical Education of the American College of Chest Physicians, in co-operation with the respective state chapters of the College as well as the staffs and faculties of the local hospitals and medical schools, will sponsor the second Regional Postgraduate Course on Diseases of the Chest in New Orleans, Louisiana, February 15 to 19, 1954. The Seventh Annual Postgraduate Course on Diseases of the Chest will be held at the Bellevue-Stratford Hotel, Philadelphia, Pennsylvania, March 15 to 19, 1954.

These postgraduate courses endeavor to bring physicians up to date on recent advancements in the diagnosis and treatment of heart and lung disease. Tuition for each course is $75.

Further information may be secured by writing to

CONTINUATION COURSES

The University of Minnesota will present a course in *Neurology for General Physicians and Specialists* from January 25 to 30, 1954, in the Center for Continuation Study.

Diagnosis and management of the more commonly-met neurological disorders will be stressed. The guest faculty will include Dr. Madison H. Thomas, chairman, neurology section, Department of Psychiatry, University of Utah; Dr. A. Theodore Steegman, professor and chief, Department of Neurology, University of Kansas Medical Center, and Dr. Adolph L. Sahs, professor and head, Department of Neurology, University of Iowa Medical School. As an integral part of the course, the annual John B. Johnston Lecture will be presented on the evening of January 27 by Dr. Andrew T. Rasmussen, professor emeritus of anatomy, University of Minnesota Medical School. The course will be presented under the direction of Dr. A. B. Baker, professor and director of Neurology, who will be joined by other members of the faculty of the University of Minnesota Medical School and the Mayo Foundation.

* * *

A course in *Child Psychiatry for General Physicians, Pediatricians, and Psychiatrists* will be presented by the University of Minnesota next February 1 to 5, 1954. The course will consist principally of small-group discussions of common problems led by recognized experts in the field. A minimum of didactic lecture material will be presented. The guest faculty will include Dr. Sherman Little, director, Orthopsychiatric Department, Children's Hospital, Buffalo; Dr. Mabel Ross, mental health consultant, U. S. Public Health Service, New York City; and Dr. Henry H. Work, assistant professor of Pediatrics and Psychiatry, University of Louisville Medical School. The course will be presented under the direction of Dr. Reynold A. Jensen, professor, Department of Psychiatry and Pediatrics, at the University of Minnesota Medical School.

* * *

A two-day course in *Cancer Detection for General Physicians* will be presented February 10 and 11, 1954, under the auspices of the University of Minnesota and the Minnesota Division of the American Cancer Society. Physicians who register for the program will spend their time in the University's Cancer Detection Center where they will observe and participate in the diagnostic activities. The Medical School's new cancer research unit, the Lyon Laboratories, will be dedicated February 11, and registrants will be invited to attend the dedication program and dinner. Housing accommodations will be available at the Center for Continuation Study as usual.

* * *

The University of Minnesota will present a course in *Fundamental Advances in Internal Medicine for Internists* at the Center for Continuation Study, February 15 to 17, 1954. Basic concepts in the fields of

design achievement
in treatment room furniture

New Steeline has gone through fifteen years of gradual development to reach the fine degree of design perfection it now has. The suggestions of scores of physicians and the engineering skill of our own production plant have been combined to produce this outstanding treatment room equipment. New features such as foam rubber cushioned contour top, magnetic door latches, concealed paper sheeting holder, superb color finishes, etc., are all fully described and illustrated in our new full-color brochure—send for yours today.

A. S. ALOE COMPANY OF MINNESOTA • 927 Portland Avenue • Minneapolis 4, Minnesota

infectious disease, gastroenterology, and hematology will be discussed. The faculty will include Dr. Walter Lincoln Palmer, professor, Department of Medicine, University of Chicago School of Medicine, and Dr. David Shemin, associate professor, Department of Biochemistry, Columbia University College of Physicians and Surgeons, New York City. Dr. Shemin will also present the annual Journal-Lancet Lecture February 16. The course will be presented under the direction of Dr. Cecil J. Watson, professor and head, Department of Medicine, and the remainder of the faculty will be made up of members of the University of Minnesota Medical School.

* * *

The University of Minnesota will present a *Conference on the Infertility Problem for Physicians,* next February 18 to 20, 1954, at the Center for Continuation Study. The course, which has been designed to meet the needs of those physicians who are frequently consulted by infertile couples, will take up this problem from a number of standpoints. Medical and gynecologic procedures in the diagnosis and management of a sterility problem will be stressed. In addition, fertility control and genetic aspects of infertility will be considered, and adoption procedures will be the subject of a panel discussion. Guest speaker will be Dr. Alan F. Guttmacher, director of the department of obstetrics and gynecology, Mount Sinai Hospital, New York City, a recognized authority in this field. The conference will be presented under the direction of Dr. John L. McKelvey, professor and head, and Dr. Louis L. Freidman, clinical instructor of the department of obstetrics and gynecology of the University of Minnesota Medical School.

* * *

A continuation course in *Clincal Dietetics for Dietitians* will be presented by the University of Minnesota at the Center for Continuation Study, March 4 to 6, 1954. Important advances in dietetics, including the relationship of diet to vascular disease, will be stressed. The course will be presented under the direction of Miss Gertrude I. Thomas, Director of Nutrition and Professor of Dietetics.

KANDIYOHI-SWIFT-MEEKER COUNTY SOCIETY

Thirty-five members attended the October meeting of the Kandiyohi-Swift-Meeker County Medical Society at the Willmar Country Club, October 22, 1953. Following the dinner, Dr. Elmer T. Cedar, of Minneapolis, addressed the members on "The Treatment of Miscellaneous Dermatoses in Office Practice." Nominations for officers for 1954 were presented for final action at the November meeting; also an application for membership.

Dr. C. Walton Lillehei, of the University of Minnesota medical school staff, addressed the meeting held November 19 on "Gastrointestinal Hemorrhage and Its Treatment." Officers were elected at this meeting as follows:

President—R. P. Griffin, M.D., Benson
President-elect—D. L. Jacobs, M.D., Willmar
Secretary-Treasurer—L. J. Opsahl, M.D., Willmar
Delegate (MSMA)—W. E. Macklin, Jr., M.D., Willmar
Alternate Delegate (MSMA)—E. J. Kaufman, M.D., Willmar
Censor (1954-56)—D. E. Dille, M.D., Litchfield

SOUTHWESTERN MINNESOTA MEDICAL SOCIETY

Election of officers for the Southwestern Minnesota Medical Society was held November 2, at the Pipestone Country Club at Worthington. Elections were as follows: Dr. R. F. Pierson, Slayton, president; Dr. R. P. Hallin, Worthington, president-elect; Dr. H. A. Christensen, Jackson, vice president; and Dr. O. M. Hedberg, Worthington, secretary (re-elected). Dr. Paul Adams, Jr., University of Minnesota, spoke on "Newer Advances in Pediatrics."

WABASHA COUNTY MEDICAL SOCIETY

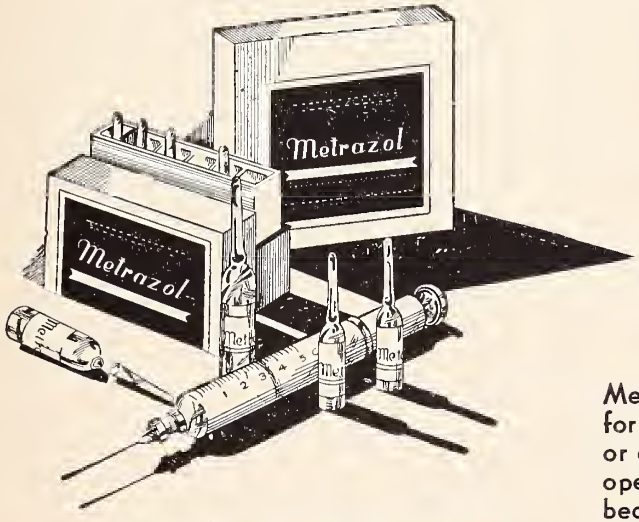
The Wabasha County Medical Society elected the following officers at its eighty-fifth annual meeting at Wabasha, October 8: Dr. C. G. Ochsner, president; Dr. Earl W. Ellis, vice president; Dr. E. C. Bayley, delegate to the Minnesota State Medical Society; Dr. W. P. Gjerde, member of Board of Censors; Dr. B. A. Flesche was re-elected secretary-treasurer. Dr. John M. Waugh, Dr. Robert Kierland, and Dr. Edward H. Juers with their wives, were among the guests. The evening meeting was held at the home of Dr. LeRoy M. Ekstrand.

THE DYNAMICS OF EMOTIONS

(Continued from Page 1233)

and electrolytes and all the enormously complex physiologic capacities of which we have only imperfect knowledge. While the external environment is perhaps more familiar to us in general, it is nonetheless equally complex—made up of parents and siblings and life experiences of success and failure and love, hope, aspiration, conflict and the rest. These environments are in a constant ferment of change, and we learn to live with change and develop techniques for nullifying the drastic effects of it. Anxiety is the conscious experience of that change. Hence our predisposition to greater or lesser anxiety is a function of all the ingredients of both these environments, as well as the magnitudes and suddenness of the changes which take place.

These, then, are some of the dynamics of emotions—obviously overly condensed and simplified to the point where they bear only a distant resemblance to the actual phenomena themselves. But even in this faint resemblance, if we look, we can catch a glimpse of our patients and their problems.



Metrazol

A DEPENDABLE, QUICK-ACTING CEREBRAL AND MEDULLARY STIMULANT

Metrazol, pentamethylentetrazol
Ampules, 1 cc. and 3 cc.
Sterile Solution, 30 cc. vials
Tablets and Powder

Metrazol is indicated for narcotic depression, for instance, in poisoning with barbiturates or opiates, in acute alcoholism and during the operation and postoperatively when respiration becomes inadequate because of medullary depression due to the anesthetic.

Inject 3 cc. Metrazol intravenously, repeat if necessary, and continue with 1 or 2 cc. intramuscularly as required.

Bilhuber-Knoll Corp. Orange, N. J.

Woman's Auxiliary

A TRIBUTE TO OUR DOCTORS

Throughout the years, the advancement of medicine has been slow at times, rapid at others. Always its concern has been the maintenance of high standards of practice while contributing ever greater service to the human race. Each generation of physicians has made progress in this great task.

Today, we pause to evaluate our generation of professional men and women and their labors. As young people, they entered the practice of medicine, little realizing the personal sacrifice they and their families would have to make. The challenge has proved to be far greater than most had anticipated, yet they have met it quietly and with assurance.

They are called upon to study and treat the mental, spiritual, and emotional as well as the physical ills of their patients, with all the understanding and ability at their command. Monetary returns cannot adequately compensate for this. They give their best efforts with kindness and concern for the individual patient, no matter how poor or lowly. Constantly called upon in addition, for civic and community work, they try to meet these requests so far as their time permits. The public fails to appreciate these many and varied efforts, principally because they do not understand the doctor's life as we do. They do not visualize the man; they think only of the physician. But we who do know should help others to realize more fully the heavy responsibilities, the deep concern, the sleepless nights, the long hours, the eternal patience, the selflessness, and the human qualities of our doctors.

They are exceptional men and women who merit the appreciation of all. We, of the Auxiliary, want them to know that they have not only our appreciation but also our loyalty and admiration.

Mrs. Virgil J. Schwartz
Minneapolis

FALL SCHOOL OF INSTRUCTION DRAWS RECORD ATTENDANCE

Auxiliary members from all over the state attended the 1953 School of Instruction held by the Woman's Auxiliary of the Minnesota State Medical Association at the Curtis Hotel in Minneapolis, October 30.

Highlights of an unusually interesting program included two panels, one of them on public relations and the other on recruiting for careers allied to medicine, two important addresses and greetings from two distinguished out-of-state visitors.

For those who were unable to attend, some of the valuable and important suggestions and information given at this meeting are summarized below.

Bill Ingram, KSTP-TV news commentator, initiated the first panel with a definition of public relations. He called it the art of acquainting the customer with the personality of the producer as well as the product itself. "The Doctor's code of ethics needs decoding," he said, "and a large share of the burden is placed on the doctor's wife."

These are Mr. Ingram's suggestions for the doctor's wife.

First, she should persuade her husband, his office staff, and hospital personnel of the importance of keeping a warm, personal interest in the patient and his family. Lack of an appearance of that kind of interest has produced the current dip in popularity of the doctor as compared with the affection, amounting to adulation, of the past when the doctor took time to be friendly and interested.

Second, she should preach constantly to others the tremendous progress of American medicine as contrasted with European ineptness and the European philosophy of the unimportance of the individual.

Mr. Ingram called attention to the fact, also, that doctors are said to be turned out in twelve months behind the Iron Curtain.

Understanding Urged

Mrs. Sherle Lowe, Minneapolis public relations expert, also presented some practical suggestions for the doctor's wife. The first was that the doctor's own warmth and interest in his patients is likely to be a reflection of the warmth and understanding of his wife. Mrs. Lowe stated that, since records are kept of the total philanthropies of all the professions, wives could well add their own contributions to those of their husbands so that a true record of medical generosity could be shown. She also suggested that Auxiliary members should watch for errors of a medical nature in the press. They should see that letters are written to the editor immediately to correct wrong impressions. Her concluding suggestion was directed to the personal conduct of the doctor's wife. "Be humble" she told the doctors' wives. "Avoid pretense in clothes, speech or manner. Faults like these will surely undo all the back-breaking work and self-denial of your husbands."

Dr. Robert N. Barr, of the Minnesota Department of Health, acted as moderator of the panel on recruiting for allied medical careers. He presented representatives of four of the associated professions allied to medicine, all of whom besought the aid of the women.

Nurses, Technicians Needed

Miss Ruth Hovde, president-elect of the American Society of Medical Technologists, suggested that the Auxiliary consider establishing scholarships for medical technologists to stimulate recruiting. Also that Career Days be held by the Auxiliary in each area to tell high school students about opportunities in the field.

Mr. John Watson, past president of the Minnesota

Society of X-Ray Technicians, told the women that there are ten unfilled openings for every x-ray technician graduated in Minnesota. He emphasized the importance of Miss Hovde's suggestion for Health Days or Career Days or even for high school teas to impress the needs upon high school graduates. Mr. Watson offered to arrange for speakers at such meetings and Miss Berdine Thompson offered booklets, films and speakers on behalf of nurse-recruiting for the same purpose. Miss Thompson, who is associate executive secretary of the Minnesota Nurses Association, promised every assistance in her power, including speakers for any type of meeting, but she asked that Auxiliary members provide transportation for the speakers in their area meetings since the nurses' organization funds are limited for this purpose. Miss Thompson also besought the doctors' wives to see that no doctor ever says anything harmful which will be overheard and quoted like this: "No daughter of mine will ever be a nurse."

Mr. C. E. Caven, who is co-ordinator of the Hospital Program of the Minnesota Department of Health, gave an over-all picture of personnel shortages in the hospitals of the state. There were 8,000 new hospital beds built in Minnesota last year, he said, and they require staffing.

Aging Gracefully

Dr. E. L. Tuohy, of Duluth, philosopher and wit, had a personal message for the women. His title was "Growing Old Gracefully" and he held a hilarious audience spellbound in the last program period before lunch.

"Don't worry if you are not buoyantly healthy," Dr. Tuohy told his listeners. "Few people are at any age.

"You can also allow yourselves to be a little eccentric without worrying too much about it, providing you don't make nuisances of yourselves."

A nation's use of its leisure time determines its civilization, Dr. Tuohy also pointed out, and a good many Americans have too much wrongly used leisure time. Furthermore, an easy conscience is essential to health and happiness at any age.

"To stay well," he said in conclusion, "don't struggle for the unattainable. Reduce your desire for material things and remember that a happy life is a life of service to others."

Governor Also Urges Recruiting

Luncheon speakers were Governor C. Elmer Anderson and Mrs. Leo J. Schaefer of Salina, Kansas, president of the Woman's Auxiliary of the American Medical Association. Governor Anderson warmly seconded the importance of persuading young people to enter all the service fields including teaching as well as nursing and allied medical careers, adding a special note of his own: "Please make these young people happy by welcoming them into your homes occasionally, too," he said.

Mrs. Schaefer called for more members in the Auxil-

iary. "With 140,000 men in the American Medical Association and only 64,000 wives in the Auxiliary, there are too many bachelors in medicine," she said.

Climax of the session was an address by Mr. Aubrey Gates, field director of the Council of Rural Health of the American Medical Association, whose outline of the part doctors' wives must play in the national, as well as the rural, health program was pointed and effective.

"Medicine's greatest allies are rural people," Mr. Gates said. "That is true in spite of the fact that the forces opposed to our system of medicine and of government are making a tremendous effort to ensnare the farmer in socialism.

"Actually, it is the farmer who is likely to decide the future of America and a well-laid, long-planned scheme has been underway for a long time to influence the farmers. Certainly, the farmer's judgment is no better than his information. And you, as doctors' wives, must help to provide for him the right information.

"Use your Health Days and all your channels of public relations to tell people what you want them to know about your husband—that is, about medicine in America. Tell them about the tremendous progress made in America in comparison with foreign lands. Tell them that 20 years have been added to the average life span in America, that our children are taller and heavier because of our progress in medicine and nutrition.

"Support the hospitals and the recruitment drives for personnel; develop speakers' bureaus of your own; do everything in your power to spread warmth and understanding for the medical profession by your own service to your community, your church and to youth activities, generally. Remember how much more important these things are than purely social activities and how much more satisfaction you will have, as a by-product, from service to others."

Mr. Gates listed a number of organizations including the 4-H Clubs, the Parent-Teacher organizations, the Farm Bureau and the National Grange, all of which are staunch allies and friends of medicine, he said.

MRS. LEONARD S. ARLING, *Minneapolis*

MENTAL HEALTH WORK

In the opinion of Secretary Hobby, the nation is making slow progress in caring for its mentally ill. Talking at the opening of the Greater Kansas City Mental Health Foundation, the head of the Department of Health, Education, and Welfare declared:

"We have a pitiful array of organized help, only 420,000 beds when we need at least 750,000. Half our mental hospitals are overcrowded as much as 20 per cent, and some of our mental hospitals are overcrowded as much as 50 per cent. The average American mental hospital has less than half as many doctors as it needs, only a fourth as many registered nurses as it needs, only one-fourth as many psychiatric social workers as it needs. . . . Nationally, our hope of treating mental illness on any sort of thorough basis remains frustrated. First, by the lack of enough facilities to apply the knowledge we now have; and second by the lack of scientific research to find new, easier, quicker, less expensive and surer ways of treating mental illness."

In Memoriam

FRED L. BREGEL

Dr. Fred L. Bregel, formerly of St. James, Minnesota, died in Saint Paul after a short illness, Friday, November 13, 1953, at the age of sixty-four.

Dr. Bregel practiced medicine for twenty-nine years in St. James, but for the past eleven months had been employed with the rating board of the Veterans Administration at Fort Snelling.

He was born in Fairfax, Minnesota, and received his medical degree from the University of Minnesota medical school. After a teaching fellowship in medicine at the University Hospital, he joined Base Hospital 26 AEF and, later, an American Red Cross Commission which kept him in Europe until 1921. He entered general practice in St. James in 1923.

Surviving are his wife, Mrs. Cecilia Bregel; two daughters, Monica of Saint Paul, and Mrs. Lee Ball of Zumbrota; a son, Charles, of Saint Paul; two grandchildren, six brothers, and one sister.

EDWARD McCLINTOCK ELSEY

Dr. Edward McClintock Elsey was killed in a hunting accident at Blackduck, Minnesota, on Saturday, November 14, 1953, the first day of the 1953 deer hunting season. He was fifty years old and had practiced medicine at Glenwood, Minnesota, for thirty-three years.

Dr. Elsey was the son of Dr. James R. Elsey, who has also practiced at Glenwood since shortly after the turn of the century and who survives him. He was born at Chokio, Minnesota, and went to school in Glenwood. He received his Bachelor of Science degree at Geneva College in Beaver Falls, Pennsylvania, from which his father, also, was graduated. He received his medical degree from the University of Minnesota medical school and returned to Glenwood to practice after a year's internship at Minneapolis General Hospital. He was a member of the West Central Minnesota Medical Society, the Minnesota State Medical Association and the American Medical Association.

In addition to his father, Dr. Elsey is survived by his wife, Mrs. Gwen Vye Elsey, and three children.

BERT M. McIVER

Dr. Bert M. McIver of Lowry, Minnesota, died at the age of fifty-nine, Saturday, October 31, 1953, at the Glenwood Community Hospital.

Dr. McIver engaged in general practice at Lowry from 1929 until 1950 when he joined the Elsey-McIver Clinic in Glenwood. He was born at Lowry, went to school in Sauk Center, and received his medical degree from the University of Minnesota medical school. After serving his internship at St. Luke's Hospital in Duluth, he took a year's postgraduate study at the University of Illinois.

He was a leader in medical and civic affairs in his community and served as president of the West Central Minnesota Medical Society in 1929. He was also a member of the American Medical Association and the Minnesota State Medical Association. He had been chief of staff of the Glenwood Hospital from 1940 when it was organized, until his death. He served with the U. S. Army Medical Corps during World War II.

His wife, Gertrude McIver, survives him together with five children, including Jessie, Beth and Danny, all of Lowry; Paul, a student at the University of Minnesota, and Bertrand, stationed at Fort Sill, Oklahoma. Three sisters and two brothers also survive: Margaret of Lowry; Mrs. Howard Lysen, of Lowry; Mrs. William Haigh of New York City; George and John McIver of Farwell.

OSCAR F. MELLBY

Dr. Oscar F. Mellby, pioneer physician and long a leading citizen of Thief River Falls, died on November 14, 1953, at the age of seventy-seven.

He had retired from active practice only a month before, with the hope that he could return to his practice after a period of rest and recuperation, in the spring.

Dr. Mellby first went to Thief River Falls as a young practitioner of thirty-one and only a few years out of medical school. He carried on an extensive and typical "horse-and-buggy" practice in the country-side around the town and, at the same time, took a leading part in civic, social and church affairs of the community.

He served at various times as president of the school board, the park board and the Parent-Teachers Association and he was a member of the State Board of Health for nine years. He was president of the local Rotary Club and he acted as health officer or city physician during most of his years of practice. He was president for three years of the Northern Minnesota Lutheran Brotherhood and a trustee and member of the board of deacons of Trinity Lutheran Church for many years.

When the Oak Park Sanatorium Commission was formed in 1916, Dr. Mellby was a member. He served that commission as president, too, for many years, and was the only original member remaining on the board at the time of his death. He was also the oldest living member of the Civic and Commerce Association, having joined a fore-runner of the association in 1907.

He served medical organizations of the county and district with distinction and was elected the first president of the Pennington County Medical Society when it was organized as a separate county organization in 1950. He was elected president of the Northern Minnesota Medical Association in 1938 and he served as president of the Physicians' Hospital Association governing Physicians' Hospital in Thief River Falls. He was a member of the Minnesota State Medical Association and the American Medical Association. In 1952, he became a member of the Fifty Club of the State Medical Association, all of whose members have practiced at least fifty years in Minnesota.

On June 30, 1947, the citizens of Thief River Falls united in celebrating "Dr. Mellby Day" in recognition of his forty years of service to their community. Climax of the observance was a dinner at which Dr. James L. Morrill, president of the University of Minnesota, gave the principal address.

Dr. Mellby was born at New Richland, Minnesota, and was graduated from St. Olaf Academy high school and St. Olaf College at Northfield. He studied medicine at the old Hamline Medical College which later united with the University of Minnesota medical school. He received his medical degree in 1901 and served his internship at Ancker Hospital in Saint Paul. Before going to Thief River Falls he practiced at Willmar, Warren and Argyle. His father was the Reverend Ole Andreas Mellby, a graduate of the University of Christiania, who came to America as pastor of a LeSueur River congregation with a circuit of nine churches in 1872.

Surviving are his wife, Mrs. Sigrid Mellby; two sons, Paul of Angola, Indiana, and Erling of Long Prairie, Minnesota; a brother, Dr. Carl Mellby, and a sister, Mrs. Marie Horneland, both of Northfield.

GEORGE H. SCHLESSELMAN

Dr. George H. Schlesselman, who practiced medicine for many years at Anoka, died at Swedish Hospital in Minneapolis, November 3, 1953. He was sixty-eight years old.

Dr. Schlesselman was born at Bremen, Indiana, and received his medical degree from Hahnemann College in Chicago in 1913. He served his internship at Leo Hospital in Rochester, New York. After a few years of practice in Chicago and in Fond du Lac, Wisconsin, and two years' service in the U. S. Army in World War I, he moved to Good Thunder, Minnesota, in 1922, and, from there, to Anoka in 1927. He retired from active practice in Anoka in 1949 and joined the staff of the Anoka State Hospital, with which he was still affiliated at the time of his death.

Dr. Schlesselman was a member of the East Central Minnesota Medical Society which he served as president in 1938, the Minnesota State Medical Association and the American Medical Association. He was also president of the Blue Earth County Medical Society in 1928. He was a member of the staff of the Swedish Hospital in Minneapolis for twenty-five years. He was also one of the founders of the Anoka Kiwanis Club and took a leading part in many civic enterprises in Anoka.

He is survived by his wife, Mrs. Jessie A. Schlesselman; a sister, Mrs. William C. Brandt of Denver, Coloradio; and a brother, Carl F. Schlesselman of Pasadena, California.

CLEVE RIDLON SENESCALL

Dr. Cleve Ridlon Senescall who practiced for twelve years at Sleepy Eye, Minnesota, died at Enumclaw, Washington, late in October. He was sixty-five years old.

Dr. Senescall moved with his family from Sleepy Eye to Tacoma, Washington, in 1943 and joined the Bridge Clinic there. Later he established an office by himself at Enumclaw. He is survived by his wife and one son, Cleve, of Seattle, Washington.

HUGH J. TUNSTEAD

Dr. Hugh J. Tunstead, who practiced obstetrics and gynecology for many years in Minneapolis, died Sunday, November 29, 1953, at the age of seventy-seven.

Dr. Tunstead received his medical degree from the University of Minnesota, College of Homeopathic Medicine, in 1901. He became a member of the Hennepin County Medical Society in 1909 and was voted a life member of the Hennepin County Medical Society and of the Minnesota State Medical Association in 1949. He became a member of the Fifty Club, all members of which have practiced medicine for fifty years in Minnesota, in 1951. He was also a member of the American Medical Association.

Dr. Tunstead is survived by two sons, Edward B. and Charles W., both of Minneapolis, a nephew and two grandchildren.

◆ Of General Interest ◆

The problem of personnel at the Holy Trinity Hospital, Norfolk, Nebraska, has been solved by the full co-operation of the local people in forming an association of twenty-two nurses from the vicinity to help the sisters. The hospital, staffed ordinarily by sisters of the Missionary Benedictine Order, has had personnel shortages because the order, with headquarters in Germany, has not been able to send the needed sisters to maintain a full community. The hospital has always been in excellent financial condition since its founding in 1914. This report comes from **Dr. I. L. Oliver**, Graceville, who recently visited the institution.

* * *

Dr. Carl J. Potthoff, appointed medical consultant to the Midwest Region, National Foundation for Infantile Paralysis, is the first regional consultant named for this area, which includes Minnesota, Iowa, Kansas, Nebraska, North and South Dakota, Montana and Alaska. Dr. Potthoff will be responsible for the 564 chapters of the National Foundation in this area, and will work in close co-operation with state, county and city medical societies and health authorities.

Dr. Potthoff was graduated from the University of Minnesota College of Medicine in 1933; later, he served eight years as associate professor of biological sciences at the University. He left in 1946 to join the American Red Cross in Washington, D. C., working there until he went to Albuquerque, New Mexico, on a special assignment for the Department of the Interior for a year. He will make Rochester, Minnesota, his headquarters.

* * *

Dr. Ezra V. Bridges, medical supervisor of Mineral Springs Sanatorium, Cannon Falls, spoke at the Pine Island Parent-Teacher Association, October 21. Dr. Bridges pointed out ways in which tuberculosis is discovered, and stressed the importance of the Mantoux test for children. He used x-rays and slides to illustrate his topic.

* * *

Dr. N. J. Berkwitz, medical director for the Community Mental Health Center in Albert Lea, recently addressed the Mower County Medical Society at their monthly meeting. His topic was "The Community Mental Health Center—Functions and Goals."

* * *

Dr. Kathleen B. Jordan, Granite Falls, spoke at the fortieth annual meeting of the Mississippi Valley Conference on Tuberculosis and the Mississippi Valley Trudeau Society, held in Minneapolis, October 16. She said: "With oncoming generations being more protected from contact with contagious tuberculosis, the age of the average patient has advanced"; making tuberculosis a disease of middle age and older folk rather than of young people.

Dr. R. H. Johnson has joined **Dr. Glenn P. Schmidt** at the Broadway Clinic, Minneapolis. Dr. Johnson was graduated from the University of Nebraska College of Medicine and served his internship at Bronson Memorial Hospital, Kalamazoo, Michigan. He also served three and a half years in the United States Navy Hospital corps during World War II.

* * *

Hector has a new clinic built by **Dr. C. A. Anderson.** It is a modern structure costing $30,000, with four examining rooms, an x-ray room, and also a room for physiotherapy.

* * *

Dr. G. A. Hedberg, hospital superintendent of Nopeming Sanatorium, pointed out the need of fire equipment at Nopeming, at a St. Louis County budget meeting October 21. Not only is there a 1913 fire truck, but "we don't have anyone to run the equipment," he said.

* * *

Dr. Frank Hammond Krusen of the Mayo Clinic, Rochester, was honored for his work in the field of employment for the handicapped persons at a dinner meeting of the Upper Midwest Industrial Health conference held in Minneapolis, October 2. At that same meeting Dr. Leonard A. Scheele, surgeon general of the United States Public Health Service, spoke on "the lack of health service for workers in small establishments." Dr. Scheele said about 99 per cent of American firms employ fewer than 500 persons, and about 70% of all United States employes are in small establishments: "Yet less than 5 per cent of these employes have any type of in-plant or on-the-job health service," he said.

* * *

A Finnish pediatrician, formerly of Helsinki, Finland, and now practicing in Duluth, **Dr. Erkki A. Leppo,** is a former medical officer of the United Nations' World Health Organization. Appointed in 1948, he was one of the first Scandinavian physicians to serve with the UN's WHO, moving to Geneva, Switzerland, at the time the agency was being set up there. Dr. Leppo traveled extensively—he was in Korea when the war broke out in 1950. Following his travels and work with WHO he received a two-year fellowship in pediatrics at the Mayo Clinic. Now he and his family have settled in Duluth, partly because of the area's large Finnish population. He has written a book in Finnish to be published shortly, "UN Doctor Around the World."

* * *

Dr. Morley Cohen and Dr. C. Walton Lillehei of the University of Minnesota, described the "poor man's" heart, a new machine tested successfully on experimental animals, at the opening session of the American College of Surgeons' annual convention held in Chicago in the early part of October.

Do You Have Investment Income?

First Investor: "I feel quite satisfied with my investments—last year I had an average return of about 6%."

Second Investor: "Well, I averaged about 4% with very safe investments, and the income is all mine."

First Investor: "I don't know what you mean—the 6% return is all mine, isn't it?"

Second Investor: "Aren't you forgetting to consider the federal income tax you must pay on your return? Even with this year's taxes your investment income will be under 4%."

First Investor: "What about the income tax on your 4% return?"

Second Investor: "My income tax payments are limited to professional earnings. My investment income is tax-exempt because I buy Municipal Bonds."

The Mayo Clinic historical committee members, including **Dr. A. B. Hunt**, chairman; **Dr. D. C. Balfour; Dr. J. R. Eckman; Dr. A. H. Sanford,** and **Dr. J. H. Tillisch,** are acquiring and preserving items of permanent historical value to the Clinic. The items have been named "Mayoana" and consist of photographs, manuscripts, papers, newspaper clippings concerning Clinic events or persons, tape recordings, motion pictures, furniture and instruments, books, reprints, and letters.

* * *

Dr. N. W. Wagner, completing nine years of service with the Oliver Clinic at Graceville, left October 10 to enter a partnership with **Dr. R. P. Griffen** at Benson. Before coming to Graceville, Dr. Wagner, graduate of University of Iowa, was with the U. S. Public Health Service for five years. Dr. G. L. Barnett, now serving with the army, and Dr. Robert Geist, at present studying at the University hospital, will join the Oliver Clinic the first of the year.

* * *

The shortage of doctors in rural areas was discussed at the League of Minnesota Municipalities regional meeting held in Askov, in September. After reading reports of the meeting the eighty-one-year-old **Dr. George E. Sherwood**, Kimball, commented: "We ought to have a law in the state of Minnesota compelling medical graduates to locate in some country place where a physician is needed, for at least one year after their graduation, and hold up their diploma until they did so. They have had such a law in Mexico for several years and it has worked out very well. Many of the doctors who have done so have liked the work and have remained in the place permanently." Dr. Sherwood wants to retire, but is unable to find a doctor to take over his practice.

* * *

Dr. Eugene L. Bauer, Saint Paul, has recently been elected to Associate Fellowship in the American Otorhinologic Society for Plastic Surgery.

* * *

Dr. Owen H. Wangensteen, University surgical chief and president of the Minnesota Medical Foundation, presented fourteen scholarships to medical students October 1, at the University of Minnesota's Medical School. One grant was $750, each of the others were $500.

* * *

Dr. E. E. Novak, who has practiced medicine in New Prague for fifty-eight years, has taken keen interest in cattle breeding during these years. He was president of the Red Poll Cattle Club of America for twenty-one years. Recently he has been honored for distinguished service to the association by the National Red Poll Cattle Club at a banquet held in Topeka, Kansas. Dr. Novak, nearly eighty years old, is a regent of the University of Minnesota, past president of the state school board association, and a founder and director of the Upper Mississippi Valley Breeders association.

Stearns County Cancer Society sponsored a cancer workshop, which was held at St. Cloud, November 13. **Dr. Donald Mosser,** specialist in pathology and radiology at University of Minnesota, spoke on "New Developments in Cancer Research and Treatment." Dr. C. B. Thuringer of St. Cloud also gave a talk during the sessions.

* * *

Dr. Harold Perry, native of Rochester, and **Dr. Frank T. Maher,** formerly of the University of Illinois, have been appointed to the staff of the Mayo Clinic.

* * *

Dr. Berenice Moriarty, Saint Paul specialist in obstetrics and gynecology, recently joined the medical staff of the Minnesota School and Colony as a resident physician. Dr. Moriarty was on the staff of Lying-in Hospital in Chicago for ten years; from 1931 to 1953 she has been in private practice in Saint Paul. One of her main interests during this time has been "Our Lady of Good Counsel" Hospital, a free institution for persons with incurable cancer. She has a sister, **Dr. Cecile Moriarty,** who is a pediatrician in Saint Paul.

* * *

Two Minnesotans, **Dr. William H. Feldman,** Rochester, and **Dr. E. P. K. Fenger,** Glen Lake, were honored recently by tuberculosis workers from twelve mid-western states. Dr. Feldman, research worker at the Mayo Foundation, was awarded the 1953 Dearholt medal of the Mississippi Valley Tuberculosis conference and its medical section, the Mississippi Valley Trudeau Society. Dr. Fenger, assistant medical director of Glen Lake sanatorium, was named Trudeau Society president-elect. He will take office in 1954.

* * *

Dr. Roger L. J. Kennedy, chief of pediatrics at Mayo Clinic, Rochester, was installed as president of the American Academy of Pediatrics at its annual business session at Miami, Florida.

* * *

Dr. W. S. Hitchings, who has practiced medicine for thirty-nine years in Lakefield, has accepted a position on the staff of the Pennhurst State Institution for Mentally Retarded at Spring City, Pennsylvania.

* * *

Dr. Roger Anderson joined the Crystal Medical Clinic staff in September. Dr. Anderson, formerly of Detroit Lakes and Minneapolis, will devote his time to obstetrics and child care.

* * *

Dr. W. L. Benedict, of Rochester, and Dr. Jack C. Copeland, of Chicago, received the Beverly Myers Nelson Achievement Awards at a luncheon at the Palmer House, Chicago, in October. The awards are granted each year to two persons who have rendered outstanding services in the field of optics.

Dr. David P. Anderson, of Austin, succeeds **Dr. C. G. Uhley,** of Crookston, as president of the American Cancer Society's Minnesota division.

* * *

Dr. Donald M. Larson, associated with the Park Region Health Center of Fergus Falls, and Leona Marie Graepp, Alexandria, were married in the American Lutheran Church of Fargo the last part of September.

* * *

Dr. P. W. Backus, of the outpatient department of Nopeming Sanatorium, told his audience in a Christmas Seal drive at Eveleth, that ten years ago the area death rate from tuberculosis was 120 per 100,000, while today it is 7.7 per 100,000.

* * *

Dr. Leo G. Rigler, head of the radiology department at the University of Minnesota, spoke at the University's convocation November 12, on the subject, "India: Masses, Mores and Medicine." Dr. Rigleg, with a fifteen-man team, sponsored by the United Nations World Health Organization and the Unitarian Service Committee, visited India last February.

* * *

Dr. Richard Bardon, Duluth, specialist in internal medicine, was head of the drive in St. Louis County seeking to find undetected cases of diabetes. The drive was sponsored by the St. Louis County Medical Society in co-operation with the American Diabetes Association as a part of a nationwide effort to detect diabetes held November 15 to 21, **Dr. H. O. Hoff,** also of Duluth, assisted Dr. Bardon.

In connection with the drive, **Dr. J. J. Eustermann** headed the work in Blue Earth and Mankato Counties during Diabetes Detection week.

* * *

Dr. P. Theodore Watson, obstetrician and gynecologist in Saint Paul, spoke on "Medical Careers" at the Carleton College Careers Conference, November 18, in Northfield. Both Dr. Watson and his parents are graduates of Carleton. His father was sent by the college to Shansi, China, after his graduation, and there Dr. Watson was born.

* * *

Dr. David T. Carr, Dr. A. M. Olsen, Dr. Donald R. Nichols, and **Dr. William J. Martin,** Rochester, spoke at the Midwest Regional meeting of the American College of Physicians in Milwaukee, November 21. Dr. Carr and Dr. Olsen discussed "Tracheopathia Osteoplastica," and Dr. Nichols and Dr. Martin spoke on "Cryptococcosis: Clinical Features and Differential Diagnosis." Physicians from Minnesota, Wisconsin, Illinois, and Iowa, and Indiana were present at the sessions.

* * *

Dr. Shohei Shirai, Mesaba Clinic, Coleraine, spoke on "Psychiatry in Industry" at a meeting of the Lake Superior Mines Safety Council in Grand Rapids, Michigan, November 12.

* * *

Dr. M. K. Plasha, associated with the Elsey Clinic in Glenwood, left recently to take up a new practice in Coon Rapids.

* * *

Dr. Gunnar Stickler, a fellow in the Mayo Foundation, spoke on "A German's Viewpoint of Germany," at the quarterly meeting of the Magazine Club at Rochester. Dr. Stickler, whose home is in Munich, Germany, spoke of the Nazi regime as a sociological disease, and considered the American occupation good; "the Americans helped the Germans to think and to realize what was happening." He felt that there is too much separation between Germans and Americans still.

* * *

Dr. Winchell McK. Craig, Rochester, president of the Association of Military Surgeons of the United States, recently had a ride in a 600-mile-an-hour jet creft. Dr. Craig was one of seventy leaders of business, labor industry, and profession, who visited the Air Proving Ground Command, Eglin Air Force Base, Florida, in connection with the joint civilian orientation conference sponsored by the Department of Defense.

* * *

Dr. John Wesley Schumacher, Minneapolis, was recently elected to membership in the Minnesota Society of Neurology and Psychiatry.

* * *

Dr. Reuben Berman, Minneapolis, and **Dr. John F. Briggs,** Saint Paul, addressed the Hennepin County chapter of the Academy of General Practice on the subject, "Angina Pectoris and Coronary Insufficiency," at a meeting held September 21.

The Seventeenth Annual Meeting

of

THE NEW ORLEANS GRADUATE MEDICAL ASSEMBLY

Conference Headquarters — Municipal Auditorium

MARCH 8-11, 1954

GUEST SPEAKERS

Perry P. Volpitto, M.D., Augusta, Ga.—Anesthesiology
Earl D. Osborne, M.D., Buffalo, N. Y.—Dermatology
Julian M. Ruffin, M.D., Durham, N. C.—Gastroenterology
Allan C. Barnes, M.D., Cleveland, Ohio—Gynecology
Walter C. Alvarez, M.D., Chicago, Ill.—Medicine
William D. Stroud, M.D., Philadelphia, Pa.—Medicine
Lawrence C. Kolb, M.D., Rochester, Minn.—Neuropsychiatry
Nicholson J. Eastman, M.D., Baltimore, Md.—Obstetrics
A. D. Ruedemann, M.D., Detroit, Mich.—Ophthalmology
Oscar L. Miller, M.D., Charlotte, N. C.—Orthopedic Surgery
Francis L. Lederer, M.D., Chicago, Ill.—Otolaryngology
Emmerich von Haam, M.D., Columbus, Ohio—Pathology
Philip M. Stimson, M.D., New York, N. Y.—Pediatrics
Ira H. Lockwood, M.D., Kansas City, Mo.—Radiology
Brian Blades, M.D., Washington, D. C.—Surgery
Samuel F. Marshall, M.D., Boston, Mass., Surgery
Orvar Swenson, M.D., Boston, Mass.—Surgery
Charles D. Creevy, M.D., Minneapolis, Minn.—Urology

Lectures, symposia, clinicopathologic conferences, round-table luncheons, three-dimensional surgical motion pictures, medical motion pictures and technical exhibits.

(All-inclusive registration fee—$20.00)

THE POSTCLINICAL TOUR TO HAWAII BY PLANE AND SHIP—MARCH 14-APRIL 6

For information concerning the Assembly meeting and the tour write Secretary, Room 103, 1430 Tulane Ave., New Orleans 12, La.

Dr. E. Sterling Nicol, Miami, Florida, **Dr. Robert L. Parker**, Rochester, and **Dr. John F. Briggs**, Saint Paul, spoke on the "Use of Anticoagulants" at the refresher course of the Minnesota Academy of General Practice, November 4.

* * *

Dr. James Seifert, New Ulm, gave a talk on the role of teeth in childbirth at a prospective parents class at the Loretto Hospital, New Ulm, September 22.

* * *

Dr. Frank J. Lexa, Lonsdale, was honored by fellow members of the Rice County Medical Society, at a meeting held at the State School and Colony, September 22, in recognition of his fifty years of active medical practice. He was also recently presented a certificate by the Minnesota Medical Association for his years of service. **Dr. F. R. Huxley**, Faribault, and **Dr. Niel S. Dungay**, Northfield, have also been given this recognition recently.

* * *

Dr. Theodor M. Vitols, Latvian medical professor and surgeon who came to this country as a refugee, was recently honored on his fiftieth birthday by the Latvian Evangelical Lutheran Church in Minneapolis. He is now affiliated with the Oxboro Clinic and is staff member of several hospitals in Minneapolis.

* * *

Dr. H. Herman Young, Rochester, with Chief Highway Patrol Officer Carl Larimer, warned of farm and highway accidents occurring during the fall, at a accident prevention clinic sponsored by the Martin County Extension Service at Fairmont October 1. Dr. Young emphasized the danger of careless handling of farm machines, especially the corn pickers.

* * *

At a regional meeting of the Women's Auxiliary to the State Medical Society in Detroit Lakes, **Dr. E. P. Tuohy**, Duluth, spoke on "How to Grow Old Gracefully," **Dr. John Freeman**, Fergus Falls, explained that 38 per cent of admissions to mental hospitals are over sixty years old, that there are twice as many mental hospitals today as ten years ago, and that 51 per cent of all hospital beds in the United States are used for mental patients. **Dr. R. Blanchard** gave a talk on tuberculosis.

* * *

Dr. John Paul Street, resident at Ancker Hospital, St. Paul, and Charlotte Marie Aust, teacher in Minneapolis schools, were married October 10 at Madison, Wisconsin. Dr. Street is a graduate of the University of Minnesota School of Medicine.

* * *

Olmstead County has recently named a county board of health, of five members, **Dr. A. F. Risser**, Stewartville among them. **Dr. Viktor O. Wilson**, city-county health officer, called a meeting to organize the board in order that it might take up its new duties.

Dr. Louis A. Loes, specialist in obstetrics and gynecology, has opened an office in St. Cloud. A veteran of World War II, Dr. Loes was recalled to active duty in 1951, and has recently been discharged. He is a graduate of Iowa State University Medical school.

* * *

Dr. Frank J. Heck was elected president of the staff of Mayo Clinic, November 16. Other officers elected were **Dr. Charles H. Watkins,** vice president; **Dr. David G. Pugh,** secretary; **Dr. Lee M. Eaton,** first counsellor, and **Dr. Mark J. Anderson,** second counsellor. Four retiring members of the voting staff were honored. They are **Dr. Frederick A. Willius, Dr. B. R. Kirklin, Dr. Harold I. Lillie,** and **Dr. Paul L. Tarara.**

* * *

Dr. Irving C. Bernstein, of Minneapolis, presented a paper on "The Psychiatric Aspects of Tuberculosis," at the fortieth annual conference of the Mississippi Valley Trudeau Society, held on October 16 at Nicollet Hotel, Minneapolis.

* * *

"Clinic Day" was held October 14 at the Fort Snelling Veterans Administration Hospital in connection with the opening of the new $6,300,000, 480-bed unit. Physicians from Minnesota, western Wisconsin and northern Iowa attended. **Dr. O. T. Clagett,** chief of the thoracic surgical section of the Mayo Clinic, Rochester, spoke on "Anatomical Variations and Pathologic Changes in Coarctation of the Aorta."

* * *

Dr. Frank H. Krusen, professor of physical medicine and rehabilitation with University of Minnesota May Foundation, has been selected to receive the second annual physician's award of the President's Committee on Employment of the Physically Handicapped.

Presentation of the award will be in February by Vice Admiral Ross T. McIntire, during the annual meeting of the Congress on Industrial Health to be held in Louisville, Kentucky.

* * *

Dr. Alexander Josewich, chief of chest follow-up at Minneapolis Veterans hospital, spoke of the high incidence of tuberculosis among servicemen at the short course for TB workers held at the Center for Continuation Study, October 13. Dr. Josewich said there were at present 2,300 veterans in Minnesota who contracted tuberculosis during their time in service. Few cases develop in camps in this country, "but in combat areas, unusual exposure to tuberculous civilians and other conditions results in unusually high incidence," he said.

* * *

Dr. Frank C. Mann, Rochester, was made an Honorary Fellow of the American College of Surgeons, October 9, 1953, in Chicago. The following citation was read by **Dr. O. H. Wangensteen** on this occasion:

> Mr. President: I have the honor to present for Honorary Fellowship in the American College of Surgeons, Frank Charles Mann, product of the schools of the Commonwealth of Indiana, illustrious citizen of the State of Minnesota, distinguished Professor Emeritus of the Graduate School of the Mayo Foundation and the University of Minnesota, keen exponent of the experimental method in surgery, and brilliant innovator of many imaginative experimental surgical techniques, which have proved useful in unraveling the complexities of organ function and disease processes.
>
> The surgical profession of the United States and Canada, on the recommendation of the Regents of the American College of Surgeons, honors you, Doctor Mann, for many significant contributions to

the growth of medical knowledge which have won for you the respect and admiration of medical men throughout the world. The Regents bestow this mark of esteem upon you with a sense of great pride in your important labors and in a spirit of grateful thanksgiving, mindful that your work has advanced the art and the science of surgery and has been the means of bringing comfort and relief to a large number of sufferers from many bodily ills which beset mankind. The force of your example has captured the imagination of a large number of fellow students who have had the opportunity, at first hand, to observe your spirit of dedicated devotion to your tasks. This precept and your encouragement have implanted in many of them the zeal to devote their lives to the advancement of knowledge and the betterment of man's health. Through them your influence will be extended on the pages of medical history down the corridors of time.

For these important services to your fellow man, the Regents of the College cite you for Honorary Fellowship in the American College of Surgeons.

MINNESOTA BLUE CROSS-BLUE SHIELD

During October, a statement was made by an out-state doctor that payment of Blue Shield claims was not received by him for a period as long as six weeks or two months after the claim was submitted. Since such statements are very infrequently heard now and are contrary to established routine Blue Shield claims processing procedures, a thorough investigation of the time involved in payment of various types of Blue Shield claims was made.

This analysis revealed that there are, in general, two types of Blue Shield claims. First of these types is the routine one in which all information necessary for proper payment is provided originally in the Medical Service Report. On the basis of the figures investigated, it was found that of claims received, 97 per cent fall into this first category and are processed for payment without delay. The second general classification of Blue Shield claims consists of those in which all information necessary for their correct payment or disposition is not included originally in the Medical Service Report. Claims falling into this classification represent approximately three per cent of the total claims received.

Claims of the first type are routinely processed. This means that the report is coded with the subscriber's contract information and then acted upon by a Claims Examiner. These procedures are accomplished in not more than four days. The claim then leaves the Claims Department for auditing and the various machine recordings necessary for statistical records. After these processes, all the claims submitted by each doctor are segregated, and the checks are then actually calculated and printed by machine. The claims and the checks are then returned to the Blue Shield Claims Department for mailing. These procedures take from one week to ten days, since two days of the week are not work days. Thus, then, claims containing all needed information are paid within a total period of ten days or two weeks of their receipt by Blue Shield.

The second type of claims, those not containing sufficient information to be processed routinely, can be further classified into the following sub-groups: (1) Pre-existing conditions, (2) related services, (3) miscellaneous, (4) "look-ups," (5) "paid-to-dates." The present analysis has disclosed that a total of 567 claims were involved in these five categories on October 30, 1953.

24-hour service **Phone NEstor 5958**

Cases involving a condition which may pre-exist the effective date of the subscriber's contract require correspondence to obtain the history, unless it is furnished in the Medical Service Report. Some claims require two or three inquiries directed to subscribers or doctors before the needed information is received. There were 157 such claims, the oldest dating back three to four weeks. Related service claims as listed are those for anesthesia, x-rays, or endoscopy with which no claim has been received from the attending physician who rendered the basic medical, surgical or obstetrical service. In such instances, the claim for anesthesia, x-ray or endoscopy cannot be processed until the basic service claim is received since the Blue Shield contract does not provide benefits for related service unless it is a part of an otherwise eligible basic service. There were 172 of these claims covering a period of four to six weeks. The miscellaneous classification includes essential information, such as the birth date of the subscriber, Workmen's Compensation data, the number of sutures in laceration cases, the date of service, the diagnosis or description of services, and whether or not x-rays were taken in the hospital or in the doctor's office. Of 104 such claims, the delay in payment was as long as four weeks.

"Look-ups" refer to those cases involving a subscriber

who is in the process of changing his contract in some manner so that the record must be "looked up" to secure the information needed. In such instances, contract information is often not available for several weeks, pending the receipt of payment, or correspondence. There were forty-seven claims. The "paid-to-dates" are very closely related to "look-ups," but specifically require determination of whether or not the subscriber's premium was paid to the date of service. A series of notifications sent the delinquent contract holders involves a thirty-day period before the contract is cancelled. There were eighty-seven claims of this type.

To summarize, it can be seen from the present analysis that the one factor most vital to the rapid processing of Blue Shield claims is that of getting complete information into the file when the claim is first received. The first three groups of claims which cannot be routinely processed because of insufficient information represent situations where the doctors and their staffs can be of material assistance in reducing or eliminating delay. Greater accuracy and detail in the original completion of the Medical Service Report will result in more rapid clearing of Blue Shield claims and greater satisfaction to both the public and the doctors.

During the month of September 11,707 participant subscribers were enrolled in Blue Cross, bringing the total enrollment as of September 30, 1953 to 978,918.

During the month of September 9,856 participant subscribers were enrolled in Blue Shield, bringing the net enrollment as of September 30, 1953, to a total of 593,294 Blue Shield participant subscribers.

As of September 30, a total of $11,102,222 has been paid to hospitals this year for services rendered to Blue Cross subscribers, and a total of $3,208,005 has been paid to doctors to date this year for the care of Blue Shield subscribers.

WMA TO MEET IN ROME

The World Medical Association will hold its 1954 meeting in Rome, September 26 to October 2. Since 1954 is a Holy Year, there will be heavy demands for transportation and hotel reservations. Any AMA member who wishes to attend this meeting should write to the World Medical Association, 345 East 46th Street, New York 17, as soon as possible. The WMA will secure transportation, hotel reservations, and help plan any side tours of Europe which the member desires. No charge is made to the physician for this service.

SURGICAL PATHOLOGY. Lauren V. Ackerman, M.D., Professor of Surgical Pathology, Washington University, School of Medicine, Surgical Pathologist, Barnes Hospital and Affiliated Hospitals, St. Louis; Consultant to the Ellis Fischel State Cancer Hospital, Columbia, Missouri; Consultant to the Armed Forces Institute of Pathology. 836 pages. Illus. Price $14.50, cloth. St. Louis: C. V. Mosby Co., 1953.

An excellent book by a prominent and experienced pathologist, "Surgical Pathology" is entirely new and in no way duplicates the previous book by Ackerman and Regato, published in 1947, entitled "Cancer, Diagnosis, Prognosis and Treatment."

This text is not meant to be a complete treatise on all of surgical pathology, but rather a brief summary of pertinent features of the more common entities encountered in a large general hospital. It includes surgical pathology of the entire body and thereby adequately covers the special interests of gynecology, urology, orthopedics, dermatology, neurosurgery and plastic surgery, as well as general and thoracic surgery. Any incompleteness of content is ameliorated by an up-to-date, readily available list of references that the interested reader can use for more detailed information.

Whenever possible, the author draws richly from his own experience and resolves controversial matters from his own fund of knowledge. Only important disputable issues are recorded. Because of this, the book is very readable, and the physician is quickly able to grasp and retain important information.

The author is progressive and up to date in his views on *in situ* cancer. The discussions of tumor pathology in general are excellent and it might be said that this indeed is the book's major contribution. In most instances, there are good, clinically useful classifications of disease; the one possible exception being that for thyroid neoplasms. The chapter on salivary glands was particularly well presented and indicates some clarification of benign and malignant tumors of these glands.

Gross and microscopic illustrations are very well chosen. Photomicrographs are exceptionally clear, rendering a useful "refresher" to the occasional microscopist and student. There are separate sections, in each chapter where indicated, devoted to frozen section, biopsy and exfoliative cytology. Here he clearly points

out the value, accuracy and limitations of these procedures. He also indicates the surgeon's responsibility to the pathologist in securing a representative and adequate specimen; for example, in proving the diagnosis of carcinoma of the pancreas. The problems and limitations of lymph node diagnosis are frankly admitted.

The author expresses his opinion of justification, or not, for a radical surgical procedure as based upon pathologic diagnosis and follow-up results. This text should be useful to the surgeon, pathologist, radiologist and medical student because it stresses gross and microscopic pathology in relationship to clinical observations. I recommend it highly.

Kenneth A. Storsteen, M.D.

OPERATIVE SURGERY. By Guy W. Horsley, B.S., M.D., F.A.C.S., Associate Professor of Surgery, Medical College of Virginia, Attending Surgeon, St. Elizabeth's Hospital, Richmond, Va.; and Isaac A. Bigger, M.D., F.A.C.S., Professor of Surgery, Medical College of Virginia, Surgeon-in-Chief, Medical College of Virginia Hospitals, Richmond, Va. 6th ed. 2 vols. Illus. Price $30.00. St. Louis: C. V. Mosby Co., 1953.

This is the first revision in thirteen years of a textbook of operative surgery which has long been recognized as one of the leading books of its kind.

There has been a complete revision of the text and the illustrations, but the book has retained its former style which made it so popular. Many new contributors have assisted in putting together the two volumes.

One of the valuable features of this text is the fact that it includes the more important operative procedures not only of what is now termed as general surgery, but also of the field of orthopedics, vascular surgery, thoracic surgery, urology, gynecology, proctology, plastic surgery and neurosurgery. The section on congenital and acquired cardiac disease is strictly up to date and is very well presented. The new chapters on thoracic surgery contain excellent descriptions of pulmonary resection, not only for tumors, but the use of resectional surgery in tuberculosis.

There is an entirely new section dealing with hernia, reflecting the great changes which have taken place in surgery since 1940. In reality, little of the old editions can be found, save some of the illustrations. This edition contains 1,274 illustrations of very good quality which are well integrated with the text. A few minor errors have crept into the book, but in general these are not important, the most glaring of these is the recommendation of enteroenterostomy with Polya gastrectomy where there is any torsion of the loops. The danger of stoma ulceration when this is carried out is not adequately emphasized.

This text is one which has a place in every good surgical library.

Frederick M. Owens, Jr., M.D.

THE PEOPLE'S HEALTH: A HISTORY OF PUBLIC HEALTH IN MINNESOTA TO 1948. By Philip D. Jordan. 524 pages. Illus. Price $5.00. St. Paul: Minnesota Historical Society, 1953.

The people's health is an outstanding achievement in the history of Minnesota medicine. Dr. Jordan has been able to place successfully on paper the significant story of our state and local health departments, a story of remarkable achievement by our pioneer physicians. With the perspective of the historian, he has been able to evaluate the personalities, the feuds and the vendetta that existed in the development of the department. In a most charming manner, he develops the personalities of our health department officials and brings to light the many contributions played by organized medicine and private practitioners to better the welfare of our state.

To go into detail concerning the various chapters of this work would steal from the reader the pleasure he will find in reading this volume.

Although many people are mentioned in the course of this essay, I am intrigued by the influence of Justus Ohage, Sr., in the development of the St. Paul Health Department, a heritage well borne by his son, Doctor Ohage, Jr., and the ubiquitous Doctors Ulrich and Tuohy whose images are reflected in every facet of our local medical history.

Doctor Jordan is to be congratulated on the completion of his arduous task, particularly for the charming manner in which he relates this story.

John F. Briggs, M.D.

DEFENSE SPENDING

A survey by the National Science Foundation shows that more than three-fourths of all federal money for scientific research and development is spent by the Department of Defense. Included in the total is the cost of medical research and development, but not the cost of such programs as medical care and hospital construction. The Department of Health, Education, and Welfare, which directs most U. S. medical research, ranks fifth on the spending list. It spent $67 million last fiscal year, but expects to cut back to $63 million the current fiscal year. NSF gives this year's estimated total for all agencies and departments as $2,187 million, compared with $2,205 million spent last fiscal year.
